Volume 9

Rheumatic Fever. Acute disease due to an infective agent not yet isolated. Organisms which have been stated to be the cause have proved to be due to some superimposed condition. Children and young adults are most commonly affected. There is some hereditary tendency to the disease, and exposure to cold or wet is often the precipitating factor. The symptoms generally begin abruptly, but may have been preceded by pains in the joints, sore throat, and inflammation of the tonsils. The temperature rises to 102° F. or more; then in a few days one or more of the joints become swollen, hot, painful, and reddened. Usually one of the large joints is affected first. The knee and ankle are the joints most frequently affected, but any joint may be involved. As the symptoms subside in one joint they may appear in another. There may be a reddish rash on the skin. Involvement of the heart is a frequent and serious complication. In many cases small nodules of about the size of a pea appear under the skin.

The course of the disease is very variable, and the convalescence must necessarily take several months. A fatal termination is rare, but permanent disease of the heart is very apt to remain, the organism having a special affinity for the mitral valve of the heart, causing this to contract in later years by the formation of fibrous tissue. There may also be changes in the joints. The essential feature in the treatment is to keep the patient at rest, so as to diminish the strain on the heart. The diet should be light. The affected joints should be wrapped in cotton-wool, and when the pain is severe hot cloths saturated with an anodyne lotion should be applied to them. Fixation of the joints with padded splints often gives relief. As internal medicines, salicin or salicylates in large doses are effective.

Rheumatism (Gr. *rheumatismos*, flux or rheum). Term popularly used for painful affections of the muscles or joints. The cause of rheumatism, and of the pain is unknown. Sepsis may play a part, as may worry and anxiety. Salicylates are the best remedy. Acute rheumatism is equivalent to rheumatic fever (*v.s.*). Originally, the word denoted a catarrh or flow of rheum.

Rheumatoid Arthritis OR **ARTHRITIS DEFORMANS** OR **POLY-ARTHRITIS**. Disease of the joints in which inflammation spreads

from the surrounding fibrous tissue to the structure of the joint itself causing destruction of the parts. There are two types—the idiopathic or “classical” type, of which the causation is unknown, and the infective type caused by a definite infective agent. The disease is commonest among women, rarely occurring after the menopause. In most cases fatigue, mental and physical, and loss of weight, precede the onset. The condition often starts in the bones of the hands, accompanied by wasting of the muscles, spreading eventually to the other joints in bilateral and symmetrical march. The joints may become stiff, ankylosing through destruction of the mechanism. Sometimes the disease arrests itself for no recognizable reason, and it is invariably held up by pregnancy.

Only some cases show any response to treatment. The general health must be maintained, and the diet must be rich in vitamins. Physiotherapy is helpful, easing pain. Splinting may be necessary to prevent deformity. Guaiacol, thyroid extracts, iodine and gold injections have been used and cortisone gives relief. Above all, septic foci must be sought for and dealt with.

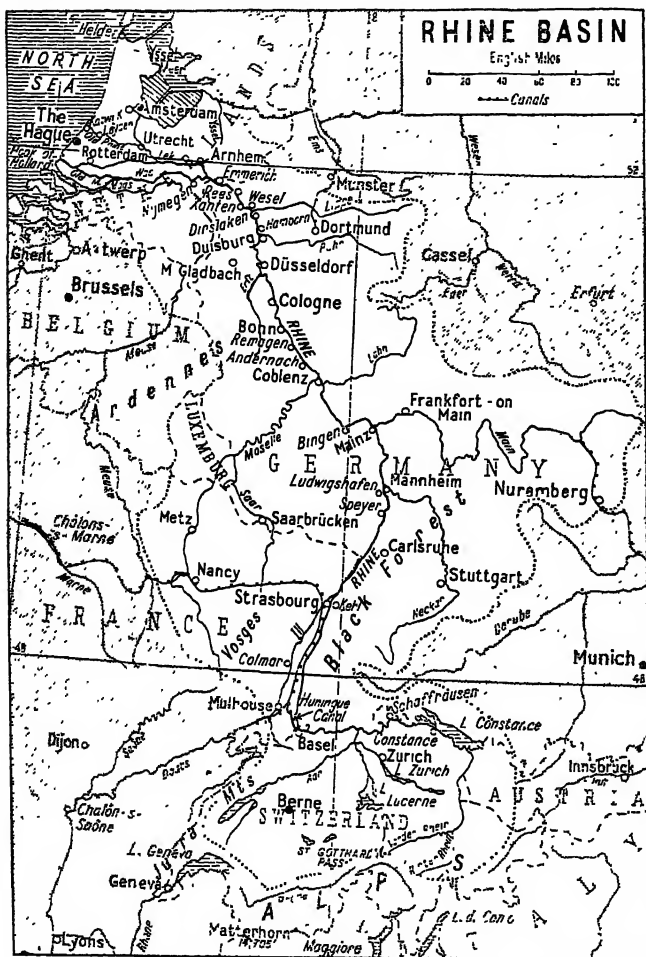

Rheydt. Tn. of W. Germany, in N. Rhine-Westphalia on the Niers, 20 m. W. of Dusseldorf. It possesses a fine Renaissance palace of 1567, but became a town only in the 1800s with the development of a textile industry. It also had a considerable electrical and printing industry, several impressive churches and a fine town hall, but was heavily damaged by bombs during the Second Great War. United with the neighbouring town of Gladbach from 1929 to 1933, it was re-established as a separate town upon the demand of Goebbels, who was born in Rheydt, and secured for himself its palace which had once belonged to the Juliers dynasty. Captured by the U.S. 9th army, March 1,

1945 in severe fighting, it lay in the British zone of occupation after Germany's surrender. Pop. (1939) 77,263.

Rh Factor. Agglutinin group factor present in red blood cells, so called because of its relation to blood of the rhesus (*q.v.*) monkey. Landsteiner and Wiener in 1940 noted that injection of blood from rhesus monkeys into rabbits or guinea-pigs led to the development of antibodies which reacted not only with the red blood cells of those monkeys but also with the cells of 85 p.c. of the white population; such persons were termed Rh positive and the remaining 15 p.c. Rh negative. When Rh factor is introduced into the blood of an Rh-negative person, *e.g.*, by a transfusion of Rh-positive blood, the production of anti-Rh agglutinins is stimulated, and any further addition of Rh is likely to produce severe reaction. In the case of an Rh-negative woman in pregnancy Rh factor may be introduced through the placenta from an Rh-positive foetus, the Rh agglutinin being inherited from the Rh-positive father. The opposite condition may result in the death of the baby. Sensitisation of patients during blood transfusions may be avoided by determining the Rh index and finding Rh-negative donors for Rh-negative recipients. In ante-natal clinics Rh tests make it possible to detect in advance the likelihood of complications due to Rh phenomena, so that necessary precautions can be taken. The Rh factor appears to be not a single substance but a mixture, and the erythrocytes of an Rh-positive person may contain one or more than one of these.

Rhine (Ger. *Rhein*; Fr. *Rhin*; Dutch, *Rijn*). Largest and most intensely navigated river of W. Europe. It is 820 m. long and rises in Switzerland, with two headstreams, the Vorderrhein on the St. Gotthard, at a height of 7,735 ft., the Hinter-Rhein near the Bernardino pass, from a glacier at a height of 9,570 ft., flows along the Swiss, Austrian, and German borders through the lake of Constance and, near Schaffhausen, plunges over an 80-ft. fall before reaching Basel. From Basel, where its E.-W. course turns N., it is navigable to Strasbourg for vessels up to 1,300 tons, from there to Mannheim up to 2,500 tons, and from Mannheim to its mouth (453 m.) up to 4,000 tons.

Its width varies, from 220 yards at Basel to 630 at Mainz, 410 at

Rhine. Map of the territory drained by the river, including part of the basin of the Maas

Bonn, 570 at Cologne, 1,060 at Wesel. Inside the Netherlands it turns W. once more and splits into a number of branches; the broadest, called the Waal and then (after being joined by the Maas river) Old Maas and New Maas, enters the North Sea S. of Overflakkee; another branch called the Rijn at Arnhem, then the Lek, then the Maas, enters the North Sea as the Scheur at the Hook of Holland; this branch has itself a branch, called the Old Rhine, which flows past Utrecht and Leyden and enters the North Sea at Katwijk. Still another branch flows as the Yssel in the bed of a canal dug in the time of the Roman emperor Drusus, from just E. of Arnhem into the Yssel Meer (formerly into the Zuider Zee). Of its total course, 430 m. are in Ger-

many or on the German frontier (113 m. with France, 5 m. with the Netherlands), 108 m. are in the Netherlands; and, taking the longer of the two headstreams, 282 m. in Switzerland.

Along the course of the Rhine lie a number of great inland ports: Basel, also on the Huningue canal; Strasbourg-Kehl, at the junction with the river Ill and the Rhine-Rhône canal; Mannheim, with the Neckar; Mainz, with the Main; Coblenz, with the Moselle and Lahn; Cologne; Düsseldorf, with the Erft; Duisburg-Hamborn, formerly the largest inland port of Europe, with the Ruhr; Wesel, with the Lippe; and Rotterdam, on the outlet of the Lek called the Maas. The Midland canal links Duisburg, Wesel, and Emmerich

and the Weser; the Dortmund-Ems canal goes to the North Sea via the river Ems; the Rhine-Main-Danube canal links the two great fluvial systems of central Europe; and the Rhine-Marne and Rhine-Rhône canals connect French waterways with the Rhine. Before the Second Great War the load carried by the Rhine averaged about 8.3 million mile-tons per year, or 60 p.c. of Germany's inland water traffic. It consisted of ore, grain, petroleum, other raw materials upstream, and coal, Alsatian potassium, building materials, and industrial products downstream; and there was a good deal of passenger traffic, the journey on board German or Dutch steamers, especially along the middle course from Bingen to Cologne, offering most attractive scenery with green, vine-covered hills, romantic castles and ruins, and old, picturesque towns and villages.

A Major Trade Route

The Rhine, originally the border line between Celts and Germans, was a trade route in Roman days. Minor sovereigns and robber barons beset it, from their castles, in the Middle Ages, exacting toll from the passing ships, a custom abolished in 1803 under French pressure. In 1868 the Rhine Shipping Act placed the river under the combined authority of the nations sharing its course: the Versailles Treaty, 1919, Articles 354-55, merely amplified this agreement, establishing Strasbourg as seat of its control commission, in which the U.K., Italy, and Belgium as well as the countries along its course were represented. There are special Rhine shipping courts for litigation concerning navigation, power stations, etc.

SECOND GREAT WAR. The Rhine was the last great barrier which the Allies had to pass from the W. to reach the heart of Germany; and it was in order to overcome it rapidly by outflanking the Siegfried line, which stopped at the Netherlands frontier just S. of Arnhem, that Eisenhower decided to carry out an airborne attack on Grave, Nijmegen, and Arnhem in Sept., 1944. This action, though partially successful, failed in its object; and a frontal attack on the Siegfried line became necessary. The Allied command therefore decided first to open the Scheldt estuary, in order to make the port of Antwerp usable, and then to line up along the W. bank of the Rhine from its mouth at least as far S. as Düsseldorf before again attempting to cross it.

The Germans occupying the N. bank of the Scheldt estuary were overcome by Nov. 9, and a channel to Antwerp was swept clear of mines by the 26th.

By that time the Rhine had in fact been reached, by the French 1st army in the S. on Nov. 20 between Mulhouse and the Swiss frontier, and by the U.S. 7th army (with the French 2nd armoured div. leading) at Strasbourg, Nov. 23. Fighting continued in this area, however, particularly around Colmar, and it was Feb. 9, 1945, before organized resistance ceased. On Dec. 3, 1944, the Germans breached the S. bank of the Rhine just below Arnhem, flooding the ground between the Rhine and the Waal, and compelling the Canadians to withdraw from their forward positions there. Then on Dec. 16 came the German counter-offensive in the Ardennes. Reorganization and redeployment of the Allied forces ready for the attack on the Siegfried line were interrupted. By the beginning of Feb. the Allies were re-established along the line they had held before the German counter-offensive, and on the 14th the Canadian 1st army reached the Rhine opposite Emmerich. The U.S. 9th army cleared München-Gladbach on March 1; German resistance on the Cologne sector collapsed and Cologne, in ruins, was captured March 7. By the 10th the Allies were along the Rhine as far S. as Düsseldorf.

Bridge at Remagen Seized

Farther S. still the U.S. 1st army reached the river at Remagen March 7, and there found intact, and seized, the Ludendorff rly. bridge, the sole bridge left standing by the Germans along the whole length of the Rhine. Five U.S. divs. were put across, and although the country was difficult, by the 24th the Americans held an area 25 m. long by 10 m. deep. The U.S. 3rd army reached the Rhine at Andernach 15 m. N.W. of Coblenz on March 9 and, sweeping southwards across the Moselle on the 15th, cleared the W. bank of the Rhine as far as Bingen by the 19th. On the 22nd this army also made a crossing by night with unexpected ease. By the 25th resistance W. of the Rhine was at an end: the Ardennes campaign had delayed the Allied attack by some six weeks; but it had also exhausted all German defensive reserves.

The major crossing remained the task of Montgomery's 21st army group, composed of the British 2nd, the Canadian 1st, and the U.S. 9th armies. The Rhine in the

stretch to the N. of Düsseldorf chosen for the operation is 600–700 yds. wide, has a depth of 20–30 ft., and a current of 3–5 m. an hr. British and U.S. naval detachments, dressed for secrecy as soldiers, dragged 200 m. overland across the Netherlands L.C.M.s and L.C.V.P.s (see Landing Craft) to be used as ferries for transporting across the river tanks, guns, and bulldozers. Dense and continuous smoke screens hid the final preparations. The assault began at 9 p.m. on March 23 in bright moonlight. In the course of the night, assault troops crossing in "buffaloes" and other amphibious craft established bridgeheads on the heavily mined E. bank at Rees, opposite Xanten, at Wesel, and near Dinslaken. Early on the morning of the 24th more than 3,000 transport aeroplanes operating from 26 British and continental bases dropped parachutists of the British 6th and U.S. 17th airborne divs. N. and N.E. of Wesel, within range of covering artillery. This, the largest airborne operation of the war, was completely successful. British engineers had constructed a bridge by 11.30 p.m. of the 24th, and 24 hrs. later seven bridges were in operation to the bridgehead which by that time had been extended to a width of 25 m. and a maximum depth of six m.

Rhineland. Name for an area of Germany demilitarised "for ever" under the Versailles treaty, comprising all of Germany W. of the Rhine and a strip 30 m. wide on the E. On March 7, 1936, the area was remilitarised by German forces as Hitler's first great act of repudiation of the treaty.

Rhineland-Palatinate. *Land* or state of the Federal Republic of W. Germany, in the French zone of occupation. Created in 1946, it comprises the S. half of the former Rhine province, the former (Bavarian) Palatinate, and the part of former Hesse W. of the Rhine; the Saar basin is not included. The capital is Mainz.

Rhine-Marne Canal. Waterway of France. Constructed during 1838–53, it runs from the canalised Ill at Strasbourg to Vitry-le-François on the Marne, where it joins the canal running alongside that river. It is 225 m. in length, can take ships up to 250 tons, has 150 locks and four tunnels up to three m. long, and is carried across the Meurthe, Moselle, and Meuse.

Rhine Province. Former S.W. prov. of the German state of Prussia. Including the Saar, it had an

area of 10,035 sq. m. It stretched along both banks of the Rhine, between Lorraine, Luxemburg, Belgium, and the Netherlands in the S. and W., Hesse-Nassau and Westphalia in the E. and N., and contained the best vineyards of the Rhine, Main, Moselle, and Saar, part of the industrial area of the Ruhr, and, in addition to its largest city, Cologne, had 12 towns of between 100,000 and 700,000 inhabitants. Chief industries were mining, engineering, and the manufacture of textiles and chemicals; most of the people, of Frankish origin, were R.C.; and a large part of the area was long ruled by archbishop-electors. The capital was Coblenz.

After the surrender of Germany in 1945, the prov. was split, the S. half coming under French occupation and forming part of the Rhineland-Palatinate *Land*, while the N., occupied by the British, was united with Westphalia to form the *Land* of North Rhine-Westphalia.

Rhine-Rhône Canal. Waterway of France. Starting from St. Symphorien, on the river Saône, it passes S.E. to the Doubs, which it follows until it passes S. of Belfort to Mulhouse and enters the Rhine basin. From Mulhouse it passes N. to Strasbourg. Built 1783–1834, it is 193 m. in length.

Rhinitis (from Gr. *rhis*, nose). Inflammation of the mucous membrane of the nose. Acute catarrhal rhinitis may be the familiar cold in the head, or may be caused by irritating gases, dust, or pollen of plants, catarrh due to the last being spoken of as hay fever.

Chronic rhinitis occurs in two forms. In the hypertrophic form there is thickening of the tissues covering the bones in the inside of the nose, which may cause some obstruction to respiration. In dry chronic rhinitis there is little discharge, and the exudation dries and forms crusts on the tissues.

Rhinoceros (Gr. *rhinos*, of the nose; *keras*, horn). Genus of large ungulate mammals, confined to Central and S. Africa and S. Asia, and once common in Europe, including Great Britain. Five species are usually recognized, of which three occur in Asia. Their most obvious distinction from all other mammals is the presence of one or two horns in the middle line of the face. But these are not horns in the same sense as those of the ox. They have no connexion with the bones of the skull, but consist of agglutinated masses of horny fibres or hairs growing out

Rhinoceros. One-horned species found in Indian jungles, distinguished by its thick folds of skin, resembling plates of armour

Gambier Bolton, F.Z.S.

of the skin. The rhinoceros belongs to the odd-toed group of ungulates, or hoofed mammals, and has three sub-equal toes on each foot and no projecting snout.

The Indian rhinoceros has one horn, and is distinguished by the thick tuberculed skin, which is folded in places and has something of the appearance of an ancient coat of plate armour. It stands a little over five feet high at the shoulder, and is of very heavy and clumsy appearance. It is found in swampy spots in the jungle, and is usually timid and inoffensive. It has been known to live over 50 years in captivity, and in a wild state it probably completes its century. The Javan and Sumatran rhinoceroses are smaller in size, and the skin is smooth and inclined to be hairy. The latter species has two horns, usually short.

The black rhinoceros is a native of Africa, and ranges from Abyssinia to Cape Colony, being usually found in thickets near streams. It has two horns, and the skin is smooth and almost hairless. The upper lip is prolonged and pointed, and, being somewhat prehensile, is used for grasping the leaves and twigs on which it chiefly feeds. Notwithstanding its great bulk, it is agile, and usually makes off with great speed when alarmed.

The white rhinoceros is the largest of all, and sometimes attains a height of over six feet at the shoulder. It lacks the pointed upper lip of the black species, and has a tuft of hair at the tip of each ear. The front horn is sometimes about a yard long, the other being much shorter. It occurs in the S. Sudan, the Congo Free State, and S. of the Zambezi river. It feeds entirely upon grass, is usually found in pairs, and is very dangerous if molested. See Animal; Ice Age.

Rhizomes. Underground stems which grow horizontally. From them adventitious roots penetrate downwards into the soil, and leaves (e.g. *Oxalis*) or stems bearing leaves (e.g. *Solomon's seal*) rise into the air. They may branch, so that one plant may form several apparently separate aerial growths. Older parts of rhizomes tend to decay, so that branches actually become separate individuals by vegetative reproduction. Many rhizomes (e.g. *Iris*) continue to live while their aerial growths die down, the food stores in the rhizome serving for the annual renewal of the aerial growths.

Rhizopoda (Gr. *rhiza*, root; *pous*, foot). Word used by zoologists for the class which includes the lowest members of the protozoa or primitive animals. It includes such organisms as the amoeba, radiolaria, and mycetozoa. They are usually of amoeboid form.

Rhode Island. State of the U.S.A. One of the original thirteen, it is the smallest state, its area being 1,214 sq. m., only a little larger than Gloucestershire; of this 156 sq. m. is inland water. The surface is level in the S., with plains and swamps along the coast, but hilly in the N. and E. Narragansett Bay extends inland for 30 m., and contains several islands, one of which gives the state its name. There are several summer resorts, of which the most notable is Newport. Some farming is carried on, but the main industrial interest of Rhode Island are its manufactures. It is the most densely populated state of the union, and was the birthplace of the American textile industry. It is still the greatest jewel-manufacturing community in the world, and there is a considerable machine-tool industry. Providence is the

capital; other large towns are Pawtucket and Woonsocket.

Various settlements were made during the 16th century in what is now Rhode Island, chiefly by persons exiled for religious reasons from Massachusetts, and the descendants of these dissenters own the great fortunes of the state to-day. In 1647 the four existing settlements of Providence, Portsmouth, Newport, and Warwick were united. In 1663 a royal charter was obtained; as the war of independence loomed ahead, Rhode Island refused to attend the constitutional convention of 1787, carrying on internal administration under its colonial charter until 1842. It attracted in the 19th century large numbers of Irish immigrants, and by the 1940s virtually the entire upper judiciary, the mayors of Providence and Newport, and Rhode Island's leading figures in Washington (the state sends two senators and two representatives to congress) were of Irish descent. Pop. 713,346. Consult Rhode Island: Three Centuries of Democracy, C. Carroll, 1932.

The Rhode Island Red breed of poultry is described under Fowl.

Rhodes (Gr. *Rhodos*). Most easterly island in the Aegean Sea, sometimes included in the Dodecanese (*q.v.*).

A Greek possession, it lies 12 m. S. of the coast of Asia Minor and is 43 m. long and 20 m. wide, covering 545 sq. m. The N. is fertile, the S. elevated, so that during the rainy winter season torrents rush down the slopes to the sea. The principal products are grapes, oranges, wine, onions, tobacco, soap, and kaolin. Pottery is made.

Known under various names in ancient times, the island was called Rhodos, probably from its extensive cultivation of roses (Gr. *rhodon*). The oldest inhabitants were the mythical Telchines, who were succeeded by Phoenicians and Dorian immigrants from Argos. Its three chief towns, Lindus, Ialysus, and Camirus—with Cnidus and Halicarnassus in Asia, and the island of Cos—formed what was known as the Doric hexapolis, or league of six cities. The island rapidly became flourishing, founded Gela in Sicily and other colonies, but first acquired political importance when the three towns in 408 B.C. built a new city called Rhodos, which became the capital.

Alternately attached to Athens and Sparta, it lost its independence in the time of Alexander the Great, regained it after his death,

and soon became a thriving commercial centre. Its code of maritime laws was later adopted by the Romans and through them by modern Europe. Science and art flourished. The Rhodian school of rhetoric, distinguished by its florid style, and originally founded by Aeschines (*q.v.*), was attended by Cicero. Its school of art was founded by Chares of Lindus, who fashioned the bronze statue of Helios (*see* Colossus). Other representatives were Athenodorus (*see* Laocoon) and Apollonius and Tauriscus of Tralles, who executed the group known as the Farnese bull (*see* Dirce).

For their loyal support of Rome during her wars against the Seleucid emperors of the East, the Rhodians were rewarded with mercantile privileges and a considerable increase of territory, which later were partly taken away owing to their suspicious attitude. Yet

40,000 surrendered to the 9,000 Germans in the island following a savage German dive-bombing attack from Crete, Sept. 8, and Rhodes remained under German control until the surrender of all Germans in Rhodes and the Dodecanese at Symi Island, May 9, 1945. Under the peace treaty with Italy, 1947, Rhodes passed to Greece. Pop. 61,886.

Rhodes. Capital of the island of Rhodes. Situated in the N.E. corner of the island, it is a port of call for Levant steamers. Its principal interest is in the remains of the Knights Hospitallers. Among these are the castle; the Street of the Knights, which contains remains of the houses of assembly of the Knights Hospitallers, several bearing armorial devices of the countries to which the inmates belonged; and the Grand Hospital of the Knights, restored by the Italian government and con-

plantation. They developed two separate mines or pipes—De Beers and Kimberley—which were a maze of individual claims. The necessity of amalgamating these brought Rhodes to the front, and after a long financial conflict with Barney Barnato, he amalgamated the mines under the name of De Beers in 1889.

C. J. Rhodes
W. & D. Douney

Between activities at Kimberley Rhodes found time to keep his terms at Oriol College, Oxford, graduating in 1881. That year he joined the Cape parliament as member for Kimberley. He entered it with a plan already formed in his mind, no less than the creation of a British Africa from the Cape to the Zambezi. In his first session Rhodes engineered the defeat of Sprigg, and under the Seamen ministry obtained power to secure for the Cape Colony control of Bechuanaland. Deputy commissioner for this country in 1884-85, he defeated Boer hopes of expansion by masterly negotiations. Rhodes could now make use of the concessions he had secured

Rhodes. Scenes in the historic capital of the Aegean island. 1. Street of the Knights, containing the old houses of the Knights Hospitallers. 2. Entrance to the castle. 3. The market

the island enjoyed semi-independence until the time of Vespasian, when it was merged in the province of Asia. Later included in the Byzantine empire, from 1309 to 1523 it was the headquarters of the Knights Hospitallers, being captured at last by the Turks.

The island, occupied by Italy during the Italo-Turkish War of 1912, was transferred to her by the treaty of Lausanne, 1924.

Rhodes was subjected to periodical naval and aerial bombardment by the Allies after Italy entered the Second Great War, 1940. When Italy surrendered to the Allies, 1943, the Italian garrison of

verted into a museum in 1914. Rhodes is the seat of an R.C. archbishopric and has law courts, and was Count Bernadotte's h.q. as Jewish-Arab mediator, 1948. Population 27,466.

Rhodes, CECIL JOHN (1853-1902). British coloniser and administrator. He was a son of the vicar of Bishop's Stortford, where he was born July 5, 1853. Educated at the grammar school, he was sent at 17 for the benefit of his health to Natal, where his eldest brother, Herbert, was planting cotton. They joined the diamond diggers on the banks of the Vaal after winding up the cotton

from Lobengula, chief of the Matabele. In 1889 he obtained from the imperial government a royal charter for the British South Africa Company, and pushed forward the well-organized expedition which took peaceful possession of Mashonaland.

In 1893, raids by the Matabele on the Mashona brought about a war, in which the latter tribe was defeated and a territory as large as France and Germany combined came under the administration of the company. President Kruger was now surrounded by British territory except for Delagoa Bay, which Rhodes had failed to pur-

chase from the Portuguese. Prime minister of the Cape since 1890, Rhodes was pressing the colony to extend its rly. system to Pretoria, and effect a rly. and customs union with the Transvaal. But the parliament refused, and the wealth of the newly discovered goldfields enabled Kruger to build his line to Delagoa Bay and punish the Colony for its exorbitant customs policy; but he carried matters too far when he "closed the drifts" to Cape merchandise and produce. This action ranged the Colony behind Rhodes.

Remembering his bloodless successes, Rhodes concentrated the Rhodesian police near the Transvaal frontier. Kruger gave way on the Drifts question, but refused any concessions to the Uitlanders. Then came the episode of the Jameson Raid (*q.v.*); Rhodes's connivance was proved; and although on Jan. 2, 1896, the day of Jameson's surrender, he tendered his resignation as prime minister, and shortly afterwards resigned his managing directorship of the Chartered Company, he was severely censured by both his own and the British parliaments. He found work and solace in the task of quelling a Matabele rebellion which had broken out upon the news of Jameson's defeat. With no authority and no backing, except moral power, he went to the Matoppo and there negotiated a peace with the chiefs.

He went back to encourage industrial development in Rhodesia; and in 1897 justified past policy on the ground that Kruger had denied the majority of the population any share in government. But this great question had to be settled by arms. At the outbreak of war Rhodes at Kimberley helped to organize the defence. Hardship helped to break down his strength, and after a painful illness he died March 26, 1902. He was buried in the Matoppo Hills.

In his imperialism Rhodes was at once a visionary and a man of impulsive action. He attempted too much and left it undone, yet the prosperity of Rhodesia witnesses his work as a founder of the British Empire. Though a financial genius, he was probably not personally interested in the fortune he acquired; but he failed to realize that subordinates were not always selfless. He would not have understood Edith Cavell's phrase, "patriotism is not enough," when it came to justifying the unconventional if brave decisions he took.

Rhodes left Groote Schuur, his house on Table Mountain, to be a residence for future prime ministers. His memorials are the buildings at Cape Town including the sculpture, *Physical Energy*, by Watts; Rhodes House in Oxford, designed by Sir H. Baker and opened in 1929; and the Rhodes Trust (*q.v.*) at Oxford university. Among many biographies may be named those by L. Michell, 1910; T. E. Fuller, 1910; A. F. B. Williams, 1921; W. Plomer, 1933; S. G. Millin, 1933; H. Baker, 1934; J. G. McDonald, 1934; J. G. Lockhart, new ed. 1946. There is an unsympathetic sketch of Rhodes in F. B. Young's novel, *City of Gold*. In a film, *Rhodes of Africa*, 1936, Walter Huston took the part.

Rhodes, JAMES FORD (1848-1927). American historian. Born at Cleveland, Ohio, May 1, 1848,

J. F. Rhodes,
American historian

he was educated at the universities of New York and Chicago, and in Paris. Paris correspondent of *The Chicago Times*, he gave up this post to enter the iron and steel business. From 1885 he was able of devote himself to the study of history. He worked on a *History of the United States from the Compromise of 1850*; eight volumes, carrying the story down to 1877, appeared 1893-1917, and a full edition in 1920. Written with marked impartiality, it is the best account of the eventful period of the civil war. In 1899 Rhodes was president of the American Historical Association. He also wrote *Historical Essays*, 1909. He died Feb. 22, 1927.

Rhodes, WILFRED (b. 1877). English professional cricketer. Born Oct. 29, 1877, at Kirkheaton, this Yorkshireman was a mainstay of his county side for 30 years from his first appearance as a slow bowler in 1899, but is chiefly remarkable for his career in England teams against Australia. He began as a bowler, batting last: at his prime he went in first with J. B. Hobbs, the pair at Melbourne in 1912 making an unprecedented

Wilfred Rhodes,
English cricketer

opening stand of 323; recalled as a bowler for the Oval test match in 1926, Rhodes was a chief figure in England's victory. No player equalled his tally of 109 Australian wickets in tests. He headed the bowling averages in seven seasons including 1926, when aged 48; each year 1900-01-02 brought over 200 victims to his skill and in 1909 and 1911 he passed 2,000 runs and 100 wickets. In seventeen seasons he achieved the all-rounder's "double" of 1,000 runs and 100 wickets, another record.

Rhodesia. Name given, in honour of Cecil Rhodes (*q.v.*), to the area of central Africa lying between Angola, the Belgian Congo, Tanganyika Territory, Mozambique, the prov. of Transvaal, and the Bechuanaland protectorate. The whole area was for more than 30 years under the administration of the British South Africa Co., chartered 1889. Southern Rhodesia became a British colony in 1923; Northern Rhodesia, created in 1911 out of the two provs. of N.E. and N.W. Rhodesia, became a British protectorate in 1924. For an account of their history and physical and other features, see Northern Rhodesia; Southern Rhodesia. For map, see Southern Rhodesia.

Rhodesian Regiment, ROYAL. British colonial regiment. Developed from the British South Africa Company's native police force formed in 1889, the unit was known until 1933 as the Northern Rhodesia Police. It had civil and military sections, the latter serving with the British army in the S. African War and the First Great War.

In 1933 it came on to the military establishment as the Northern Rhodesia Regiment. The ranks are recruited mainly from the Babemba, Baila, and Angoni tribes, while its European officers and senior N.C.O.s are permanently posted to the regiment. Normally, the regiment has a strength of two battalions, which was expanded to eight in the Second Great War. Battalions served in the East African campaign, Madagascar, N. Africa, Syria, and with the 14th Army in Burma. In April, 1947, the regiment dropped Northern from its title and was granted the prefix Royal, and the following August King George VI became colonel-in-chief.

Rhodes Trust. Trust established under the will of Cecil Rhodes for the purpose of granting scholarships at the university of Oxford to students from the

British dominions, the U.S.A., and formerly from Germany. Following Rhodes's testamentary instructions, the scholars are selected with regard to (1) literary and scholastic attainments, (2) achievements in manly outdoor sports, (3) moral qualities, and (4) exhibition of force of character, etc., in school days.

The yearly value of the Rhodes scholarships was originally £300, but this was several times increased, and in 1946 was fixed at £500. Under the will, 60 scholarships were endowed for the British Empire, two for each state of the U.S.A., and five to be nominated by the German emperor from Germany. The last-named were withdrawn by Act of Parliament during the First Great War, but from 1929 to 1939 Germans were again elected. The number of scholars at one time is about 200. The headquarters of the trust is at Rhodes House, Oxford.

Rhodian Ware. Class of glazed pottery, also known as Turkish ware. It was made in Rhodes, and

at Nicaea, Kutaya, and elsewhere in the Turkish Empire. The best ware, especially tiles and dishes, was produced in the 16th and early 17th centuries. The ground is generally pure white,

with bold designs in blues, greens, etc., outlined with a dark pigment.

Particularly characteristic is the decorative use in relief of a red clay pigment, known as Armenian bole. Sometimes this covers most of the white ground. Persian motives are frequent, though the Turkish treatment of flowers is broader and more naturalistic. The glaze is unusually thick.

Rhodium. One of the six metallic elements of the platinum (*q.v.*) family, discovered by W. H. Wollaston in 1803 and named after the Greek *rhodon*, a rose. Its chemical symbol is Rh, and it is one of the transitional elements in the second long period of the

periodic table, with ruthenium and palladium, its group neighbours being cobalt and iridium. It has an atomic number of 45; atomic weight, 102.91; specific gravity, 12.4; melting point, 1,966° C.; electrical conductivity, 35 (silver being 100); crystal form, face-centred cubic, with lattice constant $a = 3.795$; and an interatomic distance of 2.683 Å.U.

Rhodium always occurs closely associated with platinum, palladium, and the other metals of the group in the Urals and S. Africa, and as rhodite in certain gold ores, particularly in Mexico. The chief source is the low-grade copper nickel ores at Sudbury, Ont. It

is extracted by wet processes during the refining of platinum. The product is a metal of a purity of at least 99.7 p.c., bluish-white in colour. It may be melted on a lime hearth and cast at very high temperatures, but the product is hard and difficult to work until it has been forged at high temperatures. It can be produced as thin sheet and fine wire, down to a diameter of 0.004 in. The annealed metal has a Vickers hardness of about 100, but that of the electro-deposited metal is about 800. It resists the attack of all acids, including aqua regia, but will dissolve in fuming sulphuric acid at 300° C. It does not oxidise in air even at high temperatures.

Various platinum-rhodium alloys are used in industry, those containing 10 p.c. rhodium and 90 p.c. platinum, or 13 p.c. rhodium and 87 p.c. platinum, making one wire in thermocouples for high temperature measurements, the other wire being pure platinum. The alloy containing 20 p.c. rhodium is used for the windings of resistance furnaces. Similar alloys are used in crucibles, magneto contacts, and spinnerets for the rayon industry. If an article is highly polished and then rhodium-plated, no further polishing is ever needed. Electro-deposited rhodium is used for reflectors, all the polishing being completed before plating, the metal has high reflectivity over a wide range of the spectrum.

Rhodochrosite. Mineral manganese carbonate, usually containing small quantities of iron, calcium, and magnesium. Red in

colour, whence its name, it is found associated with manganese, silver, lead, and other metallic ores; also as a metasomatic replacement of limestone.

Rhododendron (Gr. *rhodon*, rose; *dendron*, tree). Genus of evergreen shrubs and trees of the family Ericaceae. They are

natives of the E. Indies, China, Japan, India, the mountains of Europe, and N. America, and have been introduced into Great Britain at various dates since 1656, when *R. hirsutum*, the hairy alpenrose, came from Switzerland. The tender kinds need ordinary greenhouse treatment in pots, at an average

Rhododendron. Flower cluster of this hardy shrub

temperature of 50° to 60° F. during winter and early spring, and they may be placed out of doors during summer. The more important hardy species may be planted anywhere, in good soil that is free from lime, while many kinds prefer peat.

They may be planted at any time in autumn or spring, and should be mulched after flowering in May with well-rotted manure. Flowers are of all shades and colours, except blue. The hardy purple-flowered rhododendron, *R. ponticum*, is an excellent subject for the wild garden, in miscellaneous belts of shrubs on the outer ring of cultivation, and also in newly made woods as a covert plant. Rhododendrons are propagated by seeds or by layers taken in spring or autumn. Choice seedlings are sometimes grafted upon *R. ponticum* and other robust species. There are over 200 species of rhododendron.

Rhodonite (Gr. *rhodon*, rose). In mineralogy, name given to a manganese silicate belonging to the pyroxene group of minerals. Part of the manganese has usually been replaced by iron, calcium, or zinc. The mineral has a glassy appearance, is some shade of red in colour usually, and generally occurs in certain metalliferous veins. Some varieties are cut and polished for gemstones and are also used to give a violet colour to glass and in glazes.

Rhodopé Mountains. Outlying chain of the Balkan Mountains (*q.v.*). They are mostly in S. Bulgaria, partly in Greek

Rhodian Ware. Sixteenth century Turkish jug having a blue background decorated with cream and red flower buds

By courtesy of The Victoria and Albert Museum, Kensington

Macedonia and Thrace, extending S.E. from the Sofia district towards Adrianople (Edirne) and the Aegean Sea. The loftiest peak is Muss-Alla Dag, alt. 9,613 ft. S.E. of this rises the range Dospad Dag (Despoto Dag), a name sometimes applied to the parent chain. Other peaks are Jel Tepe (8,796 ft.), Rilo Dag (8,790 ft.), Vitosha (7,515 ft.), Sitke Dag (7,177 ft.).

Rhodopis. Greek courtesan who lived at Naucratis in Egypt, whither she had been brought as a slave. Charaxus, brother of the poetess Sappho (*q.v.*), met her there and became so enamoured of her that he paid a large sum of money to have her set free. This roused the anger of Sappho, who attacked Rhodopis in one of her poems. The Cinderella story that Psammetichus III, king of Egypt, found her shoe and was so struck by its daintiness that he immediately made her his wife, is chronologically impossible.

Rhombus. A figure with four sides all of equal length, but having acute or obtuse angles between them, whereas a square has four right angles. The school-boy's definition, "a squashed square," is expressive. A rhomboid bears the same relation to a rhombus as a rectangle does to a square; i.e. it is a parallelogram but its adjacent sides are not equal in length, and of course it contains no right angle.

Rhonchi (Lat. *rhonchus*, snorting). Sounds heard either through the stethoscope or by placing the ear to the chest, in persons suffering from bronchitis. They are due to obstruction of the air passages, by swelling of the mucous membrane, or the presence of secretion.

Rhondda. River of Glamorganshire, Wales. It is formed by the confluence of the Rhondda-fach and Rhondda-fawr, and flows 15 m. S.E. to the right bank of the Taff at Pontypridd. It passes through the Rhondda valley, one of the chief mining districts of Wales.

Rhondda. Urban district of Glamorganshire, Wales. It stands in two valleys of the above river Rhondda, about 10 m. N.W. of Pontypridd, and is served by rly. The chief buildings are parish churches and other places for worship, the offices of the district council, and several public halls. Despite the depression of the early 1930s, coal mining remains the chief industry; but there are 28 new factories turning out garments, light engineering, and electrical appliances. Coal

began to be worked about 1870, and in 1877 an urban district was formed, its name being changed from Ystrad-y-fodwg, that of the original parish, to Rhondda in 1897. It includes Tylorstown, Pentre, Cymmer, Ferndale, Treherbert, Dinas, Porth, Treorchy, Llwynypia, and Tonyypandy. In 1885 it became a division sending one member to parliament; from 1918 it has elected two. Pop. 111,500

Rhondda, DAVID ALFRED THOMAS, VISCOUNT (1856-1918). British merchant and politician.

Viscount Rhondda,
British politician
Elliott & Fry

Born at Aberdare, March 26, 1856, he was the son of a successful grocer who later became interested in collieries. The son was educated at Clifton, and Caius College, Cambridge, after which he entered business in S. Wales. He soon became one of the leading men in the coal and allied trades, the

In 1888 Thomas entered parliament as Liberal M.P. for Merthyr, and therein he sat continuously until 1910, the last few months for Cardiff, but did not make a successful politician, and retired a disappointed man. Coming home from the U.S.A., where he had been in connexion with the supply of munitions, he survived the torpedoing of the Lusitania. In 1916 he was made a baron, and joined the coalition ministry as president of the local government board. The following

year he became food controller, and successfully started rationing, but the work broke him physically and on July 3, 1918, he died, having just been made a viscount; this title passed to his daughter (*v.i.*).

Rhondda, MARGARET HAIG, 2ND VISCOUNTESS (b. 1883). British editor. Born June 12, 1883,

she went to St. Andrews, and became known as an advocate of woman's rights. She was married, 1908-23 to Sir Humphrey Mackworth,

Bt. In 1915 she was a survivor of the Lusitania disaster. By special remainder she succeeded to her father's peerage in 1918. Founder editor of Time and Tide, she wrote a life of her father, 1921; and This Was My World, an autobiography, 1933.

Rhône. River of Switzerland and France. It rises in the Rhône glacier, between the Furka and

Viscountess Rhondda,
British editor

Rhône. Map of the area drained by the river and its tributaries. Inset, Marseilles-Rhône canal

Grimsel Passes, in the Bernese and Pennine Alps, and flows, a rushing mountain stream, into the Lake of Geneva. Passing through the lake, it emerges at Geneva, flows S.W. and S. to a point 18 m. W. of Chambéry, where it turns N.W. and W. to Lyons. Joined there by the Saône, it flows practically due S. to Arles, where it breaks into two main branches, the Petit Rhône and the Grand Rhône, and several lesser streams, which enclose the delta known as La Camargue, with an area of about 300 sq. m., and so reaches the Mediterranean.

The chief tributaries of the Rhône are the Ain, Saône, Isère, Drôme, Ardèche, Eygues, Durance, and Gard. Its valley is naturally of great economic importance, and among the towns on its banks are Brigue, Geneva, Lyons, Vienne, Valence, Avignon, and Arles. From the sea to Lyons navigation, though difficult in parts, is active; above Lyons the traffic is smaller. The Rhône is connected by canal with the Rhine, Loire, Yonne, Seine, and with Marseilles.

In 1938 work started on the Genissiat (*q.v.*) dam on the Upper Rhône. This project, interrupted by the Second Great War, was completed in Jan., 1948. The dam is 320 ft. high and impounds the waters of the Rhône for a distance of 14 m. The reservoir feeds a turbo-electric plant which, with its five 975-ton turbines, is one of the most powerful in Europe. When it was completed, only that at the mouth of the Dnieper, Russia, was more powerful. The Genissiat plant was the first of 21 projected along the Rhône valley, to have a total annual generating capacity equivalent to one-third of electricity production in France from all sources. The

dams were planned not only to provide power for the electrification of the P.L.M. rly. and for the Paris and Lyons dists., but also to reduce the rate of flow of the Rhône and so improve navigation of the river. See Geneva; Rhine.

Rhône. Dept. of France. It lies contiguous with the depts. of Saône-et-Loire, Loire, Isère, and Ain, and is the smallest dept. in area save those of Belfort and Seine. It is hilly and has many picturesque tracks, notably in the Monts du Beaujolais, de Tarare, and du Lyonnais. The stony soil is generally unfertile, except in the Rhône and Saône valleys, but the vine is successful in the Beaujolais and the S. parts, and the mulberry, used for silkworms, is important. The dept. is chiefly industrial, the great silk industry centring in Lyons, and there are engineering and iron works, muslin, chemical, and glass factories, stone quarries, iron, copper, and coal mines. The rivers include the Rhône, Saône, Azergues, Vauxonne, Ardière, Yzeron, and Garon. The towns include Lyons (the capital), Villefranche, Vaugneray, Tarare, Beaujeu, St. Laurent, Amplepuis, Thizy, and Givors. Area of dept. 1,104 sq. m. Pop. 918,866, of whom 460,748 are in the city of Lyons.

Rhubarb (from Gr. *rhēon barbaron*, barbarian *rhēum*). Edible-stalked herbaceous plant of the family Polygonaceae, genus *Rhēum*,

a native of Siberia. The stalks are stewed and eaten as a sweet, but the roots possess valuable medicinal properties. Preparations of rhubarb are valuable for disorders of the stomach and of digestion in children. Rhubarb will flourish in any soil that is not waterlogged. Well rotted stable manure should be dug deeply into the ground

before planting, and basic slag and phosphate of lime must be applied if the ground is deficient in these. Autumn planting may be resorted to, but it is better to plant in the spring, and pull no stalks of the rhubarb during the first season. Too many stems should not be taken from any particular plant during any one season, as this weakens the root.

Rhubarb can be forced in the open air by covering the young

plants with drain pipes, or similar articles, and packing the exteriors or bases of these receptacles with fermenting manure. Roots of three-year-old plants may be forced by placing them in a dark position under the staging of a greenhouse, or in a house devoted to the culture of mushrooms. Propagation is usually and simply carried out by dividing the roots with a sharp knife into as many pieces as will allot a crown to each fragment.

Rhubarb may also be raised from seed sown in autumn in the open air, though this is not usual. There are several varieties, one of the most noteworthy of which is champagne rhubarb, used in some localities in England and France to make an effervescing beverage. This is said to form the basis of many brands of cheap champagne. *R. officinale*, and some other species, are grown in the margins of shrubberies, in deep rich soil, as ornamental plants, for the sake of their bold leaves.

Rhubarb leaves are poisonous to animals and humans. The stalks are used in jam, and sometimes in the form of pulp for addition to fruit used in jam making.

Rhuddlan or **RHYDDLAN**. TOW. of Flintshire, Wales. It stands on the Clwyd, 8 m. N. of Denbigh, 3 m. S. of Rhyl, and has a station on a branch rly. It is famous for

Rhubarb. Leaves and flowers of the common edible species

Rhône. General view of the Genissiat dam, gradually filling up. One of the largest dams in Europe, it forms part of a huge hydro-electric system designed to produce one-third of all electric power in France

Rhuddlan, Flintshire. Ruins of the castle seen from across the river Clwyd

its castle, now in ruins and ranked as an ancient monument. This was built in the 11th century, and in it Edward I held a parliament in 1283. S. Mary's church is an old building. A bridge dating from the 16th century leads across the river to Rhuddlan Marsh, where, it is said, Offa of Mercia defeated the Welsh Caradoc in 795. Rhuddlan was once a flourishing seaport; encroachment of sand, however, destroyed its prosperity, and the borough privileges given by Edward I fell into disuse. Pop. 1,519. *Pron.* Rithlan.

Rhumb Line. Any line on the surface of a sphere which cuts successive meridians at a constant angle; and hence the path of a ship which sails continuously towards the same point of the compass. On the surface of the globe, rhumb lines are double spirals asymptotic to the poles; they are not the shortest distance between points, but, except for long voyages or at high latitudes, they are regularly used in navigation on account of the ease in steering. They can be simply plotted on Mercator's projection, where they are represented by straight lines.

Rhyl. Urban district and seaside resort of Flintshire, Wales. It stands at the mouth of the Clwyd, 30 m. by rly. N.W. of Chester. It was a small fishing village, but towards the end of the 19th century became well-known as a holiday centre. It has good sands, a theatre, a marine lake, and provision for all kinds of sports and amusements, including roller-skating. Pop. est. 19,000.

Rhyme or RIME (Anglo-Saxon, *rim*, probably from Gr. *rhythmos*, rhythm). In poetry, the repetition, at the end of one or more lines, of the sound or combination of sounds at the end of another line. In English rhymed verse, the last stressed vowel and all the following sounds of each rhyming line are identical, the preceding consonants being different, whereas in French verse the latter may be identical (rich

rhyme), provided that the words are not the same. In masculine rhymes the final syllable alone rhymes; feminine rhymes consist of a stressed followed by an unstressed syllable. Triple rhyme, with two unstressed syllables, is used in English poetry mainly for comic or grotesque effect. Internal rhyme, *viz.* within the limits of a single line, is common in ballads. Inexact rhymes are used by many modern poets.

As a natural means of marking and enriching rhythm, rhyme arose independently among various races. Outside Europe, it is used by the Chinese, Hindus, Arabs, and others. Intimately associated with accentual metre, it was avoided in Greek and Latin poetry, which followed the rules of quantitative metre, and reappeared in Latin verse in the 4th century A.D., when the native instinct for accent reasserted itself. Medieval Latin hymns were probably the chief source of rhyme in the W. European literatures. In English and other Teutonic languages it slowly replaced alliteration from the 9th century to the 15th. With the revival of classical learning a prejudice arose against rhyme, and many experiments were made with unrhymed metres. *See* Blank Verse; Couplet; Poetry; Prosody; Quatrain; Vers Libre.

Rhyl, Flintshire. Sea front and paddling pool

Rhymer's Glen. Glen near Melrose, Roxburghshire, Scotland. Huntly Burn flows through it, and its name is due to the story that here Thomas the Rhymer met the queen of the fays.

Rhyming Slang. Method of indicating words by a rhyming or quasi-rhyming substitute. It was

originally used in the early 19th century by London thieves and pickpockets so that they could communicate their plans within earshot of an intended victim without revealing their intentions. Examples are: tit for tat, hat; San Toy, boy; Joe Rook, book; pig's ear, beer; skyrocket, pocket; Oxford scholar, dollar. Unlike nearly all other systems of cant, rhyming slang was not founded on allegory, except in a few examples, *e.g.* sorrowful tale, three months in jail; I'm afloat, a boat; and artful dodger, lodger. In time rhyming slang became translatable to the uninitiated, and the practice arose of further concealing its meaning by suppressing the rhyming word, *e.g.* flounder and dab (cab) became flounder; I'm so frisky (whisky) became I'm so; tit for tat became titfor. Towards the close of the 19th century the *Sporting Times* printed long lists of rhyming slang words which passed into general use, especially in London.

Rhymney or RUMNEY. River of England and Wales. Forming the boundary between Monmouthshire and Glamorganshire, it flows 30 m. S. to the Bristol Channel, which it enters 2 m. E. of Cardiff.

Rhymney. Urban dist. of Monmouthshire, England. It stands on the Rhymney, 2 m. from Tredegar, and is served by rly. All around are coal mines, and the place has important iron and steel works and a clothing factory. Pop. 18,872.

Rhynie Chert. In geology, a deposit of silicified peat of Old Red Sandstone age which contains many well preserved plant remains of that period. It occurs near Rhynie, Aberdeenshire, Scotland.

Rhyolite (Gr. *rhein*, to flow; *lithos*, stone). In geology, name given to an acid silica-rich lava showing pronounced flow banding. Those in which soda is present as a large

percentage are called soda rhyolites. If quartz crystals are large enough to be seen with the naked eye, the rock is termed porphyritic rhyolite. Rhyolite grades to glassy obsidian (*q.v.*) or to scoriaceous pumice, and is found in many volcanic regions. The name was suggested by Richtenhofen from the characteristic flow-

structure of the rock. See Igneous Rock; Liparite.

Rhys, ERNEST (1859-1946). British writer and editor. He was born in London, July 17, 1859,

Ernest Rhys,
British writer

but spent his early adult years in the mining industry in Wales and N. England. In 1885 he finally settled in London and took up literature as a career, being, with Yeats, Dowson, and Lionel Johnson, among the original members of the rhymers' club. The following year he produced the first volume of the Camelot classics. His great achievement as an editor, however, was Everyman's Library (*q.v.*) which he started in 1906. As a writer Rhys produced verse, collected in *Rhymes for Everyman*, 1933; and *Song of the Sun*, 1937, as well as volumes of reminiscence, *Everyman Remembers*, 1931; and *Wales England Wed* (1940). But his status as editor was far greater than as author. He died in London May 25, 1946.

Rhys, SIR JOHN (1840-1915). Welsh philologist. Born June 21, 1840, in Cardiganshire, and educated at Jesus College, Oxford, the Sorbonne and in Germany, he became an inspector of schools in Wales. In 1877 he was appointed professor of Celtic at Oxford, and in 1895 principal of his old college, a post he retained until his death. He was an authority on Celtic inscriptions and all matters connected with Wales. His most important writings were *Lectures on Welsh Philology*, 1877; *Celtic Britain*, 1882; *The Welsh People*, 1900; *Celtic Inscriptions of Gaul*, 1911-13. He died Dec. 18, 1915.

Rhythm (Gr. *rhythmos*, measured motion, symmetry). Periodicity of processes, motions, or sounds. Rhythm is a fundamental fact of life, consisting in the alternation of the antithetical processes of waste and repair, of discharge and restitution, of activity and recuperation. All life is thus rhythmic in character, each life-cycle being a repetition of a preceding one, and during the progress of the grand period of each individual various periodic movements occur in growing and adult organs. Further, all metabolism consists of rhythmically recurrent processes of anabolism and catabolism. In addition to this regularly repeated rhythm external

factors may induce a secondary rhythm, and the phenomena observed in nature are the result of the cooperation of these two.

In its more general connotation rhythm is one of the three essential elements of music, the others being harmony and melody, and it is the distinguishing characteristic of dancing. As a result of the intimate association of poetry with music, all verse having originally been composed for intoning to the harp or singing to the pipe or lyre, rhythm draws the capital distinction between poetry and prose, which is the vehicle of thought intended to be spoken. Verse of the traditional kind, whether rhymed or unrhymed, is written in metre and strict rhythm, on its technical side thus becoming a subject for the grammarian, of whose science the laws of versification form part under the name of prosody.

Prose, on the contrary, is written without constraint of metre, and in rhythm so various as to have defied all attempts to reduce it to rule. Nevertheless, rhythm is an integral part of good prose, at once the effect and the cause of emotion in polished oratory, and providing for the finest thought a diction perfectly apt, because possessing a musical cadence in harmony with the truth expressed. Freedom from law is the distinguishing characteristic of prose rhythm, and it falls short of perfection by precisely so much as it is the product of mechanical devices such as antithesis, parallelism, and the rest. Elaborate treatments of the subject may be found in such works as Thomson's *Basis of English Rhythm*, and Saintsbury's *History of English Prose Rhythm*. Perhaps the most fruitful influence in the development of prose rhythm is the Authorized Version of the Bible. See Music; Poetry; Prose.

Rhythm. In music, term used in varying but inter-related ways. Being measured, it implies subdivision, proportion, and periodicity as applied to notes, beats, bars, and phrases. (1) As in verse, so also in music, the alternation of strong and weak units (beats) is an essential characteristic. The number of weaker beats intervening between the occurrence of the stronger ones differentiates one tune from another. Thus in the following example are shown in simple beats duple, triple, and quadruple times.

Here are accent and periodicity, but no rhythm. But where music differs from verse is in the much greater freedom with which its beats can be sub-divided. Thus the following is, as regards time, fundamentally the same as the first of the above examples, but the form of each beat is varied rhythmically, thus displaying the quality of proportion:

(2) Just as a bar consists of a grouping of beats with respect to accent, so a musical phrase is a grouping of the bars, which in themselves are also divided like beats into accented and unaccented. The termination of a phrase being marked by the occurrence of a cadence. According to the number of such bars, the phrase is said to be in two or four bar rhythm, as the case may be. Though phrases of other lengths are often to be found, the two or four bar rhythm is so predominant that it is often regarded as fundamental. In reality, however, it is no more natural than other rhythms, its greater frequency being due to its simplicity and consequent ease of apprehension.

Ria (Span., mouth of a river). Long, narrow inlet in the Galician coast of Spain. The name is used for the inlets formed by the submergence of a region of mountain ridges separated by valleys. The sunken ridges become rocky promontories separating tapering rias, which, unlike fjords, shallow continuously the farther they penetrate into the land. Bantry Bay, Kenmare River, and Dingle Bay in Eire, and Falmouth Bay and Plymouth Sound in S.W. England, are examples of rias.

Riau-Lingga. Archipelago of Indonesia (*q.v.*). Before the Second Great War it formed a Dutch residency. It embraces the Riau (Riouw), Lingga, Tambelan, Natuna, and other groups of islands. The chief island of the Riau group is Bintang or Riouw, adjacent to which on an islet is Rio (Riouw), the chief town of the residency. Trepang, tin, and pepper are exported. During the Second Great War it was in Japanese occupation from 1942-45. Area, 12,235 sq. m.

Rib. In the human being, one of a series of paired, curved bones. Ribs are twelve in number on either side of the body, and in either sex. Posteriorly, the ribs articulate with the spinal column. Their anterior ends terminate in cartilaginous prolonga-

tions, the costal cartilages. The first seven pairs of ribs articulate with the sternum or breast-bone.

Rib. Diagram indicating relative positions of true and false ribs

The cartilages of the next three are attached to the cartilage of the rib above each. The extremities of the last two ribs are entirely free, and for this reason they are sometimes termed "floating ribs." At the posterior end is a thickened part known as the head. Along the lower margin of each rib runs a groove which contains a nerve and blood-vessels.

Fracture of a rib may be produced by direct violence such as a blow, and in that event the bone breaks inwards, and serious injuries to the pleura, lungs, or liver may result. Indirect violence tends to cause fracture at the point of maximum curvature, the fractured ends being directed outwards. Indirect fractures are treated by strapping the affected side of the body with strips of adhesive plaster, to limit as far as possible movements of the bone. Strapping of a direct fracture is undesirable, as it tends to drive the broken ends farther inwards.

A cervical rib is an additional rib, usually present on each side, and arising most frequently from the 7th cervical vertebra. It may be free or may unite with the first rib. In early life this deformity may produce no symptoms, but as the bone grows it is likely to interfere with the arteries and nerves in the neighbourhood, producing neuralgia, paralysis, and possibly gangrene of the fingers from interference with the circulation. When these symptoms persist the possibility of there being an extra rib must be investigated by X-rays. If present, it should be removed by an operation. See Anatomy; Man.

Ribalta, FRANCISCO (c. 1551-1628). Spanish painter. Born at

Castellon de la Plana, he studied in Valencia and in Italy. His best works are to be found in the churches and museums of Valencia; one may cite especially his great altar-piece, *The Last Supper*, in the college of Corpus Christi. His *Christ Borne by Two Angels* is in the Prado, Madrid.

Ribar, IVAN (b. 1884). Yugoslav politician. Of Croatian birth, he became a lawyer, and member of the national assembly formed at the end of the First Great War. He was leader of the anti-fascist council of liberation under Marshal Tito during the Second Great War, and became first president of the Communist-controlled assembly, Dec. 2, 1945.

Ribbentrop, JOACHIM VON (1893-1946). German diplomatist. Born at Wesel, April 30, 1893, of a military family, he was educated at Metz and at 18 went to Canada, where he worked as a draughtsman in Quebec. He returned to Germany on the outbreak of the First Great War and served on the eastern front; later he went by submarine to the U.S.A., where he assisted Papen (*q.v.*) in sabotage activities. After Papen's recall, Ribbentrop accompanied him to Turkey. He travelled for a French wine firm, married Anna Henkel (daughter of a German millionaire), and became a partner in Henkel's, and in 1929 met Hitler. Under the Nazi regime he rose rapidly in office.

Ambassador to London from 1936, Ribbentrop was promoted to the foreign ministry in 1938, and as a member of Hitler's secret cabinet played a leading part in the Führer's preparations for aggressive war. His name became synonymous with double-dealing. He was chiefly responsible for annexing Austria and dismembering Czecho-Slovakia; negotiated the Russo-German pact; and delivered the ultimatum to Poland which preceded the Second Great War. Then he carried through the three-power pact with Italy and Japan. During the final phase of the war he was superseded by Doenitz. He was captured by British troops at Hamburg, June 14, 1945. Indicted as a war criminal at the Nuremberg trials (*q.v.*), he was executed Oct. 16, 1946.

Ribble. River of England. It rises on the E. of Wharfedale and

flows S. and S.W. through the W. Riding of Yorkshire, forming the boundary of that county with Lancashire for about 6 m. It then resumes a S.W. course through Lancashire to the Irish Sea, which it enters by an estuary of maximum breadth of 6 m. Preston is on its right bank, near the head of the estuary. Its length is 75 m.

Ribblesdale, THOMAS, 4TH BARON (1854-1925). British peer. He was born Oct. 29, 1854, and became a prominent figure in society, succeeding to the peerage in 1876. He was lord-in-waiting to Queen Victoria, 1880-85, and during 1892-95 master of the buckhounds. His portrait by Sargent, in hunting dress, is in the National Gallery. When he died, Oct. 21, 1925, the title became extinct.

Ribbon. Word used in a military sense for the specially coloured ribbons from which medals are suspended. To avoid the inconvenience of wearing a medal constantly, a piece of its proper ribbon, $\frac{3}{8}$ in. deep, is worn on the left breast, and where more than one ribbon is used, they are placed side by side, descending in order of precedence from the right of the wearer. See Medals colour plate.

Ribbon and Ribbon Making.

(Fr. *ruban*, from O.F. *riban*, *ruband*, still preserved in the English form *riband*). A woven fabric of width usually nine ins. or less, with a selvedge at each side, i.e. not cut from wider fabric; usually of silk or rayon, in either a satin or a ribbed weave, and intended for the millinery and haberdashery trades, trimmings, and ceremonial insignia. Also, in engineering, a narrow strip of metal or other material. The silk ribbon industry was brought to England by Protestant refugees from Lyons and St. Etienne about the beginning of the 18th century, and was centred round Coventry. By the end of the 19th century more than 25,000 people were employed in it there, many on hand-loom in their own houses, or in small factories having only half a dozen or so looms. By the 20th century, most of the industry was concentrated in a few large specialist firms in the Coventry and Derby areas, power-driven "smallware" looms replacing the hand looms except for certain elaborate ceremonial ribbons. The ware looms are usually multiple machines with some of the moving parts common to all, and with all moving parts working in unison. Precision-built high-speed single

J. von Ribbentrop, German diplomatist

units are also used. In addition to single-colour ribbons, striped effects in different colours, and fancy patterned effects can be woven, and gold and silver tinsel threads can be introduced. *See Loom; Silk; Weaving.*

Ribbon Development. Term applied in Great Britain to the building of factories or long lines of houses beside arterial roads leading from cities. The practice grew immediately after the First Great War, when new roads were

compressed so as to resemble a ribbon. The back fin runs the whole length of the body, and in some species it is developed above the head into a series of long rays. In one form, the ventral fins consist of single rays tipped with a red tag, which is said to be used as a bait to attract the small fishes on which the animal feeds. Some ribbon fish attain a length of 20 ft., with a depth of a foot and a thickness of little more than an inch. *See Oar Fish.*

Ribbon Grass (*Phalaris arundinacea*). Stout, tall grass of the family Gramineae. A native of the N. temperate regions, the cultivated variety *variegata* has broad, flat leaves striped with yellow. It has a creeping rootstock, and stout, erect stems 6 ft. high, ending in a loose plume of flowers tinged with purple. The wild form grows on British river-banks and the margins of lakes, and is known as reed-grass.

Ribbonmen. Term used for the members of the Ribbon Society. This was an Irish secret society founded about 1820, and so called from the green ribbon worn by members in their buttonholes. It was composed of small farmers, agricultural labourers, small shopkeepers, and artisans of the R.C. faith, and its purpose and policy varied according to district. In Ulster it was primarily a league against the Orangemen; in other provinces it was an organization against rack renting and other agrarian grievances, while in the town it approximated to trade unionism. After being proscribed as an illegal body by an Act of 1871, the society died out.

Ribchester. Village of Lancashire, England. It stands on the Ribble, 5 m. N.W. of Blackburn. It is notable as the site of a Roman station, Bremetennacum, which was garrisoned for 300 years by auxiliary troops. They included Polish Sarmatians, this being attested by an altar inscription and a gold-studded leather-covered ox-skull, now lost. A bronze helmet and sepulchral slab portray cavalry.

Ribeauville (Ger. *Rappoltsweiler*). Town of France, in the Haut-Rhin dept. It is picturesquely placed at the foot of the Vosges mts. 33 m. S.S.W. of Strasbourg. It produces excellent red and white wines, and its industries include textile manufacture, printing, and dyeing. There are a calcium-sulphate mineral spring recommended for

gravel and similar disorders, and a carbon dioxide spring bottled for use as table water. The town is connected with the main rly. line by a normal gauge rly., 2½ m. long, laid on the high road. To the W. are ruins of three castles. Above the town a barrier of unhewn stones, 8–10 ft. high, encircles the crest of the Vosges.

Ribera, JUSEPE OR JOSÉ DE (1588–1656). Spanish painter, called Lo Spagnoletto. Born at San Felipe, Jan. 12, 1588, he studied under Francisco Ribalta at Valencia, and Caravaggio at Rome. Becoming prominent among the Naturalistic painters, he worked successfully at Rome, Parma, and Naples. His Shepherd with a Lamb is in the National Gallery, London. *See Jerome, S.*

Ribeisaceae OR CURRANT FAMILY. Family of shrubs. Natives of Europe, temperate Asia, and N. America, they have alternate, lobed leaves. To the bell-shaped calyx, the minute flower petals are attached. The fruit is a pulpy berry containing numerous seeds. A few, like the American species *Ribes sanguineum* and *R. speciosum*, are grown for their showy flowers; others for fruit. *See Currant; Gooseberry.*

Riboflavin. Name for vitamin B₂, also called ovoflavin, hepatoflavin, vitamin G, dimethyl-ribityliso-alloxazine, and lactoflavin. An orange-yellow crystalline powder, slightly soluble in water, with formation of a yellow-green fluorescent solution, it is destroyed by alkalis and slowly by light, but is stable in heat. Sources are eggs, liver, kidney, meat, milk, cheese, wheat germ, and yeast. *See Vitamins.*

Ribot, ALEXANDRE FÉLIX JOSEPH (1842–1923). French statesman. He was born at St. Omer, Feb. 7, 1842, and educated in Paris, graduating in law at the Sorbonne. An advocate, he was elected to the chamber of deputies in 1878. He was foreign minister 1890–92, and paved the way for a Russian alliance. His early premier-ships were in 1892–93 and 1895; he came to office again for two days in June, 1914. He was minister of finance in 1915; prime minister for the fourth time, March–Sept. 1917; thereafter minister for foreign affairs till the fall of the

Ribbon Grass. A cultivated form of the grass *Phalaris arundinacea*

constructed and the land on either side of the road was acquired by builders who erected houses for quick sale and with little consideration for the safety or convenience of purchasers or the natural amenities of the countryside. Similar building took place beside existing main roads and this resulted in tentacle expansion of towns through which the roads passed. The practice artificially inflated roadside land values, and proved wasteful of land, as there was little building in depth.

Hundreds of miles of roads and their verging land were disfigured by ribbon development, and thousands of people were encouraged to live in conditions and surroundings which did not foster a spirit of civic responsibility. Ribbon development caused serious hindrance and danger to through traffic by badly designed points of access and the presence of stationary vehicles at the roadside, and in 1935 parliament passed an Act restricting the permitted distance of buildings from the centre of the road. Along all roads which on May 17, 1935, were classified roads, it became illegal to construct, without consent of the highway authority, any access to the road or to erect any building within 220 ft. of the middle of the road. *See Town Planning.*

Ribbon Fish (*Trachypteridae*). Popular name given to various deep-sea fishes which have the body elongated and laterally

Josepe de Ribera, Spanish painter

cabinet of Painlevé in Nov. Ribot, who was a member of the French Academy, wrote a *Life of Lord Erskine*, 1866. He died Jan. 13, 1923, and his letters to a friend appeared in Eng. trans., 1925.

Ribot, Théodule Armand (1839-1916). French psychologist. Born Dec. 13, 1839, at Guingamp, he became a teacher for some years. In 1876 he founded *The Philosophical Review*, and in 1885 began to lecture on psychology. In 1888 he was made professor at the Collège de France. Ribot defines psychology as the science of facts which appear under two inseparable aspects—the internal or conscious, and the physiological. Introspection, the examination of our own thoughts and feelings, being individual and limited, needs to be supplemented by external observation. Works translated into English include *English Psychology*, 1873; *Heredity*, 1875; *Diseases of the Will*, 1884; *Essay on the Creative Imagination*, 1906. Ribot died Dec. 9, 1916.

Ribston Hall.

Mansion in the W. Riding of Yorkshire, England. It is on the Nidd, 3½ m. S.E. of Knaresborough. Early in the 13th century it belonged to the Knights Templars, who held it until 1311, when the property passed to the possession of the crown. In 1324 it was handed over to the Knights Hospitallers of S. John of Jerusalem, who held it until the Reformation. Later it came into the hands of the Goodricke family to be rebuilt in 1674. In its gardens, in 1709, the first Ribston pippin was planted by Sir Henry Goodricke, who introduced it from Normandy.

Ricardo, David (1772-1823). British political economist. Born in London of Jewish family, April

David Ricardo, British political economist
After T. Phillips

19, 1772, he made a large fortune on the stock exchange. In 1809 appeared his letters to *The Morning Chronicle* on depreciation of currency, and a tract,

The High Price of Bullion, urged the resumption of cash payments. In 1817 came his chief work, *Principles of Political Economy and Taxation*. This is chiefly noted for an exposition of the theory of economic rent; Ricardo stating that rent does not affect prices, but is the surplus accruing to the owner of land with advantages over that on the margin of cultivation. Mainly a follower of Adam Smith and Malthus, Ricardo laid down the theory of comparative costs in foreign trade. Retired from business after 1814, he represented Portarlington in parliament from 1819 and was an active spokesman of the Radical wing. He died at Gatcombe Park, Glos, Sept. 11, 1823. See *Rent*; consult *Works*, ed. J. R. McCulloch, 1888; *Life*; J. H. Hollander, 1910.

Ricasoli, Bettino, Baron (1809-80). Italian statesman. Born at Broglio, Tuscany, March

Ribston Hall. Garden front of this Yorkshire mansion
By courtesy of Country Life, Ltd

19, 1809, he came into a family property and soon demonstrated sympathies with the movement to unify Italy. His paper, *La Patria*, was founded in 1847, and in the disturbances of the next year he was *gonfaloniere* of Florence. He was instrumental in bringing about the union of Tuscany, and Piedmont, 1860.

Baron Ricasoli,
Italian statesman

On the death of Cavour, 1861, Ricasoli became prime minister of Italy, and by his friendly attitude towards Mazzini and his attempt to open relations with Pius IX, did much for Italian progress. Resigning in 1862, he entered office again four years later and renewed his attempts to placate the Vatican. The nation, not being with him, he was obliged to resign after a few months. He died Oct. 23, 1880.

Ricci, Matteo (1552-1610). Jesuit missionary. Born at Macerata Oct. 6, 1552, he studied law

Matteo Ricci,
Jesuit missionary

in Rome, but entered the Society of Jesus in 1571. He went to India, 1577, completing his studies at Goa, and, after some discouraging attempts, succeeded in obtaining a footing for missionary enterprise in China, 1583. Having worked at Chowkingfu, 1583-89, and six years at Chaochow, after many difficulties he penetrated to Peking (Peiping), and in 1600 obtained permission to establish himself in the capital. He published a valuable book of memoirs and information on Chinese history. Ricci died at Peking, May 10, 1610.

Rice (*Oryza sativa*). Grass of the family Gramineae, native of Asia and Australia. It is very variable under different conditions, being extensively cultivated in all countries where there are marshy lands and a temperature between 60° and 80° F., which is requisite for the ripening of the grain. Fifty or more varieties are known, of which about twenty have been described as species. The flowers are produced in a pyramidal panicle. Each fruit or grain of rice stands on a separate stalk.

In average Burma rice the unhusked berry is composed of carbohydrates, 77 p.c.; proteins, 8 p.c.; fats 1 p.c.; ash, 1 p.c.; moisture, 11½ p.c. The protein element is almost wholly deficient in gliadin, the form of gluten whose stickiness enables wheat-flour to be converted by fermentation into dough. Hence rice-flour cannot be used for bread-making. Rice food takes the form of boiled or baked unleavened grain, whole, broken, or ground. In temperate climates, including China, fatty and nitrogenous elements are habitually added.

Rice. The plant and berry of this valuable grain-yielding grass

The commercial preparation of rice demands complex mechanical processes. Threshed grain or paddy, after sifting and winnowing, yields clean paddy, which by hulling is separated into husked or cargo rice and husk. Husked rice is separated by skinning into white rice and meal or bran. Polishing white rice produces the form preferred by Europeans. It may also be coated or glazed. The final yield is: polished, 44 p.c.; broken, 24 p.c.; dust, 3 p.c.; meal and polish, 9 p.c.; husk, 20 p.c.

Besides furnishing to the dietary of mankind a larger contribution than any other foodstuff, rice is used in the manufacture of starch, vinegar, and other commodities. In Japan it yields an alcoholic drink called saké. It is used in Great Britain by distillers, and in the East common arrack is made from it. The bulk of the rice crop is consumed in the countries where it is produced. Bran and polish are sold for cattle-food as rice meal. In Burma the husk, forming one-fifth of the weight of the paddy crop, is used as fuel in specially designed furnaces, or is converted into producer gas.

Rice is the chief food of the millions of China and of many others in the sub-continent of India. Failure of the rice crop is the principal cause of the periodical famine which afflicts China and Japan. The Indian famine of 1943 occurred because the Bengal harvest was short by some 15 p.c., and no rice could be drawn from Burma, which normally had a surplus for export to India, since it was occupied by the Japanese.

Rice is unsuited, except in small quantities, to those who live in colder climates as it is deficient in fatty matter and nitrogenous elements. Moreover, as it contains only a small quantity of gluten, it is useless for making into bread as it will not ferment properly. Good Indian rice contains 78.1 p.c. of starch, but only 7.4 p.c. of nitrogenous matter against 22 p.c. in wheat. See Plants colour plate.

RICE, ALICE (CALDWELL) HEGAN (1870-1942). American writer. Her maiden name was Hegan and she was born at Shelbyville, Ky., U.S.A. She made her reputation with Mrs. Wiggs of the Cabbage Patch in 1901 (a dramatisation of which proved successful in 1907). The original of the optimistic Mrs. Wiggs, "the apostle of sunshine," was reputed to have been a certain Mrs. Bass, of Louisville, who suffered annoyance from visitors on that account, and in 1904 had

Alice Hegan Rice,
American novelist

to answer a charge of throwing a pitcher at one of them. Alice Hegan married the poet and dramatist, Cale Young Rice, who collaborated with her in short stories of which the volume, *Passionate Follies*, was well received. She died at Louisville in Feb., 1942.

RICE, EDMUND IGNATIUS (1762-1844). Irish philanthropist. Born June 1, 1762, near Callan, co. Kilkenny, he was for several years in business at Waterford. About 1796 he began to take an active interest in the poor of the town, and in 1802 opened a free day school for poor children. Other schools followed, and, with a few friends, he founded the religious order of the Christian Brothers (*q.v.*). The movement spread to England and Australia before Rice's death at Waterford, Aug. 29, 1844.

RICE, ELMER (b. 1892). American dramatist. Born in New York, Sept. 28, 1892, he was educated there, and became a solicitor's clerk. His first play, *On Trial*, was produced in 1914. During the 1920s he became a leading exponent of the expressionist school of drama, *e.g.* *The Adding Machine*, 1923, also making use of his legal knowledge. *Street Scene*, 1929, was awarded the Pulitzer prize. *The powerful Judgement Day*, 1934, was the best known in England of Rice's plays. In 1945 came *Dream Girl*. Rice staged his own work, and also produced Robert Sherwood's *Abe Lincoln in Illinois*. In 1945 he was elected president of the Authors' League of America.

RICE, JAMES (1843-82). British novelist. Born at Northampton, Sept. 26, 1843, and educated at Queen's College, Cambridge, he became a barrister in 1871. In 1879 he published a *History of the British Turf*, an eminently readable if not strictly historical work. His fame rests, however, on his collaboration in writing novels with (Sir) Walter Besant, a partnership which began with *Ready Money* Mortiboy in 1872. Their joint works include *This Son of Vulcan*, 1876; *The Golden Butterfly*, 1876, most successful of all; *The Chap-*

lain of the Fleet, 1881; *The Seamy Side*, 1881. Rice died at Redhill, April 20, 1882.

Rice Bird. Popular name for the bobolink (*q.v.*). The name is also applied to the Java sparrow, commonly seen in aviaries.

Rice Flower (*Pimelea*). Genus of trees and shrubs of the family Thymelaeaceae, natives of Australasia. They have opposite or scattered leaves, and tubular flowers, mostly in clusters or dense heads, at the tips of the annual shoots. They are cultivated as greenhouse plants, the best known being *P. spectabilis* with white

Rice Flower. Stalks with foliage and flowers of this Australasian shrub

flowers in dense globular heads, surrounded by bracts with coloured margins. *P. ferruginea* has similar heads of rosy flowers.

Rice Paper. Thin, delicate paper, used by Eastern artists. It is made from the pith of *Tetrapanax papyrifer*, which grows wild in Formosa, also from *Aeschynomene* of China. Good artificial flowers are made from the paper. An edible paper used in confectionery is also made from rice straw, as are some cigarette papers. See Paper.

Rice-paper Plant (*Tetrapanax papyrifer*). Shrub of the family Araliaceae. A native of Formosa, it grows to a height of about 8 ft., and has large, lobed, downy leaves and drooping clusters of greenish flowers. The thick cylinder of white pith from the stems is rotated against the edge of a long knife, which shaves it into an even sheet to form rice paper.

Riceyman Steps. Novel by Arnold Bennett. Published in 1923, this character-study of a miser was accepted as one of its author's outstanding works. The powerful naturalism and analysis of human motives with which Bennett invested *The Old Wives' Tale*, 1908, was here repeated on a less extensive scale. The scene was Clerkenwell, London, and the

James Rice,
British novelist

steps were in reality those in Granville Place, leading to S. Philip's church.

Rich. English titled family. It was founded by Richard, 1st Baron Rich (c. 1496-1567), of Leez or Lees, now Leighs, Essex, whose grandson, Robert (d. 1619), was 1st earl of Warwick of the 1618 creation. Of Robert's two sons, Robert (1587-1658), 2nd earl, was lord high admiral; Henry (1590-1649), knighted 1610 and created Baron Kensington, 1623, and earl of Holland, 1624, was beheaded, March 9, 1649. Charles (d. 1673), 2nd son of the 2nd earl, married Mary (1625-78), daughter of Richard Boyle, 1st earl of Cork, and became 4th earl of Warwick. Robert (d. 1658), only son of the 3rd earl, Charles's elder brother, Robert (d. 1659), married Frances Cromwell, youngest daughter of the Protector. Robert, 5th earl of Warwick, and the last Rich of Lees, was son of Henry, earl of Holland. See Warwick, Earls of.

Rich. SIR RICHARD RICHEL, 1ST BARON (c. 1496-1567). English statesman. After study at the Middle Temple, he became M.P. for Colchester, 1529, solicitor-general, 1533, was knighted in 1533, and appointed speaker, 1536. Raised to the peerage as Baron Rich of Leez, Essex, in 1546, he was lord chancellor, 1548-51, amassed wealth from monastic spoils, built at Little Leighs a mansion of which the gateway and other remains exist, and in 1564 founded Felsted grammar school. He died at Rochford, June 12, 1567, and was buried at Felsted. See Felsted School.

Rich. CHRISTOPHER (d. 1714). English theatrical manager. At one time Drury Lane, the Dorset, and the Haymarket Theatres in London were under his control. Notoriously mean to his players, he died Nov. 4, 1714. His son John (c. 1682-1761) opened the theatre in Lincoln's Inn, where pantomime was introduced to England, and founded the Beef-steak Society. Of him it was said that The Beggar's Opera "made Gay rich and Rich gay." He died Nov. 26, 1761.

Rich. CLAUDIUS JAMES (1787-1821). British Orientalist and traveller. Born at Dijon, March 28, 1787, and educated at Bristol, he entered the service of the East India Company, whose resident he was at Bagdad. He died of cholera, at Shiraz, Oct. 5, 1821. His Oriental collections were acquired by the British Museum.

Rich. EDMUND. Archbishop of Canterbury, who became a saint and is noticed as Edmund.

Rich. PENELOPE, LADY (c. 1562-1607). English courtier. She was the daughter of Walter Devereux, 1st earl of Essex; her mother was a daughter of Sir Francis Knollys and cousin of Queen Elizabeth. It was the earl's last wish that she should wed Sir Philip Sidney. In 1581, however, she married Robert, 3rd Baron Rich, who in 1618 became 1st earl of Warwick. The Stella of Sidney's sonnet sequence, Astrophel and Stella, after Sidney's death she lived with Charles Blount, 8th Baron Mountjoy, who was created earl of Devonshire in 1603 and married her in 1605 after her husband had divorced her. For this offence the couple were banished from court. Her brother Robert, 2nd earl of Essex, married Sidney's widow. Florio's translation of Montaigne was dedicated to Penelope. Consult P. R. and Her Circle, M. S. Rawson, 1911.

Richard. Masculine Christian name. Of Teutonic origin, it means stern or hard in ruling. It has long been popular in England and France, and in the form Ricard was used by the Anglo-Saxons before the Norman Conquest. Ricardo is the Italian form.

Richard I (1157-99). King of England. Third son of Henry II, he was born Sept. 8, 1157, and became popularly known as Coeur de Lion (Lion Heart). In 1170 he was given the dukedom of Aquitaine by his father. He and his equally turbulent brothers, Henry and Geoffrey, quarrelled ceaselessly with each other and with their father; in 1189, Richard was again at war with his father, when the latter died and Richard became king. He threw himself with ardour into the crusade being organized, and passed only six months of his reign in England, though he laid it under crushing taxation.

The dissensions and jealousies among the crusading princes and

nobles were intensified when Richard joined them in Palestine in 1191, though the capture of the fortress of Acre was mainly due to him. Richard by arrogance made half the princes permanently his enemies; in spite of brilliant feats of arms, he found the conquest of Palestine impossible, and in 1192 made a three years' truce with Saladin.

On his way home, to avoid passing through France, he tried in the guise of a simple knight to slip through the territory of his enemy, Leopold of Austria. But he was captured and handed over to the emperor, Henry VI, who made him a prisoner. Now came the legendary episode of the minstrel Blondel. In spite of the machinations of his brother John, Richard was released on payment of a huge ransom and returned to England in 1194. He magnanimously forgave John, but almost immediately left England once more in charge of the justiciar, Hubert Walter, while he betook himself to Aquitaine and sought to form a great coalition against the French king. In the midst of his schemes he attacked the vassal of an old enemy Ademar, and was mortally wounded while besieging the castle of Chalus, April 6, 1199. Richard was a superb warrior but a useless ruler. See Armour; Berengaria; Crusades.

Bibliography. Crusade of Richard I, T. A. Archer, 1888; The Angevin Empire, J. H. Ramsay, 1903; Richard the Lion Heart, K. Norgate, 1924; Richard Coeur-de-Lion, C. Wilkinson, 1933.

Richard II (1367-1400). King of England. The younger son of Edward the Black Prince, he was born Jan. 6, 1367, and succeeded his grandfather Edward III, as king of England, June 21, 1377. During his boyhood the government of the country was mainly in the hands of his uncles. In 1381 occurred the rising of the peasantry commonly called Wat Tyler's revolt. When all the authorities appear to have been panic-stricken, the boy king displayed a courage and presence of mind which saved a critical situation. He married Anne of Bohemia in Jan., 1382.

Richard sought to shake off the yoke of his uncles, but his own favourites

Penelope, Lady Rich

King of England

Richard II,
King of England

and those whom he chose to advise him were "appealed" of treason. Richard found himself obliged to submit, but in 1389 a successful *coup d'état* removed the controlling nobles from his council, and for eight years, advised by John of Gaunt and William of Wykeham, the king ruled with moderation and wisdom. He visited Ireland, and made peace with France, from which country came in 1396 his second queen, Isabella. But he had been nursing his revenge. Suddenly, in 1397, the group of nobles against whom his resentment was hottest—principally his uncle Gloucester and the earl of Arundel—were arrested for treason and put to death, or banished. There remained two whom Richard suspected, Henry of Hereford and Mowbray, duke of Norfolk. In 1398 both were banished. A cowed parliament had already bestowed upon Richard despotic powers which he now exercised arbitrarily. When Gaunt died he seized the inheritance of Lancaster, which should have passed to Henry of Hereford.

Then when Richard in 1399 had gone to Ireland, Henry returned to England to claim his inheritance and reform the government. Richard suddenly found himself deserted, was taken prisoner at Flint, Aug. 19, carried to London, and compelled to abdicate, Sept. 29, whereupon parliament declared Henry to be lawful king of England by right of descent. Richard was imprisoned in Pontefract castle, where he died or was murdered, Feb. 14, 1400. See *Appellants*; Henry IV; King Richard the Second; Peasants' Revolt; Pontefract; *consult* Life, H. A. Wallon, 1864; England under Richard II, De L. O'Leary, 1908; *Diplomatic Correspondence*, ed. E. Perroy, 1934.

Richard III (1452–85). King of England. The youngest brother of Edward IV, he was born Oct. 2, 1452, and usurped the throne of England, setting aside the lawful king, his nephew Edward V, June 26, 1483. Apart from traditions for which his enemies are responsible, his record until his brother's death had been that of an able soldier whose loyalty had never swerved. Yet by a series of absolutely unscrupulous actions between April 9 (when Edward IV died) and June 26, he struck down one after another of the men likely to stand in the way of his ambitions, and seized the crown.

The boy king and his brother were imprisoned in the Tower.

Richard started on a royal progress through the country, and the two princes disappeared. The

Richard III,
King of England

throne won by crime could be retained only by terrorism. The atmosphere became thick with conspiracies. Hopes of plotters centred upon the young earl of Richmond, Henry Tudor, Buckingham, who had helped Richard to his crown, raised a rebellion in Nov., 1483, but it collapsed, and Buckingham was executed. On Aug. 7, 1485, Richmond landed at Milford Haven, and on the 22nd Richard, deserted at the critical moment by professed supporters, was slain at the battle of Bosworth. This marks the end of the Wars of the Roses and virtually of the Middle Ages. For Shakespeare's tragedy, see *King Richard the Third*. *Consult* History of Richard III, Sir T. More, 1833; J. Gairdner, 2nd ed. 1898; Life and Character, Sir C. R. Markham, 1906.

Richard Alexander Walter George (b. 1944). British prince, second son of the duke and duchess of Gloucester, born Aug. 26, 1944.

Richard (1209–72). King of the Romans, known as Richard of Cornwall. Born at Winchester, Jan. 5, 1209, the second son of King John of England, he was made earl of Cornwall in 1225, and, after quarrelling with his brother, Henry III, led a crusade to the Holy Land in 1240. Declining the crown of Sicily in 1252, five years later he was elected king of the Romans, but had no effective power. Reconciled to Henry, he fought for him in the Barons' War, and was taken prisoner at the battle of Lewes, 1264. Liberated next year after Evesham, he died April 2, 1272. A biography by N. Denham-Young was published 1947.

Richard, FRANÇOIS MARIE BENJAMIN (1819–1908). French prelate. Born of the noble family of Lavergne at Nantes, he was educated for the priesthood at St. Sulpice, Paris, was vicar-general of Nantes, 1850–70, and bishop of Belley, 1871. In 1875 he became coadjutor to the archbishop of Paris, whom he succeeded in 1886, becoming cardinal, 1889. This staunch defender of Church rights against the state published *La Vie de la Bienheureuse*

Françoise d'Amboise, 1865. He died Jan. 29, 1908.

Richard of Bordeaux. Drama by Gordon Daviot (*q.v.*). This fine study of Richard II introduced a fashion for historical plays written in modern colloquial dialogue. It was first produced by the Arts Theatre Club at the New Theatre, London, June 26, 1932, and at the same theatre, Feb. 2, 1933, running for 472 performances. John Gielgud appeared as Richard, and Gwen Ffrangcon-Davies as Anne of Bohemia.

Richards, GORDON (b. 1904). English jockey. Born at Oaken-gates, Salop, May 5, 1904, son of a miner, he learnt to ride pit ponies, and had his first race in 1920. Champion jockey in 1925, he maintained that position for over 20 years, except when beaten by Fox in 1930 and when injured during 1926 and 1941. In 1933 he rode 259 winners, including twelve in succession, six all in one day at Chepstow; and in 1947 broke all records with 269 successes. By winning the 2,750th race of his career, on Scotch Mist at Windsor, April 26, 1943, he passed the total of Fred Archer (*q.v.*). Richards was five times first in the St. Leger, and in 1942 won all the classic races except the Derby. Early in 1950 he rode his 4,000th winner.

Richards, THEODORE WILLIAM (1868–1928). American chemist. He was born at Germantown, Pa., Jan. 31, 1868, and educated at Haverford, Harvard, Gottingen, and Leipzig. Successively assistant professor and professor of chemistry at Harvard during 1894–1922, he took over the directorship of the research laboratories in the latter year. He carried out precise determination of atomic weights, and for this work was awarded in 1914 the Nobel prize for chemistry. He was president of the American chemical society, the American association for the advancement of science, and the American academy of arts and sciences. He died April 2, 1928.

Richardson, SIR BENJAMIN WARD (1828–96). British physician. Born at Somerby, Leics, Oct. 31, 1828, and educated at Glasgow, he came to London, 1853, and was appointed physician to a number of hospitals. Associating

Gordon Richards,
English jockey

himself chiefly with sanitary reform, he founded the *Journal of Public Health and Sanitary Review*, *Hygienic Treatment of Pulmonary Consumption*, 1857; *Cause of the Coagulation of the Blood*, 1858; *Medical History and Treatment of Teeth*, 1860. Elected F.R.S. 1867, and knighted 1893, he died Nov. 21, 1896.

Richardson, HENRY HANDEL (d. 1946). Pen name of an Australian novelist. Daughter of a doctor, Henrietta Richardson was born at Melbourne, and having been educated there, studied music at Leipzig, which city provided the background for her first novel, *Maurice Guest*, 1908. In 1917 appeared *Australia Felix*, the first volume of the Australian trilogy, *The Fortunes of Richard Mahony*; its second part, *The Way Home*, was published 1925, and the last, *Ultima Thule*, 1929. Other works included a volume of stories, *The End of a Childhood*, 1934; and *The Young Cosima*, 1939, a study of Cosima Wagner, Bulow, and Liszt. The author married J. G. Robertson (1867-1933), who held the chair of German literature at London university. She died at Fairlight, Hastings, March 20, 1946.

As a novelist she was compared with Flaubert in her remorseless observation and detachment. The *Fortunes of Richard Mahony* placed her among the outstanding novelists of the 20th century. Its hero, the fastidious, egotistical Anglo-Irish doctor, is depicted with justice and penetration, and descriptions of the Ballarat country during the gold rush of the 1850s are recorded with sombre fidelity.

Richardson, SIR OWEN WILLIAMS (b. 1879). British physicist. He was born at Dewsbury, Yorks, April 26, 1879, and educated at Batley Grammar School, and Trinity College, Cambridge. From 1906 to 1914 he was professor of physics at Princeton university, returning to England to become professor at King's College, London university, a post he held until 1924. He then became director of research in physics, and carried out work on electron theory and thermionics. He was awarded the Nobel prize for physics in 1928, and was knighted in 1939. Among his numerous publications were *Electron Theory of Matter*, 2nd. ed., 1916; *Molecular Hydrogen* and its Spectrum 1933.

Richardson, SIR RALPH DAVID (b. 1902). British actor. Born at Cheltenham, Dec. 19,

1902, he was educated at Xaverian College, Brighton, in which town he first went on the stage in 1921 as

Sir Ralph Richardson, British actor

Lorenzo in *The Merchant of Venice*. He joined the Birmingham repertory in 1925, and next year was in *Yellow Sands*, at the Haymarket, London. During seasons with the Old Vic and Malvern festival companies, he acted Sir Toby Belch at the reopening of Sadler's Wells in 1931. He first appeared in New York in 1935, as Mercutio. By now a leading Shakespearian, he also made a hit as *The Amazing Doctor Clitterhouse*, and in 1939 gave a great performance in *Johnson Over Jordan*. He had been since 1933 in films, including *Friday the Thirteenth*, *Things to Come*, *South Riding*, *The Citadel*.

War service with the Fleet Air Arm was combined with propagandist pictures, but in 1944 Richardson rejoined the Old Vic at the New Theatre as joint director. With a rich and musical voice he played Peor Gynt, Bluntschli in *Arms and the Man*, Uncle Vanya, Cyrano, Face in *The Alchemist*, the inspector in *An Inspector Calls*, Dr. Sloper in *The Heiress*, and most memorably Falstaff. A notable later film was *The Fallen Idol*, 1948. Richardson married the actress Meriel Forbes in 1944, and was knighted in 1947.

Richardson, SAMUEL (1689-1761). English novelist. Born in Derbyshire, he came to London at 17 and was apprenticed to the printing trade, becoming by his industry a prosperous master printer, with the official appointment of printer of the journals of the house of commons. All his life Richardson displayed a partiality for ladies' society, and this predilection is reflected in his novels. His genius, however, matured late; it was not until he was over fifty that he turned his mind to novel writing. His first, *Pamela* (q.v.), or *Virtue Rewarded*, 1740, was cast in the form of letters—as,

indeed, were all his novels. *Pamela* was followed by *Clarissa Harlowe* (q.v.), 1748. In his third novel, *Sir Charles Grandison*, 1754, Richardson attempted to delineate a virtuous man. Few have excelled Richardson in knowledge of feminine psychology: he was much less at home in dealing with men. Though often prolix to an unconscionable degree, Richardson represents a notable landmark in the evolution of the novel. He died July 4, 1761. See *English Literature*; Fielding, H.; Salisbury Square; consult *Correspondence*, 6 vols., ed. A. L. Barbauld, 1804; Lives, C. L. Thomson, 1900; H. A. Dobson, 1902.

Richardson, THOMAS (1870-1912). An English professional cricketer. Born at Byfleet, Surrey, Aug. 11, 1870, he first played for his county against Essex in 1892. One of the fastest bowlers the game has produced, he took part in test matches in England against the Australians in 1893 and 1896, and toured with English teams in Australia, his bowling analysis for international games being 88 wickets at an average of 25.22 runs. He died July 3, 1912.

T. Richardson, English cricketer

Richborough. British seaport. Situated on Pegwell Bay at the estuary of the Stour, it lies between Ramsgate and Sandwich, 1½ m. N. of the latter town. Called Rutupiae in Roman times, it was then the principal port of entrance to Britain and was a military station guarding the S. entrance of the channel then stretching between it and Reculver and separating Thanet from the mainland. The ruins of the castle built by the Emperor Claudius in A.D. 43 include a wall 460 ft. long and 32 ft. high. In the centre of the ruins is a mass of stonework and rubble, called S. Augustine's Cross, in allusion to the tradition that S. Augustine landed there. It is more probable that the relic originally supported a lighthouse. During the centuries the port gradually disappeared in the salt marshes. In 1916, to relieve the First Great War traffic passing through Dover, a new port was built at Richborough and eventually covered an area of 2,200 acres and included a mile of wharves. In 1917 a cross-Channel goods train ferry was established for direct shipments to France. The dock facilities were

S. Richardson

After J. Highmore

taken over in 1921 by the Port of Queenborough development co., which maintained the train ferry between the wars. In the Second Great War Richborough again became a military port. Units of Mulberry (*q.v.*) and Pluto (*q.v.*) were fabricated there, and it was one of the embarkation points for the invasion of June, 1944.

Riche OR **RICH**, **BARNABE** (c. 1540-1617). English romance writer. He fought as a soldier in Flanders and Ireland, later living in Dublin. He died Nov. 10, 1617. His 20 or 30 works were modelled more or less on Lyly's Euphues, and borrowed from Bandello and other Italian novelists. Riche, His Farewell to the Militarie Profession, 1581, contained the story of Apollonius and Silla, from which Shakespeare derived the plot of Twelfth Night.

Richelieu. River of Quebec, Canada. It issues from Lake Champlain, and, flowing N. about 80 m., falls into Lake St. Peter, an expansion of the St. Lawrence, at Sorel. It is part of the waterway between the St. Lawrence and the Hudson, and is navigable for large vessels. The river is also known as the Chambly and the St. John.

Richelieu, **ARMAND EMMANUEL SOPHIE SEPTÉMANIE DU PLESSIS**, **DUKE OF** (1766-1822). French statesman. Born in Paris, Sept. 15, 1766, he served under the tsar of Russia during the French Revolution, and as governor of Odessa raised it from a small town to an important city. Returning to France at the Restoration, he succeeded Talleyrand in 1815 as premier, and mainly as a result of his influence with the tsar obtained the complete evacuation of French territory at the congress of Aix-la-Chapelle in 1818. That year he resigned, and though he again assumed office in Feb., 1821, his failure to steer a successful middle course between the liberals and reactionaries led to his fall in Dec. He died May 17, 1822.

Richelieu, **ARMAND JEAN DU PLESSIS**, **DUKE OF** (1585-1642). French statesman and ecclesiastic. Of a noble family in Poitou, he was born Sept. 5 or 9, 1585, and at 20 was given the bishopric of Luçon in his father's preferment. Being under age, he went to Rome for a dispensation, and was consecrated in 1607. In 1614 he was chosen a clerical deputy to the last states-general called before the French Revolution. He obtained the post of almoner to Anne, queen of Louis XIII.; then through the influence of Concini became secre-

tary to the king. The murder of Concini in 1617 was followed by banishment of his friends, but the queen mother at Blois valued Richelieu's services. He arranged the treaty by which she was to administer Anjou and Normandy, and when she returned to royal favour she saw her favourite placed on the council.

De Richelieu

After P. de Champaigne

By 1624 he was virtually chief minister, and was appointed such in 1629. He received the red hat in 1622 and a dukedom in 1631. Once established, Richelieu presided over the destinies of France till his death, Dec. 4, 1642. Cold, cruel, petty, and avaricious, he aroused enmities. He had to crush conspiracies, those of Gaston of Orleans from 1626 to 1632, that of Cinq-Mars in his last year. He suffered from painful ill-health. But he was courageous, determined, amazingly competent; and thanks also to a wonderful system of spies, and the loyalty of the king (who detested Richelieu personally), he triumphed every time.

Richelieu's policy had one root and three branches. France was to be made great, by concentrating power in the hands of an absolute monarch and his minister; by making domestic strife to cease with the granting of religious toleration; and by capturing the control of international diplomacy from the Hapsburg empire. Therefore the nobility was shorn of effective power; fortified castles were demolished;

local administration was given to civil servants. The Huguenots were crushed at the siege of La Rochelle, 1629, not as heretics but as rebels, and then were allowed to enjoy their form of worship and many civic privileges. Until the struggles at court ended with the cardinal's triumph on the "day of dupes," Nov. 11, 1630, he could not intervene actively in the Thirty Years War, but then came masterly intrigues. Richelieu gave subsidies to opponents of the Hapsburgs, even the Protestant king of Sweden. His agent, Father Joseph, procured the dismissal of the best imperial general, Wallenstein. His armies seized Roussillon, Catalonia, and Savoy, and threatened the Milanese. After his death, Condé's victory over the Spaniards at Rocroi, and the treaty of Westphalia which maintained the partition of Germany, were the fruit of Richelieu's efforts.

The cardinal rebuilt and endowed the Sorbonne, where he was buried. He founded in 1635 the French Academy. Among much that he wrote, his memoirs (5 vols., 1907-22) remain interesting. For good and ill, his significance for France can scarcely be exaggerated; without him, she would have known neither the glories of Louis XIV nor the stifling of political development which at last bred revolution. He is drawn unflatteringly in Dumas's novels; and there are biographies by G. Hanotaux, 1893; E. C. Price, 1912; K. Federn, Eng. trans. 1928; H. Belloc, 1930.

Alan Phillips

Richelieu. French battleship. Laid down July, 1935, she was built at Brest and completed July, 1940. Displacing 48,500 tons fully laden on a length of 794 ft. and a beam of 108 ft., she was powered by geared turbines developing 150,000 s.h.p. to give her a maximum speed of 30 knots. Her armament consisted of eight 15 in., nine 6 in., twelve 3.9 in., seventy 40 mm., and forty 20 mm. guns, and she carried a complement of 1,946. Richelieu was one of the Allied battleships off the River Plate when the Graf Spee was scuttled. After the Franco-German armistice she took refuge at Dakar (*q.v.*), where on July 8, 1940, she was attacked by the Royal Navy and severely damaged. Following the N. Africa landings, she was sent to the U.S.A. for repairs and later joined the British Mediterranean Fleet.

Richepin, **JEAN** (1849-1926). French poet, dramatist, and novelist. He was born at Médan, Algiers

Feb. 4, 1849, fought as a franc-tireur in the war of 1870, and led a roving life before turning to literature.

As a poet he has been summed up as "frankly, boldly, and insolently a romantic"; in many of his stories he is a realist, while in

Jacques Richepin

his earlier writing he displayed a brutal coarseness. This in *Chansons des Gueux*, 1876, led to his being fined and imprisoned for an outrage against manners. His many novels include *Les Morts Bizarres*, 1876; *Le Pavé*, 1883; *La Miseloque*, 1893; *Contes Espagnols*, 1901; *L'Aile*, 1911. Among his plays are *Nana Sahib*, 1883; *Le Filibustier*, 1888; *Par le Glaive*, 1892; *Don Quichotte*, 1905; *La Route d'Émeraude*, 1909. He died Dec. 12, 1926.

His son, Jacques Richepin (1880-1946), poet and dramatist, established his reputation with *La Reine de Tyr*, 1899. Other works included *La Cavalière*, 1901, and *Falstaff*, a play in verse based mainly on incidents from Shakespeare. He married Cora Laparcène, and with her directed the Renaissance and Mogador theatres in Paris. He died Sept. 2, 1946.

Richet, CHARLES ROBERT (1850-1935). French physiologist. He was born in Paris, Aug. 26, 1850, and educated there. He became professor of physiology at Paris university in 1887, and attracted attention by his discovery of the susceptibility of animals and men to consecutive injections of foreign proteins—a phenomenon known as anaphylaxis. For this work he was, in 1913, awarded the Nobel prize for medicine. He also did valuable work on serum therapy, and edited the *Revue Scientifique*, and wrote, in collaboration, a dictionary of physiology. Richet died in Paris in 1935.

Richmond. Municipal bor., giving its name to a bor. constituency, of Surrey, England. It is

on the slope of a hill, 9 m. S.W. of Hyde Park Corner, and has excellent connexions with London by railways and bus. The borough, which includes Kew, Petersham,

Richmond, Surrey, arms

Richmond, Surrey. The famous view of the River Thames, looking upstream, from the Terrace Gardens

and part of Mortlake, was incorporated in 1890. Richmond proper, bordered N. by Kew Gardens, W. by the Thames, E. by Mortlake, and S. by Petersham, is famous for its associations with royalty and as the home of poets, writers, and painters, among them Chaucer, Bacon, Sir W. Temple, Thomson, Pope, Swift and Stella, Reynolds, Turner, and George Eliot. Its pop. has grown from about 15,000 in 1876 to about 40,000 in 1948.

Originally known as West Sheen (A.S. *schene*, shining) and once a hamlet of Kingston, Richmond owes its name to Henry VII, who was earl of Richmond, Yorks, and has been a royal manor since 1320.

The manor house was converted by Edward III into a palace, destroyed by fire 1499, rebuilt by Henry VII, and dismantled in the 18th cent. Elizabeth, once a prisoner here, died in the palace. The

remains of the palace were restored, 1913-19. The Old Deer Park is now the venue of the Richmond horse show, football, golf, hockey, and other sports. The observatory, 1768, is used for meteorological work. Near it was a Carthusian

priory founded by Henry V. Edmund Keen was lessee of a theatre which stood near the Green. Maids of Honour Row was built for the ladies of Caroline's court. The local Maid of Honour cakes are a kind of cheese cake made since 1823.

The terrace gardens, public since 1886, command a magnificent view. Near by stood the famous Star and Garter hotel, founded in 1738 and

Richmond. Part of the palace rebuilt by Henry VII, where Queen Elizabeth died
Humphrey Joel

pulled down in 1919 to make room for a home for disabled soldiers and sailors. Among the public buildings is the town hall, 1893. The parish church of S. Mary Magdalen, frequently altered, has some interesting monuments and a massive

stone tower. The poet Thomson was buried in Richmond churchyard. The heroine of the old ballad, the Lass of Richmond Hill, was Fanny l'Anson of Richmond Hill, Yorks. A stone bridge with five arches (1774-77) connects with Twickenham. *See* Ham. Kew; Petersham; Sheen; *consult* Royal Manor of Richmond, Bell, 1907; Bygone Richmond, Cundall, 1925.

Richmond, Virginia, U.S.A. White House of the Confederacy. Right, oldest house in Richmond, erected about 1836, now a memorial to Edgar Allan Poe who lived in the town

commerce, the state library, and the splendid cathedral of the Sacred Heart. The city has several monuments, including one to Washington in the capitol grounds. The Valentine museum has a fine archaeological collection, and the state library contains upwards of 100,000 vols.

Richmond is a place of many literary associations. Here Poe lived, and here the Poe foundation preserves relics of that ill-starred writer. The 20th century Richmond produced Mary Johnson, Ellen Glasgow, and J. B. Cabell. The city has become the greatest cigarette manufacturing centre in the world. It has been the state capital since 1779. For four years, 1861-65, it was the headquarters of the confederacy. Many battles were fought for its possession, and on April 2, 1865, it was finally evacuated after damage by fire. Pop. 193,042.

Richmond, EARL OF. Title bestowed on Edmund, son of Owen Tudor, by his half-brother Henry VI, and inherited by Henry Tudor, who became Henry VII (*q.v.*).

Richmond, GEORGE (1809-96). British painter. Born at Brompton, London, March 28, 1809, he studied under Fuseli at the R.A. schools. In his early career he was greatly influenced by Blake. He became A.R.A. in 1857 and R.A. in 1867. His portraits included those of Wilberforce, then

George Richmond, British painter
Self-portrait

bishop of Oxford, 1868; Keble, Macaulay, Faraday; and he also modelled a bust of Pusey, 1882. Richmond died March 19, 1896. The National Portrait Gallery possesses several of his works. *See* illus. to Dalhousie, Marquess of; Liddell, H. G.; Palgrave. Sir F.

Richmond, SIR WILLIAM BLAKE (1843-1921). British painter. Born in London, son of George Richmond, the painter,

Sir W. B. Richmond, British painter

Richmond. Mun. borough and market town of the N. Riding of Yorkshire. It stands on the left bank of the Swale, 50 m. N.W. of York, having a rly. station. The chief object of interest is the ruined castle, standing on a hill above the river. The magnificent keep and some other portions remain. The chief church is S. Mary's, which, like Holy Trinity, has been largely restored. The tower remains of a monastery of the Greyfriars. Modern buildings include the town hall and market hall. The grammar school is also modern, although the foundation dates from the 16th century. Richmond has an agricultural trade and some small manufactures. Races are held here. Near the town are the beautiful ruins of Easby Abbey.

Richmond was the head of a large honour, and from here various princes took the title of duke. The castle was built by the Normans, and the honour became

crown property when Henry, earl of Richmond, became Henry VII. It had an M.P. 1584-1885, and now gives its name to a co. constituency. Pop. 4,769. *Consult* The Story of Richmond in Yorkshire, D. Brooks, 1948.

Richmond. City of Indiana, U.S.A., the co. seat of Wayne co. It stands on the Whitewater river, 70 m. E. of Indianapolis, on the Pittsburg, Cincinnati, Chicago and St. Louis, and other rlys. Agricultural machinery, motor vehicles, furniture, and pianos are manufactured. Founded in 1805 by veterans of the war of Independence, Richmond was incorporated in 1818 and became a city in 1840. Pop. 35,147.

Richmond. Borough of New York City, U.S.A. It covers an area of 59 sq. m., and is co-terminous with Richmond co., the whole of Staten Island. It is largely a residential district, was made a borough in 1898, and is still in its appearance much like old Dutch-settled New York. Pop. 174,441. *See* New York.

Richmond. City and port of entry of Virginia, U.S.A. The capital and largest city of the state, and the co. seat of Henrico co., it stands on the James river, 115 m. by rly. S. of Washington, and is served by the Southern and other rlys., and by ocean-going steamers. The capitol, after the Maison Carrée at Nîmes, stands on Shockoe Hill, in the centre of the city. Other buildings are the city hall, the chamber of

Richmond, Yorkshire. Ruins of the Norman castle and the bridge over the river Swale

Frith

he studied at the Royal Academy schools. Known first as a painter of portraits and historical subjects, he decorated the inner dome of St. Paul's with mosaics. He was Slade professor at Oxford, 1878-83; became A.R.A. in 1888 and R.A. in 1895; and was knighted 1897. His activities included a vigorous and partially successful crusade against the smoke nuisance in London; and the direction and championship of the arts and crafts movements in Hammersmith. He died Feb. 11, 1921.

Richmond and Derby, MARGARET, COUNTESS OF. Mother of Henry VII, and benefactor of Oxford and Cambridge. See Beaufort, Margaret.

Richmond and Gordon, DUKE OF. Title held by the family of Gordon-Lennox. Charles Lennox

5th Duke of Richmond and Gordon
After E. Wilkins

(1672-1723), natural son of Charles II by Louise de Kéroualle, was made duke of Richmond in the English peerage and duke of Lennox in the Scottish peerage in 1675. His son Charles (d. 1750), 2nd duke, was lord high constable of England at the coronation of George II, and inherited the French dukedom of Aiguillon, 1734. Charles, 4th duke (1764-1819), was lord-lieutenant of Ireland 1807-13, and governor-general of Canada 1818-19.

In 1860 Charles Henry (1818-1903) became 6th duke of Richmond, and in 1876 1st duke of Gordon. He had been Conservative M.P. for W. Sussex since 1841, and became president of the board of trade and party leader in the lords, 1867. Lord president of the council, 1874-80, he was secretary for Scotland in 1885. He died Sept. 27, 1903. In 1935 the titles came to Frederick Charles (b. Feb. 5, 1904), 9th duke of Richmond and 4th duke of Gordon. His principal estate is at Goodwood, Sussex, and his heir is the earl of March.

Richmond and Lennox, FRANCES TERESA STEWART, DUCHESS OF (1647-1702). Mistress of Charles II. Born July 8, 1647, daughter of a physician, she was educated in France, and, coming to England as a maid of honour to Catherine of Braganza, soon won the king's heart by her beauty. Charles's favourite from 1663, she made a runaway match in 1667 with the duke of Richmond and Lennox, but

returned to court in 1668. She remained there during the reign of James II, and died Oct. 15, 1702. Her wax effigy, in the robes she wore at Anne's coronation, is preserved in Westminster Abbey, where she was buried. Her beauty inspired artists and poets, and "la belle Stewart" was the original model for the figure of Britannia (q.v.) on British copper coins.

Richmond and Steveston. Municipality of British Columbia, Canada, at the mouth of the Fraser river, 6 m. S. of Vancouver. It includes Lulu and Sea Islands. Five rly. and traffic bridges on the N. arm of the Fraser connect with the mainland. Sea Island is the site of Vancouver airport. Steveston, on the S. tip of Lulu Island, is a centre of the salmon canning industry. Pop. 8,182.

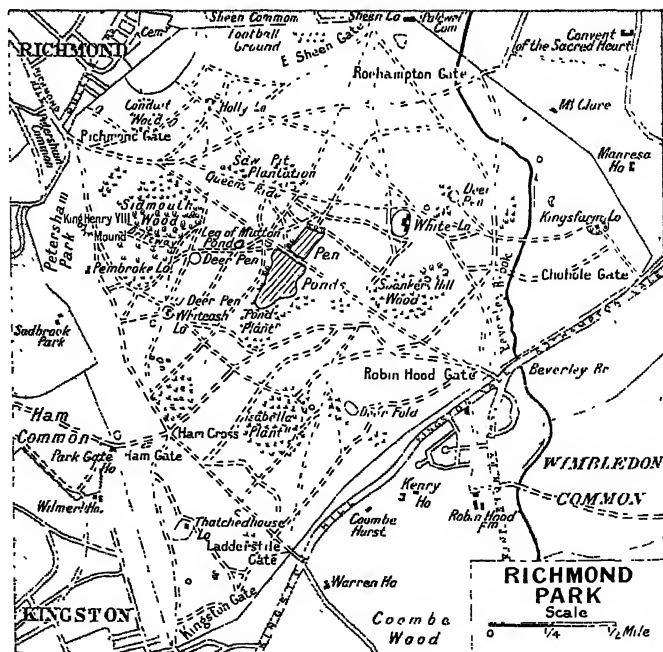

Richmond Park. Royal demesne of 2,250 acres in Surrey, England. It is bounded N. by Richmond, by Pethouse, Sheen, and Palewell commons, and by Mortlake; S. by Kingston and Coombe; W. by Petersham and Ham commons and Sudbrook

Frances Teresa,
Duchess of Richmond and Lennox

Park; E. by Kingston Hill, Kingston Vale, and Roehampton Vale. Easily the biggest and probably the most beautiful park near London, notable for its oaks, chestnuts, and birches, and undulating surface, it is stocked with red and fallow deer, and has two fine sheets of water, Pen Ponds, formed in the time of George II, and stocked with fish and water fowl. It contains White Lodge, the early home of Queen Mary and birthplace of the duke of Windsor; Pembroke Lodge, Sheen Lodge, and the Thatched House Lodge. There is a public golf course. Several motor roads go through the park.

Once known as Sheene Chase, Richmond Park was enclosed in 1637 by Charles I, for hunting purposes. In 1649 the park was granted to the City of London, but it reverted to the crown at the Restoration. In 1758 the public right of footway between Richmond, Wimbledon, East Sheen, and Kingston was maintained in the law courts by a Richmond brewer named John Lewis. Of the rangers, the 2nd earl of Portland was the first, Sir Robert Walpole the fourth, and the 2nd duke of Cambridge the 12th. The park was used in the Second Great War for experiments in the disposal of bombs. Consult History, C. L. Collett, 1937.

Richmond Park. Plan of the Royal park in Surrey
Based upon the Ordnance Survey map, with the sanction of the Controller of H.M. Stationery Office

Richter, HANS (1843-1916). Austrian conductor. Born at Raab (Győr), Hungary, April 4,

Hans Richter,
Austrian conductor

1843, he became a successful horn player and made the acquaintance of Wagner, who helped him to become chorus-master at the Munich opera, 1868. Richter conducted the first performance of Lohengrin at Brussels, 1870, and of The Ring of the Nibelungen at Baireuth, 1876, and accompanied Wagner to London in 1877. During 1875-97 he was chiefly in Vienna, but frequently in England, directing the Hallé orchestra. He died Dec. 5, 1916. His strong personality and wide technical knowledge made him the greatest conductor of his day; his friendship with Wagner made him an acknowledged authority on that master; and he was the first to present many works of Elgar, who dedicated to Richter his first symphony.

Richter, JOHANN PAUL FRIEDRICH (1763-1825). German author and humorist, often spoken of as Jean Paul. He was born March 21, 1763, at Wunsiedel, Bavaria. After studying theology at Leipzig, he determined to turn to literature; at 20 his Grönlandische Prozesse (The Greenland Law Suit) was issued by a Berlin publisher, but was a failure. Auswahl aus des Teufels Papieren (Extracts from the Devil's Papers), 1789, had little more success, but in 1793, with Die Unsichtbare Loge (The Invisible Opera Box), he won a first success; and Hesperus, 1795, made him famous.

Henceforth Richter was recognized as one of Germany's leading authors, and when he visited Weimar in 1796 and 1799 he was enthusiastically received. Other earlier works included Quintus Fixlein, 1796, translated into English by Carlyle in German Romance, 1827; Blumen, Frucht, und Dornenstücke (Flower, Fruit, and Thorn Pieces), 1796-97, trans. A. Ewing, 1892; and Das Kampaner Thal (The Campanian Vale), a discussion on immortality, 1797. In 1800 he visited Berlin, and there next year he married Caro-

line Meyer. In 1804 they settled at Baireuth. Later works included Titan, 1800-03, trans. C. T. Brooks, 1863, a romance which some critics, like the author, regard as his greatest work; Flegeljahre (Wild Oats), 1804-05; Levana, oder Erziehungslehre für Töchter, 1807 (Levana, or the Doctrine of Education for Girls, new ed. 1901); Schmelzles Reise, 1809 (Schmelzle's Journey, trans. by Carlyle in German Romance). Richter died at Baireuth, Nov. 14, 1825. One of the greatest of German writers, he influenced Carlyle's style. Richter's works were first collected in 65 vols., 1826-38. Consult Life, E. Lee, 1842; Humour and Humorists, P. Stapfer, 1911.

Richthofen Circus. Popular name of the Jagdgeschwader 11, or fighter squadron, commanded by Baron Manfred von Richthofen (1888 - 1918), German ace fighter-pilot of the First Great War. It was dubbed "circus" by the R. F. C. because of its gaudily-decorated machines and roving commissions. After Richthofen was shot down and killed in April, 1918, command of the circus passed to Hermann Goering (q.v.), one of its original pilots. There was also a Richthofen fighter-squadron of the Luftwaffe in the Second Great War.

Baron Manfred
von Richthofen,
German airman

Ricimer (d. A.D. 472). Roman general. Connected with the Visigothic royal family, he was brought up at Rome and soon attained high rank in the army. After defeating the Vandals by sea and land, in 456 he attacked the West Roman emperor Avitus, setting up Majorian in his place. From this time Ricimer, the Roman kingmaker, virtually ruled the empire for 16 years. In succession he installed upon the throne Libius Severus, 461; Anthemius, 467; and Olybrius, 472, in which year he died of the plague.

Rickets or **RACHITIS**. A disease of infants and children resulting from faulty diet and characterised by impairment of bone formation. Rickets occurs in all parts of the world, and is most prevalent among the poor children of large towns. Bad housing, overcrowding, insufficiency of food, and prolonged lactation are conditions conducive to the development of the disease, but the essential cause

is the bad functioning of the chemistry of bone growth, due largely to a deficiency of vitamin D in the diet, and the consequent failure of vitamin A, and calcium, effective only when vitamin D is present.

The symptoms begin insidiously, and are generally noticed about the sixth to ninth month. The child may have suffered from disturbance of digestion, and may have been irritable and restless. It shows a disinclination to walk, and is listless and peevish. There is a general soreness of the body, and the child cries when any attempt is made to move him. Slight fever, 100° to 101° F., is frequently present, and profuse sweating is a characteristic symptom.

As the disease progresses, changes in the bones become manifest. Their ends are enlarged, and they do not possess the normal degree of firmness, nor do they grow at the natural rate. The legs become bent, the spine curved, the sternum or breast-bone is thrown forward, and enlargement at the junction of the ribs with the costal cartilages produces a series of nodules down the front of the chest which is known as the "rickety rosary." The fontanelles or soft spaces between bones of the head remain open. The teeth often fail to erupt, or are decayed and imperfect. Some children become emaciated, while others remain well covered, but look pasty and flabby. Common complications of rickets are bronchial catarrh, pneumonia, bronchitis, and laryngismus stridulus. Enlargement of the lymphatic glands, disturbance of digestion, chronic diarrhoea, and other symptoms of general ill-health are often associated with the disorder.

If the disease is not treated in the early stages death may occur from complications, or, when adult life is reached, there may be serious and permanent deformity. The most important consideration in the treatment of rickets is the feeding. Fresh cow's milk should be given, suitably diluted and in sufficient quantity according to the age of the child. Cod-liver oil or halibut oil are essential remedies, being rich in the all-important vitamins A and D. Preparations of iron, phosphorus, and lime have their use in supplying the raw material needed for bone formation. Diarrhoea, if present, should receive the appropriate treatment. The child should be warmly clothed, given as much sunlight as possible, and should not be allowed to walk until the condition is im-

Johann Paul Richter,
German author

proved. If curvature of the bones has already occurred, the defect can often be corrected by wearing suitable splints. The condition was studied for many years before its cause was realised. The fact that poor children in fishing ports dipped bread in the oil produced when fish were being cleaned first suggested a solution.

Rickets is also the term applied to a disease common in certain breeds of dogs, notably bulldogs. It is caused by bad feeding, or a constitutional inability to deposit calcium salts in the growing bones. The bones most affected are those of the foreleg, especially the radius, which become bent forward and much distorted. The hind limbs may also suffer. The worst cases are in dogs in which there has been in-breeding. *See Dog.*

Ricketts, CHARLES (1866-1931). British artist. Born at Geneva, Oct. 2, 1866, he studied in Paris, founding a folio magazine *The Dial* in 1889, and acting as joint editor with Charles Shannon. In 1895 he started the *Vale press*, issuing a series of reprints

Charles Ricketts,
British artist

which gave great impetus to type design. He was elected R.A. in 1928; his best known paintings included *The Death of Don Juan* (Tate Gallery), and *The Plague* (Luxembourg). A fine draughtsman, he was also noted for woodcuts, many of which appeared in *The Dial*, pen drawings, and designs for the theatre: for instance, he redressed the *Mikado* for the 1929 Savoy season, and designed the costumes for Shaw's *Saint Joan* (q.v.). He died Oct. 7, 1931. His *Unrecorded Histories* appeared posthumously in 1933, and a *Memoir* by T. S. Moore the same year.

Rickmansworth. Urban dist. of Herts, England. It stands at the junction of the rivers Chess and Colne, 18 m. N.W. of London, with which there is connexion by Green Line and rly. It is also on the Grand Union Canal. S. Mary's is a modern church with some interesting internal features. The council offices are at Basing House, an 18th century mansion. On the outskirts are establishments making lorries, asbestos ware, and paper. There is picturesque scenery along the rivers Gade, Chess, and Colne. Near is Moor Park (q.v.). Population 25,000.

Rickshaw. Abbreviation of *jinricksha* (Jap. *jin*, a man; *riki*, strength; and *sha*, a car). Japanese vehicle seating one person and drawn by a hired man.

It was invented in 1869 by a Baptist missionary in Japan to provide employment for his converts. It now consists of an open, trap-like body with upholstered seat and hood mounted on pneumatic-tired rubber wheels. It is fitted with two shafts between which runs the coolie drawing it. The rickshaw was later introduced into China, India, Malaya, and S. Africa, where it plies for hire for short journeys. Rickshaw men in Durban, mostly Zulus, are noted for their elaborate feathered head-dress. Outside Japan, rickshaws sometimes seat two.

Ricochet. Term used in gunnery, when a gun is fired at a low elevation, and the shot often rebounds after striking the surface it first hits. Such a method of fire was once a recognized form of tactics in sea warfare, when round shot were used, and the ricochet shot did not rise much. The modern rifled projectile, however, tends to rise much more sharply after a ricochet, and so loses much of its chance of hitting an object. The term is also used in musketry. *Pron. rik-o-shay.*

Riddell, GEORGE ALLARDICE RIDDELL, BARON (1865-1934). British newspaper proprietor. Born at Duns, Berwickshire, May 25, 1865, he was educated in London, and became a solicitor in 1888. He secured an interest in several newspaper concerns, e.g. developing the circulation of

1st Baron Riddell,
British newspaper
proprietor

the *News of the World* from 30,000 to over 3,000,000. He succeeded Newnes as chairman and managing director of George Newnes, Ltd., and was also chairman of C. Arthur Pearson, Newnes and Pearson, and Country Life. At the Versailles conference, 1919, he acted as liaison officer between the British government and the press. His *War Diary*, and *Intimate Diary of the Peace Conference and After*, both appeared in 1933. Knighted

in 1909, he was raised to the peerage in 1920. He died Dec. 5, 1934, without an heir.

Riddle. A puzzling or enigmatical question. The most famous

Rickshaw. A single-seater rickshaw drawn by a coolie, as found in many parts of China

riddle is that supposed to have been propounded by the Sphinx: "What animal is that which goes on four feet in the morning, on two at noon, and on three in the evening?" The answer, discovered by Oedipus, was "man, for when an infant he creeps on all fours, when he has attained maturity goes on two feet, and when old uses a staff." Samson's riddle (*Judges 14*) may also be mentioned. The charade (q.v.) form has been popular in England since the 18th century, but there have been many later fashions in the style of riddle, e.g. the simple, punning riddle (Why should yellow peas be sent to Hammersmith? Because that's the way to Turnham Green); the "difference" riddle (What is the difference between a schoolmaster and an engine driver? One trains the mind, the other minds the train); the "likeness" riddle (Why is a moth flying round a candle like a five-barred gate? Because if it keeps on it sings its wings—its hinges it swings); and a double-punning form popular in the early 20th century (Why did the owl? Because the woodpecker would peck'er).

Riddle. For details of this agricultural implement, *see* Screen; Sieve.

Rideau. Lake, river, and canal of Ontario, Canada. The lake is 42 m. S.W. of Ottawa, and discharges into the river which joins the Ottawa river at the capital. The canal, built 1826-34 for military purposes, connects Ottawa with Kingston, on Lake Ontario, by means of the river and lake, and by connexions with Mud Lake and the Cataragui river. The canal is

126 m. long, and 5 ft. deep in the navigable channel.

Ridge, WILLIAM PETT (1860-1930). British novelist. Born at Chartham, near Canterbury, he was educated in Kent, and at Birkbeck College. His first novel, *A Clever Wife*, was delayed until 1895, but with *Mord Em'ly*, 1898, he established a reputation

Wm. Pett Ridge,
British novelist

for humorous and sympathetic studies of lower middle-class life in London. Later novels included *Erb*, 1903; *Name of Garland*, 1907; *The Bustling Hours*, 1919; *Ernest Escaping*, 1926. Pett Ridge's autobiography, *A Storyteller's Forty Years in London*, appeared in 1923. He died Sept. 29, 1930.

Ridgeway, SIR WILLIAM (1853-1926). British archaeologist. Born at Ballydermot, Offaly, Aug. 6, 1853, he studied at Trinity College, Dublin, and at Cambridge, where he became professor of archaeology in 1892. He was president of the Royal Anthropological Institute, 1908-10, and of the Classical Association, 1914. He was knighted 1919, and died Aug. 12, 1926. Among his works are *The Early Age of Greece*, 1901; *Who Were the Romans?*, 1907; *The Oldest Irish Epic*, 1907; *Dramas and Dramatic Dances of non-European Races*, 1915.

Ridgeway, THE. Prehistoric track following the line of the Berkshire Downs, England, from White Horse Hill to a point near Streatley. It runs parallel to and S. of the now metalled Icknield Way. This grass-grown track is unsurpassed for walking and practicable for cyclists.

Riding. Term applied to horsemanship, which may be broadly defined as getting the best work out of a horse for a given object, with a minimum of distress to horse and rider. Much has been written about "hands," i.e. the control of a horse by the rein, and more about "seat."

"Hands" cannot be acquired; the natural sensitiveness and responsiveness, together with the capacity for understanding the animal one is riding, are inborn. In the "seat" it is usual to endeavour to combine elegance with firmness. Cavalry and hack riders have the leg slightly bent, many cross-country riders prefer a

shorter stirrup, whereas the cowboy, who is as often in the saddle as on foot, rides with an absolutely straight leg. The cowboy, however, rides from his saddle, a massive and weighty article fashioned to meet the necessities of his calling. The Australian bushman, at least as good a horseman, rides with a different seat on an entirely different kind of saddle. The Red Indian, who rides barebacked, sits right forward on the withers, with the knees much bent when going at speed, in an attitude much like that adopted by the American jockey, Tod Sloan. In England one will best conform to the national school of riding by carefully observing the old jingle: "Your head and your heart keep up. Your hands and your heels keep down. Your knees keep close to your horse's sides, and your elbows close to your own."

The recognized paces of the horse are the walk, the trot, the canter, and the gallop. The trot is the natural pace as an alternative to the walk, and the acquirement of a good seat when trotting is the first object of the tiro horseman. The canter is of all paces the easiest to sit, and most delightful to the rider; unfortunately, it is injurious to the horse, inasmuch as the weight comes constantly on the same leg, and is on that account to be deprecated. Certain communities which spend much of their time in the saddle have succeeded in cultivating a modification of the canter, a "lope," in which this disability is remedied.

Riding has been divided into numerous heads, which vary with the judgement of the individual. Ordinarily the following classification is adequate. 1. Hacking, i.e. ordinary riding—on paths or along the road or over the downs, with no particular object but merely for the sake of being on horseback. 2. Hunting, i.e. riding across country to hounds, which makes the highest demands on the skill, nerve, and judgement of the horseman. 3. Military riding, under which rough riding may be included; this comprises all the horsemanship required by ordinary military duties, as well as the ability to ride across any kind of practicable country at speed. See illus. p. 6994.

C. E. Benson

Bibliography. *The Common Sense of Riding: Riding for Ladies*, N. P. O'Donoghue, new ed. 1905. *Riding*, R. Weir, new ed. 1905; *Modern Riding*, J. F. N. Birch, 1909; *Breaking and Riding*, J. Fillis, Eng. trans. M. H. Hayes, 2nd ed. 1911;

The Complete Horseman, W. S. Dixon, 1913; *Riding*, C. E. G. Hope, 1947.

Riding. Literally, the third part, a corruption of thridding. Of Scandinavian origin, the word was brought by the Danes into England, and just before and after the Norman Conquest a number of counties were divided into ridings with riding courts. Today the division still persists in the county of York, which is divided into three ridings, East, North, West. Each is an administrative county with its own lord-lieutenant and county council. See Yorkshire.

Riding the Marches. Form of beating the bounds (*q.v.*) carried out in Scottish and Border districts. Its purpose is to perpetuate the limits of parish and other boundaries, march being an old Anglo-Saxon word for boundary. The chief participants are the mayor or provost and other civic dignitaries, who ride round the area on horseback. In some districts the marches are now ridden in motor-cars.

Ridley, MATTHEW WHITE RIDLEY, 1ST VISCOUNT (1842-1904). British politician. Born in London, July 25, 1842, the son of Sir Matthew White Ridley, Bart., of Blagdon Hall, Northumberland. He was educated at Harrow and Balliol College, Oxford, and became a fellow of All Souls. In 1868 he entered parliament as a Conservative, and from 1878 to 1880 was under-secretary to the Home office, in 1885 becoming financial secretary to the Treasury. In 1895, having just failed to secure election as Speaker, he was made Home secretary. He retired and was made a viscount in 1900, dying at Blagdon, Nov. 28, 1904. In 1916 the title came to the 3rd viscount, also Matthew White Ridley (b. Dec. 16, 1903), who became regional controller for the N. under the ministry of Production in 1942.

Ridley, NICHOLAS (c. 1500-55). English prelate. Born in Northumberland, and educated at Pembroke Hall, Cambridge, he soon became prominent as a reformer. In 1537 he was appointed chaplain to Archbishop Cranmer, and was chaplain to Henry VIII and canon of Canterbury,

Nicholas Ridley,
English prelate

1541. He was canon of Westminster, bishop of Rochester, and, 1550, bishop of London, succeeding

7. Seat in gallop and, 8, in full gallop.
 Specially drawn by Charles M. Sheldon.

1. Preparing to mount. 2. Mounting. 3. Start of canter. 4. Seat at full canter. 5 and 6. Sitting and rising in saddle during trot. 7. Seating in gallop and 8, in full gallop. 9. Taking off for a jump. 10. Sitting back. 11. Preparing to dismount. 12. The dismount. See page 6993.

RIDING: MOUNTING AND THE CORRECT SEATS IN HACKING AND HUNTING

Bonner. In addition he held two country livings, and was one of the bishops who prepared the first prayer book of 1549. The foundation of S. Thomas's Hospital and of Bethlem (Bedlam) Hospital was due to his initiative. When Edward VI died Ridley sided with Lady Jane Grey, and was committed to the Tower by Mary at her accession. In 1554 he was condemned for heresy, and with Latimer was burnt at Oxford, Oct. 16, 1555.

Ridolfi Plot. Conspiracy in 1571 to marry Mary Queen of Scots to the 4th duke of Norfolk and place her on the English throne instead of Elizabeth. Roberto di Ridolfi (1531-1612) was a Florentine who settled in London, then visited Alva in Brussels, the pope, and Philip II in Madrid to gain their help in forwarding the scheme. But his agent Baillie was seized on landing at Dover, and Norfolk and other plotters were executed.

Riebeckite. Rock-forming mineral, one of the alkali amphiboles. It is a complex silicate of sodium and iron. It occurs as blue to black prismatic crystals and grains in acid igneous rocks rich in soda. Crocidolite, one of the types of commercial asbestos, is probably a variety of riebeckite, which on alteration gives rise to the Cat's Eye or Tiger's Eye used for ornaments.

Riego y Nuñez, RAFAEL DEL (1785-1823). A Spanish soldier. Born in Asturias, he early showed a patriotic spirit, and joined the forces which were fighting against France. He was, however, soon taken prisoner and spent some years in captivity. He returned at the peace of 1815, and was the leader of the insurrection of 1820, after which he held high positions in the state, being president of the cortes in 1823. That year he was again taken prisoner by the French, handed over to the royalists, and executed at Madrid, Nov. 7. The hymn of Riego is one of the most popular of Spanish songs, especially among republicans and revolutionaries.

Riel, LOUIS (1844-85). Canadian rebel. Born at St. Boniface, Manitoba, Oct. 23, 1844, he was partly of Indian descent. In 1868, he came to the front as the leader of those who disliked the transference of the Hudson Bay territories to the new dominion. The malcontents, having seized Fort Garry, called a convention and chose Riel as president of the government they set up. By them an Orange-

Louis Riel,
Canadian rebel

a member of the dominion parliament. He was expelled, again elected, and then outlawed, after which he passed some time in retirement, partly because of his mental condition. In 1885, however, he was asked by the half-breeds to champion their cause; a rebellion ensued, and, that having been crushed, Riel surrendered. He was found guilty of treason, and hanged at Regina, Nov. 16, an event which aroused hot passions.

Riemann, GEORG FRIEDRICH BERNHARD (1826-66). German mathematician. Born at Breselenz, Hanover, Sept. 17, 1826, he studied mathematics at Göttingen, where he was a pupil of Gauss, and at Berlin, under Jacobi. He successively became privatdocent, 1854, adjunct professor, 1857, and professor, 1859, at Göttingen, and died July 20, 1866. Riemann was one of the most brilliant mathematicians of the 19th century. He suffered ill-health and was severely handicapped by poverty, but despite these drawbacks his work on non-Euclidean geometry (*v.i.*) was outstanding.

Riemannian Geometry. A non-euclidean differential geometry developed by G. F. Riemann in the mid-19th century. Gauss had shown that certain properties of a two-dimensional curved surface embedded in euclidean three-dimensional space could be expressed in terms which did not involve the third dimension in which the surface could be seen to be curved. Such properties are said to be intrinsic properties of the original surface or space of two dimensions; they include a measure of the curvature at any given point, the properties of geodesics, etc.

Riemann saw that similarly a space of three dimensions might be found to be curved in a fourth dimension, and hence to be non-euclidean. He then proceeded to generalize Gauss's ideas to spaces of any number of dimensions and with any assigned quadratic differential form determining the metric. His work provided the basis for Einstein's General theory of Relativity, in which gravitation

is replaced by the geometrical conception of curvature in a four-dimensional continuum.

Rienzi, COLA DI (c. 1313-54). Roman patriot. The son of an innkeeper, he became a notary. Em-

bittered by the death of his brother, who had been murdered by a patrician, Rienzi threw all his energies into the cause of the people. A visit to Clement VI at

Avignon, 1343, brought him an official position and public notice. On Whit-sunday, May 20, 1347, Rienzi called a national council on the Capitol Hill. There he harangued the people, and was soon proclaimed tribune, asserting his jurisdiction over the other cities of Italy under the title of dictator. But when he cited the emperor and the electors to appear before him, he grew ridiculous; his popularity soon waned, and after a few temporary successes against the nobles he was crushed, Dec. 15, and fled. In 1354, after many imprisonments and vicissitudes, Rienzi was sent as senator to Rome by Innocent VI, but he had lost his following, and while attempting to quell a riot he was killed, Oct. 8. Bulwer Lytton made him the central figure of his romance Rienzi, the Last of the Roman Tribunes, which adheres closely to the facts and was written in Rome. On this Wagner based his opera Rienzi, produced in 1842.

Riesa. German town and river port on the Elbe, in Saxony, 33 m. N.W. of Dresden. Its 15th century castle, formerly a Benedictine convent, is now the town hall. A rly. and river junction and industrial centre, with steel, textile, and marble works, breweries, and agricultural trade, Riesa was before 1919 a military centre and training ground. Pop. 24,218.

Riesengebirge (Ger., giant mts.) Mt. range of Silesia and Czechoslovakia. It is 23 m. long, separating Polish-occupied Silesia from Bohemia. It forms part of the great Sudetic system, which extends from the Oder to the Elbe. Its outlines are undulating rather than rugged, while the valleys are extremely beautiful. The geological formation of the range is a blend of granite and gneiss. Highest peaks are the Schneekoppe, 5,260 ft., and the Brunnenberg, 5,120 ft.

Cola di Rienzi,
Roman patriot

Riesi. Town of Sicily, in the prov. of Caltanissetta. It is 14 m. S. of Caltanissetta, and is noted for wine and oil. Sulphur is worked in the adjacent mines.

Rieti. Italian city, in the prov. of the same name. The ancient Reate, it stands on the river Velino, 15 m. direct and 25 m. by rly. S.E. of Terni. It has a cathedral dating from 1456, and containing a statue by Thorwaldsen, and an episcopal palace of the 13th century. It trades in fruit, wine, oil, and cattle. Reate, which was a Sabine city, received the Roman franchise in 290 B.C. It suffered from earthquake in 1785 and was sacked by the papal troops in 1799. Rieti was undamaged in the Second Great War, the Germans withdrawing before the Allied advance in June, 1944. Pop. 34,769.

Rievaulx. Village of the N. Riding of Yorkshire, England. On the Rye, its name a corruption of Rye Vale, it is 3 m. N.W. of Helmsley. It is famous for the ruins of its abbey, the oldest Cistercian house in Yorkshire, founded about 1130. These remains consist of parts of the choir and transepts of the church, the refectory, chapter house, etc. The nave was cleared in 1920; it had six chapels, and two of their altars were found to be practically perfect. See Abbey.

Rif OR **ER-RIF.** Mountainous dist. in N. Morocco, bordering upon the Mediterranean. The mountains extend for about 180 m. from the W. frontiers of Algeria to the Jebel Hassan, S.W. of Tetuan, whence a N. spur, known as the Sierra de Bullones, runs towards Ceuta and terminates in the Jebel Musa. The country, which falls within the Spanish zone, is wild and difficult of access. The Berber tribes are turbulent, and have been in constant insurrection against Spain, especially during 1920-26. The principal port of entry is Melilla. See Morocco.

Rifle. Firearm of the musket type, having a grooved barrel in which the bullet is caused to rotate during its passage. The rotation is maintained during flight and increases the accuracy of fire. The invention of rifled sporting firearms occurred about 1500, and is

generally ascribed to Kottler of Nuremberg. It was, however, only slowly adopted for military purposes. The British learnt the value of the rifle in the American War of Independence, when they were opposed by large bodies of men armed with sporting rifles, and it became necessary to subsidise corps of Continental jägers, armed with rifles, to compete against the American marksmen.

After the war, the 60th Foot, later the King's Royal Rifle Corps, were rearmed with rifles, and in 1800 a new unit, the Rifle Brigade (*q.v.*), was formed and equipped with the new weapon.

Although more accurate than the musket, the early rifle was a difficult weapon to load efficiently owing to the difficulty of devising a bullet which would fit the rifling without jamming the barrel. The first bullets were made much smaller than the bore, dropped

and flame from the breech. In 1884 the German army introduced the first magazine rifle by fitting an eight-round magazine to the Mauser. Next year the French adopted the Lebel magazine rifle, which was the first to use a smokeless charge.

In 1886 Austria adopted a Mannlicher rifle provided with a Lee box-magazine into which the cartridges were loaded from a clip, thus introducing a principle found on every modern military rifle in practically unchanged form. All these military rifles fired a short bullet of a bore between .430 and .450. In 1883 Major Rubin, of the Swiss army, introduced a small calibre rifle using a longer bullet composed of a lead core in a copper case. The British government conducted experiments with this new type of projectile, and, as a consequence, adopted the .303-in. Lee-Netford rifle in 1888, an example followed by the other powers.

The success of the small bore rifle depended not only on the lessened air resistance of the projectile, but also on the introduction of smokeless powder. Calibres have varied little since this development, and now all military rifles are between .256 and .315 inch. About 1900 the rifles of all the powers were about equal as regards type and performance, but at that time a shorter weapon was successively introduced by Switzerland, Great Britain, and the U.S.A. These are considerably handier weapons than the longer type, but not quite so accurate for slow deliberate shooting, and all modern rifles with the exception of the French Lebel are capable of being loaded from clips.

Pointed Bullets

The next development was the introduction of the pointed bullet by the Germans in 1905, followed by France and the other powers. Owing to its greatly lessened air resistance, this bullet has a much flatter trajectory, so that the range with "fixed" or "battle" sights is increased from about 500 to 700 yards, and the "danger space" is very greatly increased. Muzzle velocities have risen to a maximum of 2,450 ft. per sec., which is that of the British service rifle.

For sporting purposes, as previously mentioned, the rifle kept ahead of its military use, and many are made in much the same form as double-barrelled sporting shot-guns with bores from .280 to .600 in. Most of these fire a short bullet, and the majority employ smokeless powder, but this is not advis-

Rievaulx, Yorkshire. Ruins of the Cistercian abbey, from the south-east

down the muzzle and then hammered into the rifling when they reached the breech; this frequently resulted in a burst barrel when the charge was fired.

In 1835 W. Greener invented a new bullet of oval shape, smaller than the bore, with a hollow, flat, rear end, a tapered plug of hard metal being fitted in this hole. The explosion of the charge drove the plug into the bullet, expanding the latter in the rifling. It was not until Prussia introduced the breech-loading needle-gun in 1841 that an easily loaded rifle was evolved. This was followed by the French chassepot (*q.v.*). In 1866 the British army converted its muzzle-loading Enfield into a breech-loading rifle by the addition of the Snider breech-block. This rifle fired the Boxer metallic round, the charge being enclosed in a metal case and fitted to the case. A rim on the bottom of the case prevented the escape of gas

Rifle. Mechanism and cartridges of standard patterns. 1. Expanding bullet of Delvigne carbine. 2. Minié bullet. 3. French chassepot, showing bolt action and section of cartridge. 4. Action of Winchester repeating rifle

able in calibres in excess of .450. In addition, there is now a wide choice of magazine sporting-rifles of similar construction to the military types, with the exception of the fore-end being shorter and the finish better. Dum-dum ammunition is usually employed to give greater stopping power to the small bullet. Combination guns are also used, in which a rifled barrel is used in conjunction with one or two shot-gun barrels, and in other types special barrels provided with a short length of rifling near the muzzle, or special shallow rifling the whole length, are used for either shot or bullets. Combined rifle and smooth-bore guns are used for big-game hunting.

In order to reduce the cost of tuition the Morris tube was introduced, but this has now been almost entirely superseded by the miniature rifle, a weapon similar to the full size rifle in other respects, but firing a cartridge of .22 in. calibre with great accuracy up to 150 yards.

In firing, the rifle is gripped at the small of the butt by the right hand, the end of the first finger placed on the lowest point of the

trigger and the other fingers extended as far round the small of the butt as possible. The left hand should grip the rifle beneath the back-sight, fingers extended up the side and the rifle pulled well into the shoulder, the left elbow being vertically under the rifle. The sights used on rifles vary to a very considerable extent, but the majority of weapons are fitted with "open" sights, in which the back-sight is provided with a U or V groove, whilst the fore-sight is either a vertical leaf, a pyramid, or barleycorn.

In addition or substitution, "aperture" sights are sometimes fitted, the back-sight being a disk provided with a circular hole and the fore-sight a bead; whilst some sporting rifles have a telescopic sight, consisting of a small telescope conveniently mounted and fitted with cross wires in the field. Open sights are correctly aligned when the tip of the fore-sight is exactly level with the shoulders of the back-sight and appears exactly in the centre of the notch, whilst in the case of aperture sights the bead should be in the exact centre of the aperture. The sights, of

whatever type they may be, must then be alined on the lowest point of the object it is desired to hit, or what is known as "6 o'clock." The rifle is fired by squeezing the small of the butt with the right hand. This action will result in the trigger finger exerting a gradually increasing pressure, which will fire the rifle without disturbing the aim.

Owing to the gravitational fall of the bullet, the height of the back-sight is adjusted to allow for the fall at various distances, and the ability to judge the distance of the target from the firing point is most essential to successful shooting. Moreover, the allowance that must be made for the effect of wind on the bullet is a factor which requires much experience to estimate with accuracy. The employment of rifle fire in warfare introduces further problems, as it demands rapid and accurate fire, effectively controlled under difficult conditions. The secret of success in rifle shooting, whether for hunting, competition shooting, or warfare, lies in steady nerves, combined with physical fitness. See Bisley; Breechloader; Bullet;

Cartridge; Firearms; Gun; King's Prize; Lee-Enfield; Mauser; Musket; Propellant, etc.

Rifle Bird OR RIFLEMAN (*Phalaris paradisa*). Genus of birds of paradise. It is found in Australasia and New Guinea. It has purplish black plumage with green and bronze reflections, the throat being covered by a shield of feathers of a metallic lustre.

Rifle Brigade. Regiment of the British army. Raised in 1800 from marksmen drawn from a

Rifle Brigade badge

number of line regiments, the corps was numbered the 95th Foot and armed with rifles in place of the smooth-bore muskets then normally carried by infantry. Its original duty was scouting and covering the front of the army, making itself as inconspicuous as possible, hence its green uniform, an early instance of military camouflage. In field operations its movements were controlled by bugle, and that instrument occupies the central position on the regimental badge, as on that of all rifle regiments. At the time of his death in 1861, the Prince Consort was colonel-in-chief, in commemoration of which the regiment was granted the additional title of Prince Consort's Own.

Three additional battalions were embodied in 1805, 1855, and 1857, and the Rifle Brigade remains one of the only five line regiments to have a peace-time establishment of more than two battalions. The regiment saw its first active service in 1807, in the expedition to Monte Video, and in 1809 joined the Light Division in the Peninsula, where it won 16 battle honours, and was present at Waterloo. It served in S. Africa, 1846-47 and 1851-52; in the Crimea; the Indian Mutiny; the Ashanti expedition, 1873-74; the Afghan War, 1878-79; the Burmese campaigns of 1885-87; and at Khartoum. One battalion defended Ladysmith in the S. African War, while a second marched to its relief.

Twenty-one battalions of the Rifle Brigade were raised for service in the First Great War and earned the battle honours: Le Cateau; Neuve Chapelle; Ypres, 1915, '17; Somme, 1916, '18; Arras, 1917, '18; Messines, 1917; Cambrai, 1917, '18; Hindenburg Line; France and Flanders,

1914-1918; Macedonia, 1915-18. In the Second Great War, the regiment served in France, 1939-

Rifle Bird, an Australasian bird of paradise

40, and earned particular distinction in the defence of Calais. After Dunkirk the Rifle Brigade was converted into lorry-borne infantry and fought in armoured divisions in N. Africa, Italy, and N.W. Europe. The regimental depot is at Winchester.

Rifle Corps, KING'S ROYAL. Regiment of the British army. Raised on Christmas Day, 1755, as the 60th Foot, Royal American Regiment, it was originally recruited from naturalised Frenchmen, Swiss, Germans, and Tirolese in Pennsylvania and Maryland. From its inception the regiment had four battalions and spent its first 20 years fighting against the Indians and French in N. America. It was with Wolfe at Quebec in 1759, and at Martinique in 1762. After the American War of Independence the regiment came on to the British establishment, but continued to serve in Canada and the West Indies until 1809, when it joined Wellington's army in the Peninsula and won sixteen battle honours.

In 1824 thereg. was reorganized as a rifle unit and renamed the 60th Foot, Duke of York's Own Rifle Corps and Light Infantry. It fought in the Kaffir War of 1851-53, and during the Indian Mutiny took part in the siege and capture of Delhi. In the China War of 1860 it was at the capture of the Taku forts and the march on Peking, and in the Afghan War of 1879-80 marched with Roberts from Kabul to Kandahar. The regiment was at Tel-el-Kebir (1884) and in the S. African War shared in the defence of Ladysmith. In 1881 it received its present title.

Twenty-six battalions of the regiment were raised for service in the First Great War, and earned

the battle-honours: Mons; Marne, 1914; Ypres, 1914, '15, '17, '18; Somme, 1916, '18; Arras, 1917, '18; Messines, 1917, '18; Ephehy; Canal du Nord; Selle; and Sambre. In the Second Great War it was at the defence of Calais in 1940, and later served as lorried infantry with armoured divisions in N. Africa, Italy, and N.W. Europe. The regiment has the largest number of battle honours of any British unit. The depot is at Winchester.

Rifle Grenade. Grenade fired from a rifle by means of a discharger cup and ballistite cartridge. See Grenade.

Rifle Range. Stretch of land affording facilities for rifle practice with ball ammunition at various distances from the target. These distances are, for miniature rifles, from 25-100 yds., and, for service rifles, from 200 yds. up to 1,000 yds. or more. The targets on full-sized ranges are provided with good cover for the markers, and arrangements for raising and lowering the targets as required. There is also telephonic communication between the markers' shelter-pit and the firing-point in use, while the employment of flags reduces the risk of accident on the range to a minimum.

The butts which receive the spent bullets are massively constructed and fairly high, but recruits may send a shot singing over the butt, so that in open country a considerable area has to be kept clear while firing is going on. The roads and paths leading through the danger area are therefore patrolled, and a red flag is flown as an additional warning to wayfarers. In some cases the targets are placed against a hill-foot, or in a gravel pit, etc., thus giving complete safety to civilians behind the butts.

Indoor rifle practice and certain types of competition firing are conducted in indoor ranges under cover. Normally, miniature rifles of .22 calibre are used with miniature targets, the length of the range being 25 to 50 yds. For army indoor practice, ordinary .303 service rifles are used, but with a Morris Tube (*q.v.*) inserted in the barrel to permit the firing of .22 ammunition.

Rift Valley. Type of valley produced by the depression of a strip of the earth's crust between two parallel faults. The movement producing this type of feature is generally considered to be the result of down-dropping of the crustal strip owing to tension in the crust, as in (a); but some

King's Royal Rifle Corps badge

Riga, Latvia S.S.R. Panorama of the city from the river Daugava. Right, the university

geologists favour the idea of its being forced down while the crust on either side is thrust upward, as in (b). The overhanging portions naturally could not persist, and they would slide into the depression, giving the appearance of marginal down-faulting. Most modern rift valleys are sites of volcanic activity, the products of which cover the valley floors, and tend to mask the geological structure. The opposite of a rift is a horst.

Rift valleys are characterised by abrupt straight margins, which are fault scarps. With the exception of the Red Sea, they are usually from 20 to 45 m. wide. In Europe the Rhine valley is an example of a rift formed by tension. Rift valleys are important

Rift Valley. Diagram illustrating causes of rift formation: a, valley formed by down-faulting due to tension; b, valley formed by thrusting of sides over central strip; c, the same, after landsliding has occurred

features in E. Africa, where they include the valleys of Lakes Nyasa, Tanganyika, Albert, and Rudolf, and continue N. to the Red Sea, the Dead Sea, and Jordan valley. See Fault; Horst; Mountain; consult also Rift Valleys and Geology of E. Africa, J. W. Gregory, 1921; E. African Plateaus and Rift Valleys, B. Willis, Carnegie Inst. Washington, Pub. 470, 1936.

Riga. Capital of Latvia S.S.R. A Baltic seaport, on the river Daugava (Ger., *Duna*; Russian, *Dvina*), it is the third largest city on that sea, after Leningrad and

Stockholm. Its 1939 pop. was 393,211. In 1913 it was 517,500, but in 1920 had dropped to 120,000. The name is derived from an old Balt root meaning tortuous. Riga grew out of a trading centre and marketing village on the Viking trade route from Scandinavia to the Byzantine empire. Albert I, bishop of Livonia, established here his see in 1201. The town joined the Hanseatic League in 1282. It has been the victim and coveted prize in many wars since the conquest of Latvia by the Teutonic Knights in the 13th century. As capital of Livonia it was taken by Poles in 1582, Swedes in 1621, and Peter the Great in 1710.

In the First Great War Hindenburg from June, 1915, to Sept., 1917, tried unsuccessfully to take Riga, which was defended by Lettish rifle brigades of the Russian army. Here on Nov. 18, 1918, the independence of Latvia was proclaimed. Next year the new state met assaults from Bolsheviks on the E. and Germans on the W.; the former were in possession from Jan., but driven out in May by the Germans, whom the Allies ordered to quit in Nov. After 20 years of prosperity, Russian tanks entered Riga on June 17, 1940, and the government was replaced by Communist authorities, which were unable to hold the city against the Germans in July, 1941. Before this attack Riga had suffered both from German bombing aircraft and by the mass arrest on June 13-14 and deportation of thousands of citizens by the Soviet administration. Nazi occupation ended on Oct. 13, 1944, when troops of the 2nd and 3rd Baltic armies regained Riga.

During 1920-40 Riga was the seat of a university with eleven faculties, an academy of arts, conservatoire, opera, and research institutes. Its harbour received

vessels from N. and E. Europe; it was connected by rly. and air with Moscow, Berlin, and Warsaw. Besides the local produce and manufactures, Russian timber was exported; the imports were mostly machinery. Manufactures included rolling stock, radio sets, chemicals, dyes, textiles, paper, building materials, and foodstuffs.

Riga, GULF OF. Large shallow opening of the Baltic Sea. It is 90 m. long and 60 m. broad, and its chief affluent is the Daugava or Dvina. The N. shore is Estonian territory and the remainder Latvian. Outside the entrance lie the islands of Dagó and Oesel. Naval actions between Russians and Germans in the First Great War were fought here, Oct. 12-21, 1917. See Dagó; Oesel.

Riga, TREATY OF. Agreement signed between Russia and Poland on March 18, 1921, the negotiations having been transferred to Riga from Minsk. Each party recognized the other's sovereignty and agreed to refrain from propaganda and from harbouring organizations directed against the other. Art collections, libraries, and industrial installations removed by the Russians during the First Great War were to be restored to Poland; and Russia was to pay 30,000,000 roubles in gold as Poland's share of the assets in the former tsarist empire. Poland received territory amounting to about 44,000 sq. m., and her new eastern frontier roughly corresponded to that left after the second partition of Poland, 1793. See Poland and map.

Rigadoon OR RIGA UDON. French dance. A somewhat lively but complicated dance, traditionally said to have been invented by a dancing master of Marseilles

named Rigaud. Early in the 18th century it was danced in England to the tune of "Oh, Chloe, when I

prove my passion." It retained its place as a favourite dance in Paris until the Revolution, and is still performed at French village festivals. The music was in either triple or quadruple time. Grieg's Holberg suite ends with a rigaudon.

Rigaud, HYACINTHE (1659-1743). French painter. Born at Perpignan, he studied at Montpellier, and at the Academy, Paris. In 1687 he was admitted to the Academy as a portraitist, but did not qualify as an historical painter until 1700. In 1702 he became assistant professor, in 1710 professor, and in 1733 rector. He was created a nobleman of Perpignan in 1709, and died in Paris. Rigaud's principal achievement was in portraiture. Louis XIV, Philip V of Spain, Charles XII of Sweden, Augustus II and Augustus III of Poland were among his sitters, while he also portrayed many eminent artists and litterateurs of his time. See Bossuet; Fleury; Philip V of Spain.

Hyacinthe Rigaud, French painter

Rigby, SIR HUGH (1870-1944). British doctor. Born in Dublin, he was educated at Dulwich and London university, receiving his medical training at the London hospital. There he became house surgeon and house physician; surgical registrar; and finally assistant, full, and consulting surgeon. During the First Great War he was consulting surgeon to the B.E.F. in France, becoming surgeon-in-ordinary to the prince of Wales during 1923-36, and acting as serjeant-surgeon to George V during 1928-32. When the king was dangerously ill in 1928 Rigby performed the operation which saved his life. Knighted in 1918, he was created a baronet in 1929. He died July 17, 1944.

Rigby, RICHARD (1722-88). British politician, son of Richard Rigby, of Mistley Hall, Essex. His father's wealth enabled him to secure a seat in the house of commons in 1745. He soon became one of the followers of the duke of Bedford, the group being known as the Bloomsbury gang, and under its chief held political positions in Ireland. During 1768-

84 he was paymaster-general, accumulating great wealth while holding that office. Rigby died at Bath, April 8, 1788. Rigby in Disraeli's *Coningsby* is thought to be a pen portrait of J. W. Croker.

Rigel. Second star in the constellation of Orion, Beta Orionis. Its name means the foot. It is a first magnitude star, seventh in brightness in the heavens, and distinguished by its steel blue colour. The star is a spectroscopic binary, and it has been calculated to have a brightness equal to 8,000 suns. See Constellation.

Rigging. All the ropes and chains on a ship used to support or operate the masts, sails, etc. Standing rigging comprises the shrouds and stays which support the masts. Once fixed they are subject only to adjustment or renewal; they are made of wire or hemp. Wire ropes are painted or galvanised, hemp ropes are tarred, and, in both cases, they are wrapped with tarred or painted canvas and also wrapped more closely with marline or spun yarn.

Running rigging includes all the movable ropes or chains which are used in operating the upper masts, yards, sails, etc. The chief of these ropes, which are usually made of Manila hemp, are the braces by which the yards are controlled, and the halyards by which yards or sails are hoisted. The term rigging is applied to the whole system of cordage, masts, and sails of the ship; and also for the shrouds.

In its widest sense the rigging determines the character of a sailing ship. The earlier vessels were square rigged, with their sails arranged across the centre-line of the ship. Fastest vessels of this type were the clippers in the tea trade. See Ship; Tackle; Yachting.

Right. In political speech, the party or section of a party holding conservative views as opposed to the more radical ones of the left. Its use in this sense arose in France during the Revolution. When the national assembly formed itself at Versailles in 1789, the moderate men, quite by accident, found seats on the right of the hall, and the extremists on the left. This arrangement persisted and became part of the political system of France, so much so that the words right and left became synonyms for conservative and radical opinions respectively, and are so used in most democratic countries today. See Left; Politics.

Right Ascension. In astronomy, one of the two coordinates used to define the position of a

star in the sky. On the celestial sphere right ascension has the same significance as longitude has on earth. It is the angular distance between the star's hour circle and the hour circle which passes through the vernal equinox. It is conventionally measured E. from the equinox, sometimes in degrees, minutes, and seconds of arc, but more usually in hours, minutes, and seconds of time, an hour being equal to 15 degrees. The declination of a star together with its right ascension fixes its position. See Declination.

Right Honourable. This title is explained under Honourable.

Right of Way. In English law, a form of easement involving private right to pass over land in the possession of others. By the Prescription Act, 1832, it is enacted that uninterrupted enjoyment of a right of way for 40 years is an indefeasible right, on condition that it is proved by user down to the time of the commencement of the action, unless the consent in writing of the owner has been obtained to the enjoyment of the right. By the same Act "no claim by custom, prescription, or grant, to any way or other easement . . . which has been enjoyed twenty years without interruption shall be defeated by showing the commencement of the right within the time of legal memory."

A private right of way across a particular piece of land may be claimed by immemorial usage, or be granted to an individual by special permission. If an owner grant a piece of land in the middle of his field the grantee has the implicit right to cross the grantor's land without thereby committing trespass. This is called a way of necessity. Strictly speaking, a right of way means a private way, but in popular use the term is sometimes extended to include, for example, the right of the public to use a particular pathway through land in private ownership.

When a way of this kind has been enjoyed by the public without interruption for 20 years the way is a highway unless it is proved that there was no intention to dedicate it as a highway, or that there was at no time anyone in possession capable of dedicating it. If the way has been used for 40 years it is a highway unless the first alternative can be proved. In order to prove there was no intention to dedicate, the owner may put up a notice stating there is no such intention and may deposit with the local council a map of

the land showing what ways he admits are dedicated (Rights of Way Act, 1932). The National Parks Act, 1949, required co. councils to survey and map existing rights of way within three years, and empowered local councils to create rights of way by agreement or compulsion.

Rights. In political philosophy, privileges belonging to the members of a state or community. Of the various kinds of rights may be mentioned natural, civil, political, and religious. The origin, nature, and extent of these rights occupies a large place in the writings of political philosophers, such as Hobbes and Rousseau. In English history, the measure arranging the settlement of 1688 is known as the Bill of Rights. It was preceded by the Declaration of Rights. The term has been used also for other documents embodying the political ideas of a nation. A U.N. commission, set up in 1946 under the chairmanship of Mrs. Eleanor Roosevelt, adopted in June, 1948, a Declaration of Human Rights (with 28 articles), later to be referred to the General Assembly. See Bill of Rights; Rousseau; State.

Rights of Man, THE. Exposition of democratic doctrine by Thomas Paine (*q.v.*). The first part was published in London in 1791, and the second part in 1792. The author was tried before Lord Kenyon at the king's bench for issuing "a false, scandalous, malicious, and seditious libel," and although ably defended by Erskine, was found guilty, but fled to France, where the book had prepared him a warm welcome. Written as a reply to Burke's Reflections on the French Revolution, it is a vigorous defence of the principles which inspired that movement, had an enormous circulation, and was widely accepted among the less educated classes as a text-book of democracy, although its blatancy renders it greatly inferior to the contemporary and more scholarly work of William Godwin.

Rights of Man and of the Citizen, DECLARATION OF THE. French Revolutionary decree issued by the Assembly and forced on the acceptance of Louis XVI, Oct. 5, 1789. Founded on principles of political and social liberty, and pre-

known. They are characterised by the very large head and the absence of the back fin. The mouth is arched and contains long plates of whalebone. Of this group, the Greenland whale is not known with any certainty to have occurred

Rigi, Switzerland. View showing the peak of the mountain, 5,906 ft. high

scribing the relations of individuals to the law and constitution, the declaration embodied the spirit of the Revolution and finally abolished feudalism and the old social conditions. As the charter of the people's liberty, it has been the basis of almost all subsequent European constitutions. The chief articles declare that all men are born and remain equal in rights; that social distinctions can be tolerated only as far as they are for the public good; that every citizen has a right to participate personally or by his representative in the making of laws; that public burdens should be borne by the whole community in proportion to individual abilities; that none should be imprisoned except according to law, and that freedom of religion, of speech, and of the press are fundamental rights of the citizen. See French Revolution.

Right Whale (*Balaena*). Genus of whales, of which the Greenland whale *B. mysticetus* is the best

known. They are characterised by the very large head and the absence of the back fin. The mouth is arched and contains long plates of whalebone. Of this group, the Greenland whale is not known with any certainty to have occurred

in the British seas; but the Southern right whale was formerly common in the North Sea. See Whale. **Rigi.** Mountain mass of central Switzerland. It rises between the lakes of Lucerne, Zug, and Lowerz, and is mostly in the canton of Schwyz. It is 35 m. in circuit and has an alt. of 5,906 ft. Abrupt to the N., it slopes, with broad terraces, to the S., affording fine pasturage, while, lower down, fig and almond trees flourish. It is ascended by two mountain rlys., one from Vitznau on Lake Lucerne, and another from Goldau (*q.v.*); there are foot and bridle paths from these places. The summit of Rigi commands a magnificent panorama, embracing the 125 m. range of the snow-clad Alps, the Jura, the Vosges, the Black Forest, and parts of Württemberg and Bavaria. See Alps; Pilatus.

Rigidity (Lat. *rigidus*, stiff). Property of a body by which it resists change of form, the opposite of flexibility. It clearly distinguishes solids from fluids, for while the latter have rigidity in reference to volume, *i.e.* they resist increase or diminution of volume, they have none in regard to form. Nevertheless, a fluid in a state of rapid motion may acquire an apparent or temporary rigidity, as experienced with a jet of water issuing at high pressure from the nozzle of a fire hydrant. While all solids have some rigidity there is no known material which completely resists a change of form under stress. This deformation is

Right Whale. The Greenland whale, one of the largest sea mammals, spouting

proportional to the stress, while the ratio between the stress and the deformation is called the modulus of rigidity. In this type of elasticity there is no change in volume of the specimen. *See* Matter; Materials, Strength of.

Rigoletto. Opera in three acts by Verdi. The libretto by Piave was based on Hugo's *Le Roi s'Amuse*. It shows signs of the influence of Meyerbeer's *Robert the Devil*, and is one of the favourite works in the operatic repertory. It is generally accounted one of Verdi's masterpieces, and is notable for the aria *Caro Nome* (sung by the heroine Gilda) and the tenor aria *La Donna è Mobile*. *Rigoletto* was first performed at Venice, March 11, 1851, and at Covent Garden in 1853.

Rigor (Lat.). Severe fit of shivering occurring at the commencement or during the course of certain diseases, e.g. pneumonia, typhoid fever, and various forms of blood poisoning. It is due to toxic disturbance of the heat-centre of the brain.

Rigor Mortis. Stiffening of the muscles which occurs after death. It commences usually in the neck, jaw, and face, in about six hours, and is present over the whole body in from 12 to 18 hours. It passes off in the same order, and has generally disappeared in 36 hours after death. Exceptionally, it may come on very quickly after death, or may be delayed for several days. The limbs stiffen in the attitude in which they were at death. The contraction can be overcome by forcibly bending the joint, and when overcome it does not recur.

Before the onset of rigor mortis, the reaction of the muscles is alkaline, but during the period of rigidity it is acid, owing to the formation of sarcolactic acid. After the rigidity has passed off, the reaction is again alkaline. The onset of rigor mortis is hastened by exhaustion of the muscles before death, as in hunted animals, or soldiers killed at the end of a long march, and also by the exhaustion of a lingering illness; it is delayed where the muscular tone was good before death, and in persons in sound health who die suddenly.

The rigidity also occurs more quickly in young children and old people than in adults and the middle-aged. A warm temperature hastens the onset of rigor mortis, and a cold temperature delays it. Because of these numerous and varying factors an opinion as to the time of probable death is difficult to give accurately. Instantaneous

rigidity or cadaveric spasm is a condition which sometimes immediately follows death, and in which the muscles are firmly contracted in the attitude they were in at the moment of death. It is seen in cases where death was preceded by great nervous tension or excitement. Soldiers killed in battle have been found still holding their weapons, and a pistol or razor may be held in the hand of a suicide. *See* Death; Drowning.

Rigsdag. Scandinavian word for a national legislature, the equivalent of diet and the German Reichstag. The Danish rigsdag consists of two houses, the landsting or senate, and the elected folketing. *See* Denmark.

Rig-Veda (Sanskrit, praiselore). Name of the oldest section of the Vedas (*q.v.*). It is a collection of 1,017 hymns addressed to Indra, Agni, Varuna, Soma, the Maruts, and other nature gods. The compilation probably dates from about 1000 B.C., but the hymns themselves, to which many authors' names are traditionally appended, may be from 1,000 to 500 years older, and are the oldest literature in any Indo-European language. More than 10,000 verses in all, in a great variety of metres, they were composed in archaic Sanskrit, and handed down by word of mouth for many generations. Most of the hymns were uttered by professional priestly reciters on the occasion of sacrifices.

Some of the hymns appear to have been composed by the Aryans before they descended into the North Indian plain. Most, however, belong to the Punjab. Taken as a whole, they throw much light on the social life and ideas of the primitive Aryan communities, which were passing from the pastoral to the agricultural stage of culture. The father of each family was its priest. Women enjoyed a position of freedom and honour unknown later. The hymns are almost devoid of references to caste, and combine much puerility with occasionally sublime poetic imagination. They represent a stage in religious development, nowhere else so clearly seen, in which natural powers and phenomena are worshipped as persons, but no theology or mythological system has yet arisen, though the germs of later monotheism and pantheism are present. The Upanishads interpret the Rig-Veda in terms of philosophic mysticism. *See* Indra; Sanskrit; Vedas.

Rijeka. Yugoslav name for the city better known as Fiume (*q.v.*).

Riley, JAMES WHITCOMB (1853–1916). American poet. Born at Greenfield, Ind., Oct. 7, 1853, the son of a lawyer, he was by turns sign-painter and playwright before, in 1873, he began newspaper work in Indianapolis, contributing verse to

The Indianapolis Journal, and becoming known as "the Hoosier poet." His muse is genial, sympathetic, humorous, reflecting simple homely scenes and the charm of country life, notable examples being *An Old Sweetheart of Mine*, *When the Frost is on the Punkin*, *The Old Swimmin' Hole*, *Green Fields and Running Brooks*, *Thoughts for the Discouraged Farmer*, and *Poems Here at Home*. His songs for children achieved popularity. He died July 23, 1916.

Riley, WILLIAM (b. 1866). British novelist. Son of a Yorkshire cloth merchant, he was born April 23, 1866, and educated at Bradford grammar school. He helped to inaugurate the business of optical lantern slide makers which was carried on in England and the U.S.A. by Riley Bros., and was managing director. The success of his first novel *Windyridge*, in 1912, led to a long series of other novels — mainly unpretentious, sentimental pictures of Yorkshire life. The *Windyridge* of the first book was based on Hawkesworth, near Guiseley, Yorks, and the book consisted of Crawford-like sketches of some of its inhabitants.

Rilke, RAINER MARIA (1875–1926). Writer of German poetry. Born in Prague, Dec. 4, 1875, he was intended by his father to become an army officer, but left the cadet school at 15. After a lonely and unhappy childhood he resolved to make literature his profession. He studied at Munich and Berlin, and paid two visits to Russia during 1899–1900. In 1901 he married the sculptress Clara Westhoff, and went to Paris, where for a time he acted as Rodin's secretary. He lived in Switzerland from 1919, and died near Montreux, Dec. 29, 1926.

Rilke had a lofty conception of the poet's function. He expressed his relationship with humanity in his *Stunden-Buch* (*Book of Hours*), 1908. Influenced by the Danish novelist Jacobsen, and particularly by Rodin, his *Buch der*

Bilder, 1903, revealed his strivings after objectivity and realism. The Note-book of Malte Laurids Brigge, completed in 1910, related in prose the obscure terrors of his childhood, and his experiences in Paris, which were expressed through an imaginary character. Later work, e.g. Duino Elegies (the first two of which were composed at Schloss Duino in 1912) and the 55 Sonnets to Orpheus, described in exquisite language the intangible world of man's vision, and the significance of hidden relationships. *Consult* Selected Poems, trs. J. B. Leishman, 1941; Letters, trs. and ed. by R. F. C. Hull, 1948.

Rima. Character, half human, half goddess of wild nature, introduced by W. H. Hudson into Green Mansions, a fantasy with a S. American forest setting. A bas-relief, depicting Rima, by Jacob Epstein, formed part of a bird sanctuary in Hyde Park, London, designed as a memorial to Hudson. Rima, carved in Portland stone, was depicted as a bird-like woman with outstretched arms. It was unveiled by Stanley Baldwin, May 19, 1925, and aroused violent controversy, being more than once tarred and feathered.

Rima. Bas-relief by Jacob Epstein, part of a bird sanctuary in Hyde Park, London, designed as a memorial to W. H. Hudson

Rimavská Sobota. Town of Czecho-Slovakia; formerly in Hungary. A rly. and road junction some 18 m. N.E. of Lesoncz, it is in the valley of the Rima, one of the small streams which flow from the Tatra Mts. Most of the inhabitants are Magyars, nearly half are Roman Catholics, the rest being almost equally divided between Calvinists and Lutherans. Pop. est. 7,000.

Rimbaud, JEAN NICHOLAS ARTHUR (1854-91). French poet.

Born at Charleville, Ardennes, Oct. 20, 1854, he went in 1871 to Paris, where he became friendly with Verlaine (*q.v.*). His possessiveness, which destroyed the latter's marriage, came to an end in 1873 with Verlaine's attempt to murder Rimbaud, who, after touring Europe with a circus troupe, went as a trader to Harar, Abyssinia, until illness forced him to return to Europe. He died at Marseilles, Nov. 10, 1891.

The majority of Rimbaud's poems were written before he was 20. The only work he published on his own initiative was a prose volume, *Une Saison en Enfer*, 1873. The eccentric power of such masterpieces as *Le Bateau Ivre*, written at 16, and the famous sonnet on the vowels greatly influenced the French symbolist movement, of which he became the acknowledged master. *Les Illuminations*, 1886, was published by Verlaine in the belief that Rimbaud was dead. His collected poems appeared in 1895. *Consult* Life, 1947, Rimbaud in Abyssinia, 1937, both E. Starkie; Rimbaud: the Myth of Childhood, W. Fowlie, 1946.

Rime. Accumulation of roughish, white crystals of ice, which may be found on trees, etc., when frost and wet fog occur together. The minute drops of supercooled water present in the fog freeze on coming into contact with solid objects, sometimes forming deposits which grow out to windward. A harder variety which consists of masses of ice on the vertical surfaces is associated with drizzle at temperatures below freezing point. In the U.K. rime is less frequent than hoar frost, which it resembles. *See* Frost.

Rime Royal. Stanza of seven decasyllabic lines, rhymed *abbacc*. It was established in England by Chaucer in his *Troilus* and largely used in the 15th and 16th centuries, notably by Thomas Sack-

ville, earl of Dorset, 1536-1608. The name is said to originate in the use of the form in The King's Quhair. In the 16th century the rime royal was revived with success by William Morris.

Rimini. City of Italy, in the prov. of Forlì. The ancient Ariminum, it stands on the river Marecchia, near its mouth in the

Rimini, Italy. Unfinished facade of the church of S. Francis, seriously damaged during the Second Great War

Adriatic Sea, 69 m. by rly. S.E. of Bologna. Successively Umbrian and Etruscan, the city fell to the Romans in 268 B.C. It has a triumphal arch to Augustus, badly damaged in the Second Great War, Roman bridge over the Marecchia, and ruins of an amphitheatre. A bishopric as long ago as 260, its cathedral was founded in the 13th century, rebuilt in the 15th, and severely damaged by air-raids in 1943. A monument indicates the spot where Caesar addressed his troops after crossing the Rubicon. The Palazzo Ruffo was the scene of the assassination of Francesca da Rimini in 1285. The library dates from 1617. Rimini has iron-works, silk mills, and mineral springs, while a trade is carried on in silk and sulphur. The fisheries are extensive.

The importance of Rimini under the Romans was chiefly due to its being the terminus of the Flaminian and Aemilian Ways. After a very chequered history it was held by the Malatestas from the 13th to the 16th century, when it was ceded to Venice. On the shore is a popular sea-bathing place. Pop. est. 60,000.

In the Second Great War, Rimini was the E. bastion of the German defence system known as the Gothic Line (*q.v.*), and about Rimini in Sept., 1944, the Allies encountered fierce resistance. R.N. destroyers bombarded transports and troop concentrations in the area in the first days of the month, and the Allied 8th army, com-

manded by Sir Oliver Leese, pushed forward from Pesaro, securing in bitter hand-to-hand fighting a large part of the Coriano-Sansovino ridge guarding the S. approaches to Rimini by the 13th. It was the 19th before Greek troops secured Rimini airfield, and the 21st before Rimini itself fell, much later than had been anticipated by

sakov in 1871 became professor of composition at St. Petersburg conservatoire. As conductor of Russian symphony concerts, 1886-1900, he gained a European reputation. He died June 21, 1908.

Both in his orchestral and operatic works Rimsky-Korsakov belongs to the nationalist school of Russian composers. In descrip-

Rinderpest is a common disease in South Africa, where, during one great visitation, nearly 80 p.c. of all cattle were destroyed.

The disease arises from a specific contagion, and it is believed that the infection enters the body of the animal through the mouth or nostrils, and thence spreads to all the organs. It is a fever, with very high temperature. The pulse quickens, the coat stares, the nose becomes dry, the whites of the eyes turn scarlet, appetite fails, and the animal is seized with shivering fits. Profuse diarrhoea usually follows, and as a rule inflammation of the lungs.

The infection may be spread by hay or straw, or by any form of litter, by hides, fleeces, or flesh. It

the Allied command, to Greek infantry supported by New Zealand armour.

The capture of Rimini turned the Gothic line in the E., but too late for the Allies to take full advantage of the victory: torrential rains set in, putting an end to major operations until the next spring, and the confident Allied expectation that the Germans could be driven out of Italy by the end of 1944 thus became impossible of fulfilment.

Rimmon Syrian deity worshipped at Damascus. His temple, the house of Rimmon (2 Kings 5, v. 18), probably containing the altar which Ahaz reproduced at Jerusalem (2 Kings 16), probably lies beneath the Great Mosque. Alternatively called Hadad, he is identifiable with the Babylonian thunder-god Ramman and with the corresponding Assyrian Adad.

Rimouski. Town of Quebec, Canada. The point where mail steamers take on a St. Lawrence pilot, it is 180 m. E. of Quebec on the C.N.R. The seat of an agricultural college, it has saw mills, peat mining, and a cod liver oil refining plant. A third of the populace lost their homes in a fire, May, 1950. Pop. 7,009.

Rimsky-Korsakov, NICHOLAS ANDREVICH (1844-1908). Russian composer. Born at Tikhvin, Novgorod, March 18, 1844, he began his musical education at 6 and soon was making attempts at composition. He entered the naval college at St. Petersburg in 1856. Friendship with Balakirev and his associates in the 1860s was a great influence in his career. During a cruise, 1862-65, he composed his first symphony, which Balakirev conducted. Retiring to devote himself to music, Rimsky-Kor-

Rimini. An air view of the sea front and bathing beach at this Adriatic port. Top, bridge across the Marecchia built by the Emperor Augustus: it was shaken by blast during the Second Great War

tive power his music ranks high, though lacking the depth of feeling and creative power of the greatest composers, and the brilliant scoring and melodic invention of his work made it popular. His chief operas are *The Snow Maiden*, 1880; *Tsar Saltana*, 1900; *Le Coq d'Or*, 1910. In orchestral composition he showed a preference for programme pieces, e.g. *Antar*, and the symphonic suite *Shéhérazade*. His autobiography was translated into English as *History of My Musical Life; consult also Life by Stassov*, 1890; and *History of Russian Music*, M. Nathan, 1915.

Rinderpest (Ger., cattle plague). Highly contagious and fatal disease of cattle and other ruminating animals. It is indigenous in India, China, Russia, Tibet, and other parts of Asia, but has not been found in the U.K. since 1877. A serious outbreak occurred there in 1865, when the damage to agriculture was estimated at £5,000,000 from the loss of cattle alone.

may even be carried by the air, but the range of infection by air is not great. Infected bodies buried in the ground remain virulent for months, and even freezing does not destroy the activity of the germ. There is no cure known, but in places where it is common animals which recover become immune. Where it is rare, the disease is almost invariably fatal in from four to seven days. Arsenical preparations have been tried as a remedy, and immunisation by a vaccine has been attempted. See Cattle.

Ring (A.S. *hring*, circle). Circular band, usually of metal, worn on the hand. Great importance has always been attached to rings, which have been in use since remote times. Signet-rings are among the most ancient, bearing carved or incised symbols peculiar to the owner, which gave an impression in wax or clay equivalent to a signature. It is of this type that we read in the Bible and ancient chronicles, as being used as tokens

Ring. Examples of finger-rings. 1. Etruscan; gold hoop with oval engraved stone. 2. Roman; gold octagonal hoop and garnet with intaglio. 3. Merovingian; gold set with garnets. 4. Scottish, 16th century; gold dated 1566 and engraved with the initials MH for Mary Queen of Scots and Henry Darnley, to whom it belonged. 5. French, 13th century; gold episcopal ring, with uncut sapphire. 6. English; gimmel ring set with jewels. This was the wedding-ring of Sir T. Gresham. 7. Italian, 16th century; gold set with jewels. 8. Anglo-Saxon; gold, probably an episcopal ring of Alhstan, bishop of Sherborne. 9. English, 18th century; gold signet engraved with coat of arms

2-5 and 7-9, by courtesy of the Director, Victoria & Albert Museum, S. Kensington

of authority. The Egyptians, who possessed independent seals, also wore signet-rings, many of which had pivoted bezels, one side engraved with the hieroglyphic cartouche or signature, the other carved into the shape of the sacred scarab beetle, or other religious symbol. Some of these were adorned with coloured enamels, coloured glass, or precious stones. Another practical form of this article was the bow-ring, worn on the thumb with a sloping part to protect the ball of the thumb from the rebound of the bow string.

Early types of rings were made in the shape of three part circles, the ends fitting into the bezel, or with small end rings to hold the pivoted bezel. Others are plain bands, flat or rounded. In the more elaborated types we have the hoops of varied styles attached to the flattened front part, the bezel or chaton, also called a collect when encircling a cameo or a precious stone. Twin (gimmel) rings, consisting of two circlets interlocked, as well as trick rings consisting of two, three, or more separate circlets which joined up when placed on the finger, but fell apart when taken off, are found among ancient jewelry.

Use in Classic Times

In early days Greeks made little use of rings. In republican Rome rings were plain; the equestrian order wore them made of iron, but these later became tokens of the servile state. Under the emperors great extravagance was displayed in the matter of rings, both men and women wearing superb specimens enriched with carving, chasing, enamelling, cameos, intaglios, and precious stones. Some of the most beautiful were hollow, to contain poison, either for an enemy or

for self-destruction. Such rings persisted until the 18th century. Charm rings were in use among the Romans, as they had been with the Egyptians, and later with the Coptic and other Gnostics. In medieval times and long after, charm and magic rings were in high esteem, bearing mystic inscriptions and symbols. The precious stones themselves were deemed to be charms, each having a special attribute as a preservative against poisoning, the evil eye, casting of spells, and so on.

Betrothal and Marriage Rings

In ancient Rome a ring was given as a pledge of betrothal, and though this custom seems to have been the origin of the modern wedding-ring, it may still be traced in the common practice of giving a gem-ring when a marriage engagement is agreed upon. Another form of betrothal ring, common in Elizabethan and Stuart times, was the posy or posy ring, the name being derived from the rhyming inscription cut upon it. Similar appeals for faithful love were once conveyed by rings given on the occasion of marriage.

Marriage rings were adopted by the Church from the pagan custom of placing a ring on the bride's finger, no doubt originally as a symbol of possession. Wedding-rings have nearly always retained the plain circle form of the old iron hoops. But it was otherwise with the Jews. Their marriage rings are heavy, elaborately carved, broad bands with inscriptions, and frequently possessing projecting bezels in the shape of miniature tabernacles. Certain of the ecclesiastical rings of office, bestowed on bishops, mitred abbots, cardinals, and popes, have this peculiarity of enormously projecting bezels.

Many of them are of such dimensions that they can have been used only on ceremonial occasions over gloves.

In the papal rings broad hoops support heavy projecting bezels, the shoulders and side adorned with sacred figures, symbols and heraldic shields, in the top a table or cabochon cut gem, the flat ones occasionally incised. The gems were usually sapphires, the token of purity, though rubies (fiery glory), emeralds (tranquillity), and crystal (simplicity) are also seen. This symbolism of the above value of stones has come down to us in the natal stones, a special gem being assigned to each month, and alphabet rings, one stone or a variety being chosen to give the initial letter, or even to spell a name in full. A ring, the "marriage ring of England," is used in the coronation ceremony, and formerly contained a fine sapphire, said to have belonged to Edward the Confessor. The Doges of Venice wore rings of office, and these they cast into the Adriatic on Ascension Day of each year as a token of the marriage of the Republic to the Sea. (See Bucentaur.)

Devotional and Memorial

Devotional rings include those known as decade rings, the hoops adorned with ten knobs, for ten Aves, the bezel serving for the Paternoster. Others have hinged bezels, the gem stone concealing a sacred miniature, symbol, or inscription. Similar rings of secular nature have portraits or mottoes; among these may be classed the memorial rings for lost causes, the Stuart or Bourbon rings. Allied to these are the mourning rings; some having hair of the deceased daintily plaited or formed into conventional designs, placed under crystals or white sapphires; others are enamelled black, and bear portraits, appropriate emblems, or inscriptions. Attachments to rings are not uncommon. Some Roman rings had small keys projecting from the hoop flat against the finger: probably keys of treasure chests. In later times we see gems, miniature reliquaries, or charms,

pendant on chains from rings. Rings have been worn on all the digits, including the thumb, which was much favoured among Asiatics and in Europe, especially in the 15th and 16th centuries. Ecclesiastical rings were early worn on the first finger of the right hand, then on the third of the left, the marriage finger, because it is supposed to communicate direct to the heart by an artery. The little finger of the right hand was chosen for the signet ring. The British museum contains a fine collection of rings.

In occult and magical ceremonies, the use of the ring is of very ancient date and its origin is

Ring Money. Examples of this ancient metallic currency, found in Ireland

obscure. There is a suggestion that it was an emblem of the sun, but more probably it represented the idea of binding or constriction. The necromancer stood within a ring drawn on the ground during his incantation, with the idea that he was thus enclosed against the assaults of evil spirits, who were unable to cross the boundary of the ring. Many of the earliest temples and meeting-places were built in the form of a circle. See Circle; Jewelry; Memento Mori; Nose-ornament; Precious Stones; Symbolism.

Bibliography. Antique Rings and Gems, C. W. King, 1872; Finger Ring Lore, W. Jones, 1877; Rings for the Finger, G. F. King, 1917.

Ring and the Book, THE. Blank verse poem by Robert Browning, first published in 1868-69 in four volumes. The subject is that of a 17th century murder trial, as the result of which Count Guido Franceschini and four accomplices were executed in Rome, in 1698, for the murder of the child-wife of the count and of her putative parents. Having picked up in Florence an old volume in which the record of the trial was presented, the poet determined on the form of his work,

which in its successive books gives the case from different points of view, with extraordinary psychological insight.

Ring Bolt. Bolt with a hole through the head through which a loose ring is passed. Ring bolts are largely used for embedding in masonry or bolting into timber wharves and similar structures for mooring boats.

Ringbone. Disease of horses, a cause of lameness. It results from inflammation of the periosteal covering of the bone below the fetlock. It is usually set up by a blow, a kick, or some similar accidental cause. The seat of the disease is usually the short pastern bone

Ring Dove. The common wood pigeon, with white patch on neck largest member of the tribe in Great Britain, it is so named from the patch of white on either side of the neck, and occurs throughout the country and is common in the London parks and squares. It is a voracious eater, and a serious pest to the farmer. See Pigeon.

Ringkjøbing OR SLAVNING FJORD. Large lagoon in W. Jutland, Denmark. It is 28 m. long and has a width of 9 m. At its head is the little town of Ringkjøbing, with a pop. of some 3,000.

Ring Main. In electricity, a cable arranged in the form of a ring or loop as distinct from a

Ring Main. Diagram illustrating a method of current transmission, to several points, in electricity. a. Source of electricity. b. Ring main. c. Points of use

single open-ended length of cable. Such an arrangement permits the use of a conductor of smaller cross-sectional area to supply electricity to a number of points, as the electric current to reach its destination can traverse two paths which are virtually in parallel.

Ring Money. Primitive form of metallic currency used in ancient Egypt, Gaul, Ireland, Norway, etc., and still used in some parts of Africa. It arose from and is often indistinguishable from golden articles of adornment worn by barbaric peoples. Probably it came into use among savage people as a result of the custom of wearing all their wealth in the form of ornaments. In Egypt, ring money circulated by weight, and much of the ring money later used in Africa was of Birmingham manufacture. Many examples of ring money have been found in the British Isles. See Coinage; Numismatics; consult Origin of Metallic Currency, W. Ridgeway, 1892.

Ringnes. Two islands in the Arctic Ocean, British N. America. They are situated between Axel Heiberg Land and Melville Island. The E. island is called Amund Ringnes, while that to the W. is Ellef Ringnes.

Ring of the Nibelung, THE. Sequence of four music dramas by Wagner. The plays were written in the inverse order of their natural sequence. Wagner's orig-

inal idea was to write one drama called Siegfried's Death, founded on an episode from the legendary German epic, the Nibelungenlied. He found that the story demanded so much explanation that he would have to write another opera as prelude to it, and that led to others. Begun in 1848, the poem was finished in 1852. The tetralogy comprises: Das Rheingold, first performed at Munich, Sept. 22, 1869; Die Walküre, Munich, June 25, 1870; Siegfried and Götterdämmerung, the concluding dramas, produced at Baireuth, Aug. 16-17, 1876, on the occasion of the opening of the festival theatre, when the whole cycle was first performed. Apart from certain lingering conventions, The Ring broke away from all traditional systems; it was owing to the demands made by this great work that Wagner planned his own theatre, which led to the building of the opera-house at Baireuth.

Ring-Ouzel (*Turdus torquatus*) OR MOUNTAIN BLACKBIRD. European song-bird of the thrush

Ring-Ouzel or Mountain Blackbird, a European song-bird

family. Its feathers are black with a narrow edging of greyish white, and it has a white patch on the throat. It arrives in England in April and breeds in a few districts in Devon, Derbyshire, and the N., nesting often in a tuft of heather. It is common throughout the mountainous regions of central Europe and Scandinavia. See Bird; Thrush.

Ring Snake. Alternative name for the common Grass Snake (*g.v.*).

Ringwood. Market town of Hants, England. It stands on the Avon, 24 m. S.W. of Southampton and 103 m. from London, with a rly.

station. At the end of the New Forest, it is a tourist centre and is noted for its beer. The chief building is the church of SS. Peter and Paul, largely rebuilt in the 19th century. In the High Street is Monmouth House, where the duke of Monmouth was brought as a fugitive after Sedgemoor. Ringwood is said to have been founded by the Romans as a military post. Market day, Wed. Pop. est. 5,000.

Ringworm OR **TINEA**. Affection of the skin due to the growth of a fungus, several forms of which are recognized. The common ringworm of Great Britain is most often seen in children between the ages of 5 and 15. It occurs most frequently on the scalp, starting as a small, scaly spot, which gradually enlarges and becomes almost denuded of hair. The disease may last for years if not treated. Various ointments may be applied, but by far the best treatment is the application of X-rays. Ringworm is contagious, and children suffering from it should be isolated.

Rintelen, FRANZ VON KLEIST (1883-1949). German spy. Commissioned in the navy in 1903, he was on the naval war staff in Berlin at the outbreak of the First Great War. Early in 1915 he was sent to the U.S.A. to sabotage armament cargoes. Returning to Germany on the Holland-America liner Noordam, he was taken off by the British naval intelligence and interned at Donington. After America's entry into the war, he was extradited to the U.S.A. and tried, being sentenced to four years' imprisonment. He returned to Germany, but lived from 1926 in England, where he was interned as an enemy alien 1940-45. He died in London, May 30, 1949. In 1933 he published *The Dark Invader*, about his espionage.

Rinuccini, GIOVANNI BATTISTA (1592-1653). Italian prelate. He was born in Rome, Sept. 15,

1592, and after considerable study entered the Church. He soon obtained promotion: Gregory XV made him his chamberlain, and in 1625 he was elected archbishop of Fermo. In 1645 Innocent X sent him to Ireland, where he took part in the intrigues of the Civil War. Ormonde, the royalist leader, signed a treaty with the English parliamentarians, but, influenced by Rinuccini, many Roman Catholics refused to accept it, and warfare continued. The plans of the papal envoy, however, did not succeed, and in 1649 he returned to Italy. He died Dec. 5, 1653.

Riobamba OR **BOLIVAR**. City of Ecuador, capital of the prov. of Chimborazo. It stands near the Riobamba river, 150 m. N.E. of Guayaquil on the rly. between that town and Quito, and is the headquarters of that rly. Situated near the extinct volcano Chimborazo, at an alt. of 9,100 ft., it has a ruined Inca palace, a cathedral, a seminary, and national college. The manufactures are carpets, cotton and woollen goods, butter and cheese, and footwear. One of the most ancient and historic towns of the republic, Riobamba was destroyed by an earthquake in 1797, and was entirely rebuilt on a new site 3 m. away. Pop. est. 19,500.

Rio Cuarto. Town of Argentina, in the prov. of Córdoba. It stands on the Rio Cuarto, on the Trans-Andean rly., 360 m. W.N.W. of Buenos Aires. A garrison town, it has an arsenal, and is of military importance. The centre of a fruit-growing region, it is a market also for stock reared in the district. Pop. est. 40,000.

Rio de Janeiro. State of Brazil, bounded on the S. and E. by the Atlantic Ocean. Mountainous in the interior, the surface slopes towards the coast. The Serra do Mar and the Organ Mts. are the dominating ranges. The state is watered by the Parahyba and smaller rivers, and is served by several rlys. On the coast the heat is oppressive, and malarial fevers prevail. The chief products are coffee, sugar, cacao, rice, maize, fruit, manganese, and indigo. The forests of the interior yield valuable woods; coal deposits are known; and half the steel needed in Brazil is produced in this state. The capital is Niteroy. Area, 26,627 sq. m. Pop. est. 2,070,662.

Rio de Janeiro (São Sebastião do Rio de Janeiro). Federal capital of the United States of Brazil. It lies on the W. shore just inside the entrance of the bay of Guanabara

Ringwood, Hants. Market Place and Town Hall

(commonly known as the bay of Rio de Janeiro). The name commemorates its discovery on Jan. 1, 1502. There is, however, no river of that name, the bay being a wide lagoon fed by small streams from the surrounding mountains. At its entrance, which is overshadowed by the famous Sugar Loaf Mt., the channel is less than a mile wide; but at its widest points the bay is 20–30 m. across. One of the world's finest natural harbours, it is an outstanding port of call.

The second city in importance and population of S. America, ranking next to Buenos Aires, it is situated in the S.E. corner of the federal district, which has an area of 431 sq. m. The old city, now the business centre, lies between the spurs of the surrounding mountains. It was formerly very insanitary, but drainage improvements have made it at least as healthy as most places in the tropics, with a death rate of 20 per 1,000.

About 1905, when Passos was prefect of the federal district, improvements were made in the construction of the city. Narrow streets were pulled down, and in their place wide avenidas were constructed. Notable among these was the Avenida Central, now

Avenida Rio Branco (after the famous minister for foreign affairs), which is the main artery of the city. Lined with splendid modern buildings, it is continued along the shore of the bay, past the residential suburbs of Botafogo and Gloria, by the Avenida Beira Mar, which is constructed with a sea-wall of granite and laid out in gardens and walks to an extent of 4 m.

Rio de Janeiro has many fine ancient buildings, *e.g.* the Candelaria church, while the Monroe palace, national library, and national museum are excellent specimens of modern architecture. The national telegraph office, which was formerly the royal palace, is a notable edifice. The Carioca aqueduct, in which the water of Rio is brought, extends from the mountains of Santa Thereza to those of Santo Antonio, and has been described as the only fine specimen of architecture left by the Portuguese in Brazil: it

Rio de Janeiro. Map of the environs of the city, showing the area administered as the Federal District

was completed in 1750. The hospital, Santa Casa da Misericórdia, is one of the largest institutions in the world. There are schools of medicine and law, a polytechnic school, conservatory of music, and various academies for art, science and commerce. The exchange and government offices are imposing structures. Many of the modern buildings are palatial, and the city squares with statuary, fountains, and luxuriant greenery are strikingly beautiful. The earth washed down from the Moro do Castelo now forms the peninsula of Ponto do Calabouço, on which the great airport of Santos Dumont has been built.

Extensive harbours have been constructed. The Central Brazilian rly. leads to São Paulo, Santos, and the S., the Ncopoloma rly. to Petropolis, Victoria, and the N. The principal export is coffee; imports are cereals, coal, and manufactured goods. It is estimated that the population of the Federal District, which is administratively co-extensive with Rio, is about 2,000,000. Trade winds cool the air, and the maximum temp., 90°, is in Feb., the minimum, 60°, in July.

Rio de Janeiro was discovered by the Portuguese and Italian navigators Gonçalves and Vespucci in 1502. A settlement was made there in 1504 by Coelho, a follower of Gonçalves, but it was destroyed by the Tamoyo Indians soon afterwards. In 1555 a French nobleman, Villegaignon, established a settlement at Rio on the mainland and the island of his name, but it was taken by the Portuguese governor, Mem de Sá, in 1568, who then established the town of São Sebastião do Rio de Janeiro on the Morro do Castelo. The town was bombarded by the French admiral, Duguay-Trouin, in 1711. Rio de Janeiro took the place of Bahia as capital of Brazil in 1762, and became the capital of

Rio de Janeiro. Plan of the central districts of the capital city of the United States of Brazil

1. The city and Botafogo Bay viewed from the Sugar Loaf Mt. In the distance is the peak of Corcovado. 2. The National Library. 3. Praça Floriano (Floriano Square). 4. The Central railway station. 5. The Avenida Rio Branco. 6. Copacabana beach. 7. The Parque do

Paris, on the Avenida Beira Mar, or "Edge of the Sea." 8. The huge statue of Christ which crowns Corcovado, or Hunchback Mountain, 2,329 ft. above the city. The figure, made of concrete, is 110 ft. high. It is floodlit at night and is reached by a rack railway

RIO DE JANEIRO: SCENES IN THE CAPITAL OF THE UNITED STATES OF BRAZIL

the empire of Brazil in 1822. In 1889, after the proclamation of the republic, it was made, with the surrounding territory, federal district and federal capital of the republic. It is governed by a prefect appointed by the government and assisted by a mun. council.

Rio de Janeiro. TREATY OF. Official name of the treaty of mutual defence signed by the states of the American continent, Sept. 2, 1947, at Petropolis (*q.v.*), near Rio de Janeiro.

Rio de Oro (Sp., river of gold). Spanish colony along the coast of W. Africa, S. of Morocco. The country is mainly desert, and forms a W. extension of the Sahara, and the climate is exceedingly hot. Villa Cisneros is the capital. Its area is 73,000 sq. m. Pop. est. 30,000, much increased after the rainy season, when some 30,000 nomads enter the territory with their flocks.

Rio Grande. Name of two rivers of Brazil. One rises in the mts. on the W. border of Bahia state, flows N.E., and joins the São Francisco at Barra. From the N. it receives several affluents. Its length is about 300 m., and it is navigable for 130 m. The other rises in the Serra de Mantiqueira in the S. portion of the state of Minas Geraes, flows along the frontier of Minas Geraes and São Paulo, and unites with the Paranahyba to form the Paraná after a course of about 440 m.

Rio Grande. River of U.S.A., known along parts of its course as Rio Grande del Norte or Rio Bravo del Norte. It rises in the San Juan Mt., S.W. Colorado, and flows S. and S.E., separating Texas from Mexico, to the Gulf of Mexico. About 2,200 m. long, the river may be considered in three parts: near its source it is a swift mountain torrent; it soon changes to the chief source of the irrigation of interior deserts; near its mouth it is a sluggish river of the Texas coastal plain. A dispute with Mexico over the abstraction of its waters resulted in a gigantic storage dam at Engle, New Mexico, from which 60,000 cubic ft. have been since 1907 diverted annually to Mexico for irrigation purposes. The biggest city on its course is El Paso, Texas, where the Rio Grande is almost dry for a large part of the year.

Rio Grande do Norte. State in N.E. Brazil. It lies between Ceará and Parahyba, sloping N. and N.E. to the Atlantic. It is for the most part mountainous

and not well watered, but there is a level tract near the coast. The climate is hot and dry, and, on the whole, equable and healthful. It produces cotton, cattle, sugar, various kinds of valuable timber, cochineal, coffee, wax, rubber, tobacco, drugs, salt, and fish. The capital is Natal. Its area is 22,189 sq. m. Pop. 774,503.

Rio Grande do Sul. Southernmost state of Brazil. Bounded on the N.W. by Argentina and on the S.W. by Uruguay, its coasts on the Atlantic Ocean are low and almost filled with lagoons (*see* Lagoa dos Patos). Largely grass land, the chief occupation is the rearing of cattle, horses, and mules. Vines, rice, tobacco, coffee, vegetables, maté, sugar, and cereals are cultivated, and linen, woollens, and soap are manufactured. Wolfram is mined, and copper, gold, amethysts, agates, and coal are found. The capital is Porto Alegre (*q.v.*). Its area is 112,278 sq. m. Pop. 3,336,632.

Rio Grande do Sul. The fifth seaport of Brazil, and the most S. for seagoing steamers. It is in the state of Rio Grande do Sul. It stands at the mouth of the Lagoa dos Patos, and is connected by rly. with Pelotas and the interior, and with Porto Alegre by steamer. Low-lying, on a sandy plain, it has a large harbour, and exports dried meats, hides, hair, tobacco, maté, etc. Tanning and brewing are important industries and one meat packing plant disposes of 2,000 head of cattle per day. Pop. est. 65,000.

Rioja. Spanish wine produced in La Rioja (*q.v.*) dist., Old Castile. A fine, red wine of a heavy, claret type, it is characterised by full body, slight ferruginous flavour, fair alcoholic strength, purity, and cheapness. Exported from Bilbao, it is called Spanish Burgundy.

Riom. Town of France. In the dept. of Puy-de-Dôme, it stands on the left bank of the Ambène and is a junction of the Lyons rly., 8 m. N. of Clermont-Ferrand. The church of S. Chapelle, built 1382-38, was formerly the château of the dukes of Auvergne. The 15th century church of Notre-Dame-du-Marthuret has a fine Virgin with bird on the portal. There are tobacco and linen factories and a trade in corn, wines, etc. The town contains many fine 15th and 16th cent. houses. Pop. 12,975.

Here was staged, Feb. 20-April 2, 1942, the "war guilt" trial, organized by the Vichy govt., of Frenchmen prominent in the last years of the Third Republic.

A "supreme court" composed of well known French jurists, and charged with the duty "to seek out and to try all persons having committed crimes or offences or who failed in their duty in acts concerning the transition from a state of peace to a state of war," had been installed at Riom on Aug. 8, 1940. Those eventually brought to trial before it were Edouard Daladier, prime minister in Sept., 1939; Léon Blum, prime minister in 1936; Gen. Gamelin, Allied c.-in-c. at the beginning of the Second Great War; Guy la Chambre, a former air minister; Robert Jacomet, controller-gen. of armaments; and Pierre Cot, air minister under Blum. Cot, in the U.S.A., was tried in absence.

Hitler instigated the Riom trial in order to secure public admission by former holders of high office in France that their country was responsible for the outbreak of war. In fact, the reasons for France's military defeat were the only subject argued by the court, and the proceedings became an investigation into responsibility for France's unpreparedness for war; and in a speech to the Reichstag on March 15 Hitler expressed his displeasure with the conduct of the trial.

The court was adjourned April 2, suspended April 14, dissolved June 13. The defendants, other than Cot, had been in custody or under surveillance since 1940; they were kept in prison, neither acquitted nor condemned, first in France, then, after the Allied invasion of N. Africa, in Germany until liberated by the Allies in 1945.

Rio Muni. Alternative name for Spanish Guinea (*q.v.*).

Rion. River of Transcaucasia, the ancient Phasis. Rising on the S. slope of the main Caucasus range, it falls into the Black Sea at Poti, after a course of 200 m. It was famous in antiquity from its connexion with the Argonautic expedition. *See* Georgia.

Rio Negro. Territory of Argentina, in Patagonia. Stretching from the Andes to the Atlantic, where it is indented by the Gulf of San Matias, it is bounded on the N. by the Rio Colorado and S. by Chubut Territory. It is traversed by the Rio Negro and the rly. from Bahia Blanca to Neuquen. The territory is mostly plateau, with a dry and healthful climate, and the soil is fertile when irrigated. It produces cereals and alfalfa, and raises large quantities of stock. The capital is Viedma, situated on the Rio Negro near

the coast. Area 77,610 sq. m. Pop. 42,242.

Rio Negro. Department of W. Uruguay. It is bounded on the W. by the river Uruguay and S. by the Rio Negro. The principal occupations are agriculture and stockraising. The capital is Fray Bentos (*q.v.*). Area 3,269 sq. m. Pop. 47,586.

Rios, JUAN ANTONIO (1888–1946). Chilean statesman. Born at Cañete, Arauco province, Nov. 10, 1888, he studied at Lebu and Concepción, and became a lawyer. Entering politics as a Radical, he was appointed Chilean chargé d'affaires and consul-general in Panama in 1921, and two years later took up a parliamentary career, becoming minister of the Interior in Dávila's government, 1932, and later minister of Justice. He was elected president of Chile in 1942. His handling of foreign policy was particularly skilled at the time when his country broke off diplomatic relations with the Axis countries, declared war on them, and joined the United Nations. He died June 27, 1946.

Riot (M.E. *riote*; cf. Ital. *riotta*, quarrel). Term used broadly for revelry, tumult, or disorderly proceedings. In English law, a riot is defined as a violent disturbance of the peace by not less than three persons, who, having gathered together without lawful authority, and having agreed among themselves to withstand opposition, execute or begin to execute a common purpose turbulently to the terror of the people or of at least one person of reasonable firmness and courage.

Any citizen may be called upon to help in suppressing a riot. Under the Riot Damages Act, 1886, the local police authorities may be sued for damage done during the riot. See Sedition.

Riot Act. Act passed in 1715, which gives power to magistrates to apprehend, as felons, persons who to the number of 12 or more assembled refuse to disperse within an hour after the reading of proclamation bidding them to do so. The Act, further, indemnifies any who at the request of the magistrate assist him in carrying out the law. This indemnification in effect gives magistrates power to employ military to disperse a mob. The Act was originally prompted by fears of Jacobite risings.

Rio Tinto, MINAS DE (Sp., coloured river mines). Town of Spain, in the prov. of Huelva. The name "Tinto" derives from the discoloration of the river's

waters by copper ore. It stands near the source of the river Tinto, 52 m. by rly. N. of Huelva. The centre of one of the most celebrated copper-mining regions of the world, Rio Tinto and the surrounding villages are peopled by some 10,000 miners. The mines, known to the Carthaginians, and worked by the Romans, yield over a million tons yearly of iron pyrites containing copper and sulphur.

Riparian Owner (Lat. *ripa*, bank). In law, one whose land is

Ripley, Yorkshire. Castle, built in the 16th century, where Cromwell stayed before the battle of Marston Moor. Top, Ripley Cross and stocks

part of the bank of a stream or river. In a non-tidal river, or in a tidal river above the limit to which the tide reaches, as a rule the bed of the river belongs to the riparian owner as far as the middle. This constitutes the riparian owners, in effect, the owners of a river or stream, and the public have, as a rule, no rights of navigation, or of fishing, or bathing.

Rip Cord. Device on a manually-operated parachute for releasing the silk canopy from its retaining pack. It consists of a length of cord having at its free end a metal ring or handle. When the cord is pulled the locking pins holding the flap of the canopy are withdrawn, and the springs pressing the canopy against the flap are released, forcing it out of the pack. See Parachute.

Ripley. Urban dist. and market town of Derbyshire, England. It is 10 m. N. of Derby. All Saints church is a modern building. There are some textile manufactures and around are coal mines and ironworks. Ripley was made a market town in the 13th century. Market day, Sat. Pop. 17,750.

Ripley. Village of Surrey, England. It is 5 m. S.E. of Woking. Being on the main road from London to Portsmouth, several miles of which are sometimes called the Ripley Road, it was an important place in coaching days.

Ripley. Small, but historic, village of the W. Riding of Yorks, England. On the Nidd, 3 m. N. of Harrogate, it has a fine church, dedicated to All Saints, in which are memorials to the Ingilby family. Ripley Castle dates from the 16th century, but has been modernised. Cromwell

stayed here before the battle of Marston Moor. Pop. 221.

Ripon. City and mun. borough of the W. Riding of Yorkshire, England. On the Ure, it is 26 m. N.

of Leeds, and is served by rly. Ripon cathedral replaced an earlier one, of which the crypt remains. Its erection occupied about three centuries, and consequently it displays all styles of architecture, from the Norman apse through the Transitional transepts to the Perpendicular work in the choir and elsewhere. It was restored by Scott in 1862-72. The chapel of the hospital of S. Mary Magdalen is a Norman building. The city has some old almshouses, including the hospitals of S. John the Baptist and S. Anne; an 18th century town hall; a grammar school; and two museums. The episcopal palace is just outside the town. There is a lofty obelisk in the market place. Ripon is a spa. It trades in agricultural produce and manufactures leather goods. Near are Studley Royal (*q.v.*) and Fountains Abbey (*q.v.*).

Ripon grew up around an abbey founded in the 7th century. S. Wilfrid, to whom the cathedral is dedicated, being the first abbot. It was soon made a corporate town,

Ripon arms

Ripon, Yorkshire. The cathedral viewed from the south-east

and had fairs and markets which until 1880 belonged to the archbishop of York or the ecclesiastical commissioners. It became famous for cloth, and later for the quality of its spurs. The chief official was known until 1604 as the wakeman, and a horn is still blown in the market square every evening at 9 p.m. Ripon was made the seat of a bishop in 1836, the cathedral having been a collegiate church. It had an M.P. until 1885, and now gives its name to a co. constituency. The treaty of Ripon was signed here between Charles I and the Scots in 1640. Pop. 9,177.

Ripon, FREDERICK JOHN ROBINSON, 1ST EARL OF (1782-1859). British statesman. Born in London, Oct. 30,

1st Earl of Ripon, British statesman

1782, the second son of the Baron Grantham, he was educated at Harrow and St. John's College, Cambridge. Becoming M.P. for Carlisle in 1806, he represented Ripon 1807-27. He was president of the board of trade, 1818-23; chancellor of the exchequer, 1823-27, in which capacity he was nicknamed by Cobbett "Prosperity Robinson"; secretary for the colonies; then he was made Viscount Goderich and succeeded Canning as prime minister for a few months in 1827-28. Again he was secretary for the colonies, 1830-33; lord privy seal, 1833-34; president of the board of control for India, 1843-46. Created earl in 1833, he died Jan. 28, 1859.

Ripon, GEORGE FREDERICK SAMUEL ROBINSON, 1ST MARQUESS OF (1827-1909). British statesman. Born Oct. 24, 1827, when his father, Viscount Goderich, later earl of Ripon, was prime minister,

he was educated privately. Early liberal opinions were deepened by his friendship with Kingsley, Hughes, and other Christian Socialists. In 1852 he entered parliament as M.P. for Hull, and he held other Yorkshire seats until 1859, when he succeeded his father as earl of Ripon and his uncle as Earl de Grey. That year he became under-secretary for war.

In 1863 he entered the Liberal cabinet as secretary for war, and from that time was one of the leaders of his party. In 1866 he was secretary for India, and in 1868 Gladstone made him lord president of the council. He was chairman of the commission appointed to settle the Alabama dispute, and was created a marquess in 1871, but resigned his cabinet office suddenly in 1873. Though he had become a Roman Catholic, Ripon's next important post was that of governor-general of India, 1880-84, a difficult time owing to troubles in Afghanistan. In 1886 he was first lord of the

Ripon

admiralty; during 1892-95 secretary for the colonies; and during 1905-08 lord privy seal and Liberal leader in the lords. He died at Studley Royal (*q.v.*), July 9, 1909. His son, Frederick (1852-1923), long known as Earl de Grey, succeeded him, and on his death the title became extinct.

Ripon Falls. Falls on the river Nile discovered by Speke on July 28, 1862. The three distinct falls, near where the Nile issues from Victoria Nyanza, prevented navigation, but a rly. was built, 1912-13, from Jinja to Namasagali (61 m.) to afford communication with Lake Choga (Kioga). Under the Owen Falls Dam (*q.v.*) scheme, Ripon Falls were to disappear.

Ripperda, JOHANN WILHELM, DUKE OF (1680-1737). Dutch adventurer. Born at Groningen, he entered the service of Philip V of Spain in 1715, and was rewarded for his success in negotiating the alliance of 1725 with Austria by a dukedom. On his disgrace in 1726 he escaped to Holland, and then to Morocco, and induced the sultan Muley Abdallah to attack Spanish territory in Africa. The expedition which he commanded under the name of Osman Pasha failed, and he died at Tetuan, Nov. 2, 1737.

Ripple Mark. Name given to the small-scale undulatory patterns seen on sands. Ripple marks are caused by the movement of water or air, and can result from oscillatory motion or wave action which gives symmetrical ripples, or from current action which produces asymmetrical ripples. In rivers the type of ripple mark formed depends on the velocity of the current.

Rip van Winkle. Hero of a story in Washington Irving's *The Sketch Book*, 1819-20. Inhabitant of a village in the Catskill Mts., N.Y., he falls into a 20 years' sleep, and wakes to find everything changed and himself wellnigh forgotten. The story was long popular

Ripon Falls, Central Africa. The first of the three falls in the Nile where it issues from Victoria Nyanza

in the form of a drama, first performed in 1828. There have been several revivals, including Boucicault's version, with Jefferson in the title-rôle (Adelphi, 1865), an anonymous version with Tree in the part (Her Majesty's, 1900), and Austin Strong's with Cyril Maude as Rip (Playhouse, 1911). Farnie and Planquette produced a comic opera, with Fred Leslie as Rip, at the Comedy in 1882.

Risaldar. Commissioned officer in the Indian and Pakistan cavalry. He corresponds to the infantry subhadar, and may be promoted to risaldar major.

Risca. Urban dist. of Monmouthshire, England. It stands on the Ebbw, 6 m. N.W. of Newport, and has a rly. station. There are chemical and tinplate works, and coal mines near by. Pop. 14,500.

Risdon. Town of Tasmania. It stands on the Derwent estuary, in Monmouth co., opposite Hobart. Here is one of the largest zinc-producing plants in the world, covering 150 acres and employing 1,600. Some 55,000 h.p. of hydro-electric power is supplied for the production of 80,000 tons of zinc annually from concentrates and slimes, as well as cadmium, zinc sulphate, cobalt oxide, fertilisers.

Rise. Geographical term meaning an elevation, ridge, or plateau rising above the general level of the ocean floor. An excellent example of a rise is the long and irregular elevation which longitudinally traverses the whole length of the Atlantic Ocean, and divides it into two deep basins. In the N. Atlantic it is called the Dolphin Rise, in the S. Atlantic the Challenger Rise. The Azores, Ascension, and Tristan da Cunha stand upon the Atlantic rise. See Ocean.

Rise. In mining, name of a particular kind of shaft. Small shafts are excavated from one floor level of the mine to the one next above, and such a shaft is called a rise, as distinguished from a winze (*q.v.*). It may be vertical or inclined; its sides are timbered. A timber partition goes down the middle forming two compartments, one with ladders for the miners and the other for the removal of ore or waste. Larger rises are often divided into three compartments.

Rishi. In Oriental mythology, title given to the seven mind-born sons of Brahma, the seers or sages to whom were revealed the Vedas. The term is also applied to other ancient poets and men of special sanctity. In astronomy, the word was used of the stars forming the Great Bear.

Rising Sun. ORDER OF THE. Japanese order, also known as the Eastern or Morning Sun. It was instituted in 1875, with eight grades, as a reward for military and civil services. The badge is a red sun emitting 32 white rays, the ribbon white with red borders.

Risk (Fr. *risque*, peril). Possibility of loss, damage, or danger; (verb), to subject to risk; in insurance and commerce, the thing itself which is subjected to risk. Insurance is a means of spreading the risk and consequently the loss, should this occur. Risks compulsorily insured against under state insurance schemes in the U.K. include sickness, medical expenses, disablement, industrial injuries, unemployment, and burial expenses; in addition, users of motor vehicles must insure against the risk of damage to third parties. Other risks usually covered by insurance are damage by fire, tempest, etc.; loss by theft, burglary, etc.; loss or damage of goods in transit, particularly by sea. Insurance against bad weather is common when the whole success of the project depends on the weather (*e.g.* open-air entertainment). Lloyds (*q.v.*) will issue policies of insurance against contingencies of the most diverse kind; insurance companies generally are more specialized in the risks undertaken. See Insurance; Lloyds; Railways.

Rispetti (Ital. *rispettoso*, respectful). Originally, Tuscan folk songs conveying respectful salutations to the beloved one. The characteristic form is a verse of four lines rhyming alternately, followed by a rhyming couplet, called the *ripresa*, which develops some conception or fancy, or word or phrase, of the third or fourth line of the preceding quatrain. A variant form corresponds to the *ottava rima* of Italian literature, consisting of octaves composed of six lines alternately rhyming, followed by a rhyming couplet.

Ristich, JOVAN (1831-99). Serbian statesman. Born at Kragujevatz, Oct. 27, 1831, he entered the diplomatic service, and, as chief of the mission sent to Constantinople in 1860, succeeded in preventing a definite rupture with Turkey, and ultimately secured the withdrawal of the Turkish forces from Serbian

fortresses. He was a member of the council of regency during the minority of Prince (afterwards King) Milan, and for a brief period (1872-73) prime minister. Ristich was a partisan of Russian intervention on behalf of Serbian independence, while the prince in 1873 placed his hopes on Austria, and when Serbia had declared war on Turkey against Russian advice he became the recognized leader of the Liberal party, and was again called to power in 1876. In 1878 he represented Serbia at the Berlin congress. Ristich was a member of the council of regency during the minority of King Alexander I, and when the prince prematurely announced his majority by arresting his regents, Ristich retired. He died at Belgrade, Sept. 4, 1899.

Ristori, ADELAIDE (1822-1906). Italian actress. Born at Cividade del Friuli, Jan. 30, 1822, she achieved her first

Adelaide Ristori,
Italian actress
Elliott & Fry

triumph in Rome in 1849 as the heroine of Alfieri's *Myrrha*. In 1855 she was favourably received in Paris, where Rachel's supremacy seemed unquestioned, as *Myrrha*, *Francesca da Rimini*, and *Mary Stuart*, and was also seen in the *Medea* and *Beatrice* of *Legouvé*. She acted frequently in London, making her *début* as *Medea* at the Lyceum, June 4, 1856, and playing *Lady Macbeth* at Drury Lane, July 3, 1882. She died in Rome, Oct. 9, 1906.

Risus Sardonicus. Spasm of the facial muscles producing the appearance of a sardonic grin. It occurs in convulsive diseases and in poisoning by strychnine.

Rita. Pseudonym of Mrs. Desmond Humphreys (d. 1938). British novelist. Daughter of J. G. Gollan, she went from Inverness-shire to Australia as a child, and on her return to England published a novel before she was 20. She wrote some 60 stories, plays, and essays, and was for many years a best-seller, one of her early successes being *Souls*, an attack on the society of the time. She died Jan. 1, 1938

Rita,
British author

Ritardando OR **RITENUTO** (It., holding or held back). Musical terms of almost identical meaning, indicating that the time is to be slackened. The usual abbrev. is *rit.*

Ritchie, CHARLES THOMSON RITCHIE, 1ST BARON (1838-1906). British politician. Born at Dundee,

1st Baron Ritchie, British politician

Nov. 19, 1838, he was educated at the City of London School. In 1874 he became Conservative M.P. for the Tower Hamlets. In 1885 he was financial secretary to the Admiralty, and in 1886 he became president of the local government board, holding that position until 1892. M.P. for Croydon and president of the board of Trade in 1895, he later became Home secretary, and in 1902 chancellor of the exchequer. In his budget of 1903 he took off the existing duty of 1s. a quarter on corn; this gave offence to the tariff reformers, led by Joseph Chamberlain, who resigned, as also did Ritchie. In 1905 he was created Baron Ritchie of Dundee. He died Jan. 9, 1906. His elder son Charles (1866-1948), chairman of the P.L.A. from 1925 to 1941, was the 2nd baron, and was succeeded by his secondson (John) Kenneth (b. Sept. 22, 1902).

Ritchie, SIR NEIL METHUEN (b. 1897). British soldier. Born July 29, 1897, he was educated at Lancing and Sandhurst and commissioned in the Black Watch in 1914. He won the D.S.O. and M.C. during the First Great War. After 1918 he held various staff appointments in the U.K. and India, and in 1940 was promoted acting major-gen., in command of the 51st Highland div. After the Dunkirk evacuation he was created C.B.E., and early in 1941 was appointed deputy chief of staff, Middle East. On Nov. 26, 1941, he succeeded Gen. Sir Alan Cunningham in command of the 8th army in Libya. Following the fall of Tobruk on June 21, 1942, Ritchie prepared to fall back on Mersa Matruh, a decision that had been endorsed by the Middle East defence committee, but on June 25 Gen. Auchinleck took over personal control of the 8th army. Late in the year Ritchie was given command of the 52nd Lowland div., and in 1944 took command of 12 corps, B.L.A., which he led until the end of the war with Germany. He was G.O.C. Scottish

command and governor of Edinburgh castle, 1945-47, and C.-in-C. Far East land forces, 1947-49, then went to Washington as commander British army staff and mil. member of joint services mission. See N. Africa Campaigns.

Rite (Lat. *ritus*, custom). Religious act or ceremony; also used of the general body of services used by a church or group of churches, e.g. Byzantine Rite. In the R.C. Church, the congregation of rites regulates the general uniformity of practice in matters of divine worship. It also decides causes of beatification and canonisation. The congregation was established by Pope Sixtus V. See Liturgy.

Ritornello (It., a little return or repeat). A short strain of instrumental music. Originally it signified the music played between the scenes of an opera after the style of an intermezzo, but subsequently it meant the instrumental interludes in a song when the voice was silent. It is still used in connexion with an old form of Italian verse, composed of stanzas of three lines the first and the last rhyming.

Ritschl, ALBRECHT (1822-89). German theologian. Born in Berlin, March 25, 1822, he became professor extraordinary of theology at Bonn in 1852. In 1864 he took up a similar position at Göttingen, which he occupied for the rest of his life. Early he was influenced by

Albrecht Ritschl, German theologian

Baur, but the teachings of Lotze led him to modify his views. He belonged to the Neo-Kantian school of thought, which, in view of the generally materialistic attitude of German scientists, was disposed to regard the thing-in-itself as supplying a way of escape for those who sought a ground of faith beyond the bounds of human knowledge. He regarded such questions as the existence of God and the immortality of the soul as not being of the essence of theology, which should concern itself rather with the education of the soul in accordance with the teachings of the Bible. Ritschl, who wrote Theology and Metaphysics, 1887, died March 20, 1889. Consult Ritschlian Theology, A. E. Garvie, 1899; Ritschlianism, J. Orr, 1903.

Ritual (Lat. *ritus*, a rite). Name given to forms or ceremonies used in public worship. Ritual is found in every type of religion. It serves

two purposes: (1) to express the devotion of the worshippers towards the object of their worship; (2) to illustrate or convey the message or teaching of the God who is worshipped to the minds of the worshippers. Many forms are covered by ritual, e.g. an established order of prayer, singing hymns, vestments of clergy, etc.

Ritualism. System of conducting worship according to a ritual. The term has come to be used rather in a derogatory sense, of the High Church or Tractarian movement in the Church of England. The Oxford Movement led many clergymen to pay greater attention to ceremonial in worship, and altar lights, vestments, incense, etc., were introduced in many churches. These were authorised, it was urged, by the ornaments rubric of the Prayer Book, which prescribed the use of such ornaments as were in use in 1548, but many churchmen objected strongly to them, as savouring of Roman Catholicism, and in several cases legal proceedings were taken. The most famous was when Edward King, bishop of Lincoln, was put on his trial. A royal commission inquired into this subject in 1867, and in 1874 was passed the Public Worship Regulation Act, directed against ritualistic practices. In 1906 a commission on ecclesiastical discipline made further recommendations for checking excessive ritual. See Church of England; Lincoln Judgement; Oxford Movement; Pusey, E.B.

Riukiu, RYUKYU, OR LUCHU ISLANDS. Group belonging to Japan and extending in a festoon S. from Kyushu towards Formosa. Including the Sakishima islands, the group numbers 90 islands or islets with an area of 921 sq. m. Sugar cane and sweet potatoes are raised. The pop. may number half a million. Okinawa is the largest island, and the campaign of the Second Great War is described under that heading.

Riva. Town of Italy, in the Trentino. It occupies a picturesque situation at the base of the precipitous Rocchetta, 4,976 ft., on the N. shore of Lago di Garda, 10 m. W. of Roveredo. The Palazzo Pretorio, built by the Scaligers in 1370, is used as a law court; the reconstructed 12th century castle of La Rocca as a barracks.

Rivals, THE. Five-act comedy by Sheridan, produced at Covent Garden Theatre, Jan. 17, 1775. Badly received at first, it soon became a triumphant success, and remains among the most popular

of purely English comedies. In this first play, written when Sheridan was 23, the easy satirising of foibles of contemporary character marked his innate genius. The scenes are laid in Bath, and several characters have become familiar to all, *e.g.* Bob Acres, Lydia Languish, and Mrs. Malaprop. *The Rivals* marks the close of the period of sentimental comedy. In a revival at the Criterion Theatre, London, 1945, Edith Evans played Mrs. Malaprop. Birmingham repertory presented a version in modern dress, seen in London in 1948.

Rive-de-Gier. Town of France. In the dept. of Loire, it stands on the Gier and the Canal du Gier or de Givors, 13 m. N.E. of St. Étienne. It has coal, iron, steel, and glass works, and there are silk factories. Pop. 13,931.

River. Channel by which the rainfall on the land reaches the sea or basins of inland drainage. A river system or drainage area comprises the main river and its tributaries. The line bounding the drainage area is called the water divide or watershed.

Some rivers, especially those which flow through rainless areas and receive their water only from rains near their sources, are intermittent, and by excessive evaporation may cease to flow in their lower reaches. Most rivers have seasonal periods of flood, due either to heavy rainfall or to the melting of snows at their sources. Rivers in high altitudes freeze in winter, but an undercurrent generally remains in motion. When such rivers break up in spring there are heavy floods. In the N. hemisphere rivers flowing polewards are deflected by the rotation of the earth, and press against their E. banks; those flowing equatorwards press against their W. banks. The banks of a river are termed right and left, as one looks in the direction of flow. Drainage follows the natural slope

of the ground, and valleys nearly always are the work of the rivers. In regions of soluble rock rivers sometimes flow beneath the ground.

River systems are not fixed but steadily changing and developing. Rivers which follow the natural slope of the ground are termed consequent rivers; their tributaries, which cut valleys quickly along relatively soft strata, are subsequent rivers. Streams which flowed across a country before mountains were elevated, and where downward erosion has kept pace with the elevation, flow in gorges through mountain ranges; they are termed antecedent rivers. A river is always lengthening its course by eating backwards with source streams; in this way one river may capture another.

A typical river shows three characteristic portions: (1) the torrential course; (2) the valley course; (3) the plain track. In its torrential course it flows down the hillside in a narrow ravine as a mountain torrent much interrupted by falls. In the valley course the gradient is more gentle and the velocity of the stream less; the river is relatively easily deflected from its course by obstructions, and begins to wind or meander. Its destructive work is horizontal as well as vertical, the valley being widened by the destruction of the concave banks at the bends.

In its plain course the river has eroded downwards almost to sea level, and so has a gentle gradient and a low velocity. It meanders widely, but its work is mainly constructive in the formation of shoals, flood plains, and deltas. Many rivers have only a torrential course; in others the plain course has been drowned beneath the sea by depression of the land. In this event an estuary or firth is formed. In all its stages a river does transport work, but the amount of material that can be carried in suspension or rolled along the

bed depends on the velocity. A great deal of matter is also carried in solution.

The annual flow of the Mississippi carries to the sea about 400,000,000 tons of solid matter, and about 80,000,000 tons of dissolved mineral salts. It is estimated that the destructive action of a river like the Mississippi lowers its whole basin on an average one foot in 6,000 years. Among the longest rivers of the world are the Nile, 4,000 m. long, the Mississippi-Missouri, 4,200 m., the Amazon, 4,000 m., the Yang-tse, 3,500 m., the Ob-Irtish, 3,500 m., and the Amur, 3,000 m. The speed of a river varies with the gradient. A torrential stream flows at 18 to 20 m. an hour; a moderate current is about one m. an hour. In flood time the velocity of a river is increased, often with disastrous results, since the increased velocity makes the river change its course suddenly.

Navigable rivers are natural highways, and since their valleys are generally fertile they afford routes through densely populated regions. With the increased size of vessels, only the lower courses of the largest rivers are navigable by ocean-going steamers, but river steamers of shallow draught ply on upper reaches. The head of navigation, which is often, but not always, the head of tidal influences, has determined the site of many great seaports, *e.g.* London and Glasgow.

Deltas frequently interfere with navigation from the sea, as in the Ganges, Mississippi, and Nile, three rivers with long navigable courses. The value of rivers as lines of communication is reflected in the establishment of certain rivers as international waterways, *e.g.* Congo, Danube, Elbe, etc. Unnavigable rivers are often used for floating timber, as in Canada and Sweden. Rivers of high gradients, particularly if interrupted by falls, provide abundant water power in, *e.g.*, Norway, Finland, Switzerland, the U.S.A. Before the industrial revolution this located many industries in Great Britain, such as cutlery at Sheffield, and woollens at Galashiels. Rivers flowing through dry lands are valuable for irrigation, *e.g.* Nile and Euphrates. All production in these basins has always been based on irrigation. Rivers are also of great importance in connexion with the supply of water to towns. See Amazon; Canal; Delta; Mississippi; Nile; Physiography. Reservoir; Thames; Transport:

Riva, Italy. The town at the northern end of Lago di Garda

Water Power. *Consult* The Work of Rains and Rivers, T. G. Bonney, 1912; Our Rivers, J. W. Kempster, 1948.

R. N. E. Brown

Rivera. Department of N.E. Uruguay. It is bounded N.E. by the Brazilian state of Rio Grande do Sul; S. and W. by the dept. of Tacuarembó; E. by Cerro Largo. The surface is undulating pasture land, supporting large herds of cattle. Gold is found, and cattle and animal products are exported. Area, 3,793 sq. m. Pop. 75,464. Rivera, the capital, is in the extreme N. of the dept., on the rly. which crosses into Brazil. Pop. approx. 22,000.

Riverdale, ARTHUR BALFOUR, 1st BARON (b. 1873). British industrialist. Born in London, he

was educated at Ashville College, Harrogate, and joined a steel-manufacturing firm in Sheffield, becoming a specialist in the production of high-speed steel alloys, and managing director of Arthur Balfour and Co. Master-cutler of Sheffield, 1911-12, he served on many government committees connected with heavy industry, notably the royal commission on railways, 1913, and the coal commission 1919, and was a delegate to the economic conference 1927. He was chairman of the advisory council for scientific and industrial research, 1937-46, and president of the British Council, 1947-50. A baronet in 1929, he was in 1935 raised to the peerage as Baron Riverdale of Sheffield.

River Engineering. Branch of civil engineering dealing with the canalisation, diversion, and maintenance of rivers and with works for their improvement generally. In Great Britain the responsibility for keeping rivers in condition to perform their principal function—to discharge the water which falls upon their watershed to the sea or another river—is vested in catchment boards and river boards provided by the Land Drainage Act. The same or another authority may control navigation.

Canalisation includes all work involved in rendering navigable a river or stream which in its natural or existing state is either wholly or partially unnavigable for any or all of the following principal

reasons: variation of flow due to tidal range or rapid fall; alternate drought and flood; insufficient volume of water; the presence of shoals, rocks, etc., or the formation of a bar, sandbanks, or a delta at its outlet; tortuous course; variations in depth and width due to scour, silting, or the absence of proper banks; the existence of low level bridges. To determine whether a river can be made navigable, it is necessary to ascertain the sources and volume of water, the variation in flow, whether this flow can be increased or rendered more uniform, the gradient or fall, especially of the section to be canalised, the causes and extent of obstructions and the practicability of their removal and of subsequently maintaining a navigable channel, and the rights and interests of riparian owners and public authorities.

Deltas are formed by the sediment carried down by the stream and deposited at the mouth; bars and sandbanks are due to similar causes. The remedies are dredging or the construction of training jetties or banks. Rock is removed by blasting or breaking, followed by dredging. Shoals of sand and mud are dredged until a sufficient depth and width are attained. A tortuous course may sometimes be greatly improved and shortened by dredging or excavating new channels across sharp bends. Low bridges which obstruct navigation may be raised or replaced by high level bridges, or, where the approach gradients do not permit of this, by movable bridges of the swing, lifting, or transporter type—though these hinder road traffic. A section of undue width may be reduced and the stream kept within desirable bounds by the construction of continuous banks or detached dykes.

Where the volume of flow is insufficient, it may be possible to increase it by diverting other sources of supply into the stream, but cases are rare in which a serious shortage could be made good in this way.

River engineering deals with the variation of flow due to alternating periods of drought and flood. Frequently natural river beds are only of sufficient capacity to provide for normal discharge; consequently during floods rivers overflow their natural boundaries and inundate low-lying country. Not only does this damage land, buildings, etc., but as a result of flooding and the deposit of sediment brought down from higher levels, some

ivers change their courses for considerable distances.

To provide against these effects the following methods may be adopted: (1) Dams and reservoirs may be constructed, if possible, in the upper regions, by means of which flood water may be stored against the dry season, as at Assuan on the Nile. Such works are usually carried out in connexion with water supply and irrigation. (2) The construction of continuous banks or detached dykes on low-lying sections, where flooding and erosion occur, may direct the stream into a definite channel. With this must be a system of cross dykes for guiding the flood water back again into the river, and so preventing scour behind the banks. Continuous banks are suitable where ordinary flood water can be entirely contained, but for large rivers the cost is often prohibitive, and detailed lengths of dyke are put up especially on curved sections, where the centrifugal force of the current has the worst effect.

Control by Weirs

Variations of flow due to tidal range or rapid fall may be corrected by the division of a river into sections known as reaches, this being done by the construction of weirs across the waterway at intervals determined by the full. By this means a gentle fall, unaffected by tidal variations, is maintained between the weirs, over the crest of which the water discharges itself into the channel below. The two commonest forms of weir are solid dams and dams with sluice gates, which may be raised during floods to hasten the discharge of flood water. At each weir a lock is provided through which boats may pass from one reach to another. In addition to a lock a ramp is occasionally provided, up and down which small craft can be hauled by hand.

The diversion of a river consists either of deflecting its course into a channel which it previously occupied and executing the necessary works to prevent another change of course, or, more frequently, of excavating a new channel. In such undertakings the new channel is either excavated as far as possible in the dry, the water being admitted on its completion, or the work is performed by dredging. *See* Assuan; Canal; Dam; Dredging; Irrigation; Lock; Weir; *consult* River and Canal Engineering, E. S. Bellasis, 1913; Control of Water, P. A. M. Parker, 1932; River Engineering, F. J. Taylor,

1938; Drainage and Flood Control Engineering, G. W. Pickles, 1941.

River Hog (*Potamochoerus*). A species of ungulate mammal found in W. Africa. It has

River Hog. Species found in herds in the swamps of W. Africa

bright red bristles, and is often known as the red river hog. It occurs in herds in swampy parts of the forests, usually near rivers, and feeds upon plants and roots, often doing great damage in the native plantations.

Riverina. Dist. of Australia, in New South Wales. It includes all the counties situated between the Lachlan and Murray rivers W. of the meridian of Wagga-Wagga. Entirely a lowland with an average rainfall of 20 ins., and possibilities of irrigation from the Murrumbidgee and the boundary rivers, and comprising a small artesian basin, which yields subterranean water through bores, the Riverina is an excellent wheat-growing area and suitable for sheep rearing. The Murray red gum is localised here. Most of the dist. is nearer Melbourne than Sydney, and the rlys. run S. to Melbourne and E. to Goulburn and Sydney. Deniliquin and Hay are the largest towns of the district.

River Plate. Combined estuary of the Uruguay and Paraná rivers in S. America. It provides an entrance for merchant ships to the ports serving the vast food-producing areas of the pampas. See La Plata, Rio de. For the battle in 1939, see Plate, Battle of the River.

Rivers, EARL. An English title held in turn by the families of Woodville and Savage. In 1466 it was given to Sir Richard Woodville, but it became extinct when the 3rd earl died in 1491. In 1626 it was revived for Thomas Darcy, from whom it passed to a grandson, John Savage, who became the 2nd earl in 1640. It remained in this family until the death of the 5th earl, a priest, in 1735. It is supposed that the name was first taken from that of a Devon family.

Richard Savage (c. 1660–1712), who became the 4th earl in 1694, was notorious for gallantries and debaucheries. He showed himself a soldier of ability in the wars against France, after which he became a general, master-general of the ordnance, and commander-in-chief. As an M.P. he was concerned with the accessions of William of Orange and George I. He is the earl who lived with the countess of Macclesfield, and was claimed as his father by Richard Savage (q.v.). He died Aug. 18, 1712.

Rivers, RICHARD WOODVILLE, 1ST EARL (d. 1469). English statesman. Of a Northamptonshire family, he served in the French wars, and made his fortune by marrying Jacquetta of Luxembourg, widow of the duke of Bedford, 1436. Temporarily disgraced for presumption, he regained the king's favour, and in 1448 was made a baron. A staunch Lancastrian under Henry VI, he changed sides under Edward IV, and in 1466 became treasurer and was created Earl Rivers, his daughter Elizabeth having married the king two years previously. On the defeat of Edward at Edgecote Rivers fell into his enemies' hands and was executed, Aug. 12, 1469.

Rivers, ANTHONY WOODVILLE, 2ND EARL (c. 1442–83). English statesman. Son of the 1st earl, he

2nd Earl Rivers, the English statesman, who wrote the first book to be printed by Caxton's press, is seen presenting the volume to Edward IV

fought at Towton in 1461, and in 1469 became governor of Calais and succeeded to his father's title. He acquired great influence in the Yorkist party, for whom he de-

fended London. His chief claim to fame lies in the fact that his Dictes and Sayings of the Philosophers (trans. from the French) was the first dated book from Caxton's press (March 18, 1477), and therefore almost certainly the first book printed in England. On the death of Edward IV, Rivers fell a victim to the malice of Richard III, and was beheaded at Pontefract, June 25, 1483. See Bible.

Riverside. City of California, U.S.A., the co. seat of Riverside

Riverside, California. An aerial view of the city, noted for its avenues

co. It stands on the Santa Ana river, 58 m. E. by S. of Los Angeles, and is served by rlys. The neighbouring district produces oranges and lemons; here the seedless orange was evolved in 1873 and the university of California maintains a citrus experimental station. Portland cement is manufactured. Riverside was settled in 1870 and incorporated in 1883. The chief of its famous drives is Magnolia Avenue, 10 m. long. Pop. 34,696.

Riverside Drive. Thoroughfare of New York City, lining the W. escarpment of Manhattan I., overlooking the Hudson R. It runs from 72nd Street northwards to Dyckman Street, a distance of nearly 7 m. On the river side of the roadway is a continuous strip of parkland, the other side being faced by flats and mansions, once fashionable. There are several handsome statues and monuments, as well as the tomb of Gen. Grant. From a house on the drive, Samuel Morse received the first telegraph message from Philadelphia. Riverside Church, at the corner of 122nd Street, is a famous institutional centre, nominally Baptist; it was built with financial assistance from J. D. Rockefeller, jr., and was completed 1929. See New York illus., pp. 6063, 6065.

Riveting. A method for joining the edges of metal plates or

sheets. Rivets are pins with shouldered heads at each end, which can be fitted into holes, previously drilled, punched and reamed, through two or more plates, in such a way that the plates are gripped tightly together between the shoulders, as shown diagrammatically. As a rule the rivet is supplied with one head already formed and the riveter fits it through the plates and then forms the second head *in situ*. Generally, in forming the second head the rivet stem expands tightly against the sides of the hole. Riveting is used extensively in constructional engineering, ship-building, boiler-making and aeronautical engineering, though it has to some extent been superseded by welding.

Although rivets can be made from various metals, e.g. wrought iron, steel, copper, aluminium, magnesium, many metals and alloys cannot be used. Apart from strength, the selection of a metal for a rivet is dependent on two main factors:

(1) The nature of the metal of which the plates which are to be joined are made must be considered carefully. Electrochemical corrosion (*q.v.*) must be avoided and the plates must not be damaged by the riveting process as might happen if the rivet material is much tougher than the plate.

(2) The method or methods by which the heads of the rivet are to be formed, particularly the second head, are important, e.g. iron and steel rivets are usually forged from red-hot metal rod, whereas aluminium rivets are forged from cold metal rod.

Various types of rivets are used, the main difference between them usually being in the form of head. Examples of different types of heads are shown in Figs. 1-5. Fig. 1 shows a rivet with one round, or "snap," head, which is probably the most popular type, and one conical head. Fig. 2 shows one "pan" and one countersunk head. Fig. 3 shows one "mushroom" head (flatter than the hemispherical "snap" head) and one flat, or "button," head. Fig. 4 shows a "snap" headed rivet with a hollow expanded end. This may be expanded in place by detonating a small explosive charge held in the hollow end. Fig. 5 shows a hollow, or "pop," rivet with a countersunk head at one end and an expanded head at the other. This hollow type is much employed in aircraft since this form can be

fitted by one riveter, without assistance, and entirely from one side of the plates if necessary.

Rivets can be used only on plates which overlap each other, and are most often used in groups or rows. Their relative size and spacing must be decided according to the nature of the plate and rivet materials in conjunction with the required strength of the joint. A single row of rivets (Fig. 6) can give up to 60 p.c. of the strength of the solid plate, while a double row, either in line (Fig. 7) or

Riveting. Examples in common use. See text

staggered (Fig. 8) can give up to 75 p.c. plate strength. A triple row can give up to 85 p.c. plate strength. Sometimes it is not convenient to overlap the actual plates, and then they may be joined by a single or double strapped butt joint (Figs. 9 and 10). There are various and numerous modifications to all these kinds of joints.

Rivets can be formed by hand or by machine. A riveted joint is not gas or water tight and, if such

a tight joint is required, either a sealing compound must be sandwiched between the lapped plates or the inner edge of one plate must be caulked by hammering along it with a caulking tool.

Riviera. Narrow coast strip on the Ligurian Sea (*q.v.*), extending from Fréjus to Leghorn. Backed by the S. slopes of the Maritime and Ligurian Alps and the Ligurian Apennines, it stretches for 140 m. E. and W. of Genoa as the Riviera di Levante and Riviera di Ponente respectively. With all the charm of a mt. background, a delightfully sunny winter climate, rich typically Mediterranean vegetation, and a wonderful glow of colours, it is a noted tourist resort.

In the W. the French littoral surrounds the principality of Monaco; here are Cannes, St. Juan-les-Pins, Antibes, Nice, Villefranche, Monte Carlo, and Mentone. In the larger Italian section to the E. are Ventimiglia, Bordighera, San Remo, Savona, Genoa, Rapallo, and Spezia. The indigenous flora has been so enriched with imported plants that there are specimens of all the most notable plants of the world, including thirty species of palms, eucalypts, and camphor trees. The season extends from November to May. Communications include the Corniche roads, the P.-L.-M. and Italian state rlys. and steamers.

As a health resort the Riviera is specially suited to sufferers from chronic rheumatism, nervous disorders, various chronic forms of catarrh, asthma, and the early attacks of phthisis, as well as to convalescents from other diseases who require reinvigorating; such visitors can readily find suitable resorts off the main roads and away from the fashionable spas.

Minor resorts, beginning in the E. and going W., are Pietra Santa, with the cathedral of San Martino, the church of Sant' Agostino, and the Battistero; Seravezza, with marble quarries inaugurated by Michelangelo in 1517 and a palace of Cosimo I erected in 1559; Santa Margherita, with an ancient church and the Castello Cervera; Camogli, with a school of navigation and the memory of its former greatness as a port for sailing vessels; Rocco, birthplace of Niccolò da Recco, who discovered the Canary Islands, with the parish church of San Giovanni; Bogliasco, with picturesque ancient Roman bridge; Varazze, with shipbuilding yards and the 12th century church of Sant' Ambrogio. See Corniche, La; Genoa; Mentone;

Riviera. Map of the French and the western portion of the Italian Riviera.

Inset, plans of Nice and Monaco

Nice. Consult The Riviera and the Corniche Road, Sir F. Treves, 1921; A New Handbook to the Riviera, 1930.

Riviere, BRITON (1840-1920). British painter. Born in London, of Huguenot descent, Aug. 14, 1840, he was educated at Cheltenham and Oxford. Riviere exhibited three pictures at the R.A. when 17, and established his reputation by his Academy picture, Charity, in 1870. He became an animal painter of remarkable skill, and among his notable successes were Croc, 1871, widely circulated as an engraving; Daniel, 1872; Sympathy, 1878; Actaeon, 1884; Adonis Wounded, 1887. Examples of his work are in the Tate Gallery. Elected A.R.A. in 1878, and R.A. in 1881, he died April 20, 1920.

Briton Riviere,
British painter

Rivière du Loup. River of Quebec, Canada. It rises in the highlands of the province, in the Grand Lac des Îles, flows through the Lac au Sorcier, and continuing S. falls into the St. Lawrence about midway between Montreal and Quebec in the lake of St. Peter, one of the expansions of the great river. The town of Rivière du Loup

stands on the right bank of the St. Lawrence, 115 m. below Quebec on the C.N.R. and Temiscouata rly. Pop. 8,713.

Rivington, CHARLES (1688-1742). English publisher. Born at Chesterfield, he was apprenticed to a London bookseller, and in 1711 took over the business of R. Chiswell under the sign of the Bible and Crown. Religious and philosophical publications issued by him established the reputation of the firm. In 1741-42 he published Richardson's Pamela. Dying Feb. 22, 1742, he was succeeded by his son, John (1720-92), who, becoming publisher of the S.P.C.K. in 1760, extended and widened the scope of business by editions of English classics. On his death the business was carried on by his sons Francis (1745-1822) and Charles (1754-1831), who started The British Critic in 1793. The business passed to the children of these brothers, and was taken over by Longmans in 1890.

Charles Rivington,
British publisher

Rivoli. Town of Italy, in the prov. of Turin. It is on a ridge, 8 m. W. of Turin, with which it is connected by rly., and is a resort for merchants of Turin. The chief

occupations of the inhabitants are the manufacture of silk and of macaroni. Rivoli was in that part of Italy liberated from the Germans by Italian patriots at the end of April, 1945. The 18th century castle was gutted.

Rivoli. Village of Italy, in the prov. of Verona. It stands on the river Adige, and is on the main route from Tirol, 13 m. N.W. of Verona. Here on Jan. 14-15, 1797, the French gained a notable victory over the Austrians. After their defeat at Arcola (q.v.), the Austrians gathered their forces for an attack on the French, who had established themselves on the heights of Rivoli. On the morning of Jan. 14, Napoleon began the battle by a charge against the Austrian centre. Ably supported by Joubert and Masséna, he inflicted a crushing defeat, driving the panic-stricken enemy before him and taking over 12,000 prisoners. Masséna earned the title of duke of Rivoli for his services in the battle.

Riyadh. One of the capitals of Saudi Arabia, Mecca being the other. Nearly 500 m. N.E. of Mecca, it occupies a depression in the plain, and is almost enclosed with date gardens, which are irrigated by buckets from deep wells. The town is surrounded by high mud-brick walls protected by a ditch, there being six fortified gates. The principal mosque is

adjacent to the huge palace of the ruler. The people, 150,000 in number, are Wahabite Mahomedans.

Rizal, José (1861-96). Filipino author and patriot. Born at Calamba of Malay stock, he was educated at the Jesuit college in Manila. He went to Europe to study medicine and became a skilled optical surgeon; but his studies, begun in Madrid, were extended in Paris, Heidelberg, and Berlin to cover philology and the social institutions of Europe. In 1886 he published in Spanish a novel, translated into English as *Friars and Filipinos*, 1900, which was a powerful indictment of Spanish rule in the Philippines and of the greed and bigotry of the religious orders there. He was forced to leave his native island a few months after his return, and published in 1891 *El Filibusterismo*, a sequel to his earlier novel. After receiving assurances of personal safety, he returned to Manila in 1891, but was banished to Mindanao on a charge of organizing a secret society. In 1896 he volunteered to take part in a campaign against yellow fever in Cuba, but was seized on the way, brought back, and shot as a traitor, Dec. 30.

Riza Shah Pahlevi (1877-1944). Persian ruler. This army officer in 1921 led a force of 4,000 against Teheran, and with its capture became minister for war and c.-in.-c.; as virtual ruler of Persia he secured a degree of order unknown for many years. In 1923 the shah Ahmed Kajar fled to Europe, and Riza appointed himself prime minister; and on Dec. 16, 1925, after the Majlis (national assembly) had deposed the shah, he was chosen to succeed, the throne becoming hereditary in the Pahlevi family. During his reign he greatly improved communications, laying or repairing 10,000 m. of roads and constructing the Trans-Iranian rly. When the British and Russians entered Persia in 1941 he abdicated, Sept. 16, in favour of his son Mohammed, and left the country for Mauritius. He died in Johannesburg, July 26, 1944, and was buried in Cairo, his body being reinterred near Teheran May 7, 1950.

Rizzio or Riccio, David (c. 1533-66). Italian musician, favourite of Mary Queen of Scots. A native of Pancalieri, near Turin, he came to Scotland as an attendant of an Italian envoy. Mary gave him an appointment in her court, first as a singer in the chapel, then as a valet de chambre, and finally as secretary. This pro-

motion of a foreigner and R.C. in the royal favour, which took place about the time of the marriage

David Rizzio, favourite of Mary Queen of Scots

with Darnley, roused the suspicions of the Reformers, and rumours of intrigues with Rome began to grow current. Rizzio's influence at court increased, and by about 1564 he was one of the most powerful persons in the kingdom, rich and haughty. This made the nobles jealous, while Darnley believed that the queen and her servant were lovers. The outcome was a plot to kill Rizzio, and the deed was carried out, March 9, 1566, at Holyrood, after he had been dragged from Mary's presence. The conspirators showed their vindictiveness by inflicting 56 wounds upon the body. See *Mary Queen of Scots*.

Rjukanfos (Nor., reeking or foaming fall). Grand cascade of Norway, in Telemarken. It is formed by the river Maane, which makes an almost perpendicular descent of 415 ft.

Roach (*Rutilus rutilus*). Common fresh-water fish. It is found in nearly all British rivers, and in

Roach. A specimen of the common variety of this European fresh-water fish

most European rivers N. of the Alps. It is of silvery colour, with red fins in the adult. The eggs are attached to aquatic plants, and hatch out in a week or fortnight, according to the temperature. This is a popular fish with the angler, as its wary habits call for considerable skill to take adult specimens, but its qualities as a table fish are poor.

Road Board. Former department of the British government. Set up in 1909, its function was to make grants to local authorities for the construction of new roads and the improvement of existing ones. Its income, derived from a percentage of the duties on petrol and from vehicle licences, averaged £15 000,000 a year.

The board was merged with the ministry of Transport in 1919. See *Road Fund*.

Road Fund. Fund established by parliament in 1920 to be used for general expenses connected with the roads of the U.K.; from it also grants or advances on loan were made to highway authorities for road construction and repair. Originally, all sums paid in respect of vehicle excise duty licences were carried to the road fund, but this was later reduced to two-thirds of these amounts. At first all sums paid into the road fund were reserved for road expenses, but in 1926 the practice started of transferring ever-increasing sums from the road fund to the Exchequer for general revenue or to achieve a balanced budget; this was called "raiding the road fund."

Under the Local Government Act of 1929, the road fund passed under the control of the Treasury, and the system of making grants from the fund to highway authorities ceased, the grants being made to the Exchequer which in turn transferred them to the county councils concerned. In 1937 motor licence duties ceased to be paid into the road fund, and the liability of the Exchequer to transfer licence duties, less its authorised share, to the road fund ceased. Such licence duties then went to general revenue, and amounts were paid into the road fund from moneys provided by parliament.

Road Numbering. Method of designating main roads in Great Britain. Each road is given an official number, which appears against the road on road maps and also on roadside signposts. It is preceded by a letter, A, B, or C, indicating its class. Six of the nine main arterial roads in Great Britain radiate from London and are numbered clockwise as follows: 1, Berwick and Edinburgh; 2, Dover; 3, Portsmouth; 4, Bath; 5, Holyhead; 6, Carlisle; and three from Edinburgh; 7, Carlisle; 8, Glasgow and Gourrock; 9, Inverness.

Road Racing. Term used to describe motor car and motor cycle races held on the open road, as distinct from those run on specially laid out tracks. Most countries hold grand prix, which are for cars designed for racing, while the Le Mans and R.A.C. tourist trophy races are for normal sports cars. These races are for 24 hours, entailing the use of headlamps and more standard car

equipment than is found in grand prix cars. Somewhat similar types of road racing are the Isle of Man, Targa Florio (Sicily), and Monaco grand prix. These races are essentially tests of corners, acceleration, and braking. High top speed is necessary, but it can never be maintained for any long period owing to the winding nature of the course. The Monaco grand prix is run through the town of Monaco, and, from the spectators' point of view, is considered to be the most thrilling motor car race in the world. In England road racing, as distinct from reliability trials, is illegal on normal roads. Donington Park course, opened in 1934, reproduces road conditions in a confined space.

Motor cycle road racing is the most strenuous of all mechanical sports. The first event of this kind was held in the Isle of Man in 1907 and developed into the tourist trophy event. The race, which is held in 37-m. laps, is 259 m. long and is run in three

separate classes, senior, junior, and lightweight according to the engine rating. Motor cycle road racing is a sport in which British manufacturers and riders have always excelled. Their only serious competitors were the German cycles and teams, which were first entered for the leading events in 1936. See *Motoring*.

Road Research Laboratory. British research organization. Situated at Harmondsworth, Middlesex, the laboratory is a unit of the dept. of scientific and industrial research, and is directed by a board. It is concerned with the testing of road surfacing materials for durability and non-skid properties, and the testing of new lighting systems. Road surfacing materials are tested on a circular track over which wheels of various vehicles are rotated. Experimental stretches of tested materials are laid on the main road outside the laboratory and subjected to prolonged trial in normal traffic conditions.

ditches (*sulci*) and the space between was excavated down to the subsoil. Over this a layer of fine earth was spread and rammed down, and upon it laid the *statumen*, consisting of two layers of flat stones bonded in mortar. Next was laid the *radus*, a 9 ins. thick layer of stone and mortar concrete, to carry the *nucleus*, which was 6 ins. thick and consisted of fragments of stone, brick, and pottery firmly cemented together. Finally came the actual road surface, or *pavimentum*, made up of large stone slabs 6 ins. thick carefully cemented together. The road surface was given a slight camber for drainage, and the sides had a low stone edging. Most of the roads had a depth of 3 ft. from foundation to surface.

During the Roman occupation of Britain, four main groups of roads were built radiating from London: one north-eastwards through Colchester to Lincoln and York; a second, later known as Watling Street, through St. Albans to Chester; a third south-easterly through Canterbury to the Kentish ports; and a fourth westerly to Silchester and thence to the south-west of England. A fifth road ran diagonally across England from the S. coast to the N.W. bastions of the Roman wall along the Scottish border. The roads now known as Ermine Street, the Fosse Way, and Icknield Way, which followed the lines of the primitive track roads of the early Britons, were not of great importance in the Roman system of roads in Britain.

Lost Art of Road Building

After the fall of the Roman empire, the art of building durable roads was lost, and during the Middle Ages the greater part of the existing Roman roads was allowed to fall out of repair, particularly in Britain, where bridle paths and mere tracks again became common.

In medieval England the usual practice was to lay another track alongside when the original wore out. The generally bad state of English roads was due chiefly to the state of the law, which compelled each parish to maintain its own roads. One of the earliest English road laws, passed in 1285, was not concerned with road surfaces, but merely with the cutting down of roadside hedges to prevent concealment of robbers. In the neighbourhood of London the roads were kept in repair by a system of tolls, first levied in 1346. In 1555 an Act required each parish to appoint surveyors to keep the roads in order by compulsory

ROADS AND ROAD-MAKING

David Le Roi

The history of roads, and of methods of making them, is here given, together with the chief ways of constructing and planning roads used in the 20th century. Allied articles include Alcan Highway; Appian Way; Autobahn; Ermine Street; Fosse Way; Highway; Icknield Way; Ledo Road; Pan-American Highway; Road Research Board. See also McAdam, J. L.; Telford, Thomas; Wade, George

Man's first roads were the tracks along which the communities of the Old Stone Age fetched their flints and salt 30,000 years ago, and as civilization has developed, so has the road. It was an essential element in the material advancement of a nation, and the condition in which it was kept, particularly where there was no alternative means of communication, as by river or coastwise shipping, was, until the introduction of rlys., a sure indication of the state of trade and industry and of the authority of government. All the great military powers have been road builders, as an efficient system of roads maintained in good repair was necessary for the rapid movement of armies. In island countries such as those of the British Isles, where there was little danger of sudden invasion, the building and maintenance of strategic military roads was of small importance.

One of the earliest of the road building nations was ancient Egypt, and in the time of Cheops 100,000 men were annually engaged in the building and maintenance of roads. Babylon was the centre of an elaborate system of paved roads extending to the far-

thest outposts of the Assyrian empire, and the city states of classic Greece were linked by well drained and surfaced highways. The Carthaginians were great road builders and it was from them that the Romans learned how to build the military "ways" which everywhere followed in the wake of Roman conquest. The men of the ancient civilizations of Mexico and Peru were also great road builders.

Except when some insuperable barrier intervened, Roman roads followed a straight line from start to finish, crossing hills, marshes, and ravines which could have been avoided by only slight deviations. They were usually surveyed and laid out in a line with some prominent landmark, so that their straightness was generally a matter of convenience. Roman roads were so solidly constructed that many of them have survived the traffic of 2,000 years to provide existing details of early road making. In general their method of construction was that adopted in the building of the famous Appian Way, started in 312 B.C. Having laid out the line of the road, its width, which varied from eight to 20 ft., was marked by two parallel

labour; some years later the statute labour tax was substituted for compulsory labour. But these enactments achieved little.

It was not until the introduction of the turnpike system under Charles II that a few of the more important arterial roads were made even passable to vehicles. Between 1726 and 1737 Gen. Wade built some 250 m. of roads of 16 to 18 ft. width, mainly with a view to pacifying the Highlands after the rebellion of 1715. In general, however, British roads continued in a deplorable condition even as late as 1770, as attested by Young in his *Six Months Tour*.

Continental Roads

Roads on the Continent, particularly in France and Italy, were generally in better state, chiefly for military reasons. In 1508 Henry IV of France appointed a great waywarden responsible for the building and upkeep of roads in that country, most of which followed the old Roman routes. In 1556 a stone road 15 ft. wide was constructed from Paris to Orleans and provided the model for later trunk routes.

Louis XIV did much to improve French roads, but their surface was liable to rapid wear until the mid-18th century, when Jules Tresaguet introduced the principles of construction upon which Telford and McAdam later based their systems. Tresaguet dug out the line of the road to a depth of 10 ins., and then laid a curved bed of earth in which large flat stones were set on edge with their tops broken off to form an even surface. The spaces between the stones were filled with smaller slabs, also with their tops cut level. The interstices between the two courses of upright stone were filled with hard gravel and rammed firmly to provide the road surface. Tresaguet's method was used for the network of military roads built by Napoleon to link the key points of his Continental empire.

In England, only the pressure of public opinion compelled the turnpike trusts to adopt the roadmaking methods introduced by Telford and McAdam. Telford retained the single course of large stones on edge introduced in France, but placed them on the bed of a level trench, securing a camber, or curved surface, by using large stones in the centre and smaller stones at the sides. Over the whole he spread an inch-thick layer of gravel. The top surface, or carriageway, consisted of a 6-in. depth of hard, broken stone firmly

rammed down. McAdam used only broken stone from the finished surface of the earth foundation upwards, raising the stone bed above the earth at each side instead of sinking it in a trench. McAdam's roads were always better drained than those built by Telford and depended for their solidity on the thorough compacting of the broken stones under the pressure of passing traffic.

McAdam and Telford constructed many hundreds of main roads in Great Britain, including the trunk roads between Glasgow and Carlisle, and Shrewsbury and Holyhead. These two engineers revolutionised Great Britain's road system; but, with the introduction of railways and the consequent suspension of road traffic except in the immediate vicinity of towns, British trunk roads again fell into neglect.

About 1910 the rapidly increasing volume of motor-vehicle traffic, with speeds and wheel loads never contemplated by earlier roadmakers, again focused attention upon road construction and maintenance. The picturesque irregular roads that formed the majority of highways in Great Britain did not meet the requirements of rapid transport. Thus the existing camber, or surface curvature, originally introduced to ensure drainage of rainwater from the crown of the road into ditches at the sides, was found excessive for fast motor traffic. It was a source of danger on right hand curves, where it increased the tendency of a vehicle to overturn, although it was an advantage in turning to the left.

Effect of Motor Traffic

As the speed of motor traffic increased it was found necessary to adopt the railway practice of banking to give the road some super-elevation on the outside of the curve, and sloping uniformly from the outside to the inside. With the development of mechanical road transport, gradient ceased to be one of the ruling factors in road construction. In the days of horse traction, the minimum permissible gradient was fixed by the tractive effort of horses hauling a heavy wagon. On a first-class level macadamised road the tractive force exerted by a horse to move a load of one ton varied from 38 to 45 lb.; with a gradient of 1 in 50 the tractive force would have had to be doubled. The tractive force also doubled when a level road deteriorated and became loose and muddy. The material with which the surface of a road is

covered similarly affects tractive effort; thus, in the case of motor traffic, an ordinary water-bound macadam road can have a steeper gradient than one with an asphalt carpet, as the latter becomes slippery in certain climatic conditions. In Great Britain the average gradient of the motor road varies between 1 in 20 and 1 in 30; the latter being preferred.

20th century Construction

Basically, 20th century road construction differs little in principle from that introduced by McAdam, later developments being chiefly in relation to the materials used for surfacing. The foundation is similar, improved by rolling with the heavy steam roller which he did not know and which permits the stones and gravel to be more solidly bonded together with water. Much harder stones are now used, the heavier initial cost being offset by lower upkeep charges. The best road metals are basalts, syenites, and granite, most of them obtained from the Cleve Hills in Shropshire.

To prevent the road from disintegrating and to provide it with a carriageway which is both resilient and watertight, the road is given an upper surface which will amalgamate into a continuous carpet. The most efficient carpet for a macadamised road is formed of broken granite, slag, or granite chippings coated with some tar product. The matrix is spread to a depth of three-quarters of an inch, and the prepared stone is distributed over it in two layers. The road is then rolled until the matrix works up between the pieces of stone; more binder is applied to the top and rolled in. The surface is sealed with a coating of hot tar and sprinkled with fine chippings. For roads carrying comparatively light traffic, a less expensive surface consists of a spraying of tar sprinkled with chippings.

Many of the roads laid down in Great Britain after 1926 were built of concrete. Where the subsoil is weak, or where the traffic is exceptionally heavy, the concrete is reinforced with steel mesh, placed at about one third the thickness of the concrete above the earth bed. The concrete varies from 7 to 10 ins. in thickness and is usually poured in two layers. To prevent cracking of the surface due to climatic expansion, the concrete is laid in sections with a space between adjacent sections filled with some pliable material such as bitumen. A number of roads, particularly trunk highways, have a

7-in. concrete foundation upon which is laid a surface carpet similar to that superimposed on macadamised roads. The principal advantage of concrete roads and foundations is that they can be quickly laid by machinery specially constructed for the purpose.

Other materials used for road surfaces are creosoted wood, iron, rubber, stone settes, and asphalt. Tarred wood paving laid on concrete and given a top dressing of tar and fine gravel is extensively used in London and other large cities. Iron roads have been successfully tried on test sections over long periods; the iron, in the form of studded triangular plates with honeycombed under-surfaces, is laid on concrete. The iron is hard-wearing and the studding, eliminating tyre suction, prevents the splashing of mud. An experimental length of rubber surfaced road laid at the N. approach to Blackfriars Bridge, London, gave more than 10 years' efficient service.

Many urban roads have a concrete foundation upon which is superimposed a 3-in. carpet of asphalt, a mixture of bitumen and finely-graded mineral matter. The disadvantage of the untreated asphalt surface is that it is too smooth, and is liable to induce skids in certain weather conditions, particularly when rain has just started to fall or when the road is partially dry; a thin layer of mud of an oily consistency then prevents the tyres from biting through to the solid surface. The smooth surface of the asphalt road carpet can be obviated by a top dressing of tar and sand, or tar and chippings.

For very heavy continuous traffic, as in the neighbourhood of docks, the road surface sometimes consists of granite settes, laid on a hardened concrete foundation. A bedding layer of sand is interspersed between the settes and the concrete foundation, and the joints between the settes are filled with chippings and pitch.

In general, all but the newest main roads in Great Britain follow the routes of the coach roads; they are winding, have many blind corners and junctions dangerous for fast traffic, and pass through heavily built up areas. To reduce fast traffic dangers numerous by-pass roads were built after the First Great War, and roundabouts and fly-overs were constructed to avoid right-angle crossings.

In 1937 the ministry of Transport took over for national control 4,500 m. of major roads in Great

Britain, and was given powers to include as trunk roads any new by-passes and diversions relating to major, or trunk, roads. In 1946, the ministry became highway authority for a further 3,705 m. of British trunk roads. The Act of 1946 further authorised the ministry to construct a number of inter-connecting roads between various parts of the country, and the bridges and tunnels to carry them over or under navigable waterways, and to remodel junctions and intersections. The ministry was also empowered to acquire land adjacent to trunk roads where such acquisitions would preserve national amenities, and to purchase, with a few exceptions, all privately owned bridges.

There are 180,670 m. of public roads in Great Britain, of which 154,694 m. are in England and Wales, and 25,976 m. in Scotland. They are classified according to condition and weight of traffic by the ministry, 27,721 being class 1 roads; 17,707, class 2; and 48,210 class 3. In 1915, £18,800,000 was spent on the construction and maintenance of British roads; in 1937, £68,000,000.

Road construction on the Continent has in general followed British practice, except in Germany, where the Hitler regime developed the *autobahn*, or strategic motor highway, and in Italy, where the fascist state constructed some outstanding mountain roads. In America, road builders have used concrete to a greater extent than in any other country, and their roads are noted for their undeviating routes and capacity to carry heavy volumes of fast traffic. America has also developed to a greater extent than elsewhere the fly-over system at crossings.

Bibliography. Treatise on Highway Construction, A. T. Byrne, 4th ed., 1901; The Great North Road, C. G. Harper, 1901, and other works by the same author; Roman Roads in Britain, T. Belloc, 1913; Bibliography of Road Making and Roads in the U.K., D. Ballen, 1914; Construction of Roads, A. Law and D. K. Clark, new ed., 1914; Principles of Road Engineering, H. J. Collins and C. A. Hart, 1936; Roads and Road Construction, B. N. Knight, 1938; Road Making and Road Using T. Sackfield, 1947.

Road Sign. Notice conveying information briefly by picture or word to road users. See Sign.

Road Town. The only town, and capital, of the Virgin Islands (*q.v.*). It is situated on the S.E. coast of Tortola, and is a port doing trade in fish, poultry, vegetables, and charcoal. Pop. 681.

Road Traffic Acts. Acts of parliament regulating motor vehicles and their drivers. The main Act is the Road Traffic Act, 1930. There are many amending Acts.

Road Traffic Commissioners. Persons appointed under the Road Traffic Acts. There are three commissioners in each traffic area, except the Metropolitan area. Their duty under the Road and Rail Traffic Act, 1933, is to issue licences in connexion with public service vehicles, driving licences for drivers of heavy goods vehicles, and licences for the carriage of goods by road.

Road Transport. This subject is considered under Transport.

Roanne. Town of France, in the dept. of Loire. It stands on the left bank of the Loire, which is navigable at this point, 40 m. N.W. of Lyons. The church of S. Etienne, dating from the 13th-16th centuries, was rebuilt in the 19th century. The hôtel de ville contains a museum of Roman antiquities. There are spinning, weaving, colour, and machinery factories, and anthracite mines. Roanne was known to the Romans as Rodumna, and was the capital of Roannais. It became important in the 15th century and was a duchy in 1566. In 1846 it was inundated by the Loire, much damage being done. Pop. 44,518.

Roanoke. River of the U.S.A. Formed by the confluence of the Staunton and Dan rivers, which have their source in the Blue Ridge, it flows generally S.E. through Virginia and N. Carolina to Albemarle Sound. It is, including the Staunton, 450 m. in length, and navigable by steamers for 120 m. to Weldon.

Roanoke. City of Virginia, U.S.A., in Roanoke co. It stands on Roanoke river, 55 m. W. of Lynchburg, on the Virginian and the Norfolk and Western rlys. Here is Virginia College, and in the neighbourhood are Roanoke, Elizabeth, and other colleges. The name of the city is the Indian word for shell money. Roanoke became a city in 1884. In 1881 its pop. was less than 700; growth is due to the Virginia rly., which has huge repair shops here. Pop. 69,287.

Roaring. Complaint affecting horses. Roaring or whistling in a horse may result from catarrhal affections of the throat, but the

fault more usually arises from defects in the air passages, and is in such case hereditary. It is particularly a failure of the thoroughbred horse, more especially those of Barb stock, but is rarely found in cobs or ponies. There is no cure.

Roaring Forties. Nautical expression used to denote the persistent and often boisterous W. winds in latitude 40°–50° S., over the oceans of the S. hemisphere. Sailing ships rounding the Horn into the Atlantic rely upon these winds; going in the opposite direction such ships are compelled to tack far to the S. to avoid them, and so enter within the limits of pack ice. These winds, blowing for thousands of miles over the oceans, bring regular rains to the W. coasts of Tasmania and S. Island, N.Z.; during the S. winter they carry rain to the S. of Australia.

Roark, Mrs. Aidan. Details of the career of this American lawn tennis player will be found under her more familiar name Helen Wills-Moody.

Roasting. Metallurgical process wherein ore is heated high enough to cause chemical change, but not sufficiently high to melt. Chloridising roasting consists of heating with salt, and the product is a chloride. Sometimes the roasting is conducted at a low temperature and with a limited supply of air to produce sulphates. Such a process is called sulphating. During roasting some minerals become magnetic, and can then be separated by means of a magnet. Oxidising roasting is heating in a current of air, and the products are mainly oxides. With reducing roasting a metal is separated from a chemical compound by a reducing agent such as coal or carbon. See Furnace; Metallurgy.

Roasting Furnace. Furnace used for roasting certain metallic ores to remove some constituent before smelting or to convert the ore into a form suitable for the subsequent metallurgical operations. The simplest form of roasting is in heaps or stalls, where the ore is simply piled into a heap and allowed to burn gradually. Reverberatory furnaces (*q.v.*) and furnaces for blast roasting are the other two types. It may be necessary to keep the gases away from the ore, in which case a muffle furnace must be used. Blast roasting may be carried out with a deep bed of ore in a pot or with thin beds, held in trays or palettes. In either case the air passes right through the bed and a product suitable for the blast furnace is obtained, the

latter process often being known as sintering. The illustration shows the wedge furnace, which is one of

Roasting Furnace. A wedge furnace with seven hearths and revolving rabblers. See text

Reproduced by permission of McGraw-Hill Book Co. Inc., New York, from *The Handbook of Non-ferrous Metallurgy*, by Liddell

the most common designs. The ore is introduced to the top of a series of hearths and is moved across each hearth by rabbling arms, which are driven by a central shaft. As the ore reaches the centre or edge of each hearth it drops through the hole on to the next hearth and so on, until by the time it leaves the bottom hearth it is fully roasted. See Calcination; Metallurgy; Roasting; Sintering.

Roatan or RUATAN. Island off the coast of and belonging to Honduras, Central America. It is 40 m. N.W. of Trujillo and is 30 m. long and 8 m. wide. Covered partly with forest and partly with grassy plains, it yields tropical fruits. Roatan on the S. coast is the administrative centre for the Bay islands, of which Roatan Island is the largest. The people are largely descended from British pirates and mutineers, and English is the only language spoken with fluency. Pop. about 4,500.

Robbery. In law, theft from the person, accompanied by violence. The English law is set out in the Larceny Act, 1916, s. 23, re-enacting an earlier statute. Every person who (a) being armed with any offensive weapon or instrument, or in concert with one or more other persons, robs, or assaults with intent to rob, any person; or (b) robs any person and at the time, or immediately before or after, uses personal violence, is guilty of felony. He may be pun-

ished by imprisonment for life or any shorter period. The essence of robbery is violence or terrorism. See Larceny; Theft.

Robbia, ANDREA DELLA. An account of this Florentine sculptor will be found under Della Robbia.

Robbins, SIR ALFRED FARTHING (1856–1931). British journalist. He was born at Launceston, Cornwall, and educated at the grammar school there. In 1871 he started a career in journalism, and occupied positions on many newspapers, being London correspondent of the Birmingham Post, 1888–1923, and becoming president of the institute of journalists in 1908 and chairman of the press lobby committee during 1914–15. A leading freemason, he represented the grand lodge of England in visits to the U.S.A., the Argentine, Uruguay, and Brazil between 1924 and 1927. He wrote on many subjects, among his books being *lives of W. E. Forster* (1882), *Lord Salisbury* (1882), *Sir Bevil Grenville* (1884), and *Parnell* (1926). He was knighted in 1917, and died March 10, 1931. His son, Alan Pitt Robbins (b. Jan. 21, 1888), was parliamentary correspondent of *The Times*, 1923–38, later becoming news editor, while another son, Alfred Gordon Robbins (1883–1944), was day editor of *The Times* in 1920, later deputy chairman of Ernest Benn, Ltd., and president of the institute of journalists, 1942–43.

Robbins, LIONEL CHARLES (b. 1898). British economist. He was born Nov. 22, 1898, and educated at Southall County school, University College, London, and the London School of Economics. After service in the First Great War he became lecturer at New College, Oxford, then serving on the staff of the London School of Economics, 1925–27. Back at New College as fellow for the next two years, he became professor of economics at London university in 1929. During the Second Great War he was director of the economic section of offices of the war cabinet, receiving the C.B. for his services. He wrote much on economics, among his books being *The Economic Causes of War*.

Robe. Word originally used for a garment, but now applied more especially to one worn on ceremonial occasions. See Costume; Gown; Knighthood.

Robert. Masculine Christian name of Teutonic origin. It means bright fame. It was early popular in France, whence it passed to England and Scotland, becoming

very frequent in both countries. The Italian form is Roberto. Robin is a diminutive. Hob and Rob are contractions used in Scotland; Bob is more frequent in England. Rupert is a variant of Robert. It is frequent in Germany under the form Ruprecht and became known in England owing to the fame of the cavalier prince Rupert. The feminine form is Roberta.

Robert I. King of Scotland. Official designation of the ruler who is better known as Robert Bruce. *See* Bruce.

Robert II (1316-90). King of Scotland. Born March 2, 1316, he was a grandson of Robert the Bruce, his mother being the king's daughter Marjory; his father was Walter the steward of Scotland and, having taken this for a surname, Robert was the first of the line of Steward or Stuart kings who later ruled England. When only two years old, parliament chose him as Bruce's successor, but the birth of a son to Bruce in 1324 changed the position. This son, David II, became king in 1329, and from then until 1371 Robert was one of the chief men of his kingdom. Several times he was made regent, and he was a leader at the battle of Neville's Cross, but later he rebelled against David and was imprisoned. The dissension was healed, and when David died childless in 1371, Robert succeeded. His reign was troubled by wars in which he could take little part. He died May 13, 1390, and was succeeded by his son, Robert III.

Robert III (c. 1340-1406). King of Scotland. The eldest son of Robert II and his mistress, Elizabeth Mure, he was declared legitimate and made earl of Carrick. He was prominent during the reign of his father, and in 1390 succeeded to the throne, taking the name of Robert instead of his baptismal John. As a ruler he was incompetent, and the kingdom was governed by his brother, the earl of Fife, by his son, David, and then by another brother, the duke of Albany. Robert died, a broken man, April 4, 1406. His eldest son, David, duke of Rothesay, having died before him, his successor was the younger son, James I.

Robert I (d. 1035). Duke of Normandy, known also as Robert the Devil. Son of Richard II of Normandy, he succeeded his elder brother Richard III in 1028. He consolidated his authority against various rivals, secured from Henry I of France the Vexin territory, and supported the sons of the English king Ethelred against

Canute. After the pestilence of 1033 in Normandy, Robert set out for the Holy Land, and died of fever at Nicaea on his way home. His only and illegitimate son was William the Conqueror. His sobriquet came from his ruthlessness in war.

Robert II (c. 1054-1134). Duke of Normandy. The eldest son of William the Conqueror, he quarrelled with his father, and in 1079 there was war between them. In 1087 Robert became duke of Normandy and was soon at strife with his brothers, William and Henry. In 1096 he pledged the duchy to William II and went on a crusade, from which, after many daring deeds, he returned to find Henry king of England. Henry bought off Robert's claims, but the two soon came to blows. On Sept. 28, 1106, a battle was fought at Tenchebrai, Robert was made prisoner, and he remained in captivity until his death at Cardiff in Feb., 1134. His son, William the Clito, was at one time a claimant for the English throne.

Robert II,
Duke of Normandy

Robert the Devil. Hero of a 13th century French metrical romance. He was the son of Bertha, daughter of Robert, duke of Normandy, and of a fiend in the guise of a knight. In him is represented the struggle between the dual nature of his heritage, though the human conquers. The story was used by Meyerbeer in his opera, *Robert le Diable*, 1831, for which Scribe wrote the libretto.

Robertson, Sir Hugh S. (b. 1874). Scottish musician. He was born and educated in Glasgow, and there in 1906 founded the celebrated Glasgow Orpheus choir, for which he arranged part songs and composed others, as well as conducting. Knighted in 1931, Sir Hugh was president of the Curwen Memorial College from 1944. He was an ardent pacifist.

Roberts, Frederick Sleigh **Roberts, Earl** (1831-1914). British soldier. Born at Cawnpore, Sept. 30, 1832, he was educated at Eton, Sandhurst, and Addiscombe, and received his first commission in the R.A. in 1851. After acting for a year as aide-de-camp to his father, Gen. Sir Abraham Roberts, who was in command of the Peshawar district, he was appointed to the horse artillery,

and in 1856 to the quartermaster-general's branch of the staff. On the outbreak of the Indian Mutiny, 1857, he was appointed staff officer to Chamberlain's mobile column; then in response to an appeal for artillery officers he travelled to Delhi, where he was appointed D.A.Q.M.G.

Robert Roberts

for artillery. At the end of the siege he was appointed D.A.Q.M.G. to the column sent to Cawnpore, which fought actions at Bulandshahr and Agra.

From Cawnpore, he marched with Hope Grant to the Alum-Bagh. Sir Colin Campbell, then commanding the second expedition for the relief of Lucknow, entrusted him with several dangerous missions, and when the column fought its way into Lucknow, it was Roberts who hoisted the British flag three times over the mess-house. After Lucknow he was present at the defeat of a band of mutineers at Khudaganj, Dec., 1857, and in the pursuit after this action won the V.C. by saving the life of a sowar and rescuing a standard from two sepoys. In March, 1858, he returned to England on sick leave.

Kabul and Kandahar

Returning to service, he was engaged in the Umbeyla expedition of 1863, the Abyssinian expedition of 1867, and the Lushai expedition of 1871. In 1875 he became Q.M.G. of the Indian army, and in 1878 commander of the Punjab Frontier Force. War with Afghanistan followed shortly after this, and Roberts, commanding the Kurram Field Force, defeated the Afghans at the Peiwar Kotal. After the murder of the British agent at Kabul in 1879, he invaded Afghanistan by the Shutargardan Pass, defeated the Afghans at Charasia, and entered Kabul, Oct. 7. In July, 1880, the British force at Kandahar suffered a disastrous defeat, and on Aug. 9, Roberts set out from Kabul with 10,000 troops, reaching Kandahar on Sept. 1, and defeating the Afghan army next day.

After a year in England, he was appointed c.-in.-c. at Madras, and in 1885 he became c.-in.-c. in India. During the next eight years he reorganized the defence of the N.W. Frontier, strengthened the army, and greatly improved

its efficiency. In 1895 he was appointed c.-in-c. in Ireland. In Dec., 1899, after the early British defeats of the S. African war, he was appointed to the command of the British army in S. Africa, and immediately altered the whole course of the campaign, defeating Cronje at Paardeberg and marching across the Free State to Bloemfontein, and then to Johannesburg and Pretoria. He returned home in Sept., 1900, leaving Kitchener in command.

In Jan., 1901, Roberts, now created Earl Roberts of Kandahar, and a field-marshal, became c.-in-c. of the British army until that office was abolished in 1904, when he was retired. He then became president of the National Service League, devoting himself to warning his countrymen of the coming European struggle. When it came in 1914, he was anxious to encourage by his presence among them the Indian contingent sent to fight in France, and visited their h.q. there in Nov. He caught a chill, and died Nov. 14, being buried in S. Paul's cathedral.

Roberts, known everywhere by his nickname "Bobs," had a short, well-knit figure, and a piercing eye. His courage and coolness in danger were joined to an intuitive power of divining the effect of his own moves on the enemy. After his death, his daughter, Aileen (1870-1944), became Countess Roberts by special remainder. His only son, Frederick H. S. Roberts, an artillery lieutenant, fatally wounded at Colenso, Dec. 15, 1899, in an attempt to save some guns, was posthumously awarded the V.C.

Bibliography. Roberts's own books: *Forty-one Years in India*, 1897; *Speeches and Letters on Imperial Defence*, 1906; *Lives by C. R. Low*, 1883; *W. Jerrold*, 1900; *W. E. Cairns*, 1902; *Sir G. Forrest*, 1914; *H. de Watterville*, 1938.

Roberts, ARTHUR (1852-1933). British comedian. Born Sept. 21, 1852, he made his first stage appearance as comedian, raconteur, and mimic 1878, though he had performed on Yarmouth sands at the age of eight. He was successful on the music-hall, but from 1883 he made a new reputation in some early musical comedies and in burlesque opera. He returned to the music-halls for a time in 1904, and appeared at

Arthur Roberts,
British comedian

the age of 80 with the *Veterans of Variety*. He was said to have invented the phrase "near the knuckle" to describe his own style of wit. He wrote *The Adventures of Arthur Roberts*, 1895, and *Fifty Years of Spoof*, 1927. He died Feb. 27, 1933.

Roberts, SIR CHARLES GEORGE DOUGLAS (1860-1943). Canadian writer. Born near Fredericton, New Brunswick, Jan. 10, 1860, he was educated at New Brunswick university, and became a schoolmaster, later achieving distinction as a journalist. From 1885 to 1895 he was professor at King's College, Nova Scotia. A prolific writer of verse, essays, and novels, he was best known for his tales of Canadian wild animal life. He served in the First Great War. He was acclaimed as an outstanding poet and as the "father of Canadian literature," having published his first volume of poems in 1880. Roberts, knighted in 1935, died at Toronto, Nov. 27, 1943. *Consult Life*, E. M. Pomeroy, 1943.

Roberts, DAVID (1796-1864). Scottish painter. Born at Stockbridge, Edinburgh, Oct. 24, 1796,

David Roberts,
Scottish painter

he worked under a house-painter, and began his career by scene painting. Later he painted picturesque buildings and landscapes in England, Normandy, Italy, Spain, and the Holy Land, and published volumes of drawings of Eastern subjects, becoming a very popular artist. He was elected A.R.A. in 1839, R.A. in 1841, and died in London, Nov. 25, 1864.

Roberts, GEORGE HENRY (1869-1928). British politician. Born at Chedgrave, Norfolk, he entered the

G. H. Roberts,
British politician

printing trade, and became organizer of the Typographical Association and president of the Trade Council, Norwich. Joining the I.L.P. in 1886, he was returned as Labour M.P. for Norwich in 1906. Appointed a lord commissioner of the treasury, he was parliamentary secretary to the board of trade, minister of labour, 1917-18, and food controller, Jan., 1919, to Feb., 1920. He died April 25, 1928.

Roberts, JOHN (d. 1880). British billiards player. He was born at Liverpool, and in 1844 became marker at Oldham. In 1849 he challenged Jonathan Kentfield, and assumed the title of champion when Kentfield refused to play him. He introduced spot-stroke play; and in March, 1862, made the then record break of 346, which included 55 spot hazards. He held the championship until defeated by his pupil, W. Cook, at St. James's Hall, London, Feb. 11, 1870. Roberts continued playing in matches and tournaments for some years; afterwards he retired to Manchester. He died in London in 1880.

John Roberts, jun.,
British billiards
player

Hisson, John Roberts, jun. (1847-1919), was born at Manchester, Aug. 15, 1847. For many years he was the most accomplished and attractive billiards player in the world, his open and all round methods being delightful to watch. When playing against E. Diggle, on May 3-4, 1894, he compiled a magnificent spot-barred break of 1,392. Roberts won the professional billiards championship in 1870, against Cook, holding the title against him in 1875, 1877, and 1885, and beat C. Dawson, 18,000 up level, by 1,814, for £200 and the championship in 1899. He travelled widely, visiting India, Australia, Canada, the U.S.A., and died at Worthing, Dec. 23, 1919. *Consult Modern Billiards*, with an autobiography of Roberts, 1902.

Roberts, MORLEY (1857-1942). British writer. Born in London, Dec. 29, 1857, he was educated at Bedford school, and Owens College, Manchester. At 19 he went to Australia, working on railways in Victoria, and later moved on to Canada, where he took part in the building of the C.P.R.

His first book, *The Western Avernus*, was published in 1887, but he found success with *Rachael Marr*, 1903, which drew the praises of W. H. Hudson. Other novels included *Time* and *Thomas Waring*, 1914; *Hearts of Women*, 1919. On the Earthquake Line,

Morley Roberts,
British writer

1924, and *Tales of Changing Seas*, 1927, were notable tales of adventure. Later works included *Bio-Politics*, 1938, and *The Behaviour of Nations*, 1941—books which advanced his sociological theories. He also wrote a life of W. H. Hudson in 1924. He died June 8, 1942.

Roberts, William (b. 1895). British painter. After studying at the Slade school, he became a member of the London Group. Early influenced by Wyndham Lewis's Vorticism, he evolved a sombre, highly individual style notable for its caustic observation of brutal types. He exhibited regularly in London, holding one-man shows at the Redfern and Leicester galleries. He is represented at the Tate Gallery, the Imperial War Museum, and the National Gallery of Canada.

Robertson, James Patrick Bannerman Robertson, Baron (1845–1909). Scottish lawyer. Born at Forteviot, the son of a minister, he was educated at Edinburgh high school and university. In 1867 he became an advocate, and soon came to the front, his gifts including a logical mind, a wide knowledge of law, and a mordant wit. Conservative in politics, he was M.P. for Buteshire, 1885–91; solicitor-general for Scotland, 1885–86 and 1886–88; and lord advocate, 1888–91. From 1891 he was president of the court of session, and in 1899 he was made a law lord and a life peer, as Baron Robertson of Forteviot. He died Feb. 1, 1909.

Robertson, Sir Brian Hubert (b. 1896). British soldier. Son of Sir William Robertson (whom he succeeded as 2nd baronet in 1933), he was born July 22, 1896, and educated at Charterhouse and the R.M.A., Woolwich. In the First Great War he was awarded the D.S.O.; he took part in the Waziristan expedition of 1922; and retired in 1933, to become managing director of Dunlop, South Africa, Ltd. Robertson came back to serve in the Middle East, 1941–43, and was chief administrative officer to Alexander, c.-in-c. Italy, 1944–45. General Robertson was deputy mil. gov., 1945–47, and mil. gov., 1947–49, of the British zone of occupation in Germany, then high commissioner until June, 1950, when he was made c.-in-c. Middle East land forces.

Robertson, Sir Charles Grant (1869–1948). British historian. From Highgate school he went to a brilliant career at

Hertford College, Oxford, and remained at the university until 1920, being domestic bursar of All Souls from 1897 and also senior history tutor at Magdalen from 1905. Books such as *The Rise of the English Nation*, 1895; *England Under the Hanoverians*, 1911; *Bismarck*, 1918, became authoritative works, but it was rather his gifts as teacher and administrator that led to Robertson's appointment as principal of Birmingham university in 1920. He remained 18 years and from 1927 was also vice-chancellor. In 1928 he was knighted. During the Second Great War he went back to All Souls as domestic bursar, and in 1946 published a study of Chatham and the British Empire. On Feb. 29, 1948, he died at Ringwood.

Robertson, Frederick William (1816–53). British divine. He was born in London, Feb. 3, 1816, and was articled in 1834 to a solicitor at Bury St. Edmunds. Disliking this, he studied for the army, but later entered Brasenose College, Oxford. In 1840 he was ordained in the Church of England, and became a curate at Winchester and then at Cheltenham. In 1847 he was appointed incumbent of a proprietary chapel at Brighton, and there he remained until his death, Aug. 15, 1853, the result of disease of the brain. In a few years Robertson made himself one of the most influential preachers of the 19th century, and his sermons are among the few that rank as literature. His views are generally described as broad church, but his sympathies were too wide for such classification. See *Preaching. Consult Sermons*, 1855; *Addresses*, 1858; *Life and Letters*, S. A. Brooke, 1865.

Robertson, John Mackinnon (1856–1933). British writer and politician. Born at Brodick, Arran, Nov. 14, 1856, he was educated at Stirling, but left school at 13. Associated with Bradlaugh on *The National Reformer*, which he edited, 1891–93, Robertson became a recognized authority on freethought. Entering parliament as Liberal member for Tyneside, 1906, he became parliamentary secretary to the board of trade, 1911–15, and was chairman of the committee on food supply in 1916. His publications include *Modern Humanists*, 1895; *Montaigne and Shakespeare*, 1897; *The Baconian Heresy*, 1913; *The Shakespeare Canon*; *Short History of Freethought*, rev. ed. 1935. Command of detail and

deep knowledge helped him to overcome the handicap of a somewhat turgid style. He died Jan. 5, 1933.

Robertson, Thomas William (1829–71). British dramatist. Born at Newark-upon-Trent, Jan.

T. W. Robertson,
British dramatist

9, 1829, he began as an actor, tried journalism, was rejected for the army, and had written several dramas before he achieved success with *David Garrick*, 1864. His other plays include *Society*, 1865; *Ours*, 1866; *Caste*, 1867; and *School*, 1869. *Caste*, his best known piece, was originally produced by the Bancrofts at the Prince of Wales's Theatre, London, and has been many times revived. Tom Robertson created lifelike characters, and his plays reflect accurately the manners of his time. He died Feb. 3, 1871. *Consult Life and Writings*, T. E. Pemberton, 1893.

Robertson, William (1721–93). Scottish historian. Born in Midlothian, Sept. 19, 1721, and educated at Edinburgh university, he entered the ministry of the Church of Scotland, holding charges in E. Lothian, and Edinburgh. In 1759 appeared his *History of Scotland*, an immediate success, which led to his being appointed principal of Edinburgh university and historiographer royal for Scotland. Other books, *A History of Charles V*, 1769, *A History of America*, 1777, brought great financial reward; for the former he received £4,500. Modern research has impaired the value of much of Robertson's work, notably in the *History of Scotland*, yet he will always be read for his wonderful narrative powers and his eloquent treatment of great events. Reading his works awakened Carlyle's interest in history. Robertson died June 11, 1793. *Consult Life*, D. Stewart, 1801.

William Robertson,
Scottish historian

Robertson, Sir William Robert (1860–1933). British soldier. Born at Welbourn, Lincs, he enlisted as a private in the 16th Lancers in 1877, becoming sergeant in 1882. He showed exceptional promise and was gazetted second

lieutenant in 1888, proceeding to India to join the 3rd Dragoon Guards. He remained there until 1896, during which period he rose to staff-captain, served as intelligence officer with the Chitral relief expedition, worked in the intelligence branch at Simla, received the D.S.O., and mastered Hindustani, Persian, and Pushtu. In 1896 he entered the staff college at Camberley, the first ranker to do so, and on passing out in 1898 joined the intelligence division at the War office. In the S. African War he served on the staff and took part in various battles. From 1902 to 1907 he was again at the War office (intelligence), then served as chief of staff, Aldershot. In 1910 he was appointed commandant of the staff college, Camberley, and in 1913 director of military training at the War office.

Sir W. Robertson,
British soldier

Robertson went to France in Aug., 1914, as Q.M.G. of the expeditionary force, and was chief of staff next year. In Dec., 1915, he went to the War office as chief of the imperial general staff. After Kitchener's death, Robertson was in supreme direction of British military operations on all fronts. Greater as an organizer than as a strategist, he preferred a war of attrition to spectacular strokes, but the government and people gradually lost confidence in him, and he resigned early in 1918. He next held the Eastern command, and in 1919-20 was commander-in-chief of the British Rhine forces. For his war services Robertson, who had been knighted in 1913, was made a baronet and received £10,000 in 1919. Promoted major-general 1910, lieutenant-general 1915, general 1916, he was created field marshal in 1920, the first soldier in the British army to rise from private to the highest rank. He published in 1921 his autobiography, *From Private to Field-Marshal*; his *Life* had been written by G. A. Leask, 1917. He died Feb. 12, 1933. His son, Sir Brian, is noticed separately.

Robertson-Scott, J. W. (b. 1866). British author and editor. He was born at Wigton, Cumberland, and educated at Quaker schools. Starting journalism with the *Birmingham Daily Gazette* at the age of 20, he was later on the staff of various London journals,

and then became a specialist writer on countryside subjects. In 1910 he was rural commissioner for the *Daily Chronicle* in the Netherlands and Denmark, and in 1915 he founded and edited the *Near East*, a magazine published in English and Japanese in Tokyo. In 1927 he founded *The Countryman*, and for 20 years edited what became one of the most remarkable and successful journalistic enterprises of its day. He wrote widely on the Far East and on the English countryside, his best-known book being *England's Green and Pleasant Land*, 1925. *Faith and Works in Fleet Street* appeared 1947.

Robes, GROOM OF THE. Honorary official of the British royal household. The holder, usually a retired officer, has care of the king's state uniforms.

Robes, MISTRESS OF THE. Official of the British royal household. Senior lady of the queen's household, the mistress of the robes attends her on all state occasions. Invariably a duchess, she does not reside at the palace. With a queen regnant, the appointment is political and ceases with the ministry.

Robeson, PAUL LE ROY (b. 1898). American actor and singer. A negro, he was born at Princetown, N.J., April 9, 1898, and educated at Columbia university, where he graduated in law. Abandoning a legal career, he went on the stage, first appearing in New York in 1921, and acting with Mrs. Patrick Campbell in *The Voodoo at Blackpool* in 1922. In New York he made a sensation when he appeared in O'Neill's *All God's Chillun Got Wings*, 1924, and *The Emperor Jones*, 1925, achieving success the same year in the latter play in London. In 1928 he gave a brilliant performance in the musical play *Show Boat* at Drury

Paul Robeson,
American singer

J. W. Robertson-
Scott,
British editor

Lane. As a concert singer, his rich bass voice and memorable interpretations of negro spirituals also brought him fame. He appeared as Othello in the U.S.A., during 1942-44, a performance considered the finest of his career. Robeson entered films in 1933, and played in screen versions of *Show Boat*, *The Emperor Jones*, and *Sanders of the River*. A biography, by his wife, appeared in 1930.

Robeson Channel. Strait separating N.W. Greenland from N.E. Ellesmere Island, Arctic America. It connects Hall Basin on the S. with Lincoln Sea on the N. It is 50 m. long, and its width varies between 11 m. and 24 m. It is blocked with ice nearly all the year round, but Peary succeeded in taking a ship through the channel in both directions. See *Arctic Exploration*.

Robespierre

Robespierre, MAXIMILIEN MARIE ISIDORE (1758-94). French revolutionist. Born at Arras, May 6, 1758, he became an attorney at his native place, and was one of the representatives of the Third Estate, when the States-General was

assembled in France on May 5, 1789. Fixed convictions, extreme zeal, and an ostentatious disinterestedness, joined with an enormous egoism and some talent as an orator, soon made him prominent among the extremists, with whom the Jacobin Club presently became identified.

It was on his proposal that the Constituent Assembly passed the self-denying ordinance which excluded its members from its successor, the Legislative Assembly, 1791. It was therefore as a member of the Jacobin Club, not of the Assembly, that Robespierre continued to lead the extreme faction in association with Marat and Danton. He was, however, again elected to the National Convention which met at the end of Sept., 1792, and proclaimed the French Republic. He had already brought about the creation of the Revolutionary Tribunal.

In the Convention Robespierre was at first, with Danton, leader of the extreme section known as the Mountain, who after the execution of the king, Jan. 21, 1793, entered upon their victorious struggle with the Girondists. Elected, July, 1793, to the recently appointed committee of public

safety, which was to all intents and purposes a commission endowed with absolute powers for the government of France, Robespierre was the person most responsible for the Reign of Terror, and after the execution of Desmoulins, and Danton, April 5, 1794, he became in effect dictator.

But the Terror grew intolerable; France recoiled, surfeited with the orgy of blood, a conspiracy was organized, the blow was secretly and thoroughly prepared, and on July 27 Robespierre was suddenly and vehemently denounced in the Convention. The crash was complete. Robespierre and his most intimate allies fled, but were arrested, and next day, July 28, the head of him whom Carlyle called the "Seagreen incorruptible" fell under the guillotine. See French Revolution; Jacobins. Consult The French Revolution, T. Carlyle, 1837; Histoire de R. d'après des papiers de famille, 1865-67; Lives, H. Belloc, 1901; J. M. Thompson, 1935; G. J. Renier, 1936; R. Korngold, 1937; F. Silburg, Eng. trans. 1937.

Robey, GEORGE (b. 1869). British comedian. Born George Edward Wade, Sept. 20, 1869, he made his first stage appearance on the music-hall stage in 1891. After playing at the chief London music-halls he appeared at every variety theatre of note throughout Great Britain, making his first

George Robey,
British comedian

appearance in pantomime at Brighton. His quips and innuendoes, his bowler hat, interrogative eyebrows, red nose, and battered umbrella, all contributed to make him one of the most famous comedians. He introduced many popular patter songs. He first appeared in revue at the Alhambra, London, in The Bing Boys Are Here, 1916, and he was the star of many subsequent revues at the Alhambra, Hippodrome, and elsewhere. He also gave outstanding performances as Menelaus in Helen I, 1932, and as Falstaff in Shakespeare's Henry IV (Part I) at His Majesty's, 1935. He was for many years a member of the B.B.C.'s general advisory council. His most memorable performance in films was as Sancho Panza in Pabst's Don Quixote. On many occasions Robey was outspoken in defence of what he called "honest vulgarity." He published My Life up to Now, 1908;

Mental Fireworks, 1925; Looking Back on Life, 1933. Among his hobbies were painting and the making of violins, of which instrument he was a connoisseur. His son, Edward George Robey (b. 1900), was senior legal assistant to the director of public prosecutions.

Robin (*Erithacus rubecula*).

Robin or Redbreast
W. S. Berridge, F.Z.S.

Songbird of the thrush family. Often called the robin redbreast, it is a native of Europe, W. Asia, and across Africa to the Canaries and Azores. In Britain, owing to its associations in legend and literature and its familiarity, it is probably the most popular bird. The bright red forehead, face, and breast separated by a blue-grey line from the greenish-brown of the upper parts, make it distinct from all other British birds. Its full bright black eye and long legs are other prominent features. These sexes are alike in colour.

In open country the robin nests usually in a hole in a grassy bank or ditch-side; but near houses it shows a fondness for utilising discarded boots, cans, kettles, and flower-pots for this purpose. Grass, moss, and dead leaves are its materials, the lining of hair or feathers.

There are from five to seven eggs of a buffy-white freckled with pale red, and there may be two or three batches in the year. The food consists mainly of insects, worms, and spiders, occasional berries, and in winter household scraps. The robin is a notorious fighter with his own kind when they trespass upon his special territory. The sweet but limited song may be heard at all seasons. Many of the birds migrate in autumn. See Eggs colour plate. Consult The Life of the Robin, D. Lack, 1943.

Robin Goodfellow. English name of a familiar, mischievous fairy who has now come to be better known as Puck (q.v.). The Mad Pranks and Merry Jest of Robin Goodfellow were set forth in a black-letter tract of 1628.

Robin Hood. Central figure in romantic stories told in old English ballads and songs of a robber outlaw, head of a band which dwelt in Sherwood Forest. He was a famous bowman, and robbed the rich that he might give to the poor, and is variously said to have been a goodly yeoman and a certain Robert who claimed to be earl of Huntingdon. Whether there is any historical basis for the legends is a matter of dispute. The ballads and poems concerning Robin Hood were collected by Joseph Ritson in 1795, and have been published in many forms. The outlaw is introduced into Scott's Ivanhoe as Locksley, and on this account he is supposed to have been born at Loxley in Staffordshire. His story was told in such poetic plays as Tennyson's The Foresters, 1891, and Alfred Noyes's Sherwood, 1911. See Little John; Maid Marian; Quarter-staff; Sherwood.

Robin Hood's Bay. Watering-place of the N. Riding of Yorks, England. It stands at the N. end of Robin Hood's Bay, an opening

Robin Hood's Bay, Yorkshire. Looking across the old village towards the bay

of the North Sea, 6½ m. S.E. of Whitby, with a rly. station. Known also as Bay Town, it consists of an old fishing village on the cliffs, and modern houses inland. It has a fine 19th century church. According to legend, Robin Hood sought refuge at Fylingdales, near here.

Robinson, AGNES MARY FRANCES (1857-1944). British writer. She was born at Leamington, Feb. 27, 1857, and published books of verse (Collected Poems, 1901), as well as biographical studies of Emily Brontë, Margaret of Angoulême, Mme. de Sévigné, Ernest Renan, and Racine. She married James Darmesteter (q.v.), and, after his death, Emile Duclaux, director of the Pasteur Inst., Paris. She died Feb. 9, 1944.

Robinson, EDWARD G. (b. 1893). An American film actor. Emanuel Goldenberg was born in

Bukarest, of Jewish family, Dec. 12, 1893. He went to the U.S.A. at nine, attended Columbia university, N.Y., being a remarkable linguist, and was in the navy in the First Great War. From the stage he went into films with The Bright Shawl, 1923. Five Star Final, 1932, brought him to the fore, and he specialised in criminal types but always made them sympathetic. His later films included The Honourable Mr. Wong, 1932; Two Seconds, 1933; Barbary Coast, 1936; The Amazing Dr. Clitterhouse, 1939; This Man Reuter, 1941; The Woman at the Window, 1945. In England in 1948 he made Thunder in the City.

Robinson, HENRY CRABB (1775-1867). British journalist and diarist. Born at Bury St. Edmunds,

Crabb Robinson,
British journalist

March 13, 1775, and educated at private schools, he was articled to an attorney. He gave up the law on inheriting money, and travelled abroad, meeting Goethe and Schiller at Weimar, and

studying for a time at the university of Jena. He became correspondent of The Times at Altona, then foreign editor, and subsequently represented his paper during the Peninsular War. In 1813 he was called to the bar, and practised for 13 years. He was a conversationalist of the first order, and his breakfasts became famous. Robinson's great tribute to posterity is to be found in his Diary and Correspondence, of which selections were edited and published by Sadler, 1869. Robinson died in London, Feb. 5, 1867. See Dandies and Men of Letters, L. H. Vincent, 1913.

Robinson, JOHN (c. 1576-1625). English Puritan. Born probably in Nottinghamshire, he was educated at Cambridge, most likely at Corpus Christi College. Having been ordained, he worked in Norwich, but his Puritan opinions brought him into disfavour. He joined the separatists and preached to them at Gainsborough, and then at Scrooby, and in 1608, to escape persecution, he went to Amsterdam. In 1609 he became pastor of a church at Leyden, where he formed the idea of a Puritan colony in America. In 1620, largely owing to his efforts, the Pilgrim Fathers set sail, but Robinson himself never crossed to them. He died at Leyden, March 1, 1625.

Robinson is regarded as one of the founders of Congregationalism. His name is perpetuated by the Congregational church at Gainsborough, and his numerous theological works were reprinted in 1851. See Congregationalism; Pilgrim Fathers; consult John Robinson, O. S. Davis, 1903.

Robinson, LENNOX (b. 1886). Irish dramatist. Born at Douglas, Cork, Oct. 4, 1886, he was educated at Bandon grammar school. For a time he was dramatic critic to The Observer, resigning in 1925. Having lectured on the drama at the universities of Michigan and Montana and at the Carnegie Institute, Pittsburgh, U.S.A., he became a director of the Abbey Theatre, Dublin, at which most of his plays were produced. These were notable for humour and lyrical beauty. The White-Headed Boy (1916) ran for 290 performances at the Ambassadors Theatre, London, in 1920, and has been revived. Other plays included The Big House, 1926; The Far-Off Hills, 1928; Drama at Innish, 1933; Bird's Nest, 1938. Robinson's autobiography, Curtain Up, was pub. in 1942, and he edited the letters of Lady Gregory, 1946.

Robinson, MARY (1758-1800). English actress and royal favourite. Born at Bristol, Nov. 27, 1758,

Mary Robinson,
English actress

she came to London, and having received tuition from Garrick, made her first appearance as Juliet at Drury Lane, Dec. 10, 1776. On Dec. 3, 1778, she appeared as Perdita in Garrick's adaptation of The Winter's Tale, and captured the affections of the prince of Wales, afterwards George IV, who quickly tired of her. She was subsequently the mistress of C. J. Fox, and of Colonel Tarleton, and her portrait was painted by Reynolds, Gainsborough, Romney, Cosway, and Hoppner; but she died in poverty, Dec. 26, 1800.

Robinson, SIR ROBERT (b. 1886). British chemist. He was born Sept. 13, 1886, at Chesterfield, and educated at Fulneck school and Manchester university.

Lennox Robinson,
Irish dramatist

During 1912-15 he was professor of chemistry at the university of Sydney, returning to Great Britain to take over the professorship of organic chemistry at Liverpool. In 1920 he became director of research to the British Dyestuffs Federation, but the following year was professor of chemistry at St. Andrews. He occupied successively chairs in that subject at Manchester, London, and Oxford, the last from 1930. In 1939 he was knighted and in 1949 made O.M. The Nobel prize for chemistry in 1947 was a recognition of his research work in the organic field.

Robinson, SIR THOMAS (1698-1770). British politician. The son of a Yorkshire baronet, he was educated at Trinity College, Cambridge. He was ambassador at Vienna, 1730-48. In 1754, being then an M.P., he was made secretary of state and leader of the commons under the duke of Newcastle, but resigned in 1755. In 1761 he was made Baron Grantham, and he died Sept. 30, 1770.

His grandson Thomas Philip, 3rd baron (1781-1859), became Earl de Grey and was first lord of the Admiralty, 1834-35, and lord-lieutenant of Ireland, 1841-44. On his death his titles, including the barony of Grantham, passed to his nephew, who became the marquess of Ripon (q.v.).

Robinson, WILLIAM HEATH (1872-1944). British artist and illustrator. Born at Islington, May 31, 1872, he

studied at the R.A. schools. As a book illustrator in colour and in black-and-white, he displayed a strongly marked decorative sense, and among his illustrations

W. Heath Robinson,
British artist

were those for Don Quixote, Arabian Nights, Twelfth Night, The Water Babies, and Kipling's collected verse. He was more widely known by humorous drawings distinguished by their crazy inventiveness; especially the ludicrously elaborate mechanical devices for equally ludicrous purposes, which made his name a household word when speaking of "gadgets" (such as that for putting mites into cheese) that were more ingenious than effective. His drawings were frequently collected in volume form, and in 1934 he published Absurdities. He died Sept. 13, 1944. Consult Life, L. Dav. 1947.

Robinson, WILLIAM LEEFE (1895-1918). British airman. Born in India, July 14, 1895, he was commissioned from Sandhurst in 1914 and joined the R.F.C. the next year. On the occasion of the Zeppelin raid on London, Sept. 3, 1916, Robinson attacked one ship, and after two hours aloft attacked another, bringing her down in flames at Cuffley. For this he received the V.C. In May, 1917, he was brought down at Douai and made a prisoner. He died at Stanmore, Dec. 31, 1918.

Robinson Crusoe. Novel by Defoe. The first part was published April 25, 1719, with the full title of *The Life and Strange Surprising Adventures of Robinson Crusoe of York, Mariner; who lived Eight-and-Twenty Years all alone in an Uninhabited Island on the coast*

Robinson Crusoe. An artist's representation of the hero of Defoe's novel of the same name

of America, near the mouth of the great River of Orinoco: Having been cast on Shore by Shipwreck wherein all the Men perished but himself: With an account how he was at last as strangely delivered by Pirates. Written by himself. The second part was published four months later. The story achieved instant popularity, and the first part has taken its place as a classic among adventure stories. It is supposed to have been founded on the experiences of Alexander Selkirk (*q.v.*), who had lived alone on the island of Juan Fernandez for four years and returned to England in 1711. See Defoe.

Robot (Czech *robot*, work). Automatic machine that does work ordinarily performed by a man. The word passed into popular usage in many countries to describe either mechanical devices, or workers who, by performing mechanical or repetitive work, became

almost machines themselves, after the production of Karel Capek's play, *R.U.R.* (Rossum's Universal Robots), in 1923. In *R.U.R.*, society is represented as dependent on mechanical workers called robots, which can perform any kind of mental or physical work, and when worn out are scrapped and replaced. But they develop intelligence and eventually exterminate their creators.

Electrically controlled robots have been constructed to perform specific functions in response to properly worded commands. Most of them incorporate a microphone which, upon receiving the correct sonic inflection, operates relays that move the robot's arms, legs, and head, and causes a steel recording tape to answer questions. The great brass brain, in Washington, D.C., gives, when asked, the date and time, and predicts the tides for every port in the world for years ahead. Eric, first exhibited in New York in 1925, was a mechanical man of stainless steel capable of rising to its feet, bowing, shaking hands, and answering questions. The robot principle has been applied to automatic telephone exchanges, artillery predictors, flue gas analysing machines, underground rly. signals, and vehicle-actuated traffic lights. See *Automatic Machines*; *Automatic Pilot*; *Automaton*; *Calculating Machine*; *Photo-electric Cell*; *Radio Control*; *Remote Control*.

Rob Roy (Gael., red Robert). Popular name for Robert MacGregor (1671-1734), Highland robber. Son of a freebooter, he was brought up at Balquhider and early made a name for himself by his daring exploits and cattle-stealing raids. To avoid the penal Acts revived in 1693 against the MacGregor clan, he assumed the name of Campbell. In the rising of 1715 Rob Roy played no important part, but after the battle of Sheriffmuir he made various raids on the S. and W. and became a scourge to the country until captured. He soon escaped and passed the succeeding years as a fugitive until his pardon in 1727, after which he settled in Balquhider, where he died Dec. 28, 1734. Consult *Historical Memoirs of Rob Roy*, K. Macleay, new ed. 1881; *Story of Rob Roy*, A. H. Millar, 1883.

Rob Roy. Sixth of the Waverley novels, published Dec., 1817. Its hero is the famous robber chief of the MacGregors, who is represented as a Jacobite involved in the 1715 rebellion, and as render-

ing valuable aid to Frank Osbaldistone, who tells the story. The Highland adventures stand out prominently, while the characters of Di Vernon, Bailie Nicol Jarvie, and the Osbaldistone family are notable. The novel, first dramatized in 1818, has formed the basis of several plays and operas.

Rob Roy. Type of canoe first built and used by John Macgregor, known as Rob Roy. From 12 to 15 ft. long, such canoes weigh about 70 lb. See *Canoe*.

Robsart, Amy (c. 1532-60). The daughter of Sir John Robsart of Siderstern, Norfolk, she married Robert Dudley, afterwards earl of Leicester (*q.v.*), at Sheen, June 4, 1550. The marriage was childless, and Dudley appears to have neglected her, though they remained outwardly on good terms. In 1560 Amy went to Cumnor Place, Berkshire, near Oxford, a house belonging to her husband, and on Sept. 8 was found at the foot of the stairs with her neck broken. The coroner's jury assigned her death to mischance, but suspicion at once fell on Dudley. (Consult Amy Robsart of Wymon Lane, Sir B. H. T. Frere, 1937.)

She appears as the heroine of Scott's novel *Kenilworth*. Betrothed to Edmund Tressilian, she is secretly married to the earl of Leicester, who keeps her prisoner at Cumnor Place, whence, to escape from the unwelcome attentions of Richard Varney, she flees to Kenilworth Castle, where Varney poses before the queen as her husband. Amy's letter of explanation to Leicester is delayed, and she falls through a trap-door at Cumnor as she is hastening, misled by Varney's imitation of the earl's whistle, to meet her husband.

Robson, FLORA (b. 1902). British actress. Born at South Shields, March 28, 1902, she studied at the R.A.D.A., making her first professional appearance in *Will Shakespeare*, 1921. After appearing in plays of all types, e.g. O'Neill's *Desire*

Flora Robson, British actress

Under the Elms, Bridie's *The Anatomist*, and Priestley's *Dangerous Corner*, she joined the Old Vic company in 1933, and established her reputation as an actress of great emotional power in *Shakespeare*, *Congreve* and *Chekhov*. The brooding intensity with which she

invested certain characters was especially memorable: in *Mary Tudor*, 1935; *Guilty* (a version of Zola's *Thérèse Raquin*), 1944; *Black Chiffon*, 1949. She acted in films, e.g. *Fire Over England*, 1937; *Wuthering Heights*, 1939; *Poison Pen*, 1940; *Caesar and Cleopatra*, 1946; *Black Narcissus*, 1947.

Robson, THOMAS FREDERICK (1822-64). Stage name of Thomas Robson Brownhill, British actor.

T. F. Robson,
British actor

Born at Margate, he started life as a copper-plate engraver, and after some years in obscure theatres acquired, in 1852, a reputation for burlesque at the Olympic Theatre, London, in *Frank Talfourd's* travesties of *Macbeth* and *Shylock*. In August, 1857, he undertook the management of the theatre, appearing with great success in such domestic dramas as *The Porter's Knot*, 1858, and *The Chimney Corner*, 1861. Robson excelled in the humour that verges on pathos, and in grotesque parts he was seldom surpassed. He died Aug. 12, 1864.

Robson Peak. Mt. in the Canadian Rockies. It is on the border between Alberta and British Columbia to the N.W. of Jasper Forest Park and the Yellowhead Pass, both of which are traversed by the C.N. rly. Alt. 12,972 ft.

Roburite. Ammonium nitrate, permitted explosive. Several varieties have been made in England and Germany, trinitrotoluene being employed as the sensitizer. The usual English variety contains trinitrotoluene, 16 p.c.; ammonium nitrate, 61 p.c.; and sodium chloride, 23 p.c. See *Explosives*; *Permitted Explosives*.

Roby, HENRY JOHN (1830-1915). British scholar. Born at Tamworth, Aug. 12, 1830, he was educated at Bridgnorth and St. John's College, Cambridge, where he graduated as senior classic in 1853. College lecturer and tutor until 1861, he was professor of jurisprudence at University College, London, 1866-68. In the cotton industry during 1875-93, he was M.P. for Eccles, 1890-95. Roby was best known for his *Grammar of the Latin Language*, 1871-74. He died Jan. 2, 1915.

Roc (Arab. *rokh*). In Oriental legend, a bird of gigantic size. In one of the stories of *Sindbad the Sailor*, in the *Arabian Nights'*

Rocambole. Bulb, leaves, and flower head. Inset, single flower

Entertainments, it is said to feed its young with elephants. It was by tying himself to one of the legs of a roc that *Sindbad* was carried safely from the island on which he had been left, to be put down near the valley of diamonds.

Roca, JULIO ARGENTINO (1843-1914). Argentine statesman. Born in Tucuman, he fought in the war against Paraguay, 1865-70, and against the Indians nine years later. Suppressing the Buenos Aires insurrection of 1880, he was elected president of Argentina, and proved an enlightened and progressive ruler. President again, 1898-1904, he settled a dangerous frontier dispute with Chile, 1902, and on his retirement he became minister to Brazil and then to Paris. He died Oct. 18, 1914.

Rocamadour. A village of France, in the dept. of Lot. It is picturesquely situated in the ravine of Alzou, 400 ft. high, and enclosed by precipitous hills. The church of S. Amador and the chapel of the Virgin stand on the summit of a rock, and are reached by a granite staircase, which pilgrims ascend on their knees. It

Rocamadour, France. Picturesque pilgrimage resort built in the Alzou ravine

is one of the most ancient pilgrim resorts of France. A sword preserved here is said to be the famous Durandal of Roland. Pop. est. 1,000.

Rocambole OR **SAND LEEK** (*Allium scorodoprasum*). Bulbous herb of the family Liliaceae, native of Europe. It has long, narrow leaves with a central keel down the underside. The tall flower stem ends in a head of small red-purple flowers margined with white; it produces purple bulbs, which are used for the same purpose as garlic.

Roch (c. 1295-1327). French saint. He was born at Montpellier, of a noble family, and made a pilgrimage to Rome, after which he devoted himself to the care of the sick in Italy during a great pestilence. He caught the infection, but recovered and returned to France. Accused as a spy, he died in prison, Aug. 16, 1327. S. Roch, the patron of the plague-stricken, is widely venerated in S. Europe, and is commemorated by the magnificent Scuola di S. Rocco at Venice, designed 1517.

Rocha. Department of S.E. Uruguay. Facing the Atlantic Ocean, its area is 4,280 sq. m. Lead, copper, and iron are found, but the principal industry is stock-raising. Pop. 82,814. The capital, Rocha, is near Cape Polonio, and about 120 m. E.N.E. of Montevideo, with which it is connected by road and rly. Pop. est. 12,000.

Rochambeau, JEAN BAPTISTE DONATIEU DE VIMEUR, COMTE DE (1725-1807). French soldier. Born

Comte de
Rochambeau,
French soldier

at Vendôme, July 1, 1725, he served in the War of the Austrian Succession, in the Minorca Expedition, 1756, and in the Seven Years' War, and by 1780 had risen to the rank of lieutenant-general. In the same year he was sent in command of a French force of 6,000 men to assist the American colonists in the War of Independence, loyally cooperated with Washington, and played a prominent part in the operations which ended in the capitulation of Yorktown, 1781. After his return to France he threw in his lot with the Revolutionaries, and was made a marshal in 1791, but had a narrow escape of his life in the Terror in 1793. He died May 10, 1807.

Rochdale. County and mun. borough of Lancashire, England. It stands on the Roch, 11 m. N.E.

Rochdale arms

of Manchester and 196 m. by rly. N.W. of London, and is served by canal. The chief buildings are the church of S. Chad, dating mainly from the 14th century, and the Gothic town hall, built 1866-71. Others are the art gallery, public library, museum, infirmary, and various churches. There are a

A.R.S.A. in 1894, and R.S.A. in 1900. In 1900 he decorated with frescoes the banquet hall, Glasgow municipal buildings. He died March 10, 1921.

Roche, Sir Boyle (1743-1807). Irish politician. After service in the army, he sat in the Irish parliament from 1777 until the union.

Rochdale, Lancashire. The town hall, built 1866-71. Upper picture, town centre

technical school and high schools for boys and girls. Rochdale possesses five parks and 144 acres of recreation grounds and playing fields. The industries include the manufacture of cotton goods, woollen goods, machinery, and asbestos. Important cattle markets are held, and the corporation controls a large covered market hall, with cold storage accommodation. For nearly 200 years the manor was owned by the Byron family. Rochdale is noted as the cradle of the cooperative movement and the home of John Bright. It was known for its hats and cutlery in the 16th century, but was made a borough only in 1856. It became a county borough in 1888, and from 1832 sent one member to parliament. Pop. 91,590.

Roche, Alexander Ignatius (1861-1921). Scottish painter. Born at Glasgow, Aug. 17, 1861, he studied at the local school of art, and afterwards in Paris at Julien's and the Beaux Arts. Returning to Glasgow in 1883, he settled down as a painter of landscapes with figures, modern in subject, yet tinged with romance, and in 1896 removed to Edinburgh, and developed portrait painting, though he did not abandon his former subjects. He became an

Roche Abbey. Ruins in the W. Riding of Yorks, England. They are $1\frac{1}{2}$ m. S. of Maltby, and include parts of the chancel, transepts, and gateway of a Cistercian abbey founded in 1147 as an offshoot of Fountains Abbey (*q.v.*).

Roche Abbey, Yorkshire. Ruins of the chancel and transepts of the Cistercian abbey

Rocheft-sur-Luqay, Victor Henri, Marquis de (1830-1913). French journalist and politician, generally known as Henri Rocheft. Born in Paris, Jan. 30, 1830, son of Armand de Rocheft-Luqay (1790-1871), dramatist, he was educated at the Collège St. Louis. He founded the weekly *La Lanterne*, 1868, in which he violently attacked the government of Napoleon III, and which was soon suppressed. Elected deputy,

1869, he founded *La Marseillaise*, and was imprisoned, 1870. On the fall of Napoleon, he acted for a time in the provisional govt. He resigned from the national assembly, 1871, and was transported for alleged complicity in the commune, but escaped in 1873. In 1880 he returned to France and founded

He received a baronetcy in 1782 for his support of the government, and he was a staunch upholder of the union. He died June 5, 1807. Roche acquired a great reputation for his witty speeches and delightful bulls.

L'Intransigeant, supported Boulanger, and worked for some years in London. Returning in 1895, he attacked the Panama scandals and the pro-Dreyfus movement. Rocheft, who was unvalued in his powers of bitter invective, died at Aix-les-Bains, June 30, 1913.

Rocheft-sur-Loire. Village of France, in the dept. of Maine-et-Loire. It stands on the Loiret, not far from the Loire, and is noted for its white wines. There are the ruins of a château destroyed in 1214 by royal command, and later rebuilt. It was bought by Henry IV, who dismantled it.

Rocheft-sur-Mer. Seaport of France, in the dept. of Charente-Inférieure. It stands on the right bank of the Charente, 9 m. from the Atlantic and 18 m. S.E. of La Rochelle. The modern and well-built town contains the Place Colbert, with an 18th century fountain, and the church of S. Louis, built 1835, noted for its stained glass. The marine hospital is one of

the best equipped in Europe. There are iron and copper foundries and machinery works, and a trade is carried on in grain, salt, brandy, wines, cattle, dairy produce, etc. The port of Rocheft was finished towards 1666, and here in 1815 Napoleon I embarked for England. Pierre Loti (*q.v.*) was a native. Pop. 29,472.

Rochelle, La. Seaport of France. The capital of the department of Charente-Supérieure, it

La Rochelle, France. The Avant-Port from the tower of S. Sauveur, showing the towers of S. Nicolas (left) and De la Chaine. Left, Hôtel de Ville

lies 90 m. S. by E. of Nantes, on the rly. to Bordeaux. The town is surrounded by ancient fortifications; three towers face the sea, of which two date from the 14th century. The cathedral, in Grecian style, was completed in 1762. Lying on the Atlantic coast, and sheltered by the two islands of Ré and Oléron, La Rochelle

La Rochelle arms

has a good harbour, but it is inaccessible to the largest vessels, which use the neighbouring port of La Pallice. La Rochelle became prominent as a port in the 12th century, and was a centre of Protestantism in France from the 16th century, being the chief centre of commerce with the French colony of Canada. It resisted the siege of the duke of Anjou, 1573, and was besieged by Richelieu in 1627, surrendering after great privation, Oct. 28, 1628. It still has a busy shipping trade, and its industries include shipbuilding, sawmills, chemical manufacture, and fisheries.

La Rochelle was entered by German forces on June 23, 1940, and as a U-boat base was frequently bombed by Allied aircraft during the Second Great War. The port remained in German occupation until May 9, 1945, when the garrison surrendered following the general German surrender. Pop. 48,923.

Oberland. The summit, 6,710 ft., reached by rack rly. from Montreux, commands a splendid view over the lake of Geneva.

Roche's Limit. Critical distance between a planet and its satellite, below which the satellite will be disrupted by the unequal gravitational pull exerted on its component parts by the planet. For a satellite of the same density as the planet, Roche showed in 1848 that the limit is 2.44 times the radius of the planet. No satellite in the solar system lies within this distance, but every part of Saturn's ring system does so. It is likely, therefore, that a former satellite came too close to Saturn and was disrupted into the fragments now seen as rings.

Roches Moutonnées (Fr., sheep-shaped rocks) OR SHEEP-BACKS. Name given to humps of rock subjected to the characteristic rounding and smoothing action of glaciers or ice-sheets. They are

Rochelle Salt. Sodium potassium tartrate. It is a substance showing a large piezo-electric effect and is used in microphones.

Rochers de Naye. Mt. peak of Switzerland, in the Bernese

common in Switzerland and in glaciated parts of the British Isles. *Pron.* Rosh mootonnay.

Rochester. City of Kent, England. It stands on the Medway, 8 m. from Maidstone and 28 m. by rly. S.E. of London.

The cathedral, replacing an older building, was erected in the 11th and 12th centuries, but later many additions and alterations were made. The chief features are the Norman west front, the crypt, the nave, the choir, and the tower and spire, a 20th century work. The treasures include cathedral records, tombs, and the choir stalls. Equal in interest to the cathedral is the Norman castle, one of the most complete ruins of its kind. Originally built 1097-98, the massive keep still stands. King's School has been stated to have been founded in 604. Two old houses are Eastgate House, now a museum, and Restoration House. Near are Gad's Hill Place, residence of Dickens, and the city is rich in Dickensian associations.

Rochester is a flourishing port. Both the Britons and the Romans had a settlement where Rochester stands, this being an important point on the Medway. Soon after

Rochester arms

Rochester, Kent. Remains of the Norman castle above the R. Medway

the arrival of S. Augustine, the king of Kent founded a church here and made Rochester a bishopric. Rochester's first charter dates from 1165. With Chatham it forms a bor. constituency. Pop. 41,021.

Rochester. Third largest city and a port of entry of New York, U.S.A., the co. seat of Monroe co. It stands on both banks of the Genesee river, 7 m. from its mouth in Lake Ontario, 68 m. E.N.E. of Buffalo, on the New York Central and Hudson River and other rlys. Across the river the New York State barge canal is carried by an aqueduct 848 ft. long, built in 1838. Among the buildings are the city hall and the masonic temple. Rochester is the seat of a university, and endowments by the Eastman Kodak co. have made

travelling in France and Italy, and serving in the navy against the Dutch, 1665, he settled at the court of Charles II, soon becoming known as one of the most dissolute of the king's companions. With a gift for writing delicate

2nd Earl of Rochester,
English courtier

verse of a satirical nature, his wit made him a general favourite, whilst his escapades were the talk of the town. He patronised and helped many men of letters. Worn out with debauchery, he died July 28, 1680. Many of his writings were too obscene for publication, but Ton-

Rock. In geology, the solid material of natural origin which forms the earth. Any particular rock is an individual mass or unit in the heterogeneous assemblage of rocks of which the earth is built. Though rocks are generally considered to be hard and solid, e.g. granite, sandstone, etc., the term is also used to include such unconsolidated deposits as soils, sands, snow-fields, and so forth, so long as they are elements of the earth's crust.

Rocks are classified into three main groups: igneous, sedimentary, and metamorphic. Each group is then subdivided still further on a basis of composition and mode of occurrence. Some rocks are essentially composed of aggregates of one mineral species only, e.g. quartz veins are almost 99 p.c. pure quartz, and some marbles are entirely made of calcite, but most rocks are mixtures of two, three, or more minerals, e.g. granite is a mixture of quartz, feldspar, and one or two varieties of mica, together with certain minor or accessory minerals.

IGNEOUS ROCKS are those which have been formed by crystallisation from molten rock matter derived from depth in the earth's crust. The parental melt is termed *magma* (q.v.) and it may be squirted or injected into cracks or along planes of weakness in pre-existing rocks, forming dykes, sills, etc., or it may be erupted out on the earth's surface as lava. Magma which has cooled slowly deep in the crust forms rocks which are coarsely crystalline throughout. If it is rapidly chilled by contact with cold surrounding rocks, or on being poured out as a lava flow, it forms a fine-grained rock or may consolidate as rock-glass. The chemical composition of the original magma largely controls the nature of the minerals that are formed, and the environment controls their degree of crystallisation, which may vary considerably.

Basalt is a familiar example of igneous rock.

SEDIMENTARY ROCKS are largely composed of material derived from the break-down and erosion of pre-existing rocks, which has been transported by wind, rivers, or ice. Such rocks originated as muds, sands, shingle, etc., which eventually consolidated. Some sedimentary rocks are of chemical origin, and result from the precipitation of material from solution in sea or lake water, e.g. salt deposits and some types of limestone.

Rochester, New York, U.S.A. The bridges across the Genesee river, the upper fall, and the business quarter of the city

it a notable scientific centre. Flour milling and the manufacture of machinery, cameras and photographic appliances, thermometers, boots and shoes, are the occupations. Political interests and social life are highly conservative, as is the press. Settled in 1810, Rochester was incorporated as a village in 1817, and became a city in 1834. Pop. 324,975.

Rochester, EARL OF. English title. It was given in 1652 to Henry Wilmot (c. 1612-58), one of the most devoted followers of Charles I. His son has a separate article. The title became extinct when Charles, 3rd earl, died in 1681. In the same year the earldom was revived for Laurence Hyde, only to become extinct again when his son Henry died in 1758.

Rochester, JOHN WILMOT, 2ND EARL OF (1647-80). English courtier. Born at Ditchley Oxon, April 10, 1647, he succeeded to his father's earldom in 1658, and graduated from Wadham College, Oxford, three years later. After

son published an edition in 1741, and an expurgated edition appeared in Johnson's collection.

Rochester, EDWARD. Name of the principal male character in Charlotte Brontë's novel *Jane Eyre* (q.v.) and eventually the heroine's husband.

Rochet (French; Ital. *roccetto*). The large-sleeved surplice-like vestment worn by bishops and abbots.

Of fine linen, it is worn under the chimere (q.v.). The dressmaker's "bishop's sleeve" is modelled on this garment. In its medieval form it had narrow sleeves, which were enlarged to remarkable size and width, in English usage, in the 17th century.

Rochet as worn by
Anglican bishops

Other limestones are largely composed of shell fragments, or of calcareous material secreted by organisms. Peat and coal, derived from accumulations of dead vegetable matter, are also included among the sedimentary rocks. The chief characteristic of all these deposits is that they are laid down one above the other in more or less horizontal beds or strata. They often contain fossils (*q.v.*), by means of which their geological age can be determined.

METAMORPHIC or altered rocks are those which may have been originally igneous or sedimentary, but have since been changed by geological processes: pressure or movement, heat, and chemical reactions due to interstitial fluids, etc. By these agencies the rocks are recrystallised, and new minerals and new structures are imparted to them. Flaky minerals such as mica or chlorite grow in the rocks normal to the direction of pressure and impart a slaty cleavage to the rock. Similar minerals may develop along directions of shearing in the rocks and, with increasing crystallisation, schists are evolved. In these, the newly formed minerals may be oriented by the movements the rocks are undergoing, or their growth may follow along previously formed planes of weakness—original bedding or cleavage—after movement has ceased. It is probable that the development of schists is largely due to the presence of hot solutions, which facilitate crystal growth, permeating along the channels and pores in the rocks.

With further coarsening in grain size, and the introduction of quartz and feldspar, schists grade into gneisses. These look like banded coarse-grained igneous rocks. Some of this banding may be due to penetration or soak of igneous fluid into the country rock. Such "mixed rocks" are termed *migmatites* (Gr. *migma*, mixture). Many geologists believe that most granites, granodiorites, and diorites owe their origin to some such process, and that these so-called igneous rocks may have been formed by chemical reconstitution of the pre-existing rocks without their having been truly fluid. This process is termed "granitisation" and is at present the subject of very considerable controversy. Consult *Principles of Petrology*, G. W. Tyrrell, 1926; *Metamorphism*, A. Harker, 1932; *Petrology of the Igneous Rocks*, F. H. Hatch and A. K. Wells, 1937.

Gilbert Wilson, Ph.D.

Rockall. Islet of the Atlantic Ocean. A small, rocky peak, about 100 yards in circumference, it stands about 230 m. W. of N. Uist, Hebrides. It is believed to be the only existing fragment of the lost or Paleartic continent.

Rock Climbing. Branch of mountaineering (*q.v.*). The sport of rock climbing began to be practised in Great Britain in the later part of the 19th century, the event which gave it initial impetus being the ascent of the Napes Needle on Great Gable by W. P. Haskett-Smith in 1886. The technique of rock climbing was developed from that of walking on steep ground. It demands the use of the hands, but the strength of the legs is vastly greater than that of the arms, and footwork and balance are therefore the basis of safe rock climbing. The steeper the rocks, the more unavoidable the strain on the arms and fingers, and the greater the need to conserve strength by obtaining all possible help from the feet. Balance rather than force must be relied on since holds may be loose and require very careful testing and handling. Smooth, unhurried movement, although not always attainable, is always the aim.

Importance of Judgement

Even more important than technique is the development of sound judgement—the capacity to distinguish, in any weather conditions or variations of personal form, what can and cannot safely be climbed. A large part of the attraction of the sport derives from the exercise of skill in order to climb potentially dangerous ground safely; and for a climber to have had to take a risk is almost invariably a sign of bad judgement.

The rock climber's equipment consists basically of special footgear—either, for general purposes, specially nailed boots or, on the more delicate routes, rubber or rope-soled shoes—and rope. The proper use of the rope is the climber's greatest safeguard. Climbing rope is usually either of manilla or of nylon, of a circumference of about 1·4 ins., although some climbers prefer to use climbing line, which is considerably thinner. The normal practice on British rocks is for parties of two, three, or four climbers to be roped together at equal intervals and to move one at a time. All except the man actually climbing secure themselves with the rope round a firm spike of rock, or belay. As the leader climbs, his second man pays out rope to him; the leader con-

tinues climbing until he reaches a ledge, or stance, where he can belay himself, when he in turn takes in the rope as the second man climbs. The distance between one stance and the next is called a pitch. The rope is usually paid out over the shoulder, round the back, and under the arm. If a climber slips, his weight is taken directly by the belayed man and indirectly by the rock to which the belayed man is tied, thus greatly reducing the abruptness of the jerk on the rope and the chances that the rope may break. In ascent, only the leader, in descent, only the last man can fall more than a very short distance; the most reliable climber in the party is therefore usually placed in these positions. Often, while climbing, he will be able to safeguard himself by taking a running belay, i.e. utilising a spike of rock or a stone jammed in a crack in order to fix a separate rope loop through which his own rope can be run until he reaches the next safe stance. On some climbs it may be necessary to make an artificial belay by driving a piton, or iron spike, into a crevice; but, although on the Continent pitons are used by advanced climbers as a direct aid, their use in the U.K. is purely protective and resorted to only if absolutely necessary. A small, metal spring-clip, or karabiner, used in conjunction with a rope loop, is, however, very convenient for running belays, etc.

Most climbers find climbing more awkward when descending than when ascending. On difficult passages in the descent, or for the sake of speed, a party may slide down a spare rope doubled round a belay, the rope being retrieved by the last climber.

Classification of Climbs

Rock climbs are rigidly classified according to a conventional system based on good conditions; the difficulty of any particular climb will, however, vary greatly according to weather and season. A strong wind affects the climber's balance; wet rock makes rubber shoes worse than useless and destroys much of the aid which can be gained from pressure and friction, besides numbing the fingers; snow and ice change the character of a cliff, and call for the use of the ice-axe and a completely new technique. Many of the harder climbs cannot be climbed at all in unfavourable conditions.

The best climbing areas in the U.K. are the Lake district, N. Wales, and parts of the Scottish Highlands—especially Ben Nevis,

Glencoe, and Skye. Excellent short routes are to be found on the gritstone outcrops of the Pennines. There are many well-established climbing clubs, often with local connexions with one particular district. A few clubs have climbing huts in their own districts. The clubs also publish very detailed guidebooks to most of the better known British cliffs.

Murray, 1947; The Mountains of Snowdonia, 2nd ed., H. R. C. Carr and G. A. Lister, 1948; British Mountain Climbs, 6th ed., G. D. Abraham, 1948.

Rock Cress. Large genus of annual and perennial herbs of the natural order Cruciferae, also known as *Arabis* (*q.v.*).

Rock Crystal. The clear, colourless crystals of quartz (*q.v.*). It is used in cheap jewelry, and in the manufacture of optical components of scientific apparatus. Specially selected crystals showing piezoelectric properties are used in radio and in certain refined instruments for measuring pressure variations.

Rockefeller, JOHN DAVISON (1839-1937). American capitalist. Born at Richford, N.Y., U.S.A., July 8, 1839, he began business as a commission agent at the age of 19, and in 1862 became connected with the oil business, building the Standard Oil

John D. Rockefeller, American capitalist

Refinery at Cleveland, Ohio, in 1865. Branches were opened, and five years later a combination of firms was formed as the Standard Oil Company with a capital of £200,000, J. D. Rockefeller being president. By 1882 the combine had absorbed or out-rivalled nearly all similar concerns in the U.S.A., and Rockefeller had become the wealthiest man in the world. He retired from business in 1911, having already devoted to charitable and educational objects a total sum estimated at more than £150,000,000. He lived until May 23, 1937, dying at Ormond Beach, Florida. *Consult* God's Gold: John D. Rockefeller and his Times, J. T. Flynn, 1933.

Rockefeller, JOHN DAVISON, JUN. (b. 1874). American industrialist and philanthropist. Son of the above J. D. Rockefeller, he was

born at Cleveland, Ohio, Jan. 20, 1874, and educated at Brown university. He entered the office of Standard Oil and in due time became one of its directors. In 1910 he retired from the board in order to assume the management of his father's benefactions and the chairmanship of the Rockefeller Foundation (*v.i.*), but as a large stockholder he continued to influence Standard Oil's business policies. He distributed his own benefactions not through groups of experts but directly, according to his special interests. He thus made munificent donations for negro education, the restoration of Reims cathedral, the exploration of Egyptian antiquities, and the victims of Japanese earthquakes. In 1946 he presented the United Nations with land worth some £2,000,000 as a site for its h.q. in New York City.

Rockefeller

Centre. Largest business and entertainment centre in the U.S.A. Planned and owned by John D. Rockefeller, jun., it occupies more than 12½ acres in the heart of New York City. Of this area 82 p.c. is leased for \$3,500,000 (approx. £900,000) a year from Columbia university. The lease will expire in 1915, and the buildings will then become the property of the university. The centre was constructed during 1931-40. It consists of 15 buildings several of which exceed 400 ft. in height. The tallest is the Radio Corporation of America building, which has 70 storeys, reaches 850 ft., and is said to be the largest

Rockefeller Centre. In the heart of New York City, U.S.A., the centre was planned and owned by John D. Rockefeller, jun. It was constructed 1931-40 and consists of 15 buildings, covering more than 12½ acres. The numbers indicate: 1, E.C.A. Building, 70 floors; 2, R.K.O. Building, 31 floors; 3, Radio City Music Hall; 4, International Building, 41 floors; 5, British Empire Building; 6, La Maison Française

office building in the world. This building and four others constitute Radio City (*q.v.*). Among other separate structures are the British Empire building, La Maison Française, Time and Life building, and the Associated Press building. The main thoroughfares within the centre are Rockefeller Plaza, 60 ft. wide, and the Channel, which runs between the British and French buildings.

A total of more than 32,000 persons work in the business offices of more than 1,000 companies and

their subsidiaries. The number of visitors per day to the centre in 1947 was estimated at 128,000.

Rockefeller Foundation. Wealthiest public trust in the U.S.A. It had an original endowment of \$182,814,480 (then worth about £36,500,000) and its assets in 1947 amounted to \$138,226,637 (then worth about £44,500,000). It was incorporated in New York in 1913, through a gift from John D. Rockefeller, sen., in order to "promote the well-being of mankind throughout the world." Most of its benefactions, which are international in scope, are administered indirectly through governmental and other agencies in the fields of the medical, natural, and social sciences, and public health. It established the China medical board in Peiping, and works in close alliance with the Rockefeller institute for medical research (v.i.). It lays special stress upon the training of qualified personnel in the various branches of knowledge in which it is interested. It is directed by a self-perpetuating board of trustees, who are free from all restrictions, having power to dispose of the principal as well as the income.

Rockefeller Institute. Short title of an institute for medical research founded 1901, at the suggestion of Frederick Taylor Gates, by John D. Rockefeller, sen., in New York City. Its full name is Rockefeller Institute for Medical Research. The donor erected and endowed the necessary buildings at a cost of £800,000, and the original charter was amended, 1908, to extend the scope of investigation. The institute includes well-equipped chemical, pathological, etc. laboratories, and a large hospital. In 1907 a farm in New Jersey was added for breeding animals for experimental purposes, and a further biological laboratory was opened in Massachusetts, 1911. A notable rule of the institute is that all discoveries and inventions made by salaried members of the staff must

be offered for the public benefit. The institute issues *The Monthly Journal of Experimental Medicine*, and other publications. See Rockefeller Foundation.

Rocket (*Hesperus matronalis*). Perennial herb of the natural order Cruciferae, known also as dame's violet. The name rocket is also applied to several other plants e.g. London rocket (*Sisymbrium iris*), dyer's rocket (*Reseda luteola*), sea rocket (*Cakile maritima*), yellow rocket (*Barbarea vulgaris*). See Cruciferae; Dame's Violet.

Rocket, THE. Name of a steam locomotive built by George Stephenson (q.v.). This engine, in Oct., 1829, won the prize of £500 offered for the most efficient locomotive by the directors of the Liverpool and Manchester rly., of which Stephenson was the engineer. Three other engines were entered for the competition, the only serious rival to the Rocket being Braithwaite's Novelty. The tests took place over a level 2 m. stretch of line, and the Rocket proved infinitely superior in speed and reliability, covering 12 m. in 53 mins. on the opening day of the trials. After doing good service for many years, the Rocket was withdrawn, and ultimately found a home in the Science Museum, South Kensington. See Locomotive and illus.; Railway.

Rocket (Ital. *rochetta*, a distaff, which a rocket on its stick resembles in shape). Type of firework. Rockets vary with the purpose for which they are made, but the principle on which the "body," or portion imparting motion to the projectile, is constructed and its essential design are always identical. The principle is similar to that of the recoil of a gun; the gas produced by the rapid burning of a suitable mixture, or "composition" (G), in a cylindrical case (H), sets up an internal pressure, which is allowed to escape through an opening at one end with the result that the case is forced forward. The fact that the rocket is propelled by in-

ternal pressure—not by the impact of the escaping gas on the air, as is often erroneously supposed—and would therefore function equally well outside the earth's atmosphere has attracted the attention of designers of interplanetary projectiles. (See Rocket Propulsion.)

In order that the pressure may be built up rapidly a proportionately large surface of the composition is exposed to ignition by leaving a tapering cavity (A) up its centre. The pressure is increased by "choking," or reducing the opening by which the gas escapes (B). A wooden stick (D), of sufficient length and weight to balance the rocket and guide it in flight, is attached to its side.

THE SKY ROCKET, used for display or signalling (see diag.), has a case (H) of rolled paper, to which is fitted a "cap" (E), cylindrical or conical in shape, containing coloured stars (F) or other pyrotechnic effects. These are lighted and blown from the cap by a small explosive charge, which is ignited when the composition above the cavity burns up to the clay diaphragm (G) and passes through the hole in its centre. Some signal rockets

carry in the cap only an explosive charge. The composition in rockets of this type is a mixture of the three ingredients of gunpowder, saltpetre (potassium nitrate), sulphur, and charcoal, but in different proportions. It is consolidated either by repeated blows of a wooden mallet or a wooden "drift," or by hydraulic pressure.

ROCKET APPARATUS. Contrivance consisting of rocket and tube, by means of which a thin line is thrown to a vessel wrecked near the shore, the range being about 100 yds. By means of the thin line a hawser is hauled to the ship in distress and made fast to the shore, and the rescue is carried out by means of a sling or breeches buoy, which is hauled backwards and forwards along it. The appara-

tus is very mobile, everything being kept in readiness at each station in a light cart or wagon. In 1855 the British govt. took over the system of rocket apparatus formerly maintained by the Royal National Lifeboat institution. There are some 350 rocket apparatus stations round the coasts of the British Isles; since 1870 more than 12,000 lives have been saved by means of this contrivance.

A development of the line-carrying rocket is the Schermuly pistol rocket, a compact and comparatively light apparatus, designed to carry a line from ship to shore. Apart from the advantage of firing with the wind, as is the case from a vessel blown into a lee shore, and the far larger target offered by the coast as compared with a partially submerged wreck, the range of the rocket is increased materially by the initial velocity provided by its discharge from the pistol.

ROCKET POST. Experiments in the dispatch of mail in contain-

ers placed in the heads of powder rockets were begun in Austria in 1928 by Friedrich Schmiedl, and continued in Germany (from 1931), India (from 1934), and the U.S.A. (from 1936). In Austria mail was dispatched over the Tirol mts., in Germany over the Hartz mts., and in India in the E. Himalayas; other distances crossed were the Brisbane and Ganges rivers, the English Channel, and from ship to shore in many parts of the world. The parachute rocket, in which at the start of downward flight a parachute was released to retard fall, was used in Australia in 1937; experimental firings were also carried out in the Netherlands, France, and elsewhere in Europe, as well as in Cuba and Mexico. In India livestock, food, and first-aid apparatus have been carried in addition to mail; in Spain, Finland, and Denmark propaganda leaflets were dispatched in wartime. No regular postal service had been set up by 1948.

ful rocket-powered flight on Sept. 30, 1929. In 1930, Valier joined Heyland in the production of a car driven by a liquid oxygen and petrol rocket unit which proved superior to the solid fuel unit in positive control, ease of regulation, and simplicity of installation. These private activities were terminated when the Nazis came to power in Germany, and subsequently all developments were conducted in strictest secrecy, the potential military value of the liquid fuel rocket being fully realized; at the end of the Second Great War Germany was at least ten years ahead of any other country in knowledge and achievement in this field.

Rocket units have been applied to (1) assisting the take-off of conventional land or water-borne aircraft; (2) the main or auxiliary propulsion of aircraft; (3) powering long range missiles which may be guided, controlled, or homed on the target.

Rocket assisted take-off was first suggested in 1927 for German seaplanes, and some time later a Junkers craft took off with the aid of Sander powder rockets. Solid fuel rockets were used by all combatants in the Second Great War to facilitate the take-off of heavily laden bombers. The Germans also developed special liquid fuel rockets for this purpose. At first liquid oxygen and petrol units were used, but these propellants gave off a large flame and intense heat liable to endanger the aircraft and were discontinued in favour of hydrogen peroxide and hydrazine hydrate, hydrogen

ROCKET PROPULSION AND WEAPONS

G. Geoffrey Smith and David Le Roi

The history of the development of the use of rockets as a propulsive force is here recounted, and is followed by some account of the adaptation of rocket propulsion to aircraft and weapons of war

Rocket propulsion and rocket weapons have both been developed from the firework rocket (*v.s.*). Early experiments in rocket propulsion were disappointing and inconclusive, owing to lack of knowledge and of technical facilities and finance. In various countries preliminary investigations were, however, made by private organizations of enthusiasts with limited funds, and from these data were gradually accumulated. From time to time experimental motors and rockets were built, usually in connexion with astronautics for which the rocket appears to offer the only possible means of propulsion. Probably the most notable of these societies was the *Verein für Raumschiffahrt* (society for space travel), usually referred to in English as the German rocket society. This body advocated the liquid fuel rocket motor and discounted the usefulness of the solid fuel motor except for the short range missile or the auxiliary propulsion of aircraft for short periods. It emphasised that the rocket was a practical proposition only for speeds above sonic velocity and was not a suitable means of propulsion for land vehicles or water-borne craft. The society built a number of small liquid fuel rockets.

The first liquid fuel rocket motor, however, was built by an American scientist, R. H. Goddard. Using liquid oxygen and petrol, this motor was operated on a test bed on Nov. 1, 1923. Goddard also shot the first liquid fuel rocket which, on March 16, 1926, flew on a high trajectory a distance of 184 ft. in 2.5 secs. (*See Rocket: Rocket Post.*)

Many attempts were made to apply powder rockets to motor cycles, automobiles, motor boats, ice sleds, rail cars, and aircraft. Outstanding were the Valier and Sander experiments with Opel cars fitted with batteries of rockets fired in succession. In the first public test in 1928 one of these cars exceeded 70 m.p.h.; in 1929 another car achieved almost 125 m.p.h. In 1928 an unmanned rail car attained a top speed of about 180 m.p.h.

The value of these experiments was entirely negative, but later, Fritz von Opel experimented on aircraft and made the first success-

Rocket. Douglas twin-engine commercial transport becoming airborne with rocket assisted take-off

peroxide and calcium permanganate, or nitric acid and aniline, which gave lower jet temps. Such units were jettisoned immediately after use and retrieved for replenishment. As they were liable to suffer damage in this operation they were eventually fitted with parachutes which were released automatically.

Rocket assistance can reduce the take-off time and length of run of land planes by 40-45 p.c. and of flying boats by 45-50 p.c.

Specific Impulse of Various Propellants

Oxidiser	Fuel	Specific Impulse lb.-sec./lb.
Liquid oxygen	Liquid hydrogen	350
" "	Alcohol	235
" "	Petrol	225
Hydrogen peroxide	Hydrazine hydrate	200
Nitric acid	Aniline	220

Take-off rockets are used also for lifting land planes from the decks of carriers and for launching heavily laden towed gliders. The large Messerschmitt transport glider, which could carry two medium tanks, was assisted in the take-off by two liquid fuel rockets under each wing.

Except in the Opel car demonstration and the Japanese "Baka" craft, solid fuel units were not used for main propulsion owing to their dangerous characteristics, uncontrollability, and short duration. The "Baka" was a glider bomb, launched from a parent aircraft and guided to its target under rocket power by a suicide pilot.

During July-Oct., 1938, the Germans conducted a series of careful tests of liquid rocket propulsion on a Heinkel aircraft. Starting with full power from the conventional engine supplemented by a rocket unit in the tail, the engine output was progressively reduced until complete flights were accomplished solely on rocket power. The Walter rocket unit, working on concentrated hydrogen peroxide and hydrazine hydrate in methanol, was used. From these beginnings the Germans evolved the Messerschmitt 163, the first operational rocket-driven aircraft. It was designed specifically to intercept Allied bomber formations and could climb to an alt. of 4-5 m. over a range of 14 m. whilst a Flying Fortress bomber was travelling 12 m. The rocket unit weighed about 415 lb. and developed a thrust of 3,740 lb. Carrying 5,570 lb. of propellant the aircraft could be operated on full power for only about 4-5 mins. A small cruising unit producing a thrust of 660 lb. was fitted to enable it to extend its endurance when in the air. Maximum speed at the service ceiling, 30,000 ft. (reached in 2-6 mins.)

was 590 m.p.h. with both main and auxiliary units in operation.

Another piloted German craft was the Bachem "Natter," a semi-expendable interceptor for defending specific targets. It was launched at an angle of 75° by two solid fuel rockets which were jettisoned at a height of about 5,000 ft. The

Walter liquid rocket unit then took over and the aircraft continued to climb. Initial flight was directed and controlled from the ground, and the sole duty of the pilot was to control the craft during the last few hundred yards of its flight towards the bomber formation. After delivering an attack the pilot abandoned ship. The front portion of the craft was jettisoned, while the rear portion, containing the rocket motor, was returned to earth by an automatically released parachute.

After the war, rocket units of this type were produced in the U.K. and the U.S.A. and used on special aircraft investigating the problems of high speed flight at and beyond sonic velocity. Examples are the Bell XS-1 piloted craft and the Vickers pilotless research model. Both of these are launched at altitude from a carrier aircraft. In 1948 it was announced that the Bell XS-1, powered by an American built, four-jet rocket unit, had exceeded sonic velocity (743 m.p.h. at sea level and 660

Zwei (V2 or Reprisal Weapon 2, also called A4) rocket, which had an initial weight of about 12-8 tons and a range of more than 200 m. At the end of the Second Great War a German project for an 85-ton rocket was discovered.

In general, solid fuels were used for short range rockets; after the initial impulse, which was of very short duration, they continued their flight as an ordinary artillery projectile. The more costly and elaborate liquid fuel rockets were used for long range objectives, attack on specific well-defended targets, or for the interception of high speed bomber formations. For attacking adequately defended targets on land or sea, exceptionally high velocity is necessary: with radar detection and anti-aircraft guns firing shells with

Rocket. Bell XS-1 piloted rocket aircraft, with a speed exceeding that of sound

proximity fuses, it was proved in the Pacific that a 400 m.p.h. bomb controlled by a suicide pilot could be destroyed before it reached its target.

The Germans produced a variety of missiles, some of which, particularly for defence against air attack, were developed to the operational stage. The "Evian," resembling a small aeroplane and powered by a nitric acid and aniline motor, was launched by four solid fuel rockets from a gun mount. Another ground-to-air missile, similarly powered and assisted by two solid fuel rockets, could be launched by two men. Both were furnished with proximity fuses for the warhead. The *Wasserfall* was a scaled down version of the V2 rocket furnished with wings; it was guided and controlled from the ground by radio.

Two rocket bombs for interception were the HS298, with a range of about 2-5 m., which was under radio control from the launching aircraft; and the X4 which, to prevent radio interference, was electrically controlled by means of twin wires simultaneously unreel from the missile and the parent aircraft.

Rocket. German rocket motor used for vertical climbing interceptors

m.p.h. at 40,000 ft. alt.), but no details were disclosed.

Rocket missiles may be as small as the tiny "bazooka" with a range of a few hundred yards fired from a man's shoulder, or larger than the German *Vergeltungswaffe*

The outstanding missile was the V2 rocket which, though of limited military value, was a substantial

technical achievement. It had a total length of 46 ft. and a maximum diam. of 5 ft. 5 ins. Its full

weight before launching, 12·8 tons, was made up: structure, 1·7 tons, power unit and equipment, 1·3 tons, warhead, 1 ton, fuel, 8·8 tons. The main propellants were liquid oxygen and a 75 p.c. solution of ethyl alcohol in water. About 400 lb. of auxiliary fuels, hydrogen peroxide and sodium permanganate, were required to feed a turbine which drove the two pumps supplying the main propellants to the combustion chamber. These pumps, delivering about 275 lb. of fuel per sec. at a pressure of 350 lb. per sq. in.,

could discharge the contents of the main fuel tanks in 70 sec. The rockets were transported on trailers to the firing site and fore firing as the liquid oxygen was lost by evaporation at a rate of about 4·5 lb. per min. if left standing. Initial flight was vertical, but an automatic gyro-pilot turned it from the vertical and directed it on to its course until it took an angle of about 45° to the horizontal after about 60 secs. flight, when all the fuel had been consumed. Thereafter the flight was parabolic and the alt., or trajectory, reached was the normal one, of about a quarter of the range. The highest velocity was reached at the "all-burnt" position, when the total weight had fallen to about 4 tons and the rocket was travelling at about 5,000 ft. per sec. (3,400 m.p.h.). This was also the point of highest acceleration, which approached 8 g (257 ft./sec.²). It is estimated that when the "all-burnt" condition was reached the output of the rocket unit was equivalent to more than 600,000 h.p. Operationally the V2 had a range of 180-220 m. The maximum height reached was probably about 60 m.

The choice of liquid oxygen and alcohol for the V2 was probably determined by considerations of availability of supplies, for better combinations are known. Rocket propellants are evaluated for comparison on their "specific im-

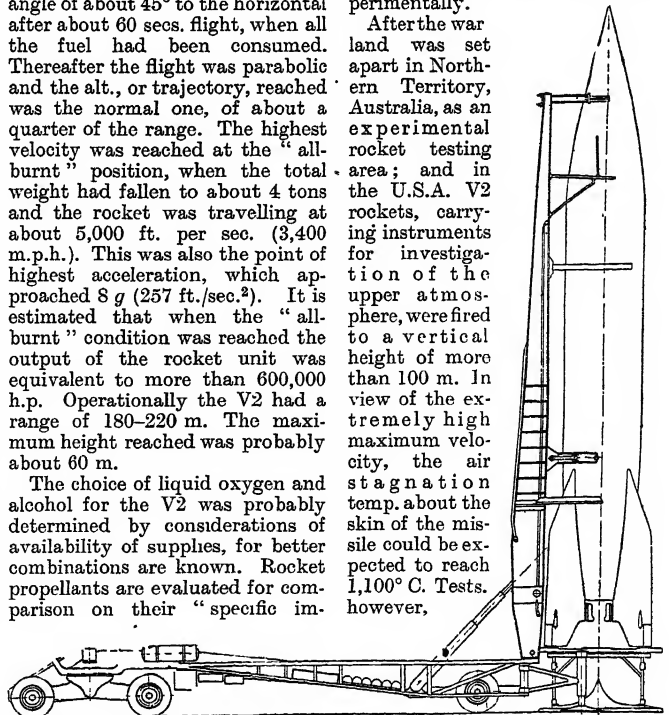

quantity of fuel consumed (lb.), and is usually expressed as lb.-sec./lb. (see table). Liquid oxygen and liquid hydrogen form theoretically an ideal fuel, but it is difficult to store and dangerous to handle, though it has been used experimentally.

After the war land was set apart in Northern Territory, Australia, as an experimental rocket testing area; and in the U.S.A. V2 rockets, carrying instruments for investigation of the upper atmosphere, were fired to a vertical height of more than 100 m. In view of the extremely high maximum velocity, the air stagnation temp. about the skin of the missile could be expected to reach 1,100° C. Tests, however,

Rocket. Launch of V2 rocket in the U.S.A. for investigation of the upper atmosphere

could discharge the contents of the main fuel tanks in 70 sec.

The rockets were transported on trailers to the firing site and

Rocket. Method of transporting and setting up V2 rocket

showed that owing to conduction and radiation the actual skin temp. did not exceed 650° C. See N.V.

G. Geoffrey Smith
ROCKET WEAPONS. Rocket missiles activated by powder propellants were the earliest explosive projectiles, first used on a large scale in the Chinese-Tartar war of 1232. Introduced into Europe about a century later, they contributed to the Venetians' successful siege of Genoa in 1380; and in 1429 rockets having warheads filled with Greek fire were used against the English at the siege of Orleans. In 1561, a French army engineer wrote the first text book on military rockets and suggested making the cases of leather instead of bamboo.

Rockets were extensively used in the Thirty Years' War (1618-1648), the most common type having a grenade head which, on bursting, threw fragments after the manner of a shrapnel shell. By the end of the 17th century, most Continental armies used rockets weighing 120 lb. with a warhead containing 16 lb. of explosive.

For long after the introduction of artillery the rocket rivalled the gun in military favour; but towards the close of the 18th century the very success of the gun as a projector of heavy missiles revived interest in the rocket. As guns became larger and more destructive, their mountings increased in weight and became therefore more difficult to move. Rockets required no heavy or elaborate mountings for their discharge, and their projectors could be moved from place to place with ease.

In 1783, Tippoo Sahib, rajah of Mysore, threw the Mahratta cavalry into confusion with rocket fire, and at the battle of Seringapatam over 2,000 rockets were discharged against the British cavalry. Their effect, although they were somewhat erratic, was deadly owing to the manoeuvrability of their projectors; and the British military authorities began to experiment with rockets.

In 1804 the British army adopted the Congreve rocket, named after the inventor, Sir Witham Congreve. The missile consisted of a cast-iron cylinder terminating in a cone, or warhead, which was either solid, for discharge against fortifications, or fitted with small shot and having a contact fuse, for use against troops. There was also a warhead filled with an explosive incendiary composition for firing magazines and ammunition dumps, and a rocket with an incendiary

charge and a pointed metal nose that embedded itself in the wooden ships against which this naval type of rocket was used. The rocket was fired from a light, metal tube fixed on an adjustable stand. Elevation of the stand governed the range: for every degree of elevation, range increased by 100 yds. up to a maximum of 3,500 yds. To counteract the rocket's inherent instability in flight, the outer casing of the projectile had four stabilising fins. The largest of the five standard types used weighed 32 lb., including the warhead.

Congreve Rockets

Congreve rockets, operated by a rocket brigade of the R.A., were first used in action in 1806 at the siege of Boulogne and set the town on fire. They were also used with good effect at Walcheren and Copenhagen in 1807, at the bombardment of Flushing in 1809, and at Waterloo in 1815. In 1835, an improved case fitted with a series of propellant charges that ignited in succession increased the projectile's range and penetrating power. These were used at the siege of Acre in 1840 and in the Burma war of 1840-42.

In 1850 five small holes were drilled in the walls of the rocket's combustion chamber through which a proportion of the gases generated by the propellant charge was forced, causing the missile to rotate on its axis in the same way as a bullet discharged from a rifled barrel. Projectors from which six of these rockets could be discharged simultaneously were used at the siege of Sebastopol. The rocket gave way to the more destructive and accurate rifled gun of the late 19th century.

There is little recoil when a rocket is discharged, so that the projector can be lightly constructed. Unlike a shell, the rocket does not lose velocity in passage from projector to target, and, gathering impetus from successive explosions of the propellant charge, strikes the target with maximum impact. The disadvantages of the older types of rocket were the weakness of the propellant charge and the comparatively low destructive effect of the explosive warhead.

During the First Great War incendiary rockets were developed for use against airships and observation balloons. They were fired from electrically-operated launching rails beneath an aircraft's wings and had a gunpowder propellant. The head of the rocket was fitted with a barb which stuck to the airship fabric, when the ex-

haust from the rocket ignited the hydrogen in the gasbag.

Some years before the Second Great War, the U.K., Russia, Germany, and France experimented with various types of rocket weapons. New and more powerful propellants were developed, and new explosives of high destructive effect which could be concentrated in a comparatively small warhead.

Long-range application of the rocket, brought into effect by the Germans in their V2, also formed part of the British research programme, but it was early decided to concentrate on a rocket gun to fill a gap in A.A. defence. The resultant rocket and projector were less accurate than the shell-firing A.A. gun, but this was of less importance as firing was normally in salvos of 100 rockets to produce a barrage. The lethal effect of a single rocket which found its target was equivalent to that of a 3·7 in. shell.

Further experiments resulted in the introduction of rocket guns for ground targets. One of the earliest of these was the American bazooka (*q.v.*). Rockets solved the problem of providing aircraft with ground assault armament having the destructive effect of a heavy gun. In the later stages of the Second Great War, Hurricanes, Typhoons, and Swordfish aircraft were equipped to launch rockets each of which had the impact effect of a 5·5 in. shell.

Rocket guns are essentially barrage weapons and, at the Allied landing in Sicily, July, 1943, and subsequent Allied landings, were used mounted on assault landing craft to saturate beach defences before the first troops were put ashore; individual craft fired several hundred rockets, each equivalent to a 5·5 in. shell. Heavy anti-tank rocket guns were mounted on armoured vehicles for saturation bombardment of enemy armour and strongpoints. The projectiles were fitted with time and contact fuses, and were launched from multiple projectors firing 30 at a time to a maximum range of 5 m.

The rockets of the Second Great War were much less accurate than shells fired from sighted barrels, but after it experiments were conducted in the development of rocket projectiles guided to their targets by remote radio control. See Parachute and Cable Unit.

David Le Roi

Rock Fish. Popular name for certain species of wrasse (*q.v.*), a large group of fishes which occur

among rocks and coral reefs. Several species are found round the British coasts.

Rockford. City of Illinois, U.S.A., the co. seat of Winnebago co. It stands on Rock river, 84 m. by rly. W.N.W. of Chicago, on the Illinois Central and other rlys. It is the seat of Rockford College. Water power is obtained from the river for the city's industries, which include the manufacture of mechanical harvesters sent to most grain-producing countries. Settled in 1834, it was chartered as a city in 1852. Pop. 84,637.

Rockhampton. A town in Queensland, Australia. It lies on the Fitzroy river, 396 m. by rail N.W. of Brisbane. The terminus of the Central Queensland rly., and the port for the mines at Mt.

2nd Marquess of Rockingham, British statesman After Reynolds

Whigs, becoming active at this time as an opponent of Bute. In 1765, on the fall of Grenville, Rockingham became prime minister, but resigned the following year. He remained an opposition leader until March, 1782, when he was again at the head of a ministry, but three months later,

July 1, 1782, he died. He left no children, and his titles became extinct. His estates in Northamptonshire and Yorkshire passed to his nephew, Earl Fitzwilliam (q.v.).

Rockingham was descended from Sir Lewis Watson (1584-1653), of Rockingham Castle, who, in 1645, was made a baron, a reward

for his loyalty to Charles I. His son Edward and then his grandson Thomas succeeded to his title and estates. The latter was made earl of Rockingham in 1714, but the title became extinct on his death in 1746. The barony, however, passed to a kinsman, Thomas Watson-Wentworth, who was made a marquess in 1746, and was the father of the prime minister.

Rockingham Ware. Pottery formerly made on the estate of the marquess of Rockingham, at Swin-

ton, near Sheffield. The works were established in 1745 and were successively controlled by Twigg, Bingley & Co., and Bramell. Rockingham ware is of a chocolate hue, the teapots, which are characteristically long, coffee-pots,

Rockingham Ware. Vase with painted landscape

jugs, and mugs being lined with white. Quaint tea and coffee pots, shaped like fruits, with moulded leaves stuck on, were produced here, and known as "Cadogans." Fine blue and white pottery was also produced in these works.

Rocking Stone OR LOGAN STONE. Massive rock so poised as to be readily swayed by hand pressure. It may be an ice-transported boulder, or a granite mass resting upon a weathered base, as at Sittaford Tor, Dartmoor. Such stones are frequent in Cornwall, Derbyshire, Yorkshire, Wales, lowland Scotland, and Ireland, often near Neolithic stone monuments, and they are associated with much local folklore. The Logan Rock (q.v.), Land's End, weighs about 70

tons; and one at Tandil, Argentina, 700 tons. Among the Kelasa Hills, Burma, a Buddhist temple crowns a rocking stone that is 3,650 ft. high.

Rock Island. City of Illinois, U.S.A., the co. seat of Rock Island co. It stands at the confluence of

Rockhampton, Queensland. Suspension bridge over the Fitzroy river, looking towards North Rockhampton

Morgan, it has rly. connexions with the other capital cities. The dist. grazes a quarter of a million cattle, and contains large meat-works, three collieries, and gold and copper mines. Pop. 34,000.

Rockingham. Village of Northamptonshire, England. It stands near the Welland, 8 m. N. of Kettering, and is noted for its castle, of which some ruins are left. This is said to have been built by William the Conqueror for the protection of the ironworks in the surrounding forest. It was rebuilt in the 16th century, but was destroyed after the Civil War. Rockingham was once a market town. S. Leonard's Church has monuments of the Watson family, who owned the castle, and took their titles from here. To the S. and E. extended the royal deer forest of Rockingham, of which a few patches remain. Pop. 184.

Rockingham, CHARLES WATSON-WENTWORTH, 2ND MARQUESS OF (1730-82). British statesman. Born May 13, 1730, he was educated at Westminster school and S. John's College, Cambridge. A member of the Whig party, he was

Rocking Stone. The Logan Stone, Rippon Tor, a famous rocking stone on Dartmoor

Rock Plants. Arrangement of a small rock garden, showing how the stones can be grouped in their natural positions, and the plants disposed in pockets and crevices

Rock and Mississippi rivers, opposite Davenport, and is served by rlys. and the Hennepin (or Illinois and Mississippi) Canal. It has the Augustana College and Theological Seminary, and on the neighbouring island, from which the city received its name, are the U.S. arsenal and armoury, about 965 acres in extent. This is a federally owned plant in which 1,600 varieties of arms are produced. E. of the island the channel has been dammed to provide water power for the city's industries. These include flour milling, iron founding, brickmaking, and the manufacture of lumber products, agricultural implements, carriages, stoves, and floorcloth. Settled in 1836, Rock Island was incorporated in 1841, and became a city in 1849. Pop. 37,953.

Rockling (*Motella*). Genus of shore fishes belonging to the cod family and nearly related to the ling. They are all of small size, and are represented in the British seas by several species. The young of one of these, formerly called

mackerel midge, was long regarded as forming a separate genus.

Rock Melon. This plant is dealt with under its alternative name of Cantaloupe. *See also* Melon.

Rock Plants. Miscellaneous genera of plants which grow in rock gardens. Most of them are natives of mountains and high valleys, but some which are not true alpiners, e.g. aubrietia and dwarf phlox, are also grown in the rock garden. They flourish in well drained soil on sloping ground. Thus, if a rock garden is made on clay such materials as sand, broken brick, and stones must be added to make it porous. Perfect drainage is the secret of success. Rock plants flower chiefly in April, May, and June. If the amateur begins with aubrietia, alyssum spinosum, alyssum saxatile, aethionema, phlox subulata, and its varieties, the Cheddar pink and other dwarf pinks, and androsace Chumbyi, silvery-leaved and mossy saxifrage, blue and yellow flaxes, houseleeks, dwarf bellflowers, and thymes, he can scarcely fail, for all are easily managed. Most rock plants need sunny places, but a few must be grown in shade.

Rock plants need much moisture in late spring and early summer, and should be watered in dry weather. Those of spreading growth, e.g. aubrietia, alyssum, and arabis, should be cut back after flowering and top-dressed with sandy leafy compost. The most difficult rock plants are those from

alpine screes at high altitudes; they will flourish in lowland gardens only in a moraine which can be made by excavating 18 in. deep, putting in a 12-in. layer of drainage, and on top a 6-in. layer of stone chips or small stones mixed with a little soil. *Consult* The English Rock Garden, R. Farrer, 1919; Rock Plants, C. Elliott, 1935; The Rock Garden and Alpine Flowers, G. A. R. Phillips, 1947.

Rock Rose (*Helianthemum vulgare*). Trailing shrub of the family Cistaceae. It is a native of Europe, W. Asia, and N. Africa. It has opposite, oblong leaves, hairy on the upper side and downy beneath. The clear yellow flowers are about an inch across. It abounds on chalk hills and dry soils. Many other species and varieties of great beauty are cultivated in rock gardens.

Rock Rose. Flowers of the trailing shrub found on chalk hills

Rockling. *Motella mustela*, the five-bearded rockling
W. S. Berridge, F.Z.S.

Rocky Mountains. Bow Valley and the Bow River, Alberta. A characteristic scene where the Canadian Pacific Railway traverses the Canadian Rockies. Near the head of the valley is Kicking Horse Pass

Rock Sculptures. Primitive designs incised upon rock surfaces, megalithic monuments, and other prehistoric stone objects. The simplest neolithic type comprised cup and ring markings. Other devices, presumably votive, are found at Gavrinis, in Brittany, N. Africa, and elsewhere. In the sterile Italian Maritime Alps 7,000 designs have been found—ploughs, oxen, sickles, ploughmen—illustrating primitive Ligurian agriculture, besides conventional signs, perhaps phonetic. Similar scribings are recorded in Finland, Portugal, and Switzerland. In Scandinavia, later in date, ploughs are intermingled with boats and sun-symbols (Tegneby). There are survivals in S. Africa, Australia, and elsewhere. See Art., Prehistoric; Assyria; Newgrange.

Rock Springs. City of Wyoming, U.S.A., in Sweetwater co. It is 258 m. W. of Laramie on Bitter Creek and the Union Pacific Rly., contains a state hospital, city hall, and public library, and is a centre for a growing trade in cereals and cattle. Lignite deposits support a mining pop. which includes 47 nationalities. Pop. 9,827

Rock Temple. Place hewn out of solid rock for religious uses. Four types occur. When denoting an excavation the term is interchangeable with cave temple. The excavation may be associated with an exposed rock-cut work. Thus the 12th century Gal Vihara at Polonnaruwa, Ceylon, has a recumbent Buddha, 46 ft. long, outside. The cliff side may be cut back, and the central mass sculptured into an open-air temple. The finest are the 8th century Kailas temple at Ellora, Hyderabad, a

richly sculptured pyramidal mass 100 ft. high, and a contemporary temple at Dhamnar, Rajputana. An exposed rock may be carved into a monolithic temple. See Cave Temple; Petra; Temple.

Rocky Mountain Goat (*Oreamnus* or *Haploceros montanus*). Goat-like mammal, found only in

Rocky Mountain Goat. White-coated mammal found in the mountain fastnesses of N. America

W. S. Berridge, F.Z.S.

N. America. It occupies a doubtful position between the goats and the antelopes. In size it resembles a large sheep, and is covered with long white hair. The horns are black, about eight ins. long, and rise from the forehead with a slight backward curve. It is found only in the most inaccessible parts of the mountains, and lacks the wariness of the true goats.

Rocky Mountains. Name in general use for the mountain system which stretches the whole

length of N. America from Alaska to the isthmus of Tehuantepec. Strictly, however, the name should be limited to the E. ridge of this complicated Cordillera, to the section of mountains abutting upon the plains which comprise the middle of the continent. In this restricted sense the Rockies vary in width from 20 to 60 m.; and in general they divide the Pacific drainage from that flowing over the central plains, although the Peace and Liard, in Canada, the Missouri and some of its tributaries, and the Rio Grande, in the U.S.A., rise to the W. of the ridge.

The range may be considered in four sections: N. of the Peace river, between the Peace and the Missouri, between the Missouri and the Rio Grande, and S. of the Rio Grande. In the N. section the Endicott Range, in Alaska, lies between the Yukon river and the Arctic Ocean; farther S. the Mackenzie Mts., the Selwyn Mts., and the Logan Range flank the lowlands of the river Mackenzie; in the Logan Range, Mt. Hunt rises to 9,000 ft.; the peaks in this section are in general below 8,000 ft.

Between the Peace and the Missouri lie the S. Canadian Rockies in a steep ridge N.W.-S.E. parallel to the upper valleys of the Fraser and Columbia rivers; there are considerable areas over 10,000 ft., and many notable peaks. Here are the rly.-traversed Crow's Nest and Kicking Horse passes, 5,500 ft. and 5,300 ft. respectively. S. of the Canadian border this section is continued at a lower elevation as the Kootenay Mts.

The main area of the U.S. Rockies is the broadest part of the system. In N.W. Wyoming is the

volcanic yellowstone region, with Mt. Washburne, 11,350 ft., and the Teton Range with Grand Teton, 13,690 ft.; farther E. lie the Big Horn Mts., and farther S. the Wind River Mts., with Fremont's Peak, 13,781 ft. In the S. of Wyoming the ridge becomes a lofty plateau, the Laramie Plains, which form a connexion with the ranges of Colorado, where Blanca, 14,390 ft., Pike's Peak, 14,108 ft., and Long's Peak, 14,271 ft., reach the highest points of the true Rockies. From Colorado S. the elevation decreases to the Rio Grande, though Truchas Peak, N.E. of Santa Fé, reaches 13,156 ft. In the S. section, within Mexico, the Rockies continue as the Sierra Madre Oriental.

S. of the Canadian border many peaks bear a considerable snow cap, although this is insufficient to give rise to glaciers and may entirely disappear in a hot summer. In Canada, however, the Rockies are more Alpine in character; there are extensive icefields, and Victoria, Lyell, Mangin, Pétain, and many other glaciers; while Lake Louise rivals in beauty the Alpine lakes. The highest peaks are Mt. Robson (12,972 ft.) in the N. and Mt. Assiniboine in the S. Little is known of the region N. of Mt. Robson, where thousands of sq. m. of mountainous country is virtually unexplored. It was in this region that Haworth in 1916, following the Finlay river, discovered the high peaks which he called the Lloyd-George range. Other lofty groups, seen by aircraft during the construction of the Alaska highway, were named Mrs. Churchill, Roosevelt, and Stalin. Coniferous forests clothe the slopes, the timber line reaching 10,000 ft. in the central portions. Grizzly bears, big-horn sheep, the Rocky Mountain goat are among the fauna.

In total length the Rockies stretch through 50° of latitude, with a general bearing to the N.W. from long. 100° W. to long. 150° W.; this implies a total length in excess of 4,000 m. Within the scope of the system are many elevated fertile valleys to which the name park is given, e.g. Luis Park, drained by the Rio Grande, and Yoho Park, near the Kicking Horse Pass. See Canada; Manitou; United States.

Rococo (Fr. *roc*, rock). In architecture and decoration, the name given to a style that prevailed in France and elsewhere on the Continent from the middle of the 17th century to the end of the 18th. It consists of an excessive

Rococo. Capital of a column in rococo style

with an entire disregard of the constructional character of the design. The term has come to be applied to anything extravagant and tasteless in style.

Rocroi. Town of France, in the dept. of Ardennes. It stands near the Meuse, 15 m. N.W. of Mézières and 2 m. from the Belgian frontier. First fortified in the 16th century, the present fortifications, built by Vauban, nearly surround the town, which consists of a central square from which streets radiate to the ramparts. The church is an 18th century building. Pop. est. 2,000.

Rocroi is chiefly famous for the battle that was fought near it during the Thirty Years' War. It was fought on May 19, 1643, between the French under Condé, then duke of Enghien, and the Spanish under de Melo and Fuentes. The latter, about 27,000 strong, were besieging Rocroi, and battle was delivered by Condé, who commanded some 22,000 men. At first the French left wing and centre suffered repulse, but the Spaniards failed to pursue their advantage, and the French left and centre were able to re-form and attack the infantry formation of Fuentes. After four assaults they succeeded; Fuentes was slain, and the Spaniards were routed with a loss of over 7,000 killed and 7,000 prisoners. French losses were about 2,000 killed and 2,000 wounded. See Thirty Years' War.

Rod. Straight, slender shoot or branch of a tree used as an instrument for measuring, chastisement, fishing, cleaning pipes, etc., and as an emblem of office. As the last it is still used by churchwardens, by an official of the royal household, and by ushers of the chief British orders of knighthood, who are called black or green rod from the colour of the wands they carry.

Rod, POLE, OR PERCH. Measure of length and area. Lineally, it is 5½ yds., or 16½ ft.; as a sq. rod, pole, or perch, it contains 30½ sq. yds., or 272½ sq. ft.; 160 rods equal one acre. The sq. rod is used largely in measuring brickwork.

Rod, ÉDOUARD (1857–1910). Swiss novelist. Born at Nyon,

use of curves, irregular disposition of doors and windows, and superabundance of ornament, imitating rock work and shells, and introduced

March 31, 1857, he studied at Bonn and Berlin, and lived for many years in Paris, where he edited *La Revue Contemporaine*. His early novels, e.g. *La Femme de*

Henri Vanneau, 1884, were influenced by Zola, but his later works were marked by a rather morbid pessimism and critical introspection. Among his other novels may be mentioned *La Vie Privée* de Michel Teissier, 1893, and *Les Unis*, 1909. He did much to introduce Tolstoy and Ibsen to French readers, and was professor of comparative literature at Geneva, 1886–93. He died at Grasse, Jan. 29, 1910.

Rodbertus, JOHANN KARL (1805–75). German economist and socialist. Born at Greifswald on Aug. 12, 1805, he studied law at Göttingen and Berlin, and held posts in the judiciary at Breslau and Oppeln, 1828–32. Thereafter

Johann Rodbertus, German economist

he devoted himself to working out his theory of evolutionary and scientific socialism, opposing the internationalist and materialist doctrines of Marx. Elected to the Prussian assembly for Usedom-Wollin, 1848, he was for a short time minister of education, and was elected to the second chamber in 1849. He died Dec. 6, 1875.

Rodenbach, GEORGES (1855–98). Belgian poet and novelist. Born at Tournai, July 16, 1855, he was educated in Paris and at Ghent university, and became a member of the Belgian bar in 1885. His main interests, however, were literary, and his first verses, *Le Foyer et les Champs*, appeared in 1877. Other volumes included *Les Tristesses*, 1879; *Le Règne du Silence*, 1891; *Les Vies Encloses*, 1896. His poetry reflects the quiet melancholy of the towns and country of Flanders, which he knew intimately, and his novel, *Bruges-*

Edouard Rod, Swiss novelist

Georges Rodenbach, Belgian poet

la-Morte, 1892, is a striking study of that city's life. He settled in Paris, 1887, dying there Dec. 25, 1898. He should not be confused with the Flemish poet, Albrecht Rodenbach (1856-80).

Rodent (Lat. *rodere*, to gnaw). Animal belonging to the Rodentia family. In them the teeth are

Rodent. Diagram showing arrangement of teeth in the hare

specialised for gnawing hard substances. There is usually only one pair of incisors in each jaw, but these teeth are largely developed and are chisel-shaped. As they have enamel on their outer side only, use tends to keep the edges very sharp. They continue growing throughout life, so that if one is lost or destroyed, the opposite one continues to grow till it may enter the other jaw, or may so curve as to prevent the mouth from opening. In other animals it curves round and assumes the form of a monstrous tusk. The canine teeth are always absent, and there is a considerable gap between the incisors and the molars. In most rodents the claws are blunt and somewhat broad, and the animal does not rest on them when walking.

As their dentition indicates, nearly all the rodents are strictly vegetarian in diet, roots, stems, and nuts constituting a large part of their food. The great majority of them burrow in the ground, though some are arboreal and a few aquatic. Hibernation is a common habit in this family, while many species store up large provisions of food for the winter. Among the rodents are included the squirrels, marmots, beavers, jerboas, rats, mice, hamsters, voles, lemmings, porcupines, agoutis, caviars, hares, and rabbits. They are world-wide in distribution. See Capybara; Coypu; Musquash.

Rodent Ulcer. Form of cancer of the skin. It is generally restricted to elderly persons, and most frequently affects the face, particularly the forehead or the skin around the eye. The condition begins as a small papule which ultimately ulcerates. Progress is

usually very slow and painless. Gradually, however, the ulceration increases until it may involve a large area of the skin and eat into the underlying structures. Treatment by X-rays or radium, particularly in the early stages, is very effective, and as a rule complete cure can be obtained. Where there has been much destruction of the deeper tissues, surgical removal of the diseased structures may be undertaken in association with radium or X-ray treatment.

Rodeo. Spanish-American term for the driving together of cattle for counting; a round-up; also the enclosure in which branding and counting takes place. The term is popularly used for a "Wild West" exhibition of trick riding of horses and steers.

Roderic. Visigothic king of Spain. His defeat by the Saracen Tarik at Jerez de la Frontera, near the Guadalete, put an end to his brief reign (710-711) and to the Gothic kingdom in that country. Nothing is known of his subsequent fortunes or of the date or manner of his death, and numerous legends have gathered round the name of Don Rodrigo.

Roderick (c. 1116-98). King of Ireland. Son of Turlough O'Connor (1088-1156), he succeeded his father as king of Connaught in 1156, and was crowned king of Ireland at Dublin in 1166. By a treaty with Henry II, 1175, Roderick acknowledged the English king as his overlord, retaining his hereditary kingship of Connaught. Deposed by his half-brother, Cathal, 1191, he died in monastic retreat at Cong.

Roderick Random. Novel by Tobias Smollett, published in 1748, in which he embodied much of his experiences as a naval surgeon's mate. The full title is *The Adventures of Roderick Random*.

Rodez. Town of France, capital of the dept. of Aveyron. It stands on a hill, 2,075 ft. alt., on the right bank of the Aveyron, 37 m. N.E. of Albi. The Gothic cathedral of Notre Dame, built between 1277 and 1535, has a tower 260 ft. high. There are manufactures of cloth, linen, and woollen materials, and a trade in cheese and cattle. Rodez was known as Segodunum and became capital of the Rutheni and later of Rouergue. Pop. 20,437.

Rodin, François Auguste (1840-1917). French sculptor. Son of a government clerk, he was born at Paris, Nov. 12, 1840, and at 14 first attended a drawing-school. Failing to enter the Beaux-Arts, he became assistant

to the sculptor Carrier-Belleuse in 1863, the year in which his first important work, *The Man with a*

Auguste Rodin, French sculptor

Broken Nose, was rejected by the Salon. In 1870 he accompanied Carrier-Belleuse to Brussels and assisted with the interior decoration of the Bourse.

Five years later he went to Italy, where he studied the works of Michelangelo and other masters. He returned to Paris in 1877, and to this period belong his *Age of Bronze* and the statue of S. John the Baptist. He then produced a remarkable series of busts, e.g. Antonin Proust, Victor Hugo, and J. P. Laurens, and in 1882 was commissioned to fashion a bronze door for the Musée des Arts Décoratifs, a work upon which he was engaged for almost 30 years, and which was never completely realized. For this great *Porte de l'Enfer*, which derived its inspiration from Dante's *Inferno*, he made many figures such as *The Thinker* (of which there are several versions), *The Kiss*, and *Ugolino*.

Throughout the 1880s and 1890s Rodin was engaged upon groups of sculpture for various cities, e.g. the monument to Bastien-Lepage at Damvillers completed 1889; *The Burghers of Calais*, ordered 1886 and erected at Calais in 1895 (a version in bronze stands in the Victoria Tower Gardens, Westminster); and the statue of Claude Lorrain at Nancy.

Rodez, France. West front of the cathedral of Notre Dame

In 1914 he presented 20 of his works to the British people in token of his admiration, bequeathing his remaining works to France on his death at Meudon, Nov. 17, 1917. The Thinker in bronze was erected over his grave there.

In the Musée Rodin, Paris, are collected many of his finished works, plaster casts, drawings, and studies. He is represented at the Luxembourg by many busts, and at the Victoria and Albert Museum, London, by 16 bronzes (which were part of the 20 works mentioned above), and a version of S. John the Baptist, presented in 1902 by subscribers. Another well-known

Auguste Rodin. The Burghers of Calais, a group erected in Calais, 1895, of which a bronze replica is in the Victoria Tower Gardens, London. Top, right, a version of The Thinker, in front of the Panthéon, Paris

work, L'Homme qui Marche, is at the Farnese Palace, Rome.

During his lifetime Rodin was accused of breaking the artistic tradition. The movement created by him was a revolt against the academic art of his day. He formed his works by planes of light and shade. Unrivalled for his modelling of the human figure, his works are full of dignity, and his nudes have the same feeling of spiritual intensity as is found in the work of Donatello. A feature of his later style, the emergence of figures undetached from the block, he adopted from Michelangelo.

Bibliography. Rodin's own books, Venus, 1912, and Les Cathedrales de France, 1914; Lives by E. Duham, 1903; C. Black, 1905; J. Cladel, 1908; J. Kahn, 1912; C. Maclair, 1918; Personal Reminiscences of Rodin. A. M. Ludovici, 1926; Rodin, R. M. Rilke, Eng. trans., 1946

Roding. River of Essex, England. It rises about 2 m. N.W. of Dunmow, and flows 34 m. in a generally S.S.W. direction, to the river Thames, 2 m. S.E. of East Ham. The lower course has been canalised to Ilford. See Roothings.

Rodney, GEORGE BRYDGES RODNEY, 1ST BARON (1719-92). English sailor. Born in London, Feb. 13, 1719, he entered the navy at the age of 14, and attained the rank of captain in 1742. Constantly at sea and with various commands, he distinguished himself in the battle off Ushant, 1747, and subsequently served on the N.

1st Baron Rodney, English sailor After Reynolds

American station. Promoted to flag rank in 1759, he bombarded Havre in that year, and in 1761, while in command of the Leeward Islands station, captured Martinique, Santa Lucia, Grenada, and St. Vincent. Made a baronet, 1764, he was governor of Greenwich Hospital, 1765-71.

Severely handicapped by poverty and by the refusal of the government to pay eight years' arrears of pay, Rodney spent some time in retirement, but in 1779 was reappointed to the Leeward Islands. He received orders to relieve Gibraltar, and this he performed by utterly defeating the Spanish fleet off Cape St. Vincent, Jan. 16, 1780. Proceeding to the West Indies, he fought several indecisive battles and was superseded in 1781. The following year he returned to the W. Indies, and defeated Grasse off Martinique, April 12, 1782. The French were routed, but Rodney refused to pursue. He was recalled, but was made a baron. He died May 23, 1792.

The barony passed to his son George (1753-1802), whose descendant, George Bridges Harley Guest (b. Nov. 2, 1891), became the 8th baron in 1909.

Rodó, JOSÉ ENRIQUE (1872-1917). Uruguayan writer. The name of Rodó is famous throughout the whole Spanish-speaking world as that of a great writer and thinker. He is the peculiar glory of the republic of Uruguay, in whose capital city, Montevideo, *Trilce Rodó* he was born.

He was professor of literature at Montevideo university in 1898, and director of the national library in 1900. His philosophic writings, notably Ariel and The Mirror of Prospero, take an optimistic and heroic view of life; "as clear as cut crystal" is a fellow critic's description of his literary style. He died in Sicily, May 3, 1917.

Rodosto or TEKIR DAGH. Town and port of Turkey, on the Sea of Marmara, anciently known first as Bisanthe, and then as Rhædestus, and is reputed to have been founded by the Samians. It is about 80 m. W. of Istanbul, has a good roadstead, and does a considerable shipping trade in grain, canary seed, fruit, vegetables, silk cocoons, and silkworm eggs. Pop. est. 35,000.

Rodrigues. Island of the Indian Ocean. It is 350 m. N.E. of Mauritius, of which it is a dependency, and is 18 m. in length and 7 m. in width, with an area of 42 sq. m. Of volcanic origin, and mountainous, its highest point is 1,400 ft. in alt. The soil is fertile and the climate healthy. The chief town and port is Mathurin, with a good harbour on the N. coast. There are two govt. schools. Rodrigues became British in 1814. It is a cable station with connexion to Cocos-Keeling I. (*g.v.*). Pop. 11,885. Consult The Island of Rodrigues, A. J. Bertuchi, 1923.

Roe, SIR (EDWIN) ALLIOTT VERDON (b. 1877). British aircraft constructor. Born April 26, 1877, he was educated at St. Paul's and King's College, London. After going to British Columbia and to sea as a marine engineer, he took up the designing of motors, winning the Daily Mail model aeroplane prize in 1907. Next year he built and flew a full-sized aeroplane on the lines of his model. In 1910 he founded with his brother, Humphrey Verdon Roe (1878-1949), a firm to build Avro aircraft, which were used in the First Great War. The firm later became Saunders-Roe, Ltd. Sir Alliott, who was chairman of Aviation Developments Ltd., was knighted in 1929. H. V. Roe married Marie Stopes (*q.v.*).

Roe, RICHARD. Imaginary name used in English legal procedure.

Roe, SIR THOMAS (c. 1581-1644). English diplomatist. Born at Low Leyton, Essex, and educated at

Sir Thomas Roe,
English explorer

Magdalen College, Oxford, he received an appointment at court in the last year of Elizabeth's reign. He was knighted in 1605. In 1610 he sailed up the Amazon and to the Orinoco, and later made two other voyages to the same quarter in quest of gold. Roe was M.P. for Tamworth, 1614, and next year was sent as ambassador to the court of the Mogul, where he obtained privileges for English merchants which established the foundations of British supremacy in India. He was back in London in 1619. Ambassador to Constantinople, 1621-28, he became a member of the privy council, and M.P. for Oxford university in 1640. He

Roedean School. Public school for girls near Brighton, Sussex

died at Bath, Nov. 6, 1644, and was buried at Woodford. Part of his journal as ambassador to the Mogul was published by Purchas, 1625, and the whole was issued by the Hakluyt Society, 1899, and a revised version, ed. Sir W. Foster, in 1927.

Roebeck, JOHN ARTHUR (1801-79). British politician. Born at Madras, Dec. 28, 1801, he was edu-

John Roebeck,
British politician

cated in Canada. In 1831, having settled in England, he became a barrister, and in 1832 entered parliament as Radical member for Bath. In 1849 he was returned for Sheffield, and, except for the period 1868-74, he sat for that town until his death, Nov. 30, 1879. Roebeck was chairman of the committee appointed at his instigation to inquire into the mismanagement of the Crimean War. In later life he broke with the Radicals and supported Beaconsfield in his Eastern policy. Intimate with Bentham and Mill, he wrote books on the colonies and the Whig ministry. An Autobiography was published 1897.

Roedean School. An English public school for girls, near Brighton. It was founded in 1885, in Brighton, the present buildings on the cliff-top facing the English Channel, 3 m. E. of the town centre, having been erected 1898. There are an upper and a junior school, with resi-

dent accommodation for 260 pupils in four boarding houses, and large playing-fields, including 20 tennis courts, open-air swimming bath, and outdoor roller-skating rink. The school, incorporated by royal charter in 1938, is governed by a council.

Roedeer (*Capreolus capreolus*). Small species of deer. It stands about 26 ins. high at the shoulder, and the colour of the pelt is reddish in summer and olive brown in winter, with a large white patch on the rump. The antlers are about 8 ins. long, and rise almost vertically from the head, usually with three short tines. The head is short and the ears rather large in proportion.

The roedeer occurs throughout most parts of Europe, and is indigenous in Great Britain. It is found in many of the more secluded parts of the Highlands of Scotland and has been known during the 20th century in Cumberland. Near Milton Abbas, Dorset, is a considerable colony, and a few specimens are to be found in other districts. Roedeer frequent woods, visiting their

Roedeer. Male specimen of the small deer that occurs in some parts of Britain
W. S. Heiridge, F.Z.S.

feeding grounds in the open only in the early morning and evening. They are often troublesome in the neighbourhood of farms, and they do great damage by gnawing the bark of the trees. *See Deer.*

Roehampton. Village and parish within the met. bor. of Wandsworth, London. To the W. of Putney Heath, it once formed part of Putney and Mortlake Park, of which, in Charles II's time, the 2nd earl of Portland was lord keeper, and built, in addition to a mansion, Roehampton Park, the private chapel of which forms part of the parish church of Holy Trinity. The property passed by purchase to Christiana, countess of Devonshire, who held here a kind of salon, at which Thomas Hobbes was a familiar figure. Joshua Vaneck, afterwards Baron Huntingfield, pulled down the mansion and built Roehampton Grove. On part of the park was erected the convent of the Sacred Heart. Here is Queen Mary's Hospital, where soldiers maimed in the two Great Wars have been provided with artificial limbs and are trained in handicrafts.

Roehm, Ernst (1887-1934). German politician. He was born at Munich, Dec. 28, 1887, and became a professional soldier, being commissioned just before the outbreak of the First Great

Ernst Roehm,
German politician

War. By 1918 he was a staff officer, and the following year he played a prominent part in von Epps's attempt to overthrow the Left-wing government at

Munich. An early member of the Nazi party and a close personal friend of Hitler, he took part in the abortive putsch of Nov., 1923, and was imprisoned. He was later lt.-col. on the staff of the Bolivian army, but returned to Germany in 1931 to become Hitler's chief of staff and leader of the S.A. and S.S. A member of the Reichstag, he tried to bring about a merger between the regular army and his own organizations. Accused of having plotted against Hitler, he was one of those shot in the "purge" of June 30, 1934.

Röer (Ger. *Rur*, sometimes *Ruhr*). River of Belgium, Germany, and the Netherlands. It should not be confused with the river Ruhr (*q.v.*), Germany. About 125 m. long, the Röer

rises in the Hohé Venn, and flows N.E. past Monschau, then N.W. past Düren, Jülich, Linnich, and Kempen, where it is joined by the Wurm, to enter the Maas at Roermond. Its valley was the scene of violent fighting during the Second Great War. Between Jan. 16 and 28, 1945, the British 2nd army drove the Germans from a salient they held along the left bank of the Röer and the Wurm between Geilenkirchen (captured Nov. 18, 1944) and Roermond. The U.S. 9th army then took over the line about Roermond. Between Feb. 8 and 11 the U.S. 1st army gained control of the W. bank of the Röer from 2 m. W. of Gemund in the S. to 2 m. upstream from Roermond in the N. The 9th army should have attacked between Roermond and Jülich a day or two after Feb. 8, when the Canadians attacked in the Reichswald, farther N.; but on the night of Feb. 9-10 the Germans blew up the dams containing the Röer reservoirs, and the river became impassable. It was still 250 ft. wide (instead of its normal 40-60 ft.) when the 1st and 9th armies struck at 3.30 a.m. on Feb. 23, and in bright moonlight forced a passage of the river. Jülich was taken by storm on the 24th; Düren, reduced to rubble, on the 25th; and with the liberation of Roermond on March 2, the whole of the Röer river was under Allied control.

Roermond. Town of the Netherlands, in the prov. of Limburg. It lies on the right bank of the Meuse, here joined by the Röer, 28 m. by rly. N.E. of Maastricht, and is a rly. junction. It has industries in cloth and tobacco manufacture, and considerable traffic. The town is partly surrounded by promenades built on the site of the old fortifications. The 13th century minster contains some interesting carving. The cathedral of S. Christopher has three main towers and several noteworthy paintings. Fortified from the 13th century, Roermond changed hands several times during the wars against the Spaniards, who were finally expelled in 1702. In 1706 it became the capital of Austrian Gelderland, and from 1793 to 1814 was in French possession. The bishopric, founded 1561, was merged with that of Liège in 1801. Occupied by the Germans from 1940, Roermond was captured by troops of the U.S. 9th army on March 2, 1945 (*see Röer*). Pop. est. 21,415. *Pron. Roormond.*

Rogation Days. Three fast days observed by the Roman

Catholic and Anglican Churches. They are the Monday, Tuesday, and Wednesday before Ascension Day, the preceding Sunday, the 5th after Easter, being known as Rogation Sunday. Mamertus, bishop of Vienne, is said to have instituted processions with litanies (Lat. *rogatio*, an intercession) on these days, on the occasion of earthquakes and volcanic eruptions in his diocese, about A.D. 467. The practice rapidly spread through the Western Church. In the Church of England there are no special prayers for these days, but at this season perambulations of parishes take place, when crops in fields, allotments, gardens, and the sea are blessed. An old name for Rogation days is Gang days, from Anglo-Saxon *gangan*, to go, walk. *See Bounds, Beating the; Litany.*

Roger (1031-1101). Count of Sicily. Son of Tancred of Hauteville, Normandy, he assisted his brother, Robert Guiscard (*q.v.*), to conquer Calabria, 1057-62, and then crossed to Sicily, where he spent the next 30 years in subduing the Muslim rulers. His government of the island was generous and just, and the conquered Arabs eventually became his loyal subjects. On Robert's death in 1085, he succeeded to his dominions on the mainland, dying June 22, 1101.

Roger (c. 1093-1154). King of Sicily. Son of Count Roger, he was an ambitious man, and in 1127 claimed Apulia, the throne of which was vacant by the death of his cousin William. Invested duke of Apulia in 1128, he extended his authority through the S. of Italy, and, as a reward for supporting Pope Anacletus II against his rival, Innocent II, Roger was made king of Sicily. Fiercely subduing insurrection in Sicily and resisting the war-like advances of rival powers from the N., he attacked the Byzantine empire, 1146, ravaged Greece and Dalmatia, and in 1147 conquered parts of N. Africa. He governed his dominions well. He died Feb. 26, 1154.

Rogers, GINGER (b. 1911). American film actress. Virginia Katherine McMath was born at Independence, Mo., U.S.A., July 16, 1911, and after acting in vaudeville started film work in 1931. She went to Hollywood where she was in Young Man of Manhattan, 1931, and afterwards appeared with Fred Astaire (*q.v.*) as his dancing partner in a series of popular films, e.g. The Gay Divorcee, 1935; Roberta, 1935; Top Hat, 1936; Shall We Dance, 1937,

Later she was starred in many "straight" films, some of which attained the same popularity.

Rogers, HENRY (1806-77). British divine. Born at St. Albans, Oct. 18, 1806, he was educated at

Henry Rogers,
British divine

Highbury College. After a few years passed in charge of a church at Poole, he was appointed in 1836 professor of English literature at University College, London. In 1839 he became professor at Spring Hill College, and in 1858 principal of Lancashire Independent College. He retired in 1871, and died Aug. 21, 1877. A powerful thinker, Rogers exercised great influence over his pupils and by his writings, of which *The Eclipse of Faith* is the best known.

Rogers, JAMES EDWIN THOROLD (1823-90). British political economist. Born at West Meon, Hants, and educated at King's College, London, and Magdalen Hall, Oxford, he took orders and worked as a parish priest until 1860, when he threw up his profession and devoted himself to teaching and the study of political economy. While living in Oxford he was four times examiner in classics, and published verse translations from Euripides, Horace, and Juvenal. In 1859 he was appointed Tooke professor of statistics and economic science at King's College, London, a position which he held until his death at Oxford, Oct. 12, 1890. His greatest work, the *History of Agriculture and Prices in England*, was begun in 1860, the first two volumes being published in 1866, and he was appointed in 1862 Drummond professor of political economy at Oxford. During 1880-86 he was in parliament as a Gladstonian Liberal, and in 1888 was re-elected Drummond professor at Oxford.

His *History of Agriculture* is a monumental record of research for the English period, 1259-1793. It was supplemented by the equally important *Six Centuries of Work and Wages*, 2 vols., 1884.

Rogers, JAMES GUINNESS (1822-1911). British divine. Born

at Enniskillen, Dec. 29, 1822, the son of the Rev. Thomas Rogers, he was educated at Wakefield, at Trinity College, Dublin, and for the ministry at Manchester. In 1846 he became minister of a Congregational church at Newcastle-upon-Tyne, afterwards having charge of churches at Ashton-under-Lyne (1851-65), and Grafton Square, Clapham (1865-1900). He died Aug. 20, 1911. Rogers was perhaps better known as a political speaker than as a preacher. A strong Liberal and a friend of Gladstone, he was one of the champions of Nonconformist and Liberal causes.

Rogers, JOHN (c. 1500-1555). English martyr. He was born at Aston, Birmingham, and in 1534 became an associate of William Tyndale. After serving as pastor of a Protestant church at Wittenberg, he became in 1550 rector of St. Margaret Moyses and St. Sepulchre in London. His great work was his translation of the Bible, which had considerable influence on the translations of the authorised version of 1611. He was burned to death at Smithfield Feb. 4, 1555, the first Protestant martyred by Mary I.

Rogers, SAMUEL (1763-1855). British poet. Born at Stoke Newington, July 30, 1763, he

Samuel Rogers,
British poet

entered his father's bank as a youth, and became head of it in 1793. His leisure was devoted to the cultivation of literature, and by 1792 he had established his fame as a poet with the very successful *Pleasures of Memory*. About this time Rogers took rooms in the Temple and soon had a large circle of acquaintances among the leading literary men of the day. The circle was further extended when he withdrew from active management of the bank.

Rogers's breakfasts became famous, the conversational powers of the host himself contributing not a little to their success. Among his friends were numbered Byron, Campbell, Moore, Wordsworth, Jeffrey, Fox, and Sheridan. At St.

J. Guinness Rogers,
British divine

James's Place, also, he began to amass the magnificent art collection and library which after his death were sold for £50,000. Exceedingly fastidious in his work, Rogers's literary output was comparatively small. His poems include, in addition to *The Pleasures of Memory*, *Columbus*, 1810, a fragment of an epic, *Jacqueline*, 1814, *Human Life*, 1819, probably the best of his works, and *Italy*, 1822, the third edition of which, published in 1830, was illustrated by Turner and Stothard. The lack of original genius in his works is compensated for by his exquisite taste and laborious artistry. Personally Rogers was one of the kindest and most benevolent of men, though his amiable qualities were somewhat obscured by his caustic wit. He died Dec. 18, 1855.

Rogers, WILLIAM PENN ADAIR (1879-1935). American comedian. Born Nov. 4, 1879, at Oolagah, Indian Territory, he went during the South African War to S. Africa, where he toured in vaudeville. In 1905 Will Rogers first appeared in New York as a humorist who was to win international reputation on stage and screen, as well as in journalism. He started film work in 1918, and acted in *A Yankee at the Court of King Arthur*, *So This is London*, *State Fair*, and *Handy Andy*. He was accounted the wittiest talker in Hollywood, and his newspaper comments were widely read. He was killed in an air crash while flying with Wiley Post between Alaska and Siberia in mid-Aug., 1935. Consult Will Rogers, P. O'Brien, 1936.

Roger's Pass. Mountain pass in Canada, in British Columbia. Here the C.P.R. crosses the Selkirk Mts. Its altitude is 4,275 ft.

Roget, PETER MARK (1779-1869). British scientist of Huguenot descent. Born in London, Jan.

18, 1779, and educated for the medical profession at Edinburgh university, he had a long and busy career, first in Manchester and afterwards in London, as a physician and lecturer on physiology and other medical subjects. A versatile and industrious man, with a strong scientific bent, Roget helped greatly in the establishment of the university of London, in which he retained his interest

Peter Mark Roget,
British scientist

throughout his life. He discovered, 1824, the phenomenon of persistence of vision, on which the cinema is based. He is chiefly remembered, however, by his enormously popular *Thesaurus of English Words and Phrases*, 1852, later often revised. He died at Malvern, Sept. 12, 1869. *Pron.* Rozh-ay.

Rogier, CHARLES LATOUR (1800-85). Belgian statesman. He was born at St. Quentin, Aug. 12, 1800, and was educated at the *lycée* of Liège. In the revolution of 1830 by which Belgium was freed from Holland, he raised a company of men of Liège and took an active part

-Charles Rogier,
Belgian statesman

in the fighting in Brussels, afterwards becoming a member of the provisional government and of the national congress. Minister of the interior in 1832 and of public works in 1840, he was anti-clerical and anti-republican, supporting the constitutional monarchy. He was twice governor of Antwerp and became the head of the Liberal ministries of 1847-52, and 1857-68. As minister of foreign affairs in the latter period he strengthened the good relations of Belgium with France, negotiating a treaty of commerce between them. He also obtained from Holland and Great Britain the suppression of the Schelde tolls which hampered the commerce of Antwerp. He died in Brussels, May 27, 1885. *Consult* Life, E. Descailles, 1896. *Pron.* Rozh-yay.

Rogue. Term used for a dishonest person, also for a vagrant. Rogue money was a phrase used in Scotland for the money levied in each county to meet the cost of catching, prosecuting, and maintaining criminals (*see* Vagrancy). A rogue elephant is one not attached to any particular herd, and is usually savage.

Rohan-Gié, HENRI, DUC DE (1579-1638). French soldier. Born at Blain, Brittany, Aug. 21, 1579, he was educated as a Protestant and served his kinsman Henry IV at the siege of Amiens, 1597. Created duke in 1603, he attended the Protestant

Duc de Rohan-Gié,
French soldier

assembly at Saumur, 1611, and became leader of the Calvinist party, fighting against Louis XIII in Béarn, 1620. Raising the sieges of Montauban and Montpellier, 1622, he helped to secure the confirmation of the edict of Nantes, 1623, and became governor of Nîmes and Uzès. He fought against Richelieu at La Rochelle, and after the peace of Alais, 1629, retired to Venice and wrote his memoirs. He commanded a French corps against Austria, 1635-36, and, wounded while fighting for the Protestants at Rheinfelden, Feb. 28, 1638, died, April 13, at Königsfeld.

Rohan-Guéméné, LOUIS RENÉ ÉDOUARD, PRINCE DE (1734-1803). French cardinal. Born in Paris, Sept. 25, 1734, he was educated at the seminary of S. Magloire, and became coadjutor to his uncle Constantine, bishop of Strasbourg, 1760. He was admitted to the *Académie Française*, 1761, and in 1772 went to Vienna as ambassador. His extravagant luxury there displeased Maria Theresa, who secured his recall, 1774. He became cardinal, 1778, and bishop of Strasbourg, 1779. He fell into disgrace on account of his implication in the affair of the diamond necklace (*q.v.*), 1785, and was arrested, but on release returned to Strasbourg. He died at Ettenheim, Feb. 17, 1803.

Prince de Rohan-Guéméné,
French cardinal

Rohilkhand. Dist. of India, now part of Oudh. It owes its name to the Rohillas, who were crushed by some British troops in 1774. It then became part of Oudh and was annexed by Great Britain in 1801. *See* India; Oudh.

Rohilkhand. Division of the Uttar union, India. It is situated E. of the Ganges and W. of Nepal at the foot of the Himalayas. Its area is 10,665, sq. m. Pop. 6,195,996.

Rohilla. People of Afghan race. Early in the 18th century they came down from the borders of Afghanistan and settled in a territory to the N.W. of Oudh, to which the name Rohilkhand was given. There they came into conflict with the Mahrattas, against whom they secured the help of the nawab of Oudh, Suraj-ud-Dowlah. For this assistance the Rohillas promised 40 lacs of rupees to the nawab, who had apparently got rid of the

Mahrattas by a monetary payment. The Rohillas discharged only a portion of their debt, whereupon the nawab made a bargain with Warren Hastings, who, in return for a sum of money paid to the E. India Co., promised to send a force against the Rohillas. The result was the short war of 1774, in which the tribesmen were quickly crushed. His conduct in this matter was one of the charges on which Hastings was impeached. *See* Hastings, W.; Suraj-ud-Dowlah.

Rohlf, FRIEDRICH GERHARD (1831-96). German explorer. Born at Bremen, April 14, 1831, he served in the Slesvig-Holstein campaign of 1848, and then studied medicine and joined the French foreign legion as a surgeon. After serving in Morocco, 1861-62, he disguised himself as an Arab and made various desert explorations. In 1863 he reached the oasis of Tuat, and in 1865 he crossed Tripoli, S. Bornu, and Sokoto, and eventually made his way to the Guinea coast. During 1868-75 he made other explorations in the African deserts, which he described in *Reise durch Marokko*, 1868; *Land und Volk in Afrika*, 1870; *Reise von Tripolis nach der Oase Kufra*, 1881. He died June 2, 1896.

Rohtak. Dist. and town of Punjab state, India. The dist. lies W. of the Jumna and N.W. of Delhi; the Sonapat subdivision was added to it on the partition of the Delhi division. The chief tribesmen are Jats. Rainfall is 29 ins. per annum, and the chief crops are native food grains, *e.g.* bajra, although some cotton and sugar-cane are grown. Its area is 1,800 sq. m. The town, of great antiquity, occupies a central position in the dist. and is on the rly. N.W. from Delhi. Pop., dist., 956,399; town, 37,000.

Roi Fainéant (Fr., do-nothing king). Term applied to the last seven Frankish kings of the Merovingian dynasty. They were so called because the officials known as the mayors of the palace, at first servants, gradually assumed royal power. *See* Franks; Merovingians.

Rokeby. Romantic narrative poem by Scott, published in 1813. The scene is Rokeby in Yorkshire, 3 m. S.E. of Barnard Castle, where the poem was written, and the period is July, 1644, immediately after the battle of Marston Moor.

Rokossovsky, KONSTANTIN (b. 1887). Russo-Polish soldier. Born in Warsaw (then in Russia) he served in the tsarist army in 1914-17, but at the Revolution joined the Bolsheviks. When Russia was

brought into the Second Great War in 1941, he was lieutenant, and commanded an army defending

K. Rokossovsky,
Polish soldier

Moscow. In the battle of Stalingrad, 1942-43, he was commander of the army of the Don; he was later commander of the 1st and then of the 2nd White Russian armies, directing operations in Poland, and cooperating in the conquest of E. Prussia, 1944-45. Promoted marshal, 1944, he became in 1949 Polish minister of national defence and supreme cmdr. of armed forces, taking Polish citizenship.

Roland. Frankish soldier, celebrated in legend as the greatest of Charlemagne's paladins. The historic Roland or Hrudodland was an obscure warden of the Breton marshes, who was slain by the Basques when they overwhelmed the rearguard of Charlemagne's army on its return from an expedition against the Moors of Spain in 778. The attack, which was made at Roncesvalles in the Pyrenees, was in retaliation for the wanton capture of Pampeluna. Popular tradition, embodied in the Song of Roland and other poems, transformed Roland into a national hero, the nephew of Charlemagne, and his assailants into Saracens. As Orlando, Roland is the hero of Ariosto's Orlando Furioso and Boiardo's Orlando Innamorato.

Roland, SONG OF (Fr. *Chanson de Roland*). National French epic, the oldest and finest of the extant *chansons de geste* (q.v.). Written probably by a Norman, between 1066 and 1099, it consists of 4,001 ten-syllabled lines, grouped by assonance into sections. Based on distorted memories of the disaster at Roncesvalles, it is heroic in spirit, and its austere, direct style, devoid of superfluous ornament, has little in common with the romantic manner of later poems. It tells how Charlemagne, after conquering Spain, accepts the feigned submission of the Saracen king, Marsile. See Charlemagne. Consult ed. with modern French version by L. Gautier, Eng. trans. Scott-Moncrieff, 1920.

Roland de la Platière, MARIE JEANNE PHILIPON (1754-93). French writer and revolutionary leader. She was born in Paris, March 18, 1754, and in 1780 married Roland de la Platière, husband and wife becoming prominent among the

Girondist leaders. Madame Roland's letters and memoirs throw much light on the period, and reveal her as one of the finest characters and one of the most brilliant intellects of her time. She was guillotined in Paris, Nov. 8, 1793. Her last words have become famous: "Oh, Liberty, what crimes are committed in thy name!" Her *Mémoires*, first published in 1820, and her *Lettres*, 1867, have been

Madame Roland de la Platière. From a drawing made at the Conciergerie prison, while she was awaiting execution

many times reissued. There was a new edition of the letters, edited by C. Perroud, 1900-02, and of the *Mémoires*, 1905. Consult Lives, M. Blind, 1886; I. M. Tarbell, 1896; I. A. Taylor, 1911; C. Young, 1930; M. P. Willcocks, 1936.

Roll (Lat. *rotula*, a little wheel). Term which has come to be used primarily for that which is rolled, or wound upon a roller, e.g. a roll of paper. In nautical phraseology the roll of a ship implies tossing from side to side as opposed to pitching from bow to stern. Calling the roll means calling over a roll or list of the names of a body of persons to ascertain which are present. The word roll is also used to describe an acrobatic manoeuvre in which a complete revolution about the longitudinal axis is made by an aeroplane. During a roll the aeroplane rotates laterally through 360°, but the actual path is a horizontal corkscrew. In cookery the term roll is applied to any food rolled up in preparation for use such as bread formed by rolling, sausage-meat rolled in pastry, jam or Swiss roll, etc. In music, by analogy, a roll is the continuous vibration of the drum head obtained by rapid strokes of the

drum sticks, usually indicated as a trill or tremolo. There are several kinds of roll on the side-drums, according to the way in which the sticks are used. It applies also to a "catch" or roll in song, e.g. "singing a gay roll."

The master of the rolls is the legal official in charge of reports and documents, formerly inscribed on rolls of parchment.

Rolland, ROMAIN (1866-1945). French writer. Born at Clamecy, Nièvre, Jan. 29, 1866, and educated at the École Normale, Paris (where in 1897 he was appointed lecturer in the history of art) he held a chair at the Sorbonne during 1903-10, resigning to devote himself to writing. His series of novels under the general title of Jean Christophe in 10 vols., written during 1904-12, for which he received the Nobel prize for literature in 1915, placed him among leading French novelists. Of this great work (which he described as "the tragedy of a generation that had disappeared") the first three vols. took their place among the best works in French literature.

Rolland was an avowed pacifist, and became unpopular in France during the First Great War. He later became a disciple of Indian religious and philosophical thought and his works on Ramakrishna and Vivekananda created for him an international reputation as a religious leader. Of his plays—never popular in France—the best-known were *Danton*, and *Le 14 Juillet*. He was also a distinguished critic and historian of music, writing biographies of Beethoven, 1903, and Handel, 1916. He died Dec. 30, 1945. Consult Life, S. Zweig, Eng. trans., E. and C. Paul, 1921.

Rolle, RICHARD (c. 1290-1349). English hermit. Born at Thornton, Yorks, he led a solitary existence from the age of 19, at Hampole, near Doncaster. Here he dedicated himself to a religious life, writing treatises and songs in the Northumbrian dialect which were widely read by scholars, and which are now of considerable interest to philologists. His most popular work was *The Pricke of Conscience* which was published, ed. by R. Morris, 1863. He died Sept. 29, 1349. Consult Life by F. M. M. Comper, 1929; English Writings of R. Rolle, ed. H. E. Allen, 1931.

Romain Rolland.
French author

Roller. Group of birds, including several genera, which are widely distributed throughout the E. hemisphere. In general appearance they resemble crows, but have plumage of very brilliant colours. One species, the blue roller (*Coracias garrulus*), breeds in S. Europe, and occasionally visits Great Britain. It is like a jay, has chestnut brown and blue plumage, and is about 12 ins. in length. The name is derived from the peculiar habit of these birds of appearing to lose balance and roll over when in

Roller, the blue species which visits Great Britain

flight, especially by the males during the courting season. The name roller is also given to certain varieties of tumbler pigeons, e.g. Oriental roller. See Pigeon.

Roller. Machine for levelling ground. There are three main types of roller: road, garden or lawn, and agricultural. The heaviest is the road roller, which varies between 2½ and 20 tons in weight and may have a steam, petrol, or Diesel engine. The first practical road roller was built in France in 1787 and, made of cast iron, was 3 ft. in diameter and 8 ft. wide. It weighed 1½ tons and was drawn by four horses. In 1817 a horse-drawn road roller was patented in England by Philip Clay. In 1859 the first steam road roller was patented by a French engineer, and in 1863 came one by Walter Batho of Birmingham. Basically, a road roller is a tractor with a steel cylinder to replace the front steering wheels, while the rear wheels have large diameter and great breadth. The rolling cylinder is usually in two sections to facilitate steering. The function of the road roller is to compress the road metal so that the jagged edges of the stones interlock and solidify into the binder, and to press the material forming the surface so that it interlocks with the lower course and is level.

Agricultural rollers may be horse- or tractor-drawn. For clod crushing, bar or tubular rollers are used; also, when the ground is particularly heavy, crossbill rollers.

which may be fluted or in serrated rings. Sub-surface or land-presser rollers consolidate the soil at the bottom of furrows. A combined clod-crushing and soil-consolidating roller—Cambridge roller—has several rings, 2–3 ins. wide, which taper to a point. Flat or land rollers smooth the surface of a field after sowing, and may be of steel, wrought iron, wood, or stone; they are commonly 7 ft. wide and 18 ins. in diameter and weigh up to 12 cwt.

Roller Bearing. Type of machine bearing in which tapered or parallel rollers are interposed between the shaft and its support to lessen friction. See Bearing.

Roller-Skating. Pastime of skating on wheels, usually on a floor of polished wood or cement. This form of skating was in vogue in the U.K. as early as 1800, but was not publicly exploited until 1815, at the Floral Hall, Covent Garden, London. At first a fixed axle type of skate was used, but with the inclined axles principle and four wheels to each skate, introduced from America in 1863, the execution of figures on roller-skates became possible. In 1879 the National Skating Association was formed to promote the sport; and in 1890 the Olympia hall, at West Kensington, was opened as a roller-skating rink. With the advent of the ball-bearing skate the pastime increased in favour. There are British amateur and professional championships for roller-skating at speed. See Skating.

Rolleston, THOMAS WILLIAM (1857–1920). Irish author. Born at Glasshouse Shinrone, Offaly, he was educated at Rathfarnham and Trinity College, Dublin. He edited The Dublin University Review, 1885–86, and published a Life of Lessing. 1889. He was interested in the development of

Irish arts and crafts, industries, and trade. He also took a prominent part in the Irish literary

Thomas W. Rolleston, Irish author Elliott & Fry

revival, acting as joint editor of The Treasury of Irish Poetry, 1900, and writing Imagination and Art in Gaelic Literature, 1900, and Myths and Legends of the Celtic Race, 1911. His other works include Parallel Paths: a Study in Biology, Ethics, and Art, 1908; and Sea Spray, poems, 1909. He died Dec. 5, 1920.

Rolliad, THE. Political satire in verse and prose, published in two parts in The Morning Herald, 1784–85. Its full title is Criticisms on the Rolliad, and the skit comprised extracts from an imaginary epic poem, these giving opportunity for caustic comments on contemporary men and matters. The immediate occasion of the satire was a speech made by Col. John (afterwards Lord) Rolle (1750–1842) on the Westminster Scrutiny, when the government attempted to unseat Fox; but the attack was mainly directed against Pitt and the members of his government. The Rolliad, a brilliant ephemeral performance, was the joint production of several Whigs.

Rollin, CHARLES (1661–1741). French historian. Born at Paris, Jan. 30, 1661, he was educated at the college of Plessis and studied theology. He became professor of eloquence at the Collège de France, 1688, rector of the university, 1694–96, and principal of the college of Beauvais, 1699–1712. He exercised great intellectual influence, but was accused of Jansenism

and obliged to retire, though he continued to teach at the Collège de France. His writings include Traité des Études, 1726–31; Histoire Ancienne, 1730–38; and the uncompleted Histoire Romaine, 1738. He died Sept. 14, 1741. His complete works were edited by Guizot, and published during 1821–27.

Rolling Mill. Machine used for rolling plates, sheets, bars, angles, etc., from cast ingots or

Roller. A heavy motor roller used for preparing cricket pitches and keeping them in good order

billets of metal. The simplest form consists of a single "stand" of two rolls (see A, Fig. 1), usually made

only part of the complete operation. The amount of reduction in each is limited by the diameter

Rolling Mill. Fig. 1. Diagram of 2-high bar mill and 3-high plate mill. A. Bar mill. B. Plate mill. C. Gear box. D. Driving wheel. e. Mill couplings. r. Rolls. f. Pressure screws. g. Handles for screwing up rolls

from cast iron and held, one above the other, in adjustable bearing housings. The rolls are geared so that they revolve at equal speeds, with the inner faces moving in the same direction, when they are driven by an engine or electric motor acting through a reduction gear. In operation the rolls are moved closer together between each passage of the metal, to give a maximum amount of reduction, a series of passes being used to give the desired total reduction.

Parallel rolls produce flat, rectangular cross-sections, but grooved formers are needed for sections of other shapes. For heavy work the rolls may be reversible, or a three-roll mill, called a three-high mill (see B, Fig. 1), may be used. With the latter, one pass is made in one direction between the bottom and middle rolls and the next pass in the reverse direction between the top and middle rolls (Fig. 2). With the arrangement shown in Fig. 1 the two-high stand would not be reversible.

Rolling Mill. Fig. 2. Three-high rolls

In such specialised devices as continuous or strip mills, a number of stands, with either two-high or four-high (see Fig. 3) non-reversing rolls, are used and the metal passes in one direction once only through each stand. Each stand performs

Rolling Mill. Fig. 3. Four-high rolls

of the rolls, and there is an economic limit to the size of mill which can be usefully employed. In a four-high mill the two large outer rolls act only as reinforcing and stiffening rolls, and the actual reduction is performed between the relatively small inner rolls. This type is more efficient and cheaper to maintain on continuous heavy work than a corresponding two-high or three-high mill, owing to the lower maintenance costs of the small working rolls.

Rollo, ROLF, OR ROU (c. 860-932). Duke of Normandy. Son of Rognvald of Norway, he left that country c. 875, took part in invasions of Scotland and England, and sailed up the Seine to Jumièges and Rouen, 876. Fortifying Rouen, he extended his power in Neustria, besieged Paris, 886, and captured Évreux, Bayeux, and other towns. By the treaty of St. Clair-sur-Epte, 911, Rollo was baptized as Robert at Rouen, his capital, is said to have married Gisèle, daughter of the king, and received the territory thereafter called Normandy and the suzerainty of Brittany. His strong, able rule brought prosperity. Abdicating in favour of his son William in 927, he died in 932.

Rollo, BARON. Scottish title borne by the family of Rollo since 1651. Sir Andrew Rollo, whose estates were at Duncrub, Perthshire, was the first holder, Charles II creating him a baron during his stay in Scotland in 1651. Robert, the 4th baron, was concerned in the Jacobite rising of 1715, and from him the title passed from one descendant to another until in 1947 it came to Eric John Stapylton, as 13th baron. Lord Rollo sits in the lords as Baron Dunning, a title created in 1869. The seat is Pitcairns, Dunning, Perthshire, and the heir to the title is known as The Master of Rollo.

Rollright, GREAT AND LITTLE. Two villages of Oxfordshire, England. They are situated in the

Cotswold Hills, 3 m. N. and N.W. respectively of Chipping Norton, and have a total pop. of about 400. Half a mile from Little Rollright, on the county boundary, are the Rollright Stones, most important megalithic remains in England after Stonehenge and Avebury. The isolated King's Stone and the clustered Whispering Knights are the chief stones left.

Rolls, CHARLES STEWART (1877-1910). British engineer and airman. Born in London, Aug. 28, 1877, a younger son of the 1st Baron Llangattock, he was educated at Eton and Trinity College, Cambridge, where he took part in cycle-racing. After some engineering work at Crewe, Rolls

Charles Stewart Rolls, British engineer Elliott & Fry

devoted his time to popularising the motor-car in England. He competed in races, investigated new designs, and formed for their manufacture the company which became Rolls-Royce, Ltd. About 1901 he turned his attention to aeronautics, and, making many daring flights, was soon one of the best known of British airmen. In 1910 he crossed and recrossed the English Channel in 95 minutes, then a notable feat. He was killed while flying at Bournemouth, July 12, 1910. There is a statue to him at Monmouth, the home of his family.

Rolls Chapel. Former London building. It stood in Chancery Lane, E.C., on ground now covered by the W. part of the Public Record Office (q.v.). The original chapel and house were built by Henry III in 1233 for converted Jews and their governor or master. In 1377 buildings were assigned to the master of the rolls, who held his court here until 1882, and was known until 1873 as keeper of the house of converts. The chapel was rebuilt by Inigo Jones in 1617, and Rolls House during 1717-25. Donne, Burnet, Atterbury, and Joseph Butler were among the preachers in the chapel, interesting monumental remains from which, including the tomb of John Young, master of the rolls to Henry VIII, are in the Record Office museum, with which parts of the old chapel were incorporated during 1896-97.

Rolls-Royce. British motor car and aero-engine manufacturers, with main works at Derby. The firm was founded in 1906 by C. S.

Rolls (*q.v.*) and F. H. (later Sir Henry) Royce. The latter continued as chief designer until shortly before his death in 1933. From the start he insisted on the very finest workmanship, and the Rolls-Royce car soon became world-famous. The earliest Rolls-Royce aero-engines appeared in the First Great War, the most powerful (the 375 h.p. Eagle) remaining in service as the power-plant of the Vickers Vimy and other notable large aircraft. The next advance in design was the Kestrel series, from 1929 onwards. These were progressively developed from 480 h.p. to 745 h.p., and from them derived the racing engine (maximum 2,350 h.p.), fitted to the Supermarine seaplanes which won the Schneider Trophy in 1929 and 1931, and also to record-breaking cars and motor boats. The first R.A.F. monoplane fighters, the Hurricane and Spitfire, were designed in 1935-36 around the then very advanced Rolls-Royce Merlin motor, which played a great part in the early air operations of the Second Great War. (*See* Merlin.) The Griffon (2,000 h.p. and upwards) was a more powerful unit of the same basic design, 12 cylinders arranged in two banks of six, at a 60° Vee angle, liquid-cooled. Rolls-Royce also took over development of the Whittle-type gas turbine for jet propulsion. The successful outcome was the River class of centrifugal-flow turbines; the Welland, Derwent (as fitted to the Meteor fighter, which set up new speed records in 1945-46), and Clyde being notable examples. *See* Aero-Engines.

Roma. Town in Roma co., Queensland, Australia. It is on the Warrego river, 318 m. by rail W. of Brisbane on the line to Cunnamulla. Pop. 3,600.

Roma. Personification of the imperial power of Rome. She was worshipped both in Rome and Asia Minor, where the first temple was built in her honour at Smyrna in 195 B.C. On Roman coins, she was represented as a warlike heroine, leaning on a shield, with the goddess of victory on her right. A temple of Venus and Roma was erected in Rome by Hadrian. *See* Marcus Aurelius.

Romagna. Region of Italy, covering the N.E. part of the former Papal States, and including the modern provs. of Ravenna and Forlì. With the neighbouring region of Emilia, it was acquired by the popes in 1278, was surrendered by them in 1797, and was joined to Piedmont in 1860.

Romains, JULES (b. 1885). French writer. Born at Saint-Julien-Chapteuil, Aug. 28, 1885,

Jules Romains,
French writer

his real name was Louis Farigoule. He was for ten years a professor of philosophy. He was one of the founders of *l'Abbaye* in 1906; this was a literary colony supporting itself on communistic lines, with its own printing-press; it was short-lived, for lack of funds. Romains afterwards founded *Unanimism* (*q.v.*), 1909, for which he wrote a manifesto. Its principles were put into practice in his volume of poems, *La Vie Unanime*, 1908, and successive volumes. As a playwright Romains was amusing and skilful; his *Knock*, 1923, produced in England in 1926 as *Doctor Knock*, was a great success, and it was followed by several others. As a novelist, his outstanding achievement is the series *Les Hommes de Bonne Volonté*, translated as *Men of Good Will*,

which extended to 20 volumes between 1932 and 1941; it is a survey of the contemporary scene. During the Second Great War, he went to America, where he wrote *Sept Mystères du Destin de l'Europe*, 1941, *Une Vie des Choses*, 1941, *Grace encore pour la Terre!*, 1941, *Stefan Zweig, Great European*, 1942, and the play *Salsette Discovers America*, 1942. He was elected to the Academy 1946.

Roman or **ROMANU**. Town of Moldavia, Rumania, the chief town of a department of the same name. It stands at the confluence of the Moldava and the Sereth, about 35 m. S.W. of Jassy. It has a fine cathedral, built in 1541, and a handsome bridge across the Moldava, and is the seat of a Greek Orthodox bishopric. Pop. est. 29,000. The area of the prov. is 810 sq. m., and its population approximately 130,000.

Roman Candle. Species of firework. The powder is contained in a cardboard tube. A continuous shower of sparks follows ignition, brilliant balls of fire being ejected at intervals. This type of firework was first made in Italy, hence its name. *See* Fireworks.

THE ROMAN CATHOLIC CHURCH

Canon W. F. Barry, author of *The Papal Monarchy*, etc.

This article is contributed by a distinguished Roman Catholic scholar. See the article Protestantism for the other side of the question. See also Christianity; Eucharist; Jesuits; Monasticism; the articles on the saints and fathers of the Church; also Papacy and biographies of the popes; and entries on Cope and other vestments

The compound term Roman Catholics is not admitted, save by accident or under protest, in documents emanating from the authorities of the institution thus described. The Vatican Council of 1870, in its decree *Dei Filius*, speaks of the "Holy Catholic Apostolic Roman Church"; and these words take us back to the Nicene Creed (325-379), beyond which the Apostles' Creed, of still higher antiquity, bears witness to primitive belief in the Catholic Church, as founded by Jesus Christ, and commissioned to teach all nations (*Matt. 28, vv. 19, 20*).

S. Irenaeus, bishop of Lyons, speaks of Rome as "the greatest church, the most ancient and conspicuous, founded and established by Peter and Paul"; he declares that "to this Church every Church, that is, the faithful from every side, must resort on account of the more powerful primacy." S. Cyprian, who pleaded with eloquence for the "unity of the Catholic Church," calls Rome "the see of Peter and the principal

Church, whence the unity of the priesthood took its rise."

S. Irenaeus and others give catalogues of the popes immediately following Peter to their own times. S. Silvester confirmed the Nicene decrees of 325; S. Celestine dictated those of Ephesus of 431; S. Leo the Great's "Tome," or dogmatic letter, was accepted by the six hundred bishops at Chalcedon, in 451, who acknowledged him to be "keeper of the vine," and "archbishop of the whole world."

None of the early heretics could persuade the popes to show them favour; while saints of the East, like Athanasius, Basil, John Chrysostom, and Cyril of Alexandria, made appeal to them in support of the Catholic creed. S. Jerome, by far the most learned among orthodox writers in the first six centuries, asks in controversy with Rufinus, "what does he call his faith? If he answers Roman, then we are Catholics"; and to Pope Damasus he writes, "I who follow none but Christ am in communion with thy Beatitude, that is to say,

with the See of Peter. On that rock, I know, the Church is built."

Pope Leo I claimed "Peter's privilege" for the see which he occupied. Nor does any historian doubt that, by the middle of the 4th century, all the essential features of the papal supremacy, both in ruling and teaching the universal Church, were manifest.

That which is now termed private judgement or free thought bore during the first period of Christendom the name of heresy. Orthodox Catholics would not suffer it, relying on S. Paul, who pronounced even an angel to be anathema, did he preach "another Gospel" (Galatians 1, v. 8); on S. John's command not to receive such a one (2 John, v. 10); on the saying of Christ, "If he will not hear the Church, let him be to thee as a heathen and a publican" (Matt. 18, v. 17). Hence the bishops, "the succession from the Apostles," defended the true revelation against its impugnors by insisting on tradition which they expounded according to "the rule of ecclesiastical and Catholic sense."

Disappearance of Sects

Heretics were cut off, excommunicated if they obstinately held to their doctrines; and those who set up bishops of their own in opposition to the recognized hierarchy, as the Donatists in Africa, were held guilty of schism, or sect-making.

The Church thus guided, in union with Rome, continued ever the same, *semper eadem*, in belief and observance, while Gnostics, Manichaeans, Arians, Nestorians, Monophysites rose, passed over the scene, and disappeared. But the sacrament of unity enabled the central Christian society to triumph over the sects, to survive the fall of the Western Empire, to convert the barbarians, and to save civilization. Papal Rome victoriously withstood the Muslim onset; by its Catholic enthusiasm Spain, after centuries of combat, won back freedom from the Moors, and planted religion in the vast American territories from Mexico to Paraguay.

We read in Gibbons's great work that the bishops made France, as bees make their hive. The crusades, inspired by popes, kept Saracens and Turks out of Europe, until the Greeks, quarrelling with Rome, lost Constantinople and enslaved themselves. In 1517, Luther opened the era of the Reformation, which led, wherever Rome's authority was denied, to national Churches, and then to sects beyond reckoning.

As computed, there may be almost four hundred millions all told who look to the bishop of Rome as their spiritual father. In every nation some are to be found. Of Churches calling themselves Christian, undoubtedly by far the largest is the Roman. Her votaries cover the whole of what was once the Western Empire, save that in Britain they are few; but Ireland, like Poland, must be added, with eight millions belonging to the various small uniate bodies in the Near East. Under the Stars and Stripes more than 29,000,000 dwell; Lower Canada is French Catholic; and nearly the whole of Central and South America belongs to the same communion. In the British Colonies and dominions 21 millions are reckoned altogether. Catholic missions flourish in Africa, especially in Portuguese, French, Belgian, and British territories. They have long been at home in India, China, and Polynesia.

This multitude of nations and peoples come under the jurisdiction of some 1,600 bishops, archbishops, and patriarchs, appointed by the pope; and is directed by a numerous clergy, the secular or diocesan, subject to local bishops, and others belonging to religious orders bound by special vows. Both diocesan and religious take upon them the lifelong obligation of celibacy. The orders of monks, friars, and various other denominations were founded by S. Benedict, S. Francis, S. Dominic, or follow the rule of S. Augustine, or are Jesuits from S. Ignatius of Loyola, to whose general method of life many more, springing up since 1600, have conformed.

Church Discipline

Orders of women, cloistered and contemplative, teaching and nursing, have grown rapidly, and are on the increase. Discipline is severe throughout the Church, and is often thought by strangers to be the secret of its power. But Catholics declare the secret to be a universal and utter belief in the supernatural treasures of which clergy and hierarchy hold the guardianship. The gift which the Church offers to the faithful is Christ Himself, not merely instruction or example, but the Holy Eucharist, absolution from sin, intercession at the altar, assistance by prayer and good works during life and after death.

All the elaborate machinery of government is only a means towards holy living and dying, of which the path and goal are set out in books, such as *The Imitation of*

Christ, *The Spiritual Exercises*, and countless others which might be quoted as illustrations of a striking fact, viz. that the most detailed Canon Law and unwearied episcopal vigilance lead us into a region where the spirit is all in all. Saints and their wonderful works are the ever-present aim of Catholic teaching; there is no age but yields a harvest; and the pope who canonises them calls himself "servant of the servants of God."

Romance (Old Fr. *romanz*, from late Lat. *romanicē*, in the vulgar tongue). Primarily signifying a work in one of the Romance dialects derived from the Latin language, especially early French and Provençal, the word romance soon came to denote specifically the chronicle of adventure, narrated in verse or prose, to which this vernacular literature was mainly devoted. Of fiction of this kind, epic in its essence, the *Odyssey* of Homer was the prototype, and its natural development was the picaresque romance exemplified in the literatures of Spain, France, and England by Don Quixote, Gil Blas, and Tom Jones. Occupying a place between the medieval legendary romance, concerned chiefly with action, and the modern novel, concerned chiefly with the dramatic presentation of ideas, romance makes use of properties of both the one and the other; and, in addition, has qualities peculiar to itself that not only invest its literary expression with glamour so distinctive as to constitute a separate art form, but also create an atmosphere in which the facts of common life appear glorified.

The evolution of romance as an art form can be studied in this Encyclopedia in the articles on the literatures of the various countries in which it was brought to high perfection, and in those on the great writers who were its best

exponents. *See* Novel; Romanticism; Romantic Movement; Troubadour.

Romance Languages. Name given to a group of languages, including a number of dialects, spoken in most of those countries of S. and W. Europe which once belonged to the Roman empire. These languages are: Italian, Spanish, Portuguese, Provençal (with Catalan), Rhaeto-Romantic (spoken in the Grisons and Tirol), Rumanian, and French. They are all descended from Latin, not the literary, but the popular language—vulgar Latin or *lingua Romana*.

The Romance languages, as contrasted with their parent, are strikingly analytic. There are hardly any traces of noun-inflexion which is abandoned in favour of prepositions; auxiliaries are much used in representing verbal inflexions; a definite and an indefinite article have been added. On the other hand, the Romance languages exhibit greater wealth of new formations, such as augmentatives and diminutives. The vocabulary is in the main Latin, consisting partly of words handed down from generation to generation, partly of words of more recent origin, derived from literary, ecclesiastical, and legal sources. Several other languages have also contributed. There are numerous Celtic elements in French. German has supplied many terms, especially in connexion with military and judicial matters, hunting, navigation, and articles of dress. Spanish and Portuguese show considerable traces of Arabic influence. But the most mixed is Rumanian, into which Slavonic, Turkish, Greek, and Illyrico-Albanian elements have made their way. Italian has remained most faithful to the parent language, while French exhibits the greatest divergences. *See* France; Latin Language; Provence; Spain, etc.

Roman de la Rose (Fr., romance of the rose). Allegoric, descriptive, and philosophic old French poem. The first part, about one-fifth, was written c. 1225 by Guillaume de Lorris, and the rest was added about 1270 by Jean de Meung or Clopinel. Two hundred MS. copies have survived. Lorris wrote of the lover, or love personified, in search of the rose typifying beauty. The continuator ranges over all fields of knowledge and speculation, and in doing so throws much light on the life and thought of the 13th century. The Romance of the Rose had great influence in Italy and England, as well as in

France. Chaucer translated nearly one-third of its 22,000 lines. In the 16th century Marot rewrote the whole poem in the French of his day; and during 1878–80 a fresh translation into modern French was published. *Consult* English version by F. S. Ellis, 1900.

Romanes, GEORGE JOHN (1848–94). British scientist. Born at Kingston, Canada, where his father was a professor, May 20, 1848, he was taken at an early age to England, where he completed his education at Caius College, Cambridge.

George J. Romanes,
British scientist

Deciding to make scientific research his life-work, he made many biological observations in a laboratory of his own, at Dunskaith, in Scotland. The results of his work appeared in various papers and lectures, and won for him the F.R.S.

In early days Romanes had thoughts of becoming a clergyman, but for a time he took up an unorthodox attitude, and his *Candid Examination of Theism*, 1878, was antagonistic to accepted beliefs. Later on, he returned to something of his old faith, and revealed this in *The Fallacy of Materialism* and some other writings, e.g. *Thoughts of Religion*, published in 1895. He died in Oxford, May 23, 1894. His works include *Animal Intelligence*, 1881; *Mental Evolution in Animals*, 1883; *Darwin and after Darwin*, 1892–97; and *Essays*, 1897. *Consult* his *Life and Letters*, by his wife, 1896. *Pron.* Romanes.

Romanes Lecture. Annual lecture delivered at Oxford. It was founded by George John Romanes in 1891, the terms being that a man of eminence shall be elected annually to deliver a lecture on a scientific or literary topic. Gladstone delivered the first, on *Medieval Universities*, Oct. 24, 1892; and later lecturers have included T. H. Huxley, W. Holman Hunt, T. Roosevelt, Lord Oxford and Asquith, John Masefield, Winston Churchill, and Julian Huxley.

Romanesque Architecture. In general, the style of building prevalent in Europe from the 4th century to the 12th. Based on Roman architecture, it expressed and developed the principle of the round arch and the vault, but locally it differed widely from its exemplar in plan and constructive

aim. Thus the Romanesque period witnessed the development of the cruciform church, henceforward the standard type of medieval church, from the old basilica. With the exception, too, of certain structures in Germany and N. Italy, where the Teutonic builders clung to the old Roman weight and massiveness of masonry up to the 12th century, Romanesque construction was comparatively light.

Broadly speaking the style followed two separate lines of development, those of the East and the West. That of the East, radiating from Constantinople, was known as the Byzantine, and had for its special mission the perfection of the dome. That of the West was profoundly modified by Byzantinism, especially in Venice, Ravenna, and along the Adriatic shore, and shared with it certain distinctive features, such as the springing of the arch direct from the cushion capital. The progress of Romanesque towards Gothic was more rapid in France than elsewhere; there, builders were the earliest to attack the structural problems, were the great experimenters in the lightening of construction, and invented the flying buttress and, ultimately, the pointed arch.

Among the principal features of a decorative character in Romanesque building was the arcade. In the Rhenish towns and throughout N. Italy, arcades are present in vast numbers, sometimes about the size of churches or cloisters, elsewhere as mere ornament on a blank wall. Every variety of colonnette was used, with or without constructional value; capitals and string courses were richly carved, the carving being more naturalistic in the N. than in the S., where the classic forms still prevailed. Domed roofs were covered with mosaics; pavements richly inlaid, especially in buildings erected under Byzantine influence. In England, Romanesque appeared in the 11th century in the form of Norman architecture (*q.v.*). It flourished also with local peculiarities in Provence, where, in the 11th and 12th centuries, it is spoken of as the Roman style. *See* Apse; Arcade; Architecture; Basilica; Byzantine Architecture; Capital; Mosaic; Rome; Art.

Romani. Town of Egypt, in the N. of the Sinai peninsula. It is 20 m. E. of the Suez Canal, on the rly. from El Kantara along the Mediterranean coast. It gives its name to a battle fought in Aug., 1916, between the British and the Turks,

and sometimes called the second battle of Katia, after the retirement of the Turks from Katia in April. At Romani the British had constructed permanent defensive works. At midnight of Aug. 2-3, the Turks attacked the British positions from Romani to Mahemdia on the sea, and at the same time attempted from the S. to cut in rear the British communications by an advance across the high sand dunes.

Fighting continued during Aug. 5-7, the British steadily resisting the Turks, and later throwing them back. The Turks retreated upon El Arish (*q.v.*). Turkish losses were estimated at 10,000, of whom 5,000 were prisoners.

Romania. Name given sometimes to the Latin kingdom of Constantinople, which was founded by the Crusaders in 1204 and lasted until 1261. In 1203 the fourth crusade reached Constantinople, and restored Isaac Angelus and his son, Alexius IV, to the throne of Byzantium. Troubles then arose between the allies, the result being that the Crusaders assaulted, captured, and plundered the city. Then the new empire was founded, its first ruler being Baldwin, count of Flanders. It was organized on feudal principles, but the emperor's authority was practically confined to the neighbourhood of Constantinople and some islands in the Aegean.

Baldwin was taken prisoner in Greece, and his successors could do nothing to maintain, much less to extend, their authority. Their vassals were occupied with their own affairs, and the Byzantine emperors, who had retired to Asia Minor, won back their lost territory piecemeal until in 1261 Michael Palaeologus retook Constantinople. The Latin empire thus came to an end, although the last emperor, Baldwin II, was occupied until his death in 1273 in planning its recovery. See Byzantine Empire; Crusades.

Roman Law. System of civil law evolved in the Roman state from the time of the kings until its codification by Justinian. Its importance lies in the fact that it is still the basis of a large part of European jurisprudence, as well as of the systems in other parts of the world, such as S. America and S. Africa, which were built up originally on the same basis. Further, it lays down many principles which are common to the English law, and under the latter system are actually expressed in the original Latin, *e.g.* *Volenti non fit injuria*,

a person cannot be injured by what he willingly consents to; *ignorantia juris neminem excusat*, ignorance of the law excuses no one; *res ipsa loquitur*, the thing speaks for itself. Moreover, it is unique in history as a steady developing system of law whose course can be traced for some 1,300 years, and which early freed itself from the somewhat superstitious and religious rites and rules.

Taking the Twelve Tables (450 B.C.) as the starting point, the sources of Roman law may be summarised as follows: (1) Imperial decisions, whether made in the form of commands to officers (*Mandata*), replies to appeals from public bodies (*Epistolae*), or from magistrates (*Rescripta*), or of judgements (*Decreta*), or of general laws (*Edicta*). (2) Equity of the praetors and curule aediles. (3) Opinions of the jurisconsults (*Responsa prudentium*), of whom the greatest were Paulus, Ulpian, Papinian, Gaius, and Modestinus. The best part of Roman law may be ascribed to the jurisconsults, though the praetors also built up a sort of case-law, useful and effective till codified by the *Edictum Perpetuum* of Salvius Julianus in the reign of Hadrian (A.D. 117-138). In 529-30 came the Institutes and Pandects of Justinian.

Freeing of Slaves

In early Roman society slavery was the general state of the masses, but slaves could be, and often were, freed in various formal ways, such as *manumissio*. In all classes *patria potestas* was the rule; the father, speaking generally, had absolute power over his wife and children, and was legal owner of all property in their possession. But, by a fictitious process of pawning his son, *mancipatio*, a father could free him from the parental power. A man could not sell any real property which formed part of his wife's dowry.

Owing to the strict laws of succession, depending upon the ancient idea of ancestral piety, it was essential in early Roman law to have an heir who was bound to undertake all the funeral rites and pay the deceased's debts, even if the latter left no estate. So if there were no son one was adopted to carry on the succession. Finally, in Justinian's time, something like the modern methods of distribution of a dead person's assets was adopted, and due regard was paid to the claims of the blood. Even then the dominant idea of a will or *testamentum* was the naming of an heir, but this was superseded

eventually by *codicilli* and *fidei-commissa*, whereby the testator's wishes for the disposal of his property could be executed with less formality. Children of a deceased person were entitled to one-fourth of his property, and he could not will it away. If there were four children or fewer, their share was $\frac{1}{4}$, if five children or more, $\frac{1}{5}$. A poor widow was allowed $\frac{1}{2}$ if without a dowry, and if she had three children she took a *virilis pars*. This bar against complete disinheritance still holds in legal systems based on the Roman law. See Jurisprudence; Justinian; Law; Scots Law; Slavery; Twelve Tables; Will.

William Latey

Romano, GIULIO (c. 1492-1546). Italian painter, whose real name was Giulio Pippi dei Giannuzzi.

Giulio Romano,
Italian painter
Self-portrait

Born in Rome, he studied under Raphael, who employed him at the Vatican. After Raphael's death, the completion of his frescoes in the Hall of Constantine in the Vatican

was entrusted to Giulio and G. Penni. In 1524 Giulio entered the service of Federigo Gonzaga at Mantua, where he acted as architect and decorator of the Palazzo del Te. He died at Mantua, Nov. 1, 1546. See Ceiling.

Romanones, ALVARO FIOQUEROA Y DE TORRES MENDEIYA DE ROMO, COUNT OF (b. 1863). Spanish statesman. He was born at Madrid, Aug. 1, 1863, and entered the cortes as Liberal deputy for Guadalajara, first holding office in 1905, when he was minister for public works, agriculture, and commerce. He was prime minister during successive Liberal governments, 1912-13, 1915-17, and 1918-19. Foreign minister in the last cabinet under the monarchy, 1931, he was an opponent of Primo de Rivera (*q.v.*). He wrote *The Republic in Spain*, 1932.

Romanov. Name of the family which occupied the throne of Russia, 1613-1917. It derives its name from Roman, a member of an old noble house, whose daughter, Anastasia, married the tsar Ivan the Terrible, while his son, Nikita, married the princess Eudoxia, a descendant of Rurik, the founder of the Russian monarchy. Nikita's son, Feodor, became the patriarch Philaret of Moscow, and his son,

Michael Romanov, was elected tsar in 1613. He was succeeded by his son Alexis, and then by his grandsons, one of whom was Peter the Great. The male line ended with Peter II in 1730, when Anna, daughter of Ivan II, ascended the throne.

On the extinction of her line, at the death of the empress Elizabeth in 1762, the crown passed to the Holstein-Gottorp or Oldenburg branch. This was descended from Anna, daughter of Peter the Great, and her husband, Charles Frederick, duke of Holstein-Gottorp. Its first sovereign was Peter III, and the family occupied the throne until the abdication of Nicholas II, March 15, 1917. *See* Moscow; Russia. *Consult* The Real Romanovs, G. Botkin, 1932.

Roman Remains in Britain.

From the deposit left by four centuries of occupation and building in the islands, it is easy to deduce in detail the Roman way of life in Britain. Foremost among these antiquities are the Roman roads (*v.i.*), the lines of which are still followed by modern highways. There are walls, gateways, and other examples of brickwork in most cities whose names end in *caster*, *chester*, or some similar form; complete towns have been excavated at smaller places like Silchester and Caerwent; villas like those at Bignor and Chedworth are widely scattered. Roman weapons, tools, playthings, and artistic objects are constantly coming to light; even in the Second Great War a Home Guard in Hampshire gave information which led to the unearthing of one of the richest finds of Roman pottery. *See* Air Photography; Antonine's Wall; Baths; Ermine Street; Hadrian's Wall; Roman Wall; Verulamium; Watling Street.

Roman Road. Highway constructed by the Romans. They were great builders of roads and those they made possess remarkable powers of endurance. They also developed existing roads. In England many roads radiated from London. The chief were Watling Street and Ermine Street; while three others were Akeman Street, Icknield Way, and Fosse Way. *See* Britain; Roads; Watling Street, etc.; *consult also* Roman Roads in Early Britain, T. Codrington, 1905.

Romans. Town of France, in the dept. of Drôme. It stands on the right bank of the Isère, 49 m. W. of Grenoble. A bridge connects it with Bourg-de-Péage

opposite. It has manufactures of leather, shoes, gloves, baskets, hats, etc., and there is a considerable trade in cloth, liqueurs, and cattle. The mulberry is cultivated, and in the vicinity is the famous vineyard of l'Ermitage. The town grew up round an abbey founded by S. Bernard of Vienne, in 837. The church of S. Bernard lost some valuable ancient stained glass by air raids during the Second Great War. Pop. est. 17,000.

Romans, Epistle to the. One of the four principal Epistles of S. Paul. It would seem to have been written from Corinth towards the end of the Apostle's third missionary journey, and to have been intended to prepare the way for a visit to the Roman Christians, which he was hoping soon to make. Its purpose is to explain the universal character of the Gospel, and the leading ideas of Christian doctrine, and to give practical advice.

S. Paul declares that Jew and Gentile alike are assured the righteousness of God by faith (justification by faith). What then becomes of the law? The answer is that, since Abraham himself was justified by faith apart from the law, justification by faith implies freedom and redemption from the law. The Apostle himself was set free by Christ from the law of sin and death (Rom. 7, v. 13-25; cf. 1 Cor. 15, v. 22). If God rejected the Jews in order to save the Gentiles, the responsibility was their own; and it was still possible for them to be restored to favour (chaps. 9-11). In the practical exhortation the Romans are urged to love the brethren, to submit to the powers that be, to avoid judging one another harshly, and to bear the infirmities of the weak (chaps. 12-15).

The epistle was written about A.D. 58 to a community which included both Jews and Gentiles. Its genuineness is fully attested. It is included in the Canon of Marcion and in the Muratorian Canon. It was used freely by the author of 1 Peter, and by Clement of Rome, Ignatius, and Polycarp. It has much in common with other epistles written by S. Paul. It should be added that there is manuscript authority for the omission of the words "in Rome" in 1, vv. 7, 15; and in some manuscripts the doxology of 16, vv. 25-27 (A.V.) is found at the end of 14, or in both places, or is not found at all. Possibly there were in circulation abbreviated copies of the

epistle. *See* Bible; Paul. *Consult also* Romans, H. C. G. Moule, 1907; Epistle to the Romans, E. F. Scott, 1947.

Romansch. A language of Switzerland. It is an offshoot of Latin, and, by a decree of the Swiss federal council, passed on July 8, 1937, became an officially accepted language of the country, jointly with French, German, and Italian, except in parliament. The language's great protagonist in recent times was Eider Lausel, Romansch poet, a native of the Lower Engadine. The language is spoken by some 50,000 people in the Engadine, the Oberhalbstein, and the Grison's Oberland.

Romanticism. Movement in art. Embodying a revolt against the classic tradition in art, it began about the middle of the 18th century, and permeated all Western Europe. It constituted an appeal to the emotions instead of to the intellect, and reached its climax of intensity in the first part of the 19th century, affecting the modes of the day, when materialism in the industrial world had become all-powerful. Its principal manifestations were the school of figure painters headed by Géricault and Delacroix, and that of the Barbizon painters of landscape, while the same ideal was taken up by the English Pre-Raphaelites. There were counterparts of art romanticism in Germany, particularly at Düsseldorf under Schadow's leadership, and also in the Antwerp school of historical painters.

Romantic Movement. Name given to a phase through which imaginative fiction in prose and verse passed in the period approximately covered by the last third of the 18th and the first third of the 19th century. It was to some extent a literary version of romanticism in painting. A reflection in literature of the universal effort at emancipation from tyranny that culminated in the French Revolution, with its later repercussion throughout Europe, it was largely a rebellion against the inflexible rigidity and limited imaginative range of the classical school which had dominated all European literature for over a century.

In Great Britain the movement is dated as beginning with Percy's *Reliques of Ancient Poetry*, 1765, and the literary forgeries of Macpherson and Chatterton. The native wealth of romantic material thus discovered gave literary genius a new interest in medievalism. In The Castle of Otranto,

1. Road through the Forest of Dean, Glos. marked by large stones characteristic of Roman paving. 2. Steps and garden at Chedworth villa near Cirencester. 3. Helmet found near Guisborough, Yorks. 4. Sculpture found in the bed of the river Walbrook

which once flowed across London. 5. Bust of Hadrian recovered from the Thames. 6. 4th cent. bastion of the Legionary camp at York. 7. Central heating system under the floors of a villa at Darent, Kent. 8. 2nd cent. mosaic at Verulamium near St. Albans

ROMAN REMAINS IN BRITAIN: RELICS OF THE INVADERS OF 2,000 YEARS AGO

Photos, 1, B C Clayton, 2, Humphrey Joel, 7, B C Youens, 8, Photo Work, Ltd, Brighouse

1764, Horace Walpole deliberately made the experiment of blending ancient romance with the modern, grafting the supernatural element of the former on to the realistic truth to life of the latter. His book, with all its faults, obvious even at that time, fixes his place as the inaugurator of the romantic movement that in England passed through Anne Radcliffe, "Monk" Lewis, and others, to find its full perfection in the romances of Scott and the poetry of Byron, Shelley, and Keats.

In Germany the romantic movement may be traced through Goethe (in his first phase), Schiller, Bürger, and the Schlegels; in France through Rousseau, Chateaubriand, the elder Dumas, Victor Hugo, whose *Hernani*, 1830, marks a climax, Béranger, and de Musset; in Italy, where it never established itself securely, in Manzoni and Leopardi. See Goethe; Romance; Rousseau, etc.

Bibliography. *Histoire du Romantisme*, T. Gautier, 2nd ed. 1874; *Main Currents in 19th Century Literature*, 6 vols., G. Brandes, Eng. trans. 1901-05; *English Romantic Movement in the 18th Century*, W. D. MacClintock, 1903; *The Romantic Revolt*, C. E. Vaughan, 1907.

Romantic Music. A term applied to that class of composition which early in the 19th century began to supersede the so-called classical school, as a result of a desire to make music expressive of emotion and imagination rather than merely correct on formal lines. Even in classical times, however, the spirit of romanticism was often present. The later works of Beethoven showed the way to Schubert, Chopin, Schumann, Mendelssohn; and Berlioz, Liszt, and Wagner carried the movement further.

Roman Type. Principal style of type used for book, magazine, and newspaper printing, as distinct from italic, gothic, black letter, and other decorative types. It was the style of lettering used on Roman inscriptions, which replaced the older Greek letters.

Roman Wall. Term used in the U.K. to denote in particular Antonine's Wall and Hadrian's Wall (*q.v.*). Remains of other walls built by the Romans mark their forts at Aesica, Castle Cary, Ribchester, etc., and their towns at Silchester, Viroconium, Caerwent (the ancient Silurum), Chester, (the ancient Deva), and London (see London Wall). They were developed from earthwork

campes laid out by Agricola and his successors. See Britain.

Romany Rye, THE (The Gypsy Gentleman). Autobiographical romance by George Borrow, first published in two volumes in 1857. A sequel to *Lavengro* (*q.v.*), and written at Oulton Broad, it recalls some of the author's early experiences of gypsy life in England, and is one of the most popular of his works. The title is taken from a song sung by Petulengro in chap. 54 of *Lavengro*.

Romberg, SIGMUND (b. 1887). Hungarian-born American composer. Born at Szegedin, July 29, 1887, and educated at Bukarest university, he became a prolific

composer of operetta, musical comedy, and revue. His most tuneful scores were for *The Student Prince*, 1924; *The Desert Song*, 1926; *The New Moon*, 1927, all popular in London and New York. Romberg scored an outstanding Broadway success with *Up in Central Park*, 1945.

Rome. Prov. of Italy, in Latium. Lying S. of Viterbo and N. of Littoria, its area is 4,664 sq. m. Backed by the Apennines, it is largely mountainous. The Tiber flows through it, and it contains Bracciano, Albano, and other lakes. Although it includes the city of Rome, it is mainly an agricultural area.

ROME: THE CITY AND ITS HISTORY

Thomas Ashby, D.Litt., Director, British School at Rome, 1906-25

This article deals with the city of Rome, the empire which developed therefrom being the subject of the succeeding article, while a further contribution deals with Roman art. See also the entries Capitol; Forum; Palatine; Vatican; Viminal, and others associated with the city; also Ostia; Romulus, etc.

A city of Italy, capital of the republic as it was of the monarchy, Rome stands on the Tiber, mainly on the left bank, 17 m. from its mouth. Pop. (1947) 1,551,520.

The traditional date of the foundation of Rome is 753 B.C., and recent discoveries have shown that

this is approximately correct. The nucleus of the city was the Palatine hill, no doubt selected by the first settlers, whoever they were, owing to its natural

Rome. Arms of the city

advantages of strength and position. There were other settlements on the surrounding hills, of less importance, and these were fused into one about the middle of the 6th century B.C., when the Cloaca Maxima was constructed, and the adoption of the Forum as a market place made possible.

To this period belong the earliest city walls, attributed to Servius Tullius, which were reconstructed after the capture of Rome by the Gauls in 390 B.C.; they enclosed the seven hills of Rome—Palatine, Capitol, Aventine, Caelian, Esquiline, Viminal, and Quirinal. They consisted of a massive embankment wall, built on the edge of the cliffs (which were far more prominent in ancient times than now, when it is often difficult to recognize them), or protected by a ditch where it was necessary to cross level ground.

An outpost on the right bank, on the summit of the Janiculum, protected the crossing of the river by the Pons Sublicius, the earliest of Roman bridges, built entirely of wood. The area which these walls enclosed was larger than was actually occupied by buildings, and the growth of the city was naturally at first most rapid in the low ground, where water could be obtained from wells, and where the Tiber, an important waterway even in early times, was most easily accessible. Its main lines were dictated by the natural features and by the position of the city gates, from which issued the famous roads which, at first leading only to the villages in the neighbourhood, were gradually extended all over the Roman empire.

The first military highway, the Via Appia, was constructed in 312 B.C., and the first aqueduct dates from the same period. Others followed as occasion demanded, and the provision of a good water supply—and no city in the world had or has a better—rendered it possible for Rome to extend over the hills. The city grew up, however, quite unsystematically; the area by the river was cramped, although it had already overflowed into the Campus Martius, the low ground on the north by the river, which was originally the drill ground and had been left outside the walls of the city.

Julius Caesar was the first to devote particular attention to this problem. He remodelled the

1. The Via dell'Impero, a road constructed by Mussolini, leading to the Colosseum. 2. Piazza di Spagna. 3. The Ponte Fabricio built in 192 B.C., the oldest bridge over the Tiber. Beyond is the Church of San Bartolomeo and a medieval watch-tower. 4. The

National Monument to Victor Emmanuel II. 5. Quirinal Palace, founded by Gregory XIII in 1574. 6. Flats in the St. Lorenzo ward, built after the Second Great War, one block was reserved for war victims. 7. Crescent of shops in the Trajan's forum

Forum of Nerva. 6. Forum of Vespasian and Temple of Minerva. 7. Temple of Venus. 8. Basilica Aemilia, built by Aemilius Lepidus, 179 B.C. 9. Temple of Antoninus and Faustina, dedicated A.D. 141. 10. Portico of Livia. 11. Baths of Trajan. 12. Colosseum. 13. Colossal statue of Nero as god of the sun, 118 ft. high. 14. Temple of Titus and Trajan. 15. Basilica of Constantine, originally built by Constantine, 312-35 A.D. 16. Theatre of Marcellus, completed 13 B.C., accommodating about 14,000 spectators. 17. House of the Vestals. 18. Triumphal arch of Augustus. 19. Temple of Vesta. 20. Basilica of Castor and Pollux, built by Julius Caesar, 6 B.C. 21. Rostra, or platform from which the public orators made speeches, erected by Augustus. Nos. 14 to 21 were included in the Great Forum. 22. Arch of Septimius Severus, erected A.D. 203 to commemorate the emperor's eastern victories. 23-25. Imperial palaces on the Palatine Hill. 26. Circus Maximus, which held over 200,000 spectators. 27. The Velabrum quarter. 28. Theatre of Marcellus.

ROME: RECONSTRUCTION OF THE SOUTHERN AND MOST IMPORTANT PORTION OF THE ANCIENT CITY

From the reconstruction in plaster by Prof. Mercatelli

Forum Romanum—what we now see there is in the main his in conception—and built the first of a series of fora in the space between the Capitol and Quirinal, with a view to the improvement of communications between the N. and S. parts of the city. It was in his time, too, that the river was first embanked, and that Pompey erected the first important group of public buildings in the Campus Martius.

Augustus completed what Julius had begun, and besides displayed much activity in other directions; so that his famous boast that he found Rome of brick and left it of marble is amply justified. He erected three groups of public buildings in the Campus Martius, restored no fewer than 82 temples and built others, including that of Apollo on the Palatine, divided the city into 14 regions, eight of them within the Servian wall and five outside it, the fourteenth being formed by the island and a considerable commercial quarter on the right bank of the river. A police and fire brigade was also established, the river was once more regulated, and the first public baths were constructed.

Imperial Palaces

The next emperors were mainly occupied with providing themselves with magnificent palaces. Augustus had been content with the house of Cicero's opponent Hortensius, which, generally known as the house of Livia, may still be seen on the Palatine. This was the aristocratic quarter, and recent excavations there have brought to light remains of other houses of the same period with fine paintings. The successors of Augustus constructed a splendid palace on this hill, while Nero occupied the whole district between the Palatine and Esquiline with his enormous Golden House, which spread over a larger area than the Vatican. Whether he was responsible for the fire which is always associated with his name will never be known; but he certainly took advantage of it, not only in this respect, but by compelling private proprietors to reconstruct their houses more substantially and to encroach less on the streets.

Vespasian marked the accession of a new dynasty by the restoration to public uses of much of what Nero had appropriated, and built the first permanent amphitheatre, the Colosseum, where Nero had formed an ornamental lake; he also added a new forum, that of Peace, rebuilt the temple of Jupiter on the Capitol, and carried out a new survey of the city. To his second son, Domitian, is mainly due the construction of a still more

magnificent imperial residence on the Palatine. Of that which had preceded it, we may gain some idea from the remains which he left under the floors of his palace, for Roman builders did not destroy the remains of previous edifices, but left them to serve as foundations. It was approached from the Forum by a series of magnificent halls, one of which has been wrongly identified with the temple erected in honour of Augustus after his death, while the church of S. Maria Antiqua was ensconced in another in the 6th century.

Thence an inclined plane led up to the Palatine, where the palace of Tiberius on the N.W. summit of the hill was rebuilt, while the S.E. part was taken up by another huge palace, divided into state apartments, a residential portion, and a garden. Domitian began the construction of a new forum, which was finished by Nerva; but the series of imperial fora was completed by Trajan, who finally cut back the cliff of the Quirinal to a maximum height of 100 ft., as the inscription on his column records, and overcame the difficulty of communications through this narrow space—a modern problem also until Mussolini built the Via dell' Impero. Trajan also brought another aqueduct to Rome, and erected enormous public baths on the site of the Golden House. These were until 1895 known as the baths of Titus, which were in reality close to the Colosseum, and very much smaller.

The Golden Age

Hadrian, his successor, was also active in building, and besides the immense villa which he erected for himself near Tivoli he is responsible for the temple of Venus and Rome, for the Pantheon in its present form, one of the best preserved ancient buildings, and certainly the most beautiful interior which we have, and for his mausoleum, which later became the Castle of S. Angelo, the great fortress of the popes, and the bridge leading to it. Marcus Aurelius imitated Trajan in erecting a column on which his campaigns were represented in bas-relief; but Septimius Severus was the next great builder, the fire in the reign of Commodus having given him his opportunity.

The temple of Vesta, the house of the Vestals, and other buildings were restored by him; he made a considerable addition to the imperial palace on the Palatine, and was responsible for a marble plan of ancient Rome, considerable fragments of which exist. His son

Caracalla built huge thermae on the Via Appia, but the rest of the emperors of the 3rd century A.D. had no leisure for building, with the exception of the hasty construction of the city walls by Aurelian and Probus, who took advantage as far as possible of existing buildings. They are built of concrete faced with brick and are still in great measure preserved.

In 283 another fire gave Diocletian the opportunity of further extensive restorations; he was also responsible for the colossal baths which bear his name, and which are now the seat of one of the finest of Roman museums. Maxentius erected the greater part of the huge basilica in the Forum which his conqueror, Constantine, completed—a building which can no longer claim to be the earliest basilica in Rome, now that one of the 1st century A.D., undoubtedly pagan, decorated with very fine stuccoes, has been found underground near the Porta Maggiore.

Christian Basilicas

Constantine was also responsible for the erection of the earliest and most important of the Christian basilicas: S. Pietro, S. Paolo, S. Lorenzo, etc., many of which stood on the actual site of the tombs of the martyrs; this fact led to the preservation of the roads which led to them throughout the Middle Ages, and is thus of topographical importance. After the triumph of Christianity the catacombs, which had been excavated along the main highroads, became the goal of pilgrims, and some of the basilicas of Constantine were built over the tombs of the saints.

After the barbarian invasions, in which the aqueducts were destroyed, the upper portions of the city, which depended on them for their water supply, were abandoned, and medieval Rome, with the exception of a number of isolated churches, convents, and strongholds, was crowded into the low ground near the river. Many of the last were built into the remains of ancient edifices, which had been partially ruined by earthquakes; one of the worst of these occurred in the middle of the 9th century. It is to these, and not to the damage wrought by the barbarian invaders, that the destruction of the ancient monuments must be attributed.

Of medieval Rome, as a fact, very little remains except towers and campanili. Most of the churches, as well as the great papal palaces of the Vatican and the Lateran, have been transformed entirely by the architects of the Renaissance and of its successor

the baroque period. And the popes, no less than the emperors, sacrificed the work of both their pagan and Christian predecessors to their own, which was in most cases of great merit, though less can be said in favour of the decay in taste of the 18th and the neo-classicism of the 19th centuries.

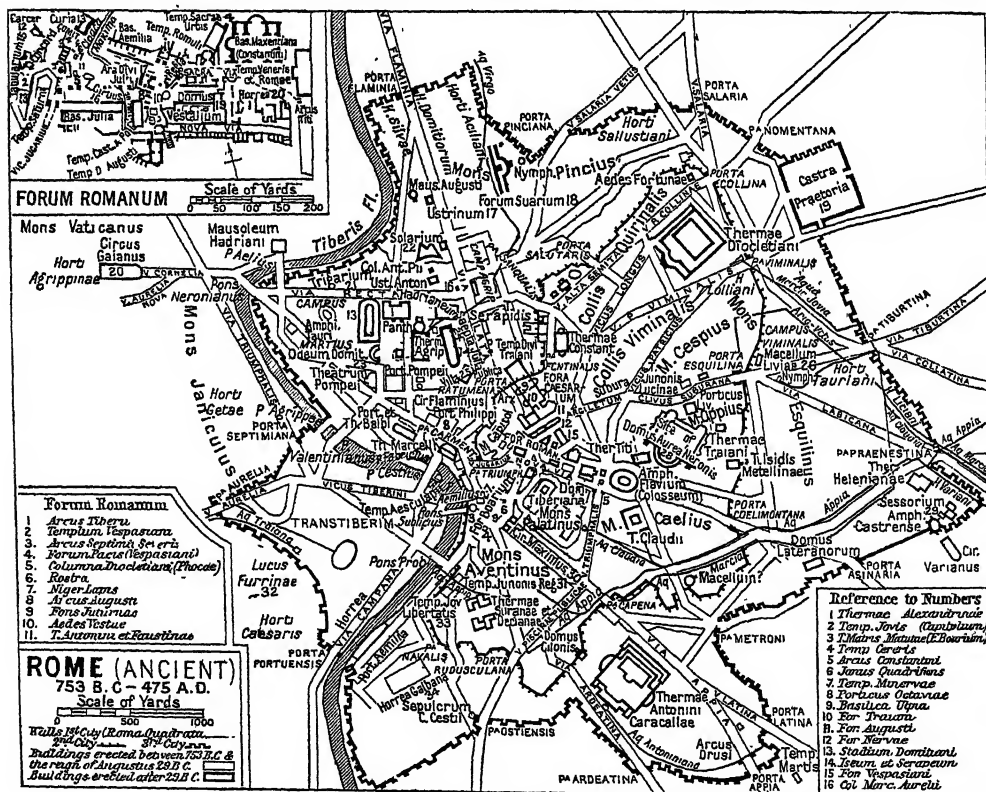

From the 15th century onwards we have a series of plans, bird's-eye views, and views of the city which surpasses in completeness anything else of the kind. From these we learn that it was in the pontificate of Sixtus V (1585-90) that Rome took on the outward appearance which it had until after 1870. By the construction of an aqueduct which supplied the hills, he rendered them once more fit for habitation, and the transformations which he wrought in the

streets are noteworthy. The reerection of many ancient obelisks did much to give them a striking termination. After 1870, the growth of the modern city led not only to the occupation of almost all the areas within the city walls by buildings, but to the construction of numerous suburbs, which are now regulated in accordance with a plan drawn up by the municipality.

The fundamental error, however, which was made in the first few years of Rome's life as the capital of Italy, can never be wholly corrected; and, indeed, its consequences must always be felt. Owing to the fact that the new quarters were allowed to spring up on all sides of the old city, it has been necessary, and will always be so, to cut new thoroughfares through the centre of it, and the compromise between

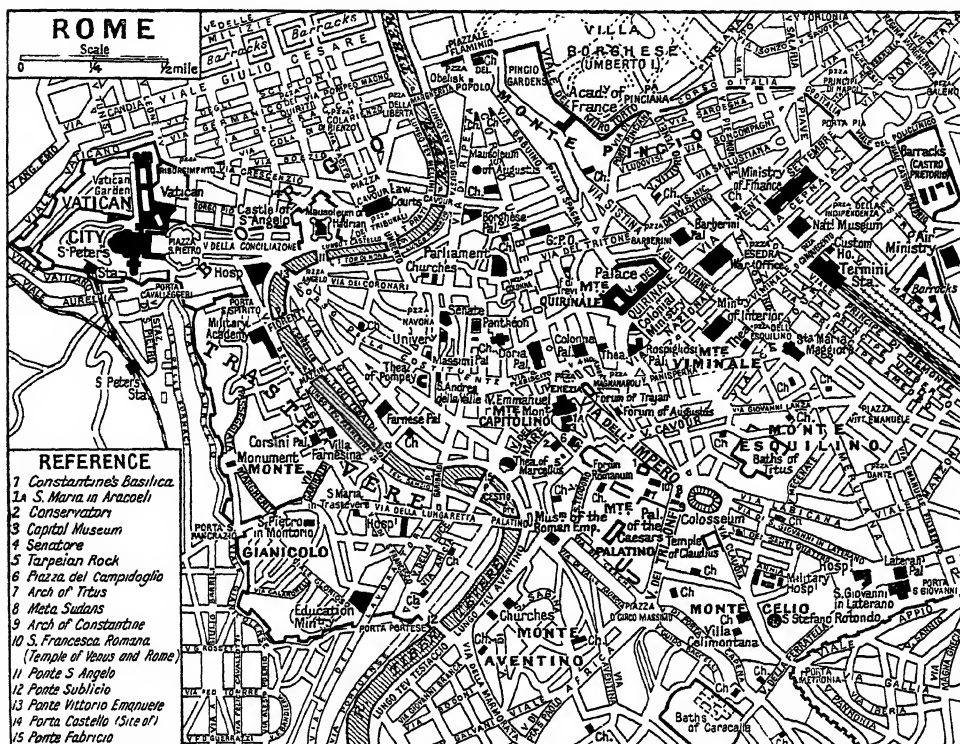

the demands of modern traffic and the claims to preservation of buildings of artistic and historical importance will never be found.

The most prominent buildings of the modern city are the huge monument to Victor Emmanuel II, on the north side of the Capitol, the law courts, on the right bank of the Tiber, the new Chamber of Deputies, the Banca d'Italia, and the principal civil hospital, the Policlinico. None of them is quite worthy of its surroundings. The embankment of the river caused the removal of much that was picturesque, as did the construction of the Via dell'Impero and other works of fascist Italy. These changes led to the discovery of many ancient remains, and often to their inevitable destruction. Much has, however, been done in

English names of places indicated by numbers. 1. Baths of Alex. Severus. 2. Temple of Jupiter (Capitol). 3. Temp. of Mater Matuta (Cattle mkt.). 4. Temp. of Ceres. 5. Arch. of Constantine. 6. Arch. of Janus with four faces. 7. Temp. of Minerva. 8. Colon. of Octavia. 9. Basilica of Trajan. 10. Forum of Trajan. 11. For. of Augustus. 12. For. of Nerva. 13. Stadium of Domitian. 14. Temp. of Isis and Serapis. 15. For. of Vespasian. 16. Col. of Marcus Aurelius. 17. Crematorium. 18. Swine Mkt. 19. Camp of Praetorian Guards. 20. Circus of Caligula. 21. Training Stables. 22. Sundial. 23. Concert hall of Domitian. 24. Voting enclosures of Julius Caesar. 25. Public Villa. 26. Provision Mkt. of Livia. 27. Cattle Mkt. 28. Golden House of Nero. 29. Court of Law. 30. Great Circus.

31. Tem. of Queen Juno. 32. Grove of Furrina. 33. Tem. of Jupiter and Liberty. 34. Granaries of Galba. Roman Forum. 1. Arch. of Titus. 2. Tem. of Vespasian. 3. Arch. of Septimius Severus. 4. For. of Peace (of Vespasian). 5. Col. of Diocletian (Phocas). 6. Orators' platforms. 7. Black Stone. 8. Arch. of Augustus. 9. Spring of Juturna. 10. Tem. of Vesta. 11. Tem. of Marcus Aurelius and Faustina. 12. Mamertine dungeon. 13. Senate House. 14. Voting place. 15. Record office. 16. Pool of Curtius. 17. Altar of Julius Caesar. 18. Palace of Numa. 19. House of the Vestals. 20. Granaries. Latin terms and their equivalents in English: *Aqua*, aqueduct; *colis*, hill; *horti*, gardens; *mons*, hill; *pons*, bridge; *porta*, gate; *thermae*, baths; *viciis*, street.

Rome. Plan of the capital city of Italy, showing the principal churches and public buildings

way of laying bare the remains of the Forum and Palatine, and many other buildings, in order that they may remain permanently visible. The region extending on both sides of the Via Appia and bounded by the city walls has been made into a public park, under the name of the *Passaggiata Archeologica* (archaeological park); but unluckily no excavations were made on the site before the park was laid out. The fascist government under Mussolini was particularly active in pulling down medieval and later buildings in order to unearth remains of the ancient city. To Mussolini also is due the imposing *Via dell'Impero* which, linking the forum of Julius Caesar and the Trajan column with the Colosseum, provides a fine vista of the latter building. We may also note the construction of a tunnel under the Quirinal hill, 1902. The municipal government of the city of Rome is in the hands of the *sindaco* or mayor and a council.

Rome is also the seat of government of Italy. The Vatican City (*g.v.*) is extra-territorial. The population of Rome has increased rapidly since 1870, when it was

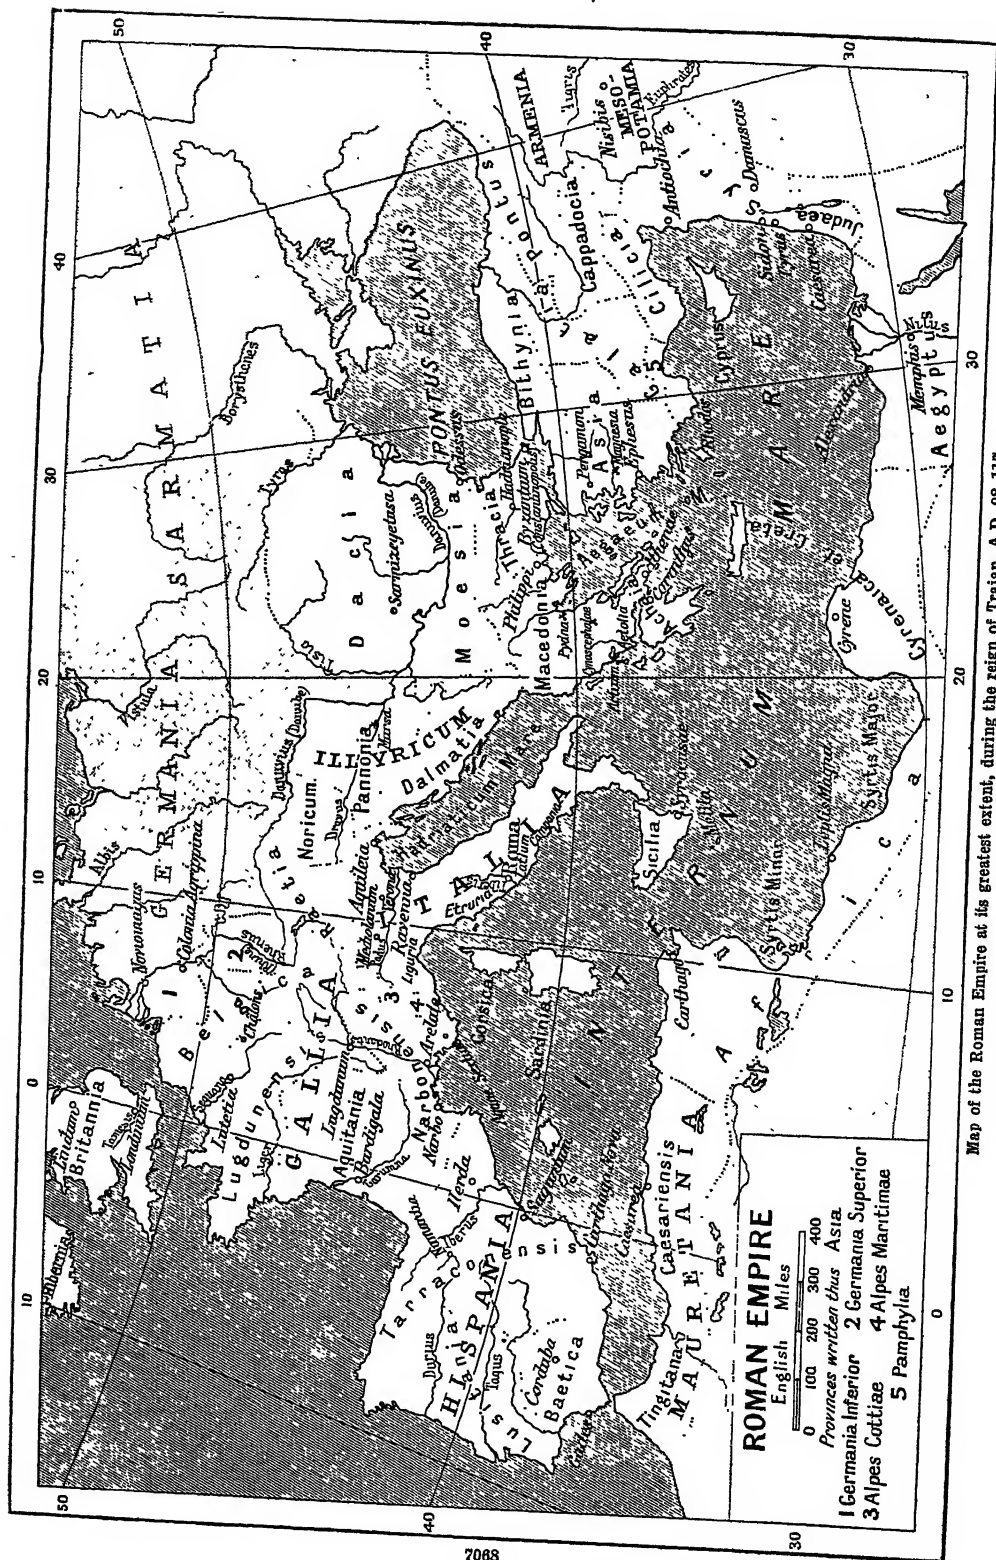

only 226,022. This is mainly due to its importance as the seat of government and as a city visited by tourists, for it has no trade or industries.

Besides the many buildings of interest of all periods which it contains, Rome is richer in museums and picture galleries than almost any other city in Europe, and this despite the fact that very many of the art treasures which it still possessed in the 18th century have since then been transported elsewhere.

During the Second Great War, the only damage suffered by the monuments of Rome occurred July 19, 1943, during an air attack by U.S. bombers, on the rly. marshalling yards, when a bomb fell on S. Lorenzo fuori le Mura; the damage, however, was repairable. Two breaches of 50 ft. and 15 ft. were also made in the Aurelian Wall. There was a second heavy air raid on military targets near Rome on Aug. 13, and next day the Badoglio govt. declared Rome an open city. After the surrender of Italy in Sept., Badoglio's govt. and the royal family abandoned Rome, which was then garrisoned by

German troops. More than 5,000 tons of bombs were dropped by Allied aircraft on neighbouring airfields in the week before the landings at Anzio on Jan. 22, 1944. On June 4, U.S. troops of the 5th army reached Rome. There was stiff fighting on the E. and S. edges of the city; but the main German forces had withdrawn earlier. Occupation of the city was completed during the day, and Rome became the seat of Italian govt. again on July 15.

ROME: THE WESTERN EMPIRE

J S. Reid, Bitt.D., Former Professor of Ancient History, Cambridge

This sketch of the history of the Roman empire is supplemented by articles on the emperors, Augustus; Nero; Trajan, and others; and on great Romans such as Caesar Julius; Scipio; while it is carried further in those on Byzantine Empire; Italy; Papacy. See also Carthage and entries on Plebeians; Senate; Tribune, and other institutions. For Roman literature see Latin and articles on Cicero; Tacitus, etc. See also Roman Law; Villa

The date accepted by Roman antiquaries for the foundation of Rome was 753 B.C. The earliest glimpses which we can get of the Romans present them to us as a community whose existence depended on agriculture and war. What is known as "land-hunger" played a very great part in Roman history. Early Rome must have been engaged in almost incessant warfare. The right bank of the Tiber was in possession of the Etruscans, alien to all other races of Italy, and the mountains in all directions were beset by turbulent raiders, Aequians, Volscians, and others. The inhabitants of the plains of Latium, the Latins, were closely akin to the Romans. Rome was originally a member of a confederation of Latin-speaking communities, of which she was a principal defensive outpost. Nothing but a very closely knit military and civil organization could have

enabled Rome to exist in the earliest period.

The Roman polity rested on an idea of authority in many respects unlike anything found in any other ancient state. The word for this was *imperium*, and its possessor in early days exercised absolute sway over all affairs, military, civil, and religious. That there was a monarchical period in Roman history is made certain by many things that survived into the late Republican age. The change from monarchy to Republic involved, as Cicero says, no change in the quality of the *imperium*.

The changes were: (1) the *imperium* was put into commission and held jointly by two persons; (2) the tenure of it was limited to a year; (3) the whole body of burgesses, i.e. the whole body of warriors, had a voice in the appointment, as was natural, since the appointment was, first and

foremost, a choice of commanders over the army. The principle of collegiality was established in connexion with all offices subsequently created. Exercise of a function by an officer who had no colleague was very exceptional. The principal example is afforded by the dictatorship. The difficulties which would certainly arise from the exercise of power by two joint holders of equal privilege must have been foreseen on the institution of the Republic. They were met by the singular practice whereby either of the two principal magistrates (called *praetores* at first, afterwards *consules*) might nominate a dictator, who held supreme authority for six months over citizens and ordinary magistrates. He appointed a subordinate officer, called *magister equitum* (master of the horse).

The first great step made by Rome towards empire was by obtaining control over the Latin League of cities, of which she had been at first an equal member. This was achieved finally, after a good many generations of strife, in 338 B.C. on the close of a serious war. The control of the Greek cities in Campania was obtained about the same time, and soon after the Etruscan power, once the greatest

Rome. The forum of Julius Caesar, with Trajan's column in the centre, seen across the N.W. end of the via dell' Impero. In the background (left) is the Palazzo Venezia, the German embassy before the First Great War; from a balcony here Mussolini was accustomed to harangue the Romans assembled in the Piazza Venezia, in front of the palace

in Italy, was subjugated, and by the beginning of the 3rd century B.C. Rome had the control of the whole peninsula. The complete domination of some parts of it was not, however, attained until later times. Thus the Ligurians, in the mountain regions above the Riviera, and the Gallic tribes on the Alpine slopes were not completely subjugated until the age of the emperor Augustus.

In this course of conquest in Italy Rome adopted a policy towards conquered peoples which was continued outside Italy and was the principal cause for her rise to empire. She kept all foreign relations in her own hands, but interfered as little as possible in the internal government of the subject communities or tribes. And she was most moderate in the burdens cast upon her subjects. The chief requirement was that of military service, which the primitive peoples were ready to give. Taxation was seldom required of Italians. This politic moderation on the part of Rome explains why Rome was the only ancient city state which succeeded in founding a stable empire.

Struggles with Carthage

The Greek cities of S. Italy struggled continually against the Italic barbarians, Lucanians, Brutians, and others, and from time to time had summoned Greek commanders to their aid. The venture of Pyrrhus, king of Epirus, who came over to aid Tarentum early in 280 B.C., brought Rome on to the southern scene, and completed her ascendancy in Italy. One result of this contest was a rupture between Romans and Carthaginians, who had previously been allies. After three great struggles (264-241 B.C., 218-201, and 149-146) Carthage was utterly destroyed. The first war was chiefly naval in character. It resulted in the first Roman annexation outside the peninsula, the Carthaginian possessions in Sicily. Immediately after this event Corsica and Sardinia were wrested from Carthage.

In 230 and 219 wars were waged against the Illyrian pirates, and some points occupied on the Eastern Adriatic shore. Rome was thus brought into political contact with the communities of Greece proper. Philip V of Macedon allied himself with Hannibal, and the Aetolian Confederation with Rome, during the Second Punic War. Immediately after Hannibal had departed, war was declared against Philip, who was overthrown by Flaminius at the battle of Cynoscephalae, in 197 B.C. In the following year Flaminius declared the "liberation" of Greece, following the an-

cestral Roman policy of respecting the internal autonomy of the separate cities, while looking with disfavour on leagues or combinations of cities or tribes.

Philip was crippled by this measure of "liberation," but the Romans annexed for themselves none of his territory. Philip had been aided by Antiochus, king of Syria, who was next attacked by Rome. After his crushing defeat at Magnesia, 190 B.C., he was treated very much as Philip had been. Roman allies, Eumenes king of Pergamum, and the Rhodians who headed a confederation of commercial cities, received accessions of territory. Philip, who had rendered very important assistance against Antiochus, was shabbily treated and consequently nursed dreams of revenge.

In the contests with Philip and Antiochus, two great Greek federations, one of the Aetolian, and the other of the Achæan cities, had been deeply concerned. The dissensions generated by the struggles led ultimately to the violent suppression of both by the Romans, the former in 189 B.C., the latter in 146, when Corinth, the great Achæan centre, was razed to the ground.

At the end of the Hannibalic War, only a narrow band of territory in Africa had been annexed. In 146 it was enlarged. The Third Macedonian War, against Perseus, concluded by the victory of Pydna, 168 B.C., made an end of the Macedonian monarchy, and Achæa, with Macedonia, went to form a province. From the time of the Second Punic War onwards the Romans had been occupied by strenuous struggles to establish their ascendancy in Spain, suffering from time to time great disasters. The capture of Numantia by the younger Scipio in 133 gave them more security, but Spain was still turbulent in the time of Augustus. In 133 the last king of Pergamum bequeathed his dominions to Rome, and they became the Roman province of Asia. About the same time the first steps were taken towards the conquest of Gaul. In 124 Aquæ Sextiæ (Aix in Provence) was founded, and six years later the Roman colony of Narbo (Narbonne), the first organized Roman settlement outside the peninsula.

Measures of the Gracchi

In the period from 133 to 121 the revolutionary measures of the Gracchi were carried out, and the supremacy of the compact ring of noble families which had controlled the Senate was undermined. The chief measures were: (1) the vindication of public ownership in

the national estates. (2) The constitution of the *equites* as a separate order. (3) The attempt to found great Roman colonies across the seas. Gaius Gracchus proposed to enfranchise the Italian allies. The refusal to pass this measure led a generation later to the Social War, which had for its result the acquisition of Roman citizenship by all the cities of Italy, by the *lex Iulia* of 90 B.C. The conception that men of Italian birth formed a people apart from the rest of the empire was now definitely established, with important consequences.

End of the Republic

The last annals of the Republic were filled with the struggles for control of the Roman polity between military commanders—the Scipios, Marius, Sulla, Pompey, Julius Caesar, and Mark Antony—and then the Republic perished. The imperial system itself emerged from a great scene of bloodshed, within and without Italy. The final decision in favour of Augustus at the great naval battle of Actium raised him to undisputed dominance in 31 B.C. Julius Caesar merely destroyed the Republic; and paid the penalty with his life. His successor had what he had not, the constructive spirit. So vast a transformation was surely never carried through with such consummate ease.

In the preceding century great portions of Asia Minor, also Egypt and Gaul and lands by the Danube, had been incorporated in the empire. An actual autocracy was established, so cunningly veiled that its methods presented themselves to the Romans as a natural and easy development from those of the Republic. A world weary of war greeted gladly one who posed as a prince of peace.

Such quietude and material prosperity as subsisted with few interruptions for two centuries, had never been known to the ancient world since the dawn of history. Even the extinction of the great founder's line when Nero perished, A.D. 68, shook the foundations of the imperial edifice but little. The commotion which swept away Nero was due to a consciousness among the legionaries, posted by Augustus in great permanent camps on the boundaries of the empire, by Rhine, Danube, and Euphrates, that the imperial power rested on their support, and might be bestowed by their grant. The Julio-Claudian line was succeeded by the nominees of the Eastern forces in the person of Vespasian; then there was an interlude under Nerva, when the Senate, whose formal right to a voice in the

appointment of an emperor had been recognized from the first, succeeded in making the right effective.

Then followed soldier emperors of great ability, Trajan and Hadrian, and after them the Antonines, the best governors of the whole imperial period. The philosopher-emperor Marcus Aurelius gave place to a feeble and vicious son, Commodus; on his assassination, A.D. 180, military nominations followed for several generations, often due to anarchic action by the legions, each great army striving to set its commander on the throne, in order to secure the largess to be obtained by success. The 3rd century was chaotic from this cause, until some men appeared whose powers were strong enough to give them secure control.

Aurelian and Diocletian

Aurelian, in 270, found the empire ready to crumble away owing to internal weakness and dissensions, and the formidable assaults of Germanic tribes, chiefly the Goths, Franks, and Alamanni. The pressure of the barbarians was due greatly to need of land, in large part caused by tribes in the far East, driven westward by the same necessity. The emperors adopted the policy of allotting vacant lands within the empire to the newcomers from time to time, in return for military service, an utterly ineffectual policy. Large portions of the empire rapidly passed from civilization to barbarism. To a great extent these aliens filled the ranks of the army, and high officials of patently barbaric origin swayed the destinies of the empire. In 282 a vigorous emperor, Probus, was murdered by his soldiers, and after an interval of confusion Diocletian, one of the greatest of the emperors, succeeded, and a new era began for the empire.

After Augustus, Diocletian was the greatest political organizer that Rome ever had. He tried to reconstitute all the imperial institutions in such a manner as to remove a number of sores which were threatening destruction to the body politic. (1) He tried to devise a method whereby succession to the throne should take place peacefully. He placed the supreme power in commission. There were to be two emperors-in-chief, called Augusti. Each of these was to nominate an assistant to bear the title of Caesar, and at the end of 20 years' tenure of office, the Augustus was to retire, being succeeded by the Caesar, who would have received a thorough training for the work of a ruler. For administrative purposes, the empire was divided

into two spheres, an Eastern and a Western, and each of these spheres again into two. In practice the four sections had for their superintendence one of the four imperial personages, while the two Augusti settled matters of universal concern in common.

(2) The provinces were split up into smaller portions. It would thus be very difficult for an ambitious governor to find sufficient resources near at hand to make himself dangerous to the supreme authority. Diocletian preserved the provincial councils, a very beneficial creation of Augustus. (3) The complex hierarchy of officials was thoroughly reorganized with a view to efficiency. (4) The immobility of the legions, stationed by Augustus permanently on the frontiers, had conduced to chaos, and Diocletian created a mobile army. (5) A great council of the Empire (*Consistorium*), with definite constitution and powers, was organized. (6) A vast and urgently needed reform of the coinage was begun, and completed by Diocletian's successor, Constantine. (7) A great and uniform organization of finance was undertaken. The land became the chief basis of taxation.

Growth of Despotism

The whole scheme was but partially successful, but it undoubtedly stayed the previously imminent ruin. Several processes, which had been for many generations gradually stealing over the empire, now reached their full development. (1) The monarchy, at first a despotism unavowed, and for that very reason less oppressive, now became frankly autocratic. (2) The empire started as in essence a vast confederation of communities invested with a great degree of local autonomy. But the central power had been continually encroaching on the privileges of the innumerable civic communities of the empire. These were ruined by bad financial administration, which was aggravated in some respects by the changes which Diocletian introduced.

Responsibility for the production of the taxes was laid on the municipal councils, with the result that local interest and initiative were paralysed. No one of the causes which can be assigned to the fall of the Roman empire was more potent than this. (3) A disastrous tendency developed towards a kind of social caste system. Caracalla, in 212, had made all the subjects of the empire citizens with nominally equal privileges before the law; but these privileges came to be of little value to the general mass. By the require-

ments of the state, men were deprived of anything like free choice in ordering their lives. Thus sons of soldiers were obliged to adopt the military career.

The class from which municipal councillors were drawn were subjected to such compulsion that any method of escape was welcome, even that of ordination in the Church—for the Christian empire left the clergy free. In the eye of the government the real object of the cultivator's existence was to produce taxes; he therefore sank into serfdom, and his children after him. So the greater part of the world became bound in chains. (4) A progressive Orientalisation of the Imperial Court took place, which rendered it a hotbed of intrigue. The Eastern idea that a monarch is in some sense divine, introduced by Augustus, thoroughly transformed the atmosphere. The whole public service became servile and corrupt.

Acceptance of Christianity

The attempts made to cure these evils ever became more strenuous and severe, and always failed. (5) The old Roman Senate, treated with outward respect by Augustus, became little more than a local council for the city of Rome. (6) Italy lost her pride of place, and became even as the extra-Italian provinces. (7) The official acceptance of Christianity by Constantine introduced a disastrous intermingling of politics and religion. Heresy now became a thing of infinite political consequence. (8) Rome was deprived of its pre-eminence by Constantine, who in 330 gave the famous old Greek city Byzantium a new name, Constantinopolis, after himself. The new capital was settled after the model of old Rome. Even in Italy, old Rome ceased to be the unrivalled city of the rulers. Late emperors held court frequently at other places, especially in the cities of Milan and Ravenna.

In 337 Constantine died. In the following year the three Augusti, his three sons, divided the empire. The East fell to Constantius, Illyria and adjacent parts to Constantine II, and the West to Constans. A year after this partition Constans attacked and killed Constantine II, and annexed his dominions. In ten years' time a formidable pretender, Magnentius, drove Constans to his death, and reached Rome. In 351 Gallus, nephew of Constantine and brother of Julian the Apostate, was recognized as Caesar, and Magnentius was overthrown by Constantius, at Mursa in Pannonia.

In 360 Julian became Caesar and Constantius died. Next year Julian

entered Constantinople as emperor, and re-established the old heathen cults. On his death in the war with Persia the soldiers raised to the throne Jovian, who reinstated the Christian religion. Jovian was assassinated, and Valentinian I, the son of a Pannonian peasant, became Augustus, and bestowed the same honour on his brother Valens. Valentinian established himself at Milan, Valens at Constantinople. Procopius, a trusted officer of Julian, raised the standard of revolt against Valens in Constantinople, 365, but lost his life in the next year. Valentinian, on the whole a strong general, and successful for long against the barbarians, died on a campaign in 375. Valens, while operating against the Goths, suffered at Hadrianopolis a terrible defeat, which forms a turning point in history, and lost his life. His nephew Gratian assumed as colleague a stout and successful soldier, Theodosius.

In 382 Gratian removed from the Roman Senate-house the altar of Victory, the last heathen symbol that remained there. He was treacherously captured and killed, 383, by an upstart emperor, Maximus, in Gaul, where a Frankish general, Arbogast, who had held the real power for some years, nominated Eugenius as emperor, intending to rule through him. A great struggle between forces from the West, chiefly Franks and Gauls, and the army of Theodosius from the East, took place on the river Frigidus, near Aquileia, where Theodosius won a great victory and Eugenius was killed; Arbogast committed suicide 388, and Valentinian resumed control of the West, but met his death in 392. In 395, on Theodosius's death, his son Arcadius became ruler of the East; another son, Honorius, had been declared Augustus in the West the year before his father's death, with Stilicho as his general. This involved the real, though not nominal, division of the Roman empire into two empires.

Domination of the Germans

The consequences of this split are obvious in Europe to this day. Stilicho held the Gothic chief Alaric in check for a while, but in 400 Alaric made his way into Italy; however, in 402, Stilicho won over him two great victories at Pollentia and Verona. In 405 another barbarian, Radagaisus, penetrated Italy, but he and his forces were destroyed by Alaric. Gaul also at this time was being ravaged by the barbarians. But long ere this the Germans had become the controlling element in the European dominions of Rome. Both military

and civil services were controlled by men of Germanic origin, and large districts were peopled by their kinsmen.

Only a few more incidents in the dying agony of the Western empire remain to be mentioned. By the end of the first quarter of the 5th century the Goths had overrun Italy and Gaul; the Franks and Alamanni held the Rhine-lands, Vandals and Germans were in Spain, Vandals were in Africa. In 439 they possessed themselves of Carthage, the great and brilliant stronghold of Roman civilization there. Shortly afterwards Attila led his hordes of Huns to the plunder of the Eastern empire. In 451 he reached Gaul, where he suffered a tremendous defeat at the hands of Theodoric the Visigoth, near Châlons. In 453 he died in Rome, which had been sacked by Alaric in 410, was plundered by Vandals in 455, and once more by Ricimer, a pure German, who had been made commander of the armies of the West. Ricimer repeatedly set up shadowy emperors according to ancient form, but was real ruler himself.

The last titular emperor, named by an irony of destiny Romulus Augustulus, 476, was pensioned by the barbaric leader Odoacer. Europe had already been parcelled out into barbaric kingdoms.

ROME: ITS ART AND ARCHITECTURE

H. Stuart-Jones, M.A., Former Professor of Ancient History, Oxford

In addition to the illustrations herewith, Roman art is illustrated under a great number of headings throughout this work. These include Aqueeduct; Arch; Capitol; Colosseum; Forum; Pantheon; S. Peter's and those on the sites where Roman remains exist, e.g. Nîmes; Rimini; and others. See also Art; Architecture; Etruria; Numismatics; Pottery

The Romans were not by nature highly endowed with the artistic faculty, and during the Republican period, when they were engaged in a perpetual struggle, they were, as a rule, content to employ the services of foreign artists, whether Greek or Etruscan, in the erection and adornment of their temples and other buildings. Examples of Roman craftsmanship, such as the *cista* or engraved casket made by Novius Plautius, and found at Praeneste, show a close adherence to Greek models.

We can, however, trace connexion between Etruscan art—especially in the realism of its portraiture—and that which afterwards flourished in Rome. Again, even in republican times, the art of the Romans was closely wedded to history. We possess a fragment of an historical painting from the Esquiline, which seems to represent episodes of the Samnite wars, and reminds us of the traditions of Fabius Pictor (the Painter), who adorned the temple of Salus with frescoes in 304 B.C., and of the paintings carried in triumph by successful generals. An impulse

was given to the art of portraiture by the practice of setting up waxen busts of the more famous members of the great families of Rome in the *atria*, or courts of their houses. These may have been at first derived from death-masks, but in time marble busts were substituted, and by the last century of the Republic we find a flourishing school of portraiture in existence. Caesar, Pompey, and Cicero are all represented in extant busts.

The enormous increase in wealth due to the conquests of Rome and the diffusion of Hellenic culture, led to the collection of Greek masterpieces, great numbers of which were transported to Rome by victorious generals, and to the multiplication of copies for the decoration of the palaces and villas of those who could not acquire originals; and a school arose in which, instead of direct copying, adaptation of earlier Greek types was practised. Its founder was Pasiteles, a contemporary of Caesar.

The establishment of Roman supremacy in the Mediterranean world naturally made the capital a centre of artistic production, and

Augustus was not slow to turn this to account. It is, of course, difficult to say how far the works which may be assigned to his reign were the product of Roman craftsmen; but at least we may see a truly Roman spirit in the close association of art with history. The statue of Augustus himself from Prima Porta, with its allegorical decoration and accessories, is the first, but also the finest, of the series of imperial statues.

In addition to sculpture, other arts, such as those of the gem-engraver and the silver chaser, were made to serve the ends of the dynasty. The *Grand Camée* of the Bibliothèque Nationale represents Tiberius and Livia, above whom the deified Augustus hovers; the silver cups from the villa of Bosco Reale, near Pompeii, now in the Rothschild collection, bear reliefs which celebrate the triumphs of Augustus and his successor. But the most perfect expression of Roman-Imperial art is found in the historical monuments decorated with reliefs, which begin with the Ara Pacis Augustae, executed between 13 and 9 B.C., to celebrate Augustus's pacification of the West, several slabs of which have been preserved.

Pompeian Art

The triumphal arch and the trophy, especially the former, gave free scope to this form of national art. At the same time, we can form some conception of the art which ministered to private luxury from the series of decorative wall-paintings from Rome and Pompeii, in which two parallel tendencies, one towards the creation of an illusory outlook on to an external landscape, and the other towards the representation of the masterpieces of easel-painting, exert a mutual influence. A good example is the wall of the dining-room in the house of Livia on the Palatine. Impressionist landscape is a common form of decoration, and stucco is used with remarkable skill for like purposes. The combination of both—as the scanty surviving fragments, compared with certain tomb-decorations, prove—achieved its culminating triumph in the decorations of the Golden House of Nero.

The comparative lack of public monuments belonging to the Julio-Claudian period is compensated for by their abundance in that which follows. Under the Flavian emperors Roman sculpture reached its zenith; the reliefs of the arch of Titus solve the problem of giving the atmosphere, which painting supplies by more direct

means, to compositions which retain full plastic effect. The best portraits of this period are masterpieces of art, giving the essential and significant traits of the subject without meticulous detail.

In the reign of Trajan the technical perfection of execution rapidly declined, but historical art entered on a new phase with the spiral reliefs of the column set up in the Basilica Ulpia, which tell the story of the emperor's Dacian wars, in what has been termed the "continuous style," usually unfolding its successive scenes as on a scroll, but sometimes summing up the narrative in a broad panorama. We begin in this period to see the tendency to overcrowding, and the objection to vacant intervals which leaves no space unadorned. The triumphal arch of Trajan, at Beneventum, the reliefs of which are full of historical significance, and almost fulfil the function of an Imperial programme, is thus overcharged with ornament. Roman sculptors, again, excelled in the execution of barbarian types, statues of captives playing a large part in the decoration of triumphal monuments; and in the reign of Hadrian, whose Greek tastes led to a revival of classicism, personified provinces were added. The portraits of the Emperor's deified favourite Antoninus furnish the best illustration of the tendencies of the time.

Declension of Standards

Throughout the succeeding period we can trace a gradual declension from the classical Hellenic standard, and the invasion of new artistic principles, which are thought by many critics to be derived from the East. Sculpture endeavours by an increased use of chiaroscuro to obtain some of the effects of painting, but fails to convey the impression of movement in a free atmosphere, and has to be content with that of an intricate pattern of lights and shadows. Various experiments are made, such as the detachment of puppet-like figures from the background in a relief from the base of the Antonine column; and the sense of proportion and perspective is lost in the bird's-eye reliefs from the Arch of Septimius Severus. The sarcophagi of the wealthy, which represent to us the private art of this time, show the same tendencies in their crowded compositions. Portrait sculpture, however, remains at a high level, especially in the amazingly frank characterisation of the busts of Caracalla. In the decoration of private houses mosaic played an important part, and here, too, artistic tradition was

well maintained, and taste in decoration declined but slowly.

The 3rd century A.D. was a time of strife and decay, and art is mainly represented by a series of imperial portraits, many of which are still of remarkable excellence. That of Philip the Arabian, rough as the artistic methods are, is a marvellous character study, and there was even a revival of art in the troubled times of Gallienus, as that emperor's busts prove.

Economic exhaustion hastened the decay of art, and when order was re-established by Diocletian and Constantine, the impulse given by Hellenism was practically exhausted, and, with the triumph of Orientalism, sculpture virtually ceases to be the embodiment of life, and becomes purely monumental, though in its best examples—such as the colossal portrait of Constantine—undeniably grandiose. Symmetry and frontality, the marks of primitive art, characterise the reliefs of this time, e.g. on the arch of Constantine, and in fact we are in the presence of the death of an old and the birth of a new—i.e. Christian—art, which works up what remains of the historical and monumental genius, informing Roman imperial art in the service of the conquering religion.

Besides the art whose story we read in the imperial monuments, the handicrafts flourished under the early empire. Gem-cutters and die-sinkers excelled in their several spheres, and the imperial coin portraits and medallions embody much first-class workmanship. The provinces, too, had their schools, in which pottery, brasswork, and sculpture, often valuable for its realism, set up centres of artistic tradition. The tombstones and other monuments of Roman officers or rich provincials furnish the best examples of this. Even in Britain, sculpture was a living art, as is witnessed by the Gorgon, which decorated the pediment of a temple at Bath.

Bibliography. Roman Art, F. Wickhoff, trans. E. Strong, 1900; Roman Sculpture, E. Strong, 1907; The Art of the Romans, H. B. Walters, 1911; Life and Literature in the Roman Republic, T. Frank, 1930.

Rome. City of Georgia, U.S.A., the co. seat of Floyd co. It is situated at the confluence of the Oostanaula and Etowah rivers, 71 m. N.W. of Atlanta, and is served by the Southern and other rlys. The buildings include the city hall. Peaches and other fruit, grain, and cotton are important products of the locality marketed here

Industrial interests are chiefly rayon. Rome was settled in 1834, and became a city in 1847. Pop. 26,282.

Rome. City of New York, U.S.A., a co. seat of Oneida co. It stands on the Mohawk river, 16 m. N.W. of Utica, and is served by the New York Central and the New York, Ontario, and Western Rlys., and the Erie, New York State Barge, and Black River canals. It contains the Rome Free Academy and the Jervis library. Among its manufactured products are brass, iron, and copper ware, canned goods, motor vehicles, locomotives, and cheese and butter are also produced. Founded in 1796, Rome was incorporated in 1819, and became a city in 1870. Pop. 34,214.

The spot where Rome stands was, in the 18th century, an important portage on the route from the valley of the Mohawk to Lake Ontario. The Indians used and named it, and early in the century the English built forts hereabouts, which were attacked by the French. In 1756 a new fort, called, after its builder, Fort Stanwix, was erected, its name being afterwards changed to Fort Schuyler. Held by the colonists on the outbreak of the war of independence, it was besieged in 1776 by a British force, but this was compelled to retire. The defence made was a great encouragement to the Americans, and it is said that the name of Rome was given to the town that sprang up on the spot because the republic had been defended heroically here.

Rome-Fee or **ROME-SCOT.** Name for the hearth tax imposed by the pope on England and other countries, subsequently known as Peter's Pence (*q.v.*).

Romeo and Juliet. Tragedy by Shakespeare. Romeo, a Montague, and Juliet, a Capulet, fall in love and are secretly married. Romeo's friend, Mercutio, being killed by Juliet's cousin, Tybalt, in a brawl arising from the rivalry of the Montagues and the Capulets, Romeo kills Tybalt, and is banished from Verona. Her family plan to marry Juliet to Count Paris, while she, seeking advice from Friar Laurence, who married her to Romeo, swallows a powerful sleeping potion, and is laid, as dead, in the family tomb. A message sent to Romeo miscarries, Romeo and Count Paris meet at the tomb, Romeo kills the count, and, thinking Juliet dead, poisons himself by her side. Juliet awakens, and, seeing the dead Romeo, fatally stabs herself with his dagger. The family feud ends over the dead bodies of

the lovers. The tragedy is lightened by the characters of Mercutio and Juliet's old nurse. The scenes are laid in Verona and Mantua.

The story appeared in the Novellino of Masuccio di Salerno, 1476; was told by Luigi di Porto, as *The Story of Two Noble Lovers*, printed at Venice, 1535; was retold by Bandello, 1554; told again, in French, by Boastuau, whose version formed the basis of a poem by Arthur Broke, 1562, and was translated in Painter's *Palace of Pleasure*, 1567. Shakespeare's play was written and probably acted in its first form as early as 1591, was first published in a mutilated form in 1597, other quartos following in 1599 and 1609, the last named supplying the basis of the folio text of 1623. Of its 3,002 lines, 405 are prose, 2,111 blank verse, and 486 pentameter rhymes. It has been many times revived, an especially noteworthy revival being at the New Theatre, London, in 1935, with John Gielgud, Laurence Olivier, Peggy Ashcroft, and Edith Evans. In 1937 there appeared an American film version, with Leslie Howard, Norma Shearer, and John Barrymore.

Römer, OLE, OLAF, OR OLAFS (1644–1710). Danish astronomer and mathematician. Born at Aarhus, Jutland, Sept. 25, 1644, and educated at Copenhagen university, he went to Paris in 1671, where he became teacher of the dauphin and a member of the academy. He was appointed professor of mathematics and director of the observatory at Copenhagen, 1681, and died there, as burgo-master, Sept. 19, 1710. Römer was the first man to discover that light had a finite velocity, and he calculated its speed from observing an eclipse of the first moon of Jupiter. He was the inventor of the astronomical instrument known as the meridian circle. His observations on the immersions and emissions of Jupiter's satellites were the basis of celestial measurements called Römer units.

Rome Scholarships. British academic awards in archaeology, history and letters, architecture, painting, sculpture, and engraving, made by the faculties of art in

those subjects of the British School at Rome. A British student winning one of these awards can spend two years studying his subject in Rome. The scholarships, founded in 1913, and awarded in normal times annually, are worth £250 p.a. There is a public exhibition of works submitted.

The British School at Rome (London office, 1 Lowther Gdns., S.W.7) was founded in 1901 as a school of archaeology. In 1911 it was reconstituted to include faculties in the further subjects mentioned. The school has accommodation for 24 students. The building, designed by Lutyens, stands in the Valle Giulia, overlooking the gardens of Villa Borghese; it escaped both injury and confiscation during the Second Great War.

Romford. A mun. bor. and market town of Essex, England. It stands on the Rom, a small tributary of the Thames, 12 m. by rly. N.E. of London. The chief

Romford, Essex. A busy market day scene

building is the modern church of S. Edward the Confessor, the successor of a much older one. The main industry is brewing, but there are light engineering and other works. Cattle and corn markets are held in the town. The Romans had a station called Durolitum here, and in the Middle Ages Romford was the chief place in the liberty of Havering, which ceased to exist in 1892. An arterial road runs from Woodford and Wanstead to Romford. Market days, Wed., Fri., and Sat. Pop. 72,519.

Romilly, JOHN ROMILLY, 1st BARON (1802–74). British lawyer. Son of Sir Samuel Romilly, he was born Jan. 10, 1802, graduated at Trinity College, Cambridge, 1823, and was called to the bar in 1827. He entered parliament in 1832,

1st Baron Romilly, British lawyer

became solicitor-general, and was knighted in 1848. Attorney-general, 1850, he became master of the rolls, 1851. He introduced various chancery reforms and was the last master of the rolls to sit in the commons. Created Baron Romilly of Barry in 1865, he resigned his mastership of the rolls in 1873, and died Dec. 23, 1874. The title came in 1905 to William, 4th baron (b. March 8, 1899).

Romilly, Sir Samuel (1757-1818). A British legal reformer. Born, of Huguenot descent, in

Sir S. Romilly,
British lawyer
Sir T. Lawrence

London, March 1, 1757, he had a private education and entered Gray's Inn in 1778, being called to the bar in 1783. He was deeply influenced by his study of Rousseau, the

Encyclopédistes, and Beccaria, and became a strong advocate of humanitarian principles in criminal law. In 1806 he became solicitor-general, and he was an M.P. thenceforward until his death. Romilly secured the abolition of the death penalty for certain classes of petty theft, and consistently supported measures of reform and emancipation. An able speaker and a learned lawyer, he cut short a distinguished career by suicide, Nov. 2, 1818, following the death of his wife. *Consult* Life, C. G. Oakes, 1935.

Romilly-sur-Seine. Town of France, in the dept. of Aube. It stands on the left bank of the Seine, 23 m. N.W. of Troyes. It has locomotive works and stocking and needle factories. In the Cistercian abbey of Scellières, 2 m. N.W. of the town, the body of Voltaire was interred in 1778, but was transferred to the Panthéon in Paris, 1791. Pop. 13,314.

Rommel, Erwin Eugen Johannes (1891-1944). German soldier. He was born at Heidenheim, Nov. 15, 1891, and studied at Württemberg royal academy and Tübingen university. Entering the army in 1910, he served throughout the First Great War, winning distinction at Caporetto. He was at Hitler's h.q. during the German invasions of Austria,

E. E. J. Rommel,
German soldier

1938, Czecho-Slovakia and Poland, 1939; and at the head of a Panzer div. in France, 1940, took St. Valéry-en-Caux. In Libya in command of the German Afrika corps, he established a reputation as a bold and skilful leader, nearly destroying the British 8th army in 1942 before he was defeated at Alamein and driven into Tunisia. In 1943 he was given a command in Italy, and in May, 1944, was transferred to France. He was wounded on July 17, when his car was attacked by an Allied aircraft; and on Oct. 15, 1944, his death from wounds was announced. Hans Speidel, Rommel's chief-of-staff in Normandy, stated however, in *Invasion*, 1944 (Eng. trans. 1950), that Rommel was involved in the July Plot (q.v.), and was murdered at Hitler's orders. According to other accounts, he committed suicide.

Romney. Mun. borough of Kent, England, one of the Cinque Ports. It is 75 m. S.E. of London and 8 m. S.W. of Hythe, with a station on British rlys. (S. region). The chief buildings are the church of St. Nicholas, mainly Norman, and the town hall containing a collection of documents relating to the Cinque Ports. In the Middle Ages Romney was the chief of these ports and a corporate town governed by jurats. In the 13th and 14th centuries the encroachments of the sea destroyed its fine harbour, and it is now about a mile from the coast. Littlestone-on-Sea is part of the borough, called New Romney to distinguish it from Old Romney, a village 2 m. W. Pop. 2,100.

Romney Marsh, to the N., reclaimed in Roman times, is used extensively for sheep-grazing.

Romney, Earl of. British title borne since 1801 by the family of Marsham. Sir John Marsham (1602-85), who belonged to an old Kentish family, was a clerk in the court of chancery. He became an M.P., and in 1663 a baronet. His descendant, Sir Robert (1685-1724), 5th baronet, governor of Dover Castle and M.P. for Maidstone, was made a baron in 1716. His grandson Charles (1744-1811), 3rd baron, also an M.P. before succeeding to the title, was made earl of Romney in 1801. In 1933 Charles Marsham (b. July 9, 1892) became 6th earl. The earl's son is called Viscount Marsham.

There had been an earlier earl of Romney, Henry Sidney (1641-1704), a son of Robert Sidney, 2nd earl of Leicester. He was a courtier in the time of Charles II, who

sent him to represent him at The Hague. Afterwards he supported William of Orange, and was made a baron in 1689. Under William he was a secretary of state, lord-lieutenant of Ireland, and master-general of the ordnance. Created earl of Romney in 1694, he died unmarried, April 8, 1704.

Romney, George (1734-1802). British painter. Born at Dalton-in-Furness, Dec. 15, 1734, he had a scanty education, and for a time worked with his father, a cabinet-maker, studying drawing in spare moments. Apprenticed to Edward Steele, a portrait painter, in 1755, he worked at various places in the north, and in 1762 settled in London. His first pictures of note were *The Death of Wolfe*, 1763, purchased for the council chamber

George Romney, British painter
From a self-portrait in the National
Portrait Gallery, London

at Calcutta, and *The Death of King Edward*, 1765 (first prize at the Society of Arts). In 1764 he stayed for a short time in Paris. Slowly building up a connexion as a portrait and subject painter, he prospered sufficiently to visit Italy, 1772-74, where he made copies of many famous pictures, including Raphael's Transfiguration, the altar-piece at Montorio.

On his return he became fashionable and a rival of Reynolds, painting, among others, the duke of Richmond, then president of the Society of Arts, Lady Warwick and her Children, "Perdita" Robinson, and Lady Russell and Child. From 1782 most of his attention was devoted to Lady Hamilton, of whom he painted about 30 character portraits. After her departure for Naples he turned out a great quantity of work until 1789, when ill-health caused him to retire. He resided for a time at Hampstead, but in 1799 bought an

estate at Ulverston, where on Nov. 15, 1802, he died. Except at sales, no work by Romney was exhibited between 1772 and 1817, and most of his canvases are in private hands, except those at the National and National Portrait Galleries. He is generally ranked below Reynolds and Gainsborough, but scores over them in simplicity. *See* Cravon, Lady; Cumberland, R.; Jordan, D.; Newdigate, Sir B.; Paine, T.

Bibliography. Lives, W. Hayley, 1809; H. E. Maxwell, 1902; G. R. and His Art, H. Gamlin, 1894; Romney, H. Ward and W. Roberts, 1904; B. L. K. Henderson, 1922.

Romney, Hythe, and Dymchurch Railway. Miniature rly. in Kent, England. The smallest public rly. in the world, built to a gauge of 15 ins., it runs 13 m. from Hythe to Dungeness lighthouse. Its construction was begun in 1926, and on Aug. 5 that year the duke of York (King George VI) drove the engine of a trial train. The stretch from Hythe to New Romney was opened to the public in 1927, and extended to Dungeness the following year. During the Second Great War the line was requisitioned, first by the army for a mobile A.A. unit, and later by the ministry of Supply for Operation Pluto. It was reopened to the public by the film stars Laurel and Hardy in 1947.

Romney Marsh. Extensive level tract of rich pasture land in Kent, England. It is protected against the encroachment of the sea by an earthen embankment stretching from New Romney to Hythe. Managed by a corporation, it contains several villages.

Romsdal, Norway. Valley of the Rauma, looking towards Stuefjoten

Romø. Danish island in the N. Sea. One of the N. Frisian group, off the coast of Slesvig, it is 9½ m. from N. to S., and 3 m. from E. to W. Kongsmark and Kirkeby villages are on the E. shore, and Lakolk, a sea-bathing resort, on the W. Pop. est. 1,000.

Romola. Historical romance by George Eliot. First published serially in *The Cornhill Magazine*, July, 1862-Aug., 1863, it was issued in book form in the latter year. The scene is laid in Florence at the end of the 15th century, and in the book is introduced the story of Savonarola's career

Romsey, Hampshire. Market Square, with statue of Lord Palmerston. Top, right, abbey church of S. Mary, from the south-east

Frith & Valentine

and martyrdom. It is a very close and detailed account of Florentine history. The title is taken from the name of the heroine.

Romorantin. Town of France. In the dept. of Loir-et-Cher, it stands at the confluence of the Sauldre and the Morantin, 37 m. N.W. of Bourges. There are cloth and cotton factories and oil refineries. Romorantin was formerly the capital of Sologne and belonged to the counts de Blois in the 12th century. It was captured by the Black Prince in 1356. In the 15th century it passed to the dukes of Orléans, and later to the dukes of Angoulême. The celebrated edict of Romorantin in 1560 prevented the establishment of the Inquisition in France.

Romsdal. Valley of the Rauma, central Norway. It runs S.E. from the S. arm of the Romsdal Fjord, and is dominated by the Romsdalshorn, 5,095 ft., and the Trolltinder (witch needles), some 6,000 ft. high. Aandsnes, at the head of the fjord, is the terminus of the

road up the valley and across the plateau to the Gudbrandsdal, wherein is the trunk rly. from Oslo to Trondhjem. In the valley are wild reindeer. Cod and herring fishing is carried on. The name Romsdal is also that of an island at the mouth of the fjord.

Romsey. Mun. borough and

market town of Hants, England. It stands on the Test, 10 m. N. of Southampton, with a rly. junction. The chief building is the beautiful church, originally that of a Benedictine nunnery, founded in 907, and around which the town grew. Dedicated to S. Mary, its proportions resemble those of a cathedral; it is almost entirely Norman in style, and is regarded as perhaps the finest building of its kind in the country. It was bought by the parishioners from Henry VIII for £100. There are an agricultural trade, manufactures of paper and leather, and the growing of willows for cricket bats. Romsey became a chartered town in 1607, and was a centre of the woollen trade. Near is Broadlands, once the seat of Lord Palmerston, now the seat of Earl Mountbatten. Market day, Thurs. Pop. 6,500.

Romulian Calendar. Division of the Roman year, traditionally ascribed to Romulus, and divided into ten months only, comprising in all 304 days. In the reign of Numa two more months were added. *See* Calendar. *Consult* The Calendar, A. Philip, 1921.

Romulus. In ancient Roman legend, the founder of the city of Rome. He was represented as a son of Mars by Rhea Silvia, daughter of Numitor, son of the last king of Alba Longa. Numitor's brother Amulius had made Rhea a vestal

virgin vowed to perpetual chastity, so that she should have no children to claim the throne which he had seized. When her twin sons Romulus and Remus were born, mother and children were cast into the river by order of Amulius. The children in their cradle drifted ashore and were suckled by a she-wolf. Discovered by a shepherd, the boys were brought up by him, and on reaching manhood slew the usurper Amulius and reinstated their mother's father Numitor.

They then proceeded to found a city on the Palatine Hill, and when the walls were built Remus leapt over the walls to show his contempt for them. This so enraged Romulus that he killed his brother. A motley crowd gathered round him in the new city, and in order to provide his people with wives Romulus invited the Sabines to

Romulus, legendary founder of Rome
From a coin

join them in sacred games, during the progress of which the Sabine women were seized by the Romans. This led to a war with the Sabines, which was ended by the interposi-

tion of the women who had been seized, and the Romans and the Sabines agreed to unite and become one nation.

Romulus was king, first with the Sabine Titus Tatius as colleague, and latterly alone. He was taken up to heaven in a fiery chariot by his father Mars, and thereafter worshipped by the Romans as a god under the name Quirinus. See Quirites; Rome.

Romulus Augustulus. Last Roman emperor of the West, A.D. 476. See Augustus.

Ronald, Sir Landon (1873-1938). British conductor and composer. Son of Henry Russell, composer of *A Life on the Ocean Wave*, and other popular songs, he was born June 7, 1873, and educated at the Royal College of Music. A fine pianist, he played the accompaniment to the wordless play *L'Enfant Prodigue* at the Prince of Wales's Theatre, London, 1891, and was later Melba's accompanist. As a con-

Sir L. Ronald,
British musician

ductor he directed the Royal Albert Hall orchestra in 1908, and instituted successful concerts at Birmingham and elsewhere, becoming well known for his conducting of Elgar's symphonies. He was principal of the Guildhall School of Music during 1910-37. His compositions included incidental music for stage productions, e.g. *The Garden of Allah*, 1920, and over 200 songs, the best known of which was *Down in the Forest*. He was knighted in 1922. His reminiscences *Variations on a Personal Theme* appeared in 1924, and *Myself and Others* in 1931. He died Aug. 14, 1938.

Ronald Megaw Prize. Naval prize. It was founded in 1906 in memory of Midshipman Ronald Megaw, who was killed accidentally aboard H.M.S. Montagu, Nov. 11, 1904. From the interest upon a sum of £1,000 a presentation sword, books, etc., are given annually to the sub-lieutenant who obtains the highest place during the preceding year in the various examinations for promotion.

Ronalds, Sir Francis (1788-1873). British scientist. Born Feb. 21, 1788, and educated

Sir Francis Ronalds,
British scientist

privately, he made a study of electricity. In 1816 he made the first experimental electric telegraph, laying down eight miles of wire at Hammersmith, and transmitting signals by means of synchronised rotating disks. His invention was rejected by the Admiralty, and after publishing details of it in 1823, Ronalds took no further interest in it. In 1843 he was made director of the Meteorological Observatory at Kew, and while there he invented photographic self-recording instruments, which began to be used in 1845. This invention was of great practical importance in all work connected with automatic registration for scientific purposes. His invention of the telegraph was developed by Wheatstone and others, the former of whom acknowledged the debt he owed Ronalds. Knighted in 1871 in recognition of his work as a pioneer in the electric telegraph, Ronalds died Aug. 8, 1873.

Ronaldshay. Two islands of the Orkneys, Scotland. North Ronaldshay, the most northerly of the islands, is 3 m. long and 2 m. broad, and the surface is

mainly low and flat. At Burrian are the ruins of a castle. The North Ronaldshay Firth, which separates it from Sanday, is dangerous to navigation. Pop. est. 400.

South Ronaldshay is the most southerly of the Orkney Islands. It is 8 m. long and 4 m. broad, with a low, level surface, and is well cultivated. The island has two old churches and remains of several Picts' Houses. Pop. est. 2,000. The title of earl of Ronaldshay is borne by the eldest son of the marquess of Zetland. One holder of the title earl of Ronaldshay, Lawrence John Lumley Dundas (b. 1876), was M.P. for Hornsey 1907-16, and governor of Bengal 1917-22. The details of his life are given under his later title of Zetland, Marquess of.

Roncesvalles (Fr. *Roncevaux*). Village of Spain, in the prov. of Navarre. It lies, at an altitude of 3,220 ft., in the Pyrenees, 5 m. S. of the French frontier and 21 m. N.E. of Pampeluna. It is famous as the scene of the defeat of the rearguard of Charlemagne and the death of Roland and the 12 peers. There is a remarkable 13th century pilgrimage church containing relics of the paladin Roland. The library of the monastic house here has many valuable documents.

Ronda. Town of Spain, in the prov. of Malaga. It stands on the Guadalevin river, 43 m. W. of Malaga and 44 m. by rly. S.W. of Bobadilla on the Algeiras Rly. It is placed on both sides of a deep, rocky gorge, surrounded by mts. at an alt. of 2,460 ft. The river is spanned by three bridges. Ronda was the capital of a small Moorish kingdom until 1485, when it was

Ronda, Spain. Bridge over the rocky gorge of the Guadalevin

taken by the army of Ferdinand V. The old town was built by the Moors; the new one was founded by the Catholic kings after the siege of 1485. Besides some Roman and Moorish relics, Ronda has one of the largest and finest bull-rings in Spain. It has a considerable trade in leather, horses, wine, and hats. Pop. 32,600.

Rondeau. Development of the early French native songs made for the accompaniment of dancing or household work. It was inaugurated by Guillaume de Machault (1295-1377), and elaborated by the French lyrical poets who followed him. The recurring refrain is its characteristic feature. The rondeau consists of three parts, the first of five lines, the second of three, and the third of five, with the first word, or the first half, of the first line repeated at the end of the second or third parts. The lines are generally octosyllabic and there are but two rhymes. The formula is: aabba; aab, refrain; aabba, refrain. *See Poetry; Rhyme.*

Rondebosch. Suburb of Cape Town, S. Africa. It is 5 m. to the S. of the city proper and is a residential area. Here is Groote Schuur (*q.v.*). *See Cape Town.*

Rondel. Verse form. Like the rondeau, it originated in the native French dance-song, and is distinguished by the recurring refrain. It consists of three groups of lines, usually octosyllabic, with but two rhymes. The first group has four lines; the second has four, the last two of which are the first two of the first group; and the third group has six lines, the last two being the first two of the first group. The formula is: ABba, abAB, abbaAB (*see Rhyme*), the capital letters representing the lines which are repeated. The rondel was largely superseded by the rondeau. Andrew Lang and Austin Dobson are successful exponents of it, as of many other old French verse forms. *See Poetry; Verse.*

Rondo. Form of musical composition. In it the principal subject occurs not less than three times and always in the tonic key. Rondos are of two kinds: "old," in which the appearances of the subject are separated by episodes in related keys; "modern," in which the place of the first and third episodes is taken by a second subject treated according to the rules of Sonata form (*q.v.*). The second episode may be retained, or instead of it there may be a development section. The term is

sometimes given, loosely, to light and gay movements.

Rønne. Seaport of Denmark, capital of the island of Bornholm (*q.v.*). It stands on the W. coast, and is connected by cable with Møn in Zealand, and by rly. with Naxø on the E. coast. It has an artificially deepened harbour and shipbuilding yards, and manufactures pottery from the local kaolin. Pop. est. 10,000.

Ronsard, PIERRE DE (1524-85). French poet. He was born at La Poissonnière, Vendôme, Sept. 11, 1524, the son of a court official of Francis I. Pierre passed a little time at the college of Navarre, in Paris, before he became a page at court. He went to

Scotland in the retinue of Mary of Guise, 1538, remaining in the British Isles for three years. After returning to France he lived in court circles, but devoted much of his time to poetry. Successive kings patronised him, and he was on friendly terms with Elizabeth of England, Mary Queen of Scots, and other royal ladies. About 1572, however, he retired to the country, and on Dec. 27, 1585, he died at Tours.

About 1549 Ronsard became leader of the *Pléiade* (*q.v.*), the object of which, as set forth in Du Bellay's *Deffense et Illustration de la Langue Françoisse*, was to enrich the language of literature and to revolutionise French poetry by the imitation of the masterpieces of classical antiquity. In accordance with this programme, Ronsard wrote *Hymnes* on the Homeric model, *Pindario odes*, and an unfinished epic, *La Franciade*. These experiments, however, have only an historical interest. His real qualities as a poet must be sought in his sonnets and minor lyrics. Unduly depreciated by the classical school, his poetic reputation was championed by the Romantics. *Consult Works*, with notes, by P. Blanchemain, 1857-87; *Songs and Sonnets of Pierre de Ronsard*, C. H. Page, 1903; *Ronsard and the Pléiade*, George Wyndham, 1906; *Ronsard Lyrics*, trans. W. Stirling, 1946; *Ronsard*, D. B. Wyndham Lewis, 1946.

Röntgen, WILHELM KONRAD (1845-1923). German physicist. Born at Lennep, in the Prussian Rhine prov., March 27, 1845,

and educated at Zürich university, he became professor successively at Hohenheim, 1875; Strasbourg, 1876; Giessen, 1879; and Würzburg, 1885. In Nov., 1895, he announced the discovery of the rays which for long bore his name, in 1899 he was appointed professor of experimental physics at Munich, and in 1901 he received the Nobel prize for physics for his discovery of the Röntgen or X-rays. He wrote numerous scientific papers on them, as well as on other branches of physics, and carried out valuable research work on the conductivity of heat of crystals, magnetic rotation of polarised light, absorption of heat of gases, etc. He died Feb. 10, 1923. *See X-Rays. Pron. Runtghen.*

W. K. Röntgen,
German physicist

Rood (A.S. *rōd*, cross). Old name for a cross or crucifix. It is specially used for the great crucifix

Rood. Cross above chancel rail in
Westminster Cathedral, London

which in English churches, from the 14th century to the reign of Elizabeth, generally stood on the rood-screen dividing the chancel from the nave. At the foot were often figures of the Virgin and S. John the Evangelist. In some churches a gallery, from which parts of the service were recited, ran along the top of the screen. This was called the rood-loft or jubé; and a staircase in the masonry of one of the piers, called the rood-stairs, still seen in many churches, gave access to it. Modern

Roof. The structural details of a hipped roof on a domestic building shown in isometric drawing, and in plan (top) with sectional dimensions of the principal members. The design is by Edgar Lucas, A.I.A.A.

roods occasionally replace those destroyed at the Reformation. See Doom; Holyrood.

Roof. Unit of land or superficial measure, equal to one-fourth of an acre. It is divided into 40 rods, or 1,210 sq. yds. The name is cognate with rod, and probably originally denoted the wand first used in measuring land.

Roodepoort. Town of S. Africa, in the Transvaal. It is situated on the rly. 25 m. N.W. of Johannesburg and, as a centre of the Witwatersrand goldfields, had considerable prosperity following S. Africa's departure from the gold standard at the end of 1932. During the 1930s its population showed a great rise, and it is now 17th among the towns of the union. Pop. 41,572.

Roof. Top covering of a building to give protection from weather. A roof has two distinct parts: the structure, and the covering. The structure supports the dead load of the roof and also loads caused by weather, e.g. snow. The roof is supported either on the walls or on a structural frame. The traditional roof shapes were determined largely by local rainfall. In countries with low rainfall roofs are either flat or of low pitch. In northern countries, where the

rainfall is high, roofs are usually pitched at angles of 30 to 60 degrees. Modern roof shapes are determined largely by the type of roof and framing. As flat roofs can be covered with water-tight materials they are now used irrespective of rainfall. A flat roof is more convenient on a plan of irregular shape.

PITCHED ROOFS. A pitched roof has a slope of more than 10 degrees, and a very low pitch is adequate for impervious sheet materials. But pitched roofs are usually covered with overlapping units. These include tiles of clay, concrete, and asbestos-cement; slates both natural and of asbestos-cement; wood shingles; thatch; and sheets of asbestos-cement, iron, steel, and aluminium. For these materials pitches vary from 22 to 50 degrees. A sub-roofing is often added to increase weather resistance and insulation. Bituminous felt may be laid under clay tiling as a positive stop against rain, dust, and draught, which otherwise might penetrate. Fibreboard may be fixed to improve thermal insulation. Roof trusses or principals are frames fixed at intervals to support the roof members. In traditional roofs the timber trusses sometimes form fine architectural features, as in Westminster hall. In modern roofs trusses are usually of steel or reinforced concrete, or of wood in a lattice form of construction. In steelwork welding is widely used.

FLAT ROOFS. The roof structure may be of wood or steel joists supporting boarding or a concrete slab, or of pre-cast units. The covering may be a material without joints, such as asphalt; a material with sealed joints, such as felt; or a sheet material with lapped joints, such as lead. A flat roof has a slight fall for drainage.

GLAZED ROOFS. These are of two kinds: pitched, with sheets of glass set in glazing bars, and flat with blocks of glass set in frames of steel or pre-cast reinforced concrete. Lantern lights may also be used on flat roofs. Where it is desired to exclude direct sunlight a north-light roof is used. This has a steep glazed side facing approximately N. See Architecture; Building; Mansard.

Rook (*Corvus frugilegus*). Common bird of the crow family. The plumage is black with purple reflections, and the length of the bird is 18 in. s. It is readily distinguished from the crow by the bare whitish patch of skin surrounding the base of the beak. It is common in Great Britain, and nests in large colonies in the tops of high trees, near houses.

Rook. Gregarious bird of the crow family

W S Berridge, F.Z.S.

About March the old nests, which are made of sticks and lined with grass, are repaired or new ones built. Five or six eggs are laid, bluish green in colour and spotted with brown and purple. The male often shares the duty of incubation with the female. Out of the breeding season the rookery is usually deserted. Rooks are gregarious, and fly morning and evening to their feeding grounds, for grubs and insects. See Eggs colour plate.

Rook or CASTLE. Piece in chess. Each player has two rooks, which start in the corner squares and may move any number of squares in a straight line vertically or horizontally. Either rook may combine with the king once in a game in a special move known as castling. See Chess illus. p. 1996.

Rooke, SIR GEORGE (1650-1709). English sailor, born near Canterbury. Going to sea as a lad,

Sir George Rooke, English sailor

he saw much service against the Dutch and was promoted rear-admiral in 1690. The victory of Barfleur, 1692, was practically due to Rooke's gallantry and seamanship, and he was knighted in 1693. Lord commissioner of the Admiralty in 1694, he became commander-in-chief of

the Mediterranean fleet in the following year, and in 1697 of the Channel fleet. On the outbreak of the war with France, 1702, Rooke sailed with 14,000 men under the duke of Ormonde, and by a brilliant and daring attack seized Vigo and totally destroyed the Franco-Spanish fleet anchored there. In 1704 he assisted in the capture of Gibraltar, July 21, and fought an indecisive battle off Malaga. He died Jan. 24, 1709.

Roon, ALBRECHT THEODOR EMIL, COUNT VON (1803-79). German soldier. Born April 30, 1803,

Count von Roon,
German soldier

at Pleushagen, near Kolberg, the son of an officer, he entered the Prussian army in 1821. He made a reputation as a writer by works on military geography, while he taught cadets, lectured, served on the general staff, and acted as tutor to Prince Frederick Charles. In 1848 he saw a little actual warfare, and with the support of King William I began the work of reforming the army. Minister of war 1859, and of marine 1861, he held both posts until 1871, and the fruit of his labours was seen in the wars against Austria and France. In the former war he commanded a division. In 1871 he was made a count and in 1873 a field marshal. He died Feb. 23, 1879. His memoirs were edited by his son, 1892, who also wrote his Life.

Roorkee or **RURKI**. Town of the Uttar union, India, in Saharanpur dist. It is situated in the E. of the dist. and has rly. connexions with Dehra, Saharanpur, and Najibabad. Thomason civil engineering college is the most noted of this type of educational institution in India; the town is the headquarters of the Ganges Canal administration, and contains the canal workshops. It was a mud village before the canal was constructed. Pop. 18,600.

Roosebeke. Village of Belgium, near Courtrai, W. Flanders prov. In battle here, Nov. 27, 1382, the French under Charles VI, defeated with vast slaughter the Flemish burghers under Philip van Artevelde (q.v.).

Roosevelt, (ANNA) ELEANOR (b. 1884). American politician, sociologist, and writer. Daughter of Elliott Roosevelt and niece of President Theodore Roosevelt, she was born in New York, Oct. 11,

1884, and educated privately. She married F. D. Roosevelt (q.v.), a distant cousin, in 1905. After he

Eleanor Roosevelt,
American politician

became president in 1932, she achieved prominence as public speaker and writer. She was hostess to King George VI and Queen Elizabeth during their visit to the U.S.A. in 1939. Her column, My Day, syndicated among some 90 newspapers, was widely read; while her strong, sympathetic personality and her eloquence as a speaker made her a popular figure. She was on the U.S. delegation to the first United Nations

assembly which met in London, Jan.-Feb., 1946, when her column appeared temporarily in the Evening News. At the assembly's second meeting, in New York, she was nominated, Dec., 1946, to the commission on human rights of the U.N. economic and social council. Under her chairmanship from its first meeting, Jan., 1947, this commission drew up and adopted June 18, 1948, a declaration setting up a common standard of human rights. She stayed with the king and queen when she came to London to unveil the memorial to her husband in Grosvenor Square, April 12, 1948. She wrote the autobiographical *This Is My Story*, 1937; *If You Ask Me*, 1948; *This I Remember*, 1949; and edited *Letters of Elliott Roosevelt*, 1932.

F. D. ROOSEVELT, 31ST U.S. PRESIDENT

D. W. Brogan, author of *The American Political System*, etc

This life of one of the most important presidents of the U.S.A. is supplemented by articles on his wife (Anna) Eleanor Roosevelt and his political associates and opponents, e.g. Dewey, T. E.; Hopkins, H. L.; Hull, Cordell; Perkins, Frances; Smith, A. E.; Wallace, H. A.; Wilkie, W. See also Lease-Lend; New Deal; Tennessee Valley Authority; United States of America: History, etc.

Franklin Delano Roosevelt was born Jan. 30, 1882, the only child of James Roosevelt by his second wife, Sarah Delano. On both sides he belonged to distinguished and wealthy American families, though neither the Roosevelts nor the Delanos were multimillionaires. He grew up on the family estate, Hyde Park, on the Hudson, was sent to Groton, a new and fashionable imitation of the great English public schools, and, in due course, to Harvard. Lively and intelligent as well as handsome and physically strong, young Roosevelt was more prominent in college politics and journalism than in his studies or in formal college sports. His boyish ambition had been to enter the navy, he was from boyhood a daring and skilful yachtsman.

After graduating, Roosevelt entered the law school of Columbia university in New York city and was admitted to the bar. More important, he married his remote cousin, Eleanor Roosevelt, niece of the president of the U.S.A. His ambition turned to politics. The long eclipse of the Democratic party, to which his branch of the family was attached, was ending; nevertheless, his remarkable feat in winning a seat in 1910 in the state senate in a "rock-ribbed" Republican district attracted attention to the young political aspirant, who had a famous

name, good looks, and ability. Interest was increased by his taking the lead in a successful campaign in the legislature against the Tammany Hall leadership of the Democratic party.

A Supporter of Wilson

As the presidential election of 1912 approached, Roosevelt became a leading supporter of the claims of the governor of New Jersey, Woodrow Wilson. 1912 saw the triumph both of Roosevelt's party and of his candidate. Wilson rewarded his young supporter by the post of assistant-secretary of the navy—the post which had been the gateway of political opportunity for his uncle-in-law, President Theodore Roosevelt. Young Roosevelt's defeat, in 1914, in a campaign for the Democratic senatorial nomination from New York was a blessing in disguise. The Roosevelt household was one of the most active political centres of the younger set in Washington, and Mrs. Roosevelt made an important contribution to her husband's political education and progress by keeping in constant touch with such leaders of the movement for social reform as Frances Perkins. With American entry into the First Great War, in 1917, Roosevelt's post became of great importance, and he discovered how long it takes to turn a peace economy into an effective fighting

machine; he also learned that it can be done.

Roosevelt received, in 1920, the high honour (for so young a man) of the nomination for vice-president. The Democratic ticket was overwhelmingly defeated, and Roosevelt went into business, not very successfully. In 1921 he was stricken with infantile paralysis, and for a long time seemed doomed to be a helpless cripple. In the slow and at times desperate climb back to health, Roosevelt learned a great deal; in particular patience and understanding. A devoted secretary, Louis Howe, collaborated with his wife in saving the crippled man from accepting relegation to the rôle of spectator. Although till his death Roosevelt was terribly crippled, forced to wear an elaborate harness and to be dependent on a stick and on the arms of attendants for his limited power of movement, his general health was completely restored.

In 1924 he again attracted public attention by a brilliant speech nominating "Al" Smith for the presidency, and in 1928 he was spokesman for the same politician, whom he had called "the happy warrior." His friendship for Smith led him to consent to run for governor of New York state, since his candidacy would help the presidential candidate. Smith was defeated, and while he had not carried even New York, Roosevelt was elected governor. From that moment Roosevelt was among the obvious favourites for the Democratic nomination in 1932, and, when he was re-elected governor in 1930 by a larger majority than had ever been secured before, he was automatically first favourite.

He secured the nomination and, defying all precedent, flew to the convention to accept it on the spot, then set out on a speaking campaign that was an occasion both for developing a programme and, more important still, for proving his physical fitness for the exacting office to which he was asking to be elected. By the autumn of 1932 the world economic crisis was at its height. In electing Roosevelt the American people voted less for something than against something. The four months' interval which then elapsed between election of a new president and his inauguration was marked by deepening economic crisis in which the president-elect several times conferred with the defeated president-in-

office, but refused to accept any responsibility for joint action. His ideas on how to deal with the crisis were, in temper if not in detail, poles apart from those of Hoover. Roosevelt had promised the American people "a new deal," and he meant it. It was by a narrow chance, however, that the president-elect survived to take office, for while on holiday in Florida in Jan., 1933, he was shot at by a crazy fanatic, and the mayor of Chicago, who was beside him, was mortally wounded.

By March, 1933, the crisis was threatening all American economic life. In state after state, banks

Franklin D. Roosevelt

shut down; and the new president, as his first act, closed all the banks in the U.S.A. There were millions of unemployed, private and public bankruptcy, and the demoralisation caused by more than three years of increasing misery. "But," said Roosevelt, "the only thing we have to fear is fear itself," and within a few days the nation was stimulated to hope by its new chief's energy.

His administration had a short-term and a long-term task: to stop the rot and to try to remove its causes. Public confidence was rapidly restored; most banks reopened and the economic paralysis passed. Then began the "first new deal," of which the most publicised feature was the national recovery administration (NRA). This was a scheme of voluntary cooperation among businessmen not to cut prices or indulge in "unfair competition." Labour was supposed to gain union recognition and better wages and conditions. Acceptance of the NRA was a patriotic duty; but within a year it was becoming plain that American

business was not yet ready for self-regulation and that most of labour's gains were illusory. The agricultural adjustment administration (AAA), which paid farmers to cut down production of unmarketable crops, was better planned. The insurance of bank deposits below a certain figure bred confidence, as did the beginnings of effective regulation of the stock exchanges. The departure of the U.S.A. from the gold standard, although it torpedoed the world economic conference that was meeting in London, showed Americans that the president was indifferent to the judgement of orthodox financiers—at that moment the most unpopular class in the U.S.A. Within a few months the new president was overwhelmingly the most discussed, admired, or suspected figure in the Union. The old political leaders were eclipsed, and the newcomers, members of his "brain trust," were mere lieutenants of their chief, not great public figures in their own right. The mid-term congressional elections of 1934 ratified the president's policies and were a plebiscite on his personality; the Democrats made further gains in both houses.

Despite this victory, the honeymoon period of the new deal was over. Criticism centred chiefly on the lavish expenditure of the federal government, in contrast with the promises of retrenchment made in the Democratic platform of 1932. The economies the new administration had carried through were overshadowed by the grants for federal aid to the unemployed and especially by the programme of public works. This was launched under NRA but survived that experiment. It fell into two main classes: the long term, carefully planned, and slowly executed schemes of public works administered by the secretary of the interior, Ickes, head of the public works administration (PWA), and the short-term, empirical, improvised schemes of the works progress administration (WPA) under Harry Hopkins. It was especially WPA that was attacked. Its efforts to find work for the unemployed, actors as well as manual labourers, writers as well as dockers, were described by critics as "boomdogging" and criticised as the creation of a vast political machine of federal beneficiaries as well as a means of destroying the autonomy of the states. In defence it was not only

asserted that the human values preserved by work, even by "made work," were greater than the mere financial computation could show, but that the federal govt. was "priming the pump" by putting purchasing power into the hands of the poorest, a simplified version of Keynes's economic theories. The critics were not mollified; and only the civil conservation corps (CCC) that enrolled hundreds of thousands of young men in camps to restore forests, improve waste land, etc., was virtually exempt from criticism. The election of 1936 was, however, the most one-sided contest in U.S. history. Governor Landon of Kansas carried only the two small New England states of Maine and Vermont, and no previous election in American history had been fought on such an open class basis.

Effects of 1936 Election

So great a victory had two dramatic results. The first was the outbreak of a series of "sit-down" strikes in the great automobile plants. They arose from the anger of the workers at the effective nullification of the right to organize independent unions formally guaranteed by NRA. The Roosevelt administration verbally deplored illegality; but the Democratic governor of Michigan, Frank Murphy, took no steps to eject the strikers, and his inertia (or prudence) was violently attacked and the administration blamed.

Still more anger and apprehension were caused by the president's "court plan." In a series of decisions, the supreme court had invalidated most important new deal statutes and had also seriously limited the power of the states to pass effective social legislation. Both political parties were in a dilemma: for, if the court had its way, there would be great areas of American life for which neither the federal nor the state govts. could legislate. The remedy of a constitutional amendment was slow and uncertain, and in secret the president chose to alter the composition of the court, or, as it was said, to pack it. For every judge over 70 who did not retire, the president could, in the bill brought forward, add a judge to a maximum of six. This was a bold, even reckless attack on the most sacred of American institutions. It might have succeeded but for the change in the court itself. One justice changed sides and several very

important new deal laws were saved. The necessity of carrying through so drastic an innovation was no longer obvious, and the president suffered his first defeat. It was not his last. A bill for the reorganization of the civil service was defeated by a campaign against "dictatorship"; and a sharp decline in economic activity in the late summer of 1937 showed that the administration had not solved the economic problems of American society. In face of the "recession," Roosevelt turned to the left, gave up the new policy of reducing expenditure, and asked for a great expansion of WPA, which congress granted. The mid-term elections of 1938 showed a marked turning away from the Democratic party. To some Democratic politicians the lesson was plain: the president must be induced to break the most sacred of American taboos and run for a third term.

But by the end of 1938 attention was moving away from internal affairs. The Roosevelt administration in its first year or two had been comparatively indifferent to diplomatic problems. The absurdity of not recognizing the Soviet govt. was ended in 1933, and the policy of the good neighbour was applied in Latin America by the abrogation of all American limitations on the sovereignty of Cuba, Panama, Haiti. The secretary of state, Cordell Hull, was even more interested in lowering trade barriers, and his Trade Agreements Act (1936) made progress in that sphere possible and, in some cases, real. But the temper of the American people was violently isolationist. This was revealed in the two Neutrality Acts of 1935 and 1937, by the refusal to grow indignant over the Japanese attack on the gunboat Panay in 1937, by the proposed "Ludlow amendment" that would have made it impossible to declare war until after a plebiscite, and by the hostile reception given to the president's trial balloon when in 1937 he suggested putting aggressive nations "into quarantine."

Preparation for War

Roosevelt's determination to build up the navy, especially after Japan refused to continue the limitations of the Washington naval treaties, was regarded as a more or less harmless eccentricity. The Munich crisis ended all that; rearmament was now undertaken with general approval but on a very inadequate scale. As the European crisis grew worse, the president tried in vain to secure

repeal of the Neutrality Acts; these, in effect, worked to help Germany, which would in any case be blockaded.

The outbreak of war revealed how hostile the American people was to Hitler's Germany—and how determined to stay out of the war. After two months of heated debate, the neutrality legislation was amended to allow purchases of war materials on a cash-and-carry basis. But equally significant was the American policy of barring all belligerent ships from the seas around both American continents, a pious opinion which did not prevent British and German warships from fighting inside what was ironically christened "the chastity belt." The invasion of Norway, then of the Low Countries, and the defeat of France ended what the Americans called the "phony war," and immensely increased the prestige of the president. It made inevitable, too, his nomination for a third term. He had shown his sense of crisis by inviting two eminent Republicans to head the service departments—Col. Henry Stimson the war and Col. Frank Knox the navy department.

Henceforward the main interest of the president's life was defence, and then war. But, scarcely noticed by the public, most of the original new deal had been reenacted and validated by the supreme court, now by the passage of time full of Roosevelt appointees. The Wagner Act effectively guaranteed trade union rights; minimum wage laws, the outlawing of child labour, the constitutionality of that great experiment in integrated economic and social reconstruction the Tennessee Valley Authority, the vast extension of federal aid to housing and child welfare, the establishment of a system of unemployment insurance were all given sanction by the new court. And the continuing left temper of the administration was underlined by the choice of Henry Wallace, the secretary of agriculture, as vice-presidential candidate.

The election of 1940 was much closer than that of 1936, but Roosevelt's policy was ratified—and supported by the Republican candidate, Wendell Willkie. By a bold interpretation of his powers, Roosevelt had in the summer of 1940 transferred great quantities of weapons to the U.K.; then, in exchange for bases in British possessions, he transferred 50 "over-age" destroyers and, once re-elected, produced the even

bolder scheme of lease-lend as the most effective means of "all aid to Britain short of war." With the German invasion of Russia, the Soviet Union qualified for lease-lend. There were incidents—the sinking of U.S. ships, the orders given to the navy to "shoot at sight"; and war between the U.S.A. and Germany came closer. In Aug., 1941, Roosevelt met Churchill for the first time, off the American coast. They drafted and issued the document called the Atlantic Charter; but Roosevelt evaded any promise of active belligerent aid. Then the rulers of Japan launched their surprise attack on the Pacific fleet at Pearl Harbour (Dec. 7, 1941), Germany and Italy declared war on the U.S.A., Roosevelt's period of waiting and manoeuvring was over.

Pearl Harbour united the American people; but at first there was only a series of disasters to report. Preparations for building an immense army, navy, and air force were put in hand; the Japanese threat to Australia was parried, and the policy of the grand alliance with Great Britain and Russia was worked out. The invasion of N. Africa was planned, and took place a week after the mid-term elections of 1942 had shown a violent reaction against the administration's conduct of the war, especially on the home front. But though the American voters did not know it, the tide had turned.

The president concentrated more and more on waging war. He chose the generals and admirals, decided the main issues of grand strategy in consultation with Churchill at Washington, Quebec, Casablanca, and, with Stalin added, at Teheran. The general economic problems of the home front he entrusted to a close friend, James Byrnes, who left the supreme court. Italy was invaded and the reconquest of the territories seized by Japan begun. By 1944 it was evident that the war would be won, and that it might be won soon. The invasion of France in June by U.S. and British forces marked the opening of the last act. And it justified the decision of the president to run for a fourth term, to make the peace that was seen to be near. Deciding that Wallace was, for various reasons, impossible as a vice-presidential candidate, the president accepted the nomination of Senator Truman of Missouri, who had acquired a deservedly high reputation as an investigator of war contracts, but was otherwise little known. The

Republicans nominated Governor Dewey of New York, and the campaign was sternly fought. The president was forced, as in 1940, to make a series of campaign speeches, if only to answer widespread rumours about his bad health. He withstood the strain in a fashion that surprised close friends who had begun to worry; but on the long journey to the Crimea to meet Churchill and Stalin and at the Yalta conference (Feb., 1945) there were ominous signs. With victory in sight, however, Roosevelt planned, with his wife, the details of his forthcoming state visit to London, and worked on current problems and on the problems of peace. Neither his wife nor his personal physician was present at Warm Springs, the Georgia spa where he had gone for many years for treatment, when, on April 12, he suddenly and unexpectedly died.

There can be no doubt that Roosevelt's presidency, the longest in American history, will rank as one of the most important for the U.S.A. and incomparably the most important for the world. It saw an immense extension of federal authority and the further exaltation of the presidential office. It saw, too, world history decisively affected by American policy, which was the president's policy, from the decision made in 1940 to resist the triumphant march of the Third Reich to the decision to attempt the manufacture of the atomic bomb. The claim of Roosevelt to greatness was and will be much disputed. But no one disputed his courage, his stubbornness, his political adroitness, which some called his disingenuousness. He was an innovator in the art of politics as well as of government. He was the first to develop to the full the possibilities of radio, not only in formal addresses to congress or to great public meetings, but in the famous "fireside chats" to the American people. If not a great orator, he was a great phrase-maker. He turned the presidential press conference into a great political instrument. No president was more hated, and none more admired and trusted by the masses of the poor and underprivileged who never doubted his concern for them, perhaps because physical accident had made him one of them.

Roosevelt, THEODORE (1858–1919). American statesman, president of the U.S.A., 1901–08. He was born in New York, Oct. 27, 1858, and entered politics after graduation from Harvard. He quickly stood out as a champion of good government. As Republican leader in the New York state assembly, 1882–84; as Federal civil service commissioner, 1889–95; and as New York City police commissioner, 1895–97, he fought corrupt politicians and all who batted on vice. During this period he spent a year on a ranch, establishing his reputation as a hunter of big game.

Theodore Roosevelt, American president

When the Spanish-American war broke out in 1898, Roosevelt was assistant secretary of the navy, but resigned to become lieutenant-colonel of a Rough Riders regt. raised by himself, which distinguished itself at San Juan Hill, in Cuba. He returned, a popular idol, to be elected governor of New York state, 1899–1900. His enemies, the bosses of his own party, planned to be rid of him by making him vice-president of the U.S. On McKinley's assassination in Sept., 1901, Roosevelt succeeded to the presidency. In 1902 he opened his attack on the trusts and "special interests." In foreign affairs he was equally forceful, mobilising the U.S. navy when Germany sought to seize a Caribbean port, and seizing the chance offered by revolution in Colombia to foil that country in its endeavours to block the building of the Panama Canal. The presidential election of 1904 saw Roosevelt re-elected by an enormous majority.

For his efforts in negotiating peace between Russia and Japan, 1905, he was awarded the Nobel peace prize in 1906. Two years later, suspecting Japanese designs, he sent the U.S. fleet on a world tour as a demonstration of strength. At home he continued his fight against the political machine and the financial interests, initiating a movement for the conservation of the country's natural resources. Refusing a third presidential

term, he procured the election of his successor Taft, and in 1909 left for a scientific hunting trip in E. Africa.

Dissatisfied with Taft's policy, he broke with him to form the Progressive, or Bull Moose, party, running as its presidential candidate in 1912. Though unsuccessful, he ensured Taft's overwhelming defeat. In 1913 he went exploring in Brazil, discovering the Dubida river, but his health was seriously impaired. From the outset of the First Great War he strenuously supported the Allied cause. His four sons all fought in the war, one being killed. Two others died on active service in the Second Great War. Roosevelt died suddenly, Jan. 6, 1919.

His intense Americanism, his astonishing vitality, his supreme self-confidence, his real sympathy for the under-dog, made Roosevelt popular at home and carried his fame abroad. He showed little conception of the vast social changes on the eve of which he lived, and never tackled the underlying problems of tariff, currency reform, or labour. But he was the first to awaken Americans to a conception of their true international position. He built up the U.S. navy and was the first president to make the influence of his country world wide.

His published works included *Hunting Trips of a Ranchman*, 1886; *American Ideals and Other Essays*, 1897; *The Rough Riders*, 1899; *African Game Trails*, 1910; an *Autobiography*, 1913; *The Great Adventure*, 1919. *Consult* *Lives*, N. M. Butler, 1919; W. D. Lewis, 1919; Lord Charnwood, 1923; H. Pringle, 1932; also R. in the *Bad Lands*, H. Hagedorn, 1924; R. and the Caribbean, H. C. Hill, 1927; R. as We Knew Him, F. S. Wood, 1927; T. R., Owen Wister, 1930.

Root. Lower extremity of the main stem in higher plants. Its beginnings are already laid down in the embryo—the plumule which forms the shoot and the radicle which forms the root. The function of the root is to anchor the plant in the soil and to absorb water in which soluble salts are dissolved.

The growing point is protected by a sheath of cells called the root cap, which is renewed from within. The root tip is geotropic and hydrotropic; its hydrotropism may promote it to leave its normally straight course towards water and dissolved plant foods. The root branches laterally; the branch

roots grow away from the main root (exotropism). The lateral branches are produced on all sides of the root and themselves branch. A considerable area of soil may therefore be explored by one plant. If some obstacle checks the onward growth of a root, the tip may work around it and then resume its course. Food absorption is by numerous thin-walled and single-celled root hairs near the root tip.

The growth of root and top is broadly proportional. True roots are limited to the higher plants. In many cases, however, the food collecting function of the normal root hair is supplemented by either symbiosis or mycorrhiza. Legumes provide the characteristic example of root symbiosis. Many trees (e.g., *Pinus*) provide good examples of mycorrhiza in which fungus and root are in partnership to break down the products of organic decay sometimes under anaerobic conditions.

In perennial plants the roots become reservoirs for the storage of reserves to bridge over adverse conditions, e.g. periods of drought or cold. This enables the plant to return to full vigour when more normal conditions return. Selection and hybridisation have produced abnormally succulent roots of sugar beet, parsnip, carrot, mangold, turnip, and others.

Root pruning is practised in horticulture upon trees which

produce much top growth but few fruit buds. The young tree is lifted up cleanly from the ground and the tap root removed. Wood may be cut away freely but all young shoots retained. In large trees the method is to trench round the tree, lever it upwards until the tap root can be cut and the laterals shortened. The vacant space left at the base is filled with soil mixed with compost. The tree is returned to its original position and the trench filled.

Root CROPS. Before the introduction of the turnip into agriculture, land was allowed to remain in a fallow state, i.e. without a crop, at regular intervals, partly to allow of thorough cleaning. But the invention of drilling by Jethro Tull allowed of tillage between the rows for cleaning purposes, while by growing turnips or an equivalent, not only was the productivity of the land increased, but food provided for winter stock, and the necessity for living on salted meat obviated. Such a crop is often known as a fallow crop, because it takes the place of the old bare fallow. The term root crop is not only applied to turnips, swedes, mangolds, sugar beets, carrots, and parsnips, where the part harvested is actually a root, but also to potatoes, which are tubers, or thickened underground stems, and to such things as rape, kohlrabi, or field cabbages, which occupy the same place in a rotation. The American term intertillage crop is all-inclusive, and is therefore strictly accurate.

Root crops are also advantageous in giving full employment to labour at times when it would otherwise be slack, and in affording the opportunity for maintaining the

fertility of the land by the application of heavy dressings of manure. The work begins as soon as harvest is over, is followed by winter and spring ploughing, and afterwards by the preparation of a seed-bed and the sowing of the crop, during the growth of which singling and intertillage make further demands on labour. See *Agriculture*; *Botany*; *Crops*; *Mycorrhiza*; *Plant*.

Root. In philology, that part of a word which remains after it has been stripped of everything forma-

Root. Method of pruning roots of fruit trees. 1. Diagram showing how roots grow. 2. Shortening tap root of young tree. 3. Trench dug round older trees to permit of pruning their roots

tive and accidental. Take the word "examination," from Lat. *examinationem*, accusative of *examinatio*, the verbal noun of *examinare*. *Examin-* is from *exa(g)men*, the scale of a balance (*exigere*, to weigh out), and contains the suffix *-men* (seen in English *acumen*, *regimen*) and the prefix *ex-*, out. Remove these and *-ag-* remains. This is the root, the original idea of which was "driving." Roots have no independent existence, and probably do not constitute the beginnings of language, but are convenient labels under which to classify derivatives. See Philology; Place Names.

Root. In mathematics, a quantity which when multiplied by itself a requisite number of times produces a given expression. Thus the square root of a number is such that when multiplied by itself it gives that number, e.g., 5 is the square root of 25 (written $5 = \sqrt{25}$); and 3 is the cube root of 27 (written $3 = \sqrt[3]{27}$). The number indicating the degree of the root, e.g. $\sqrt[3]{-}$ is called the radix of the root. The values of the unknowns which satisfy an equation are called the roots of the equation.

Root, ELIHU (1845-1937). U.S. statesman. Born at Clinton, New York, Feb. 15, 1845, he graduated at Hamilton College in 1864, and was called to the New York bar three years later. He was U.S. district attorney at New York, 1883-85, and, as secretary of war in McKinley's cabinet, 1899-1904, he reorganized the war department and introduced several reforms into the army. Under Theodore Roosevelt, Root was secretary of state, 1905-09, serving as senator from the latter year until 1915. In 1910 he was appointed member of The Hague tribunal, being awarded the Nobel peace prize in 1912. In 1917 he went to Russia at the head of a diplomatic mission.

Elihu Root,
American statesman

At different times Root sat on many important commissions and tribunals, including the Alaskan Boundary tribunal, 1903, and The Hague tribunal of arbitration between Britain, France, Spain, and Portugal concerning church property, 1913. Chairman of the Republican convention of 1912, he refused nomination for the presidency. As an international jurist,

Root Parasites. Toothwort, *Lathraea squamaria*, a leafless root parasite

he had much to do with setting up the permanent Court of Justice under the League of Nations. He wrote much on international questions, his books including *The Citizen's Part in Government*, 1907; *The Military and Colonial Policy of the U.S.*, 1916. He died Feb. 7, 1937.

Root and Branch Men. Name applied to those members of the English parliament who favoured the policy of destroying episcopacy root and branch in 1640-41. A petition to this effect was signed by 15,000 citizens of London and presented to parliament, Dec. 11, 1640. A bill on these lines was afterwards introduced, but eventually it was dropped. Leading root and branch men were Henry Vane, John Hampden, and Nathaniel Fiennes.

Rootes, SIR WILLIAM EDWARD (b. 1894). British industrialist. He was born Aug. 17, 1894, and educated at Cranbrook School. After serving as pupil engineer, he was in the Royal Navy 1915-17 and later in aircraft engineering. He formed Rootes Ltd., car distributors, in 1919 and gradually built up one of the largest organizations in the motor industry. He served on various official committees, and during 1941-42 was chairman of the supply council, ministry of Supply, and was knighted in 1942.

Rooting on Roding. Name of eight parishes of Essex. Situated between Ongar and Dunmow, they are Abbots or Abbess Rooting, Aythorpe Rooting, Beauchamp Rooting, Berners Rooting, High Rooting, Leaden Rooting, Margaret Rooting, which has a Norman church, and White Rooting, which includes the hamlet of Morrell Rooting, an ancient church and a picturesque Tudor house, Colville Hall. The Rootings take their name from the river Roding (q.v.).

Root Parasites. Plants which attach themselves to the roots of

other plants, from which they absorb water and food. Some of these, like toothwort (*Lathraea*) and broom rape (*Orobancha*), separately described, are total parasites, obtaining the whole of their nourishment in this way, and therefore producing no true leaves. Others, like eyebright (*Euphrasia*), rattle (*Rhinanthus* and *Bartsia*), lousewort (*Pedicularis*), and cow-wheat (*Melampyrum*), are partial parasites, obtaining only crude fluid from their hosts and elaborating it in their leaves.

Root's Blower. Form of rotary pump used for providing air or gas under moderate pressure. It was first constructed by P. H. and F. M. Root, of the U.S.A., and was introduced into Great Britain about 1860, largely for use with blast furnaces. It takes a place between the fan and the Blowing Engine (q.v.) and can be run at

Root's Blower. Diagram of the machine. AA', revolving arms. GG', gear wheels. See text

high speeds, since the rotating parts are balanced; but it has the disadvantage, compared with the fan, of a pulsating delivery. It consists of two arms AA' running on parallel shafts, geared to run at equal speeds by gear wheels GG' and fitting as closely as possible to the casing and to each other. Each rotor is essentially a wheel of two teeth only. The epicycloids *abc, def* and the hypocycloids *agh, dkl* being generated from circles rolling on the pitch circles of the wheels GG'. The second rotor is in gear at right angles to the first.

Since the rotors run at high speed and have a comparatively large moment of inertia, the teeth of the driving wheels must be cut very accurately, or frequent breakages will occur. The rotors act as pistons, dividing the casing into two compartments, one of which receives air, while in the other the air is compressed and forced out of the casing. The blower has been used for supercharging small internal combustion engines.

Rope. Stages in the manufacture of rope. 1. Yarn passing from the bobbins through a vertical iron plate and tubes to form strands. 2. Rope walk, 580 yds. long, showing strands passing to twisting machine. 3. The three strands being twisted on travelling machine to form a rope

Rope. Strands of fibre, wire, or other material twisted together to form a pliable cord one or more inches in circumference. The point in twisting the fibres is that mutual friction holds the strands together when a strain is applied to the rope. Until the introduction of rope-making machinery, hemp and flax were the principal materials; hemp is still used for tarred and marine ropes. Where strength and durability are the chief requirements, abaca, commonly referred to as manila, is desirable. Henequen, often misnamed sisal, is the next most important rope material. Jute and cotton make braided ropes; wire and nylon other kinds.

Rope making is one of the oldest industrial arts. Primitive communities fashioned ropes from strips of hide, reeds, rushes, or hair; the ancient Egyptians made them from yarns, and their method of manufacture altered little until the middle of the 19th century. The yarn or hemp was first hackled

or straightened by combing over a board studded with short metal spikes; then, after attaching a few strands to a hook on a spinning wheel, the spinner placed the remainder round his waist, and as the hook on the wheel was revolved by hand, walked backwards feeding the fibre from this supply. A number of yarns were then twisted together into a strand, three strands were twisted to "lay," or form, a hawser. Three hawsers formed a cable.

Machine rope-making processes are essentially the same, irrespective of the materials used. The fibre or other material is carded in a machine which delivers it in a continuous stream or sliver to be coiled on drums. Another machine removes inequalities. Next the slivers pass through a funnel-shaped tube to be wound round the capstan which turns them into yarn and delivers them on to bobbins. The yarns from the bobbins are threaded through holes in a

vertical iron plate, and passed through a fixed iron tube, the ends attached to hooks on a twisting machine which runs on rails laid along the rope walk; as it moves the yarn is twisted into strands.

Strands are twisted into rope on a machine having at its fore end a number of hooks to which the strands are attached. At the other end of the rope walk is the traveller. Between the traveller and the fore end, and running on the rails of the rope walk, is a conical guide-block, through the grooves of which the strands are passed and then fastened to the hooks on the traveller. The hooks on the traveller and on the fore end revolve in opposite directions, and as the strands are twisted the guide block is pushed along the rails by the closing strands.

Some manila ropes are given a wire core, the fibre strands being wound round the wire as the rope is formed. Cable-laid rope consists of three completed ropes twisted together. For tarred ropes the yarns are first passed through tanks of heated tar, then through rollers to squeeze out the superfluous tar, after which they are allowed to dry for a few days before being formed into ropes. In making cord for fishing lines and nets, the yarn is passed through hot starch and drying and polishing rollers to impart the necessary polish.

Wire rope was first made in Germany early in the 19th century, and in 1838 R. S. Newall invented the first machine for its manufacture, but not until the introduction of flexible wire in 1874 did wire rope displace hempen to any extent. It generally has a hemp core round which are twisted wire strands, each built up of from seven to 60 separate wires.

Nylon rope, which is light in weight and very flexible, was introduced in the Second Great War for towing gliders; it is usually woven or braided, rather than twisted, owing to its tendency to ravel.

Roper. River of the Northern Territory, Australia. Formed from the rivers Strangway and Chambers, it flows E. to the Gulf of Carpentaria. Navigation is somewhat impeded by the bar at the mouth, but is possible for boats of 12 ft. draught for 90 m. to Leichhardt's Bar. Stores for the Overland Telegraph were landed at the Roper, and conveyed by the valley route 200 m. to Bitter Springs.

Roper, MARGARET (1505-44). Eldest daughter of Sir Thomas More (*q.v.*). One of the most learned and at the same time one

of the most loved women of her time, about 1525 she married William Roper (1496-1578), her father's biographer. She is said to have secured her father's head after his execution, and to have preserved it until she died. She was buried in Chelsea church, but the head of Sir Thomas is believed to have been discovered in 1824 in a leaden box in the Roper vault at S. Dunstan's church, Canterbury. Many of her letters are extant. Her character is reflected in Ann Manning's *The Household of Sir Thomas More*, a work which purports to be a journal kept by Margaret from her 15th year until her father's death.

Rope Trick. Alleged performance by Indian jugglers. According to the popular story, the performer throws a rope into the air where it remains suspended and a boy climbs up and vanishes at the top. Described in this way, the trick is entirely mythical; the actual trick that has been witnessed consists in elevating a faked, internally stiffened rope up which the boy climbs. The trick has been an Indian fable for over 500 years; no Oriental juggler visiting Europe has ever performed it, while no European juggler visiting India has ever seen it. In 1902 Lord Lonsdale offered £10,000 to anyone performing the real rope trick, and Maskelyne and Devant for years offered £100 a week to anyone who would perform the trick in London. Neither reward nor salary was ever claimed. It is sometimes stated that the trick is a mass hypnotising of the spectators, but this explanation originated only in a short story printed in the *Detroit Free Press* in 1905.

Ropeway. Wire cable on which a carriage is supported and run on wheels for the purpose of transport. Aerial ropeways are an alternative to railway tracks laid on the ground, and in many conditions of terrain, particularly in hilly country and across rivers, afford the only reasonably cheap method of transporting goods.

The first ropeway was built in 1644 by Adam Wybe, a Dutch engineer who used an endless hemp rope passing over pulleys suspended on posts; to the rope were attached a number of tubs which carried earth from a nearby hill for rebuilding the ramparts of Danzig. The first wire ropeway was constructed in 1860 to carry ore from a mine in the Hartz mts. to a railroad. Several later systems were evolved, but basically their principle is the same: that of strong

wire cables strung on towers and carrying the load in suspended buckets.

Fig. 1 illustrates a system suitable for moving very heavy individual loads over long, steep spans. The load is borne on a single fixed cable, and pulled up or let down by an endless hauling rope of smaller diameter. Fig. 2 shows a duplication of the first system. Here the descending load assists to draw up the ascending load. The third system (Fig. 3) employs two fixed carrying ropes and an endless hauling rope travelling always in the same direction. On reaching the end of the track, the buckets and their carriers are run on to a shunt rail, emptied, or filled, and returned to the other track. The carriers automatically let go the hauling rope when entering a shunt, and grip it again when leaving. The jaws of the grips are actuated by the weight of the bucket; the steeper the incline and the greater the pull, the more tightly do they cling to the rope.

In the fourth system (Fig. 4) one endless rope, travelling continuously in the same direction, supports and moves the carriers, which are either attached rigidly to it or grip it automatically. In the second case the carriers can be shunted at the terminals.

The last two systems are used for long cable-ways designed to carry a rapid succession of moderate loads. If the ropeway has a sufficient gradient, it will work by gravity alone, assuming the loaded carriers to travel downwards. Otherwise power is required to operate it. Very long ropeways are usually divided into sections that are independent of one another, each provided with wind-

ing and tension drums, and the carriers are transferred from one section to the next over short level shunt rails.

At Dorada, Porto Rico, is a ropeway 47 m. long. Built on the single-rope system, it is in 15 sections and has a carrying capacity of 20 tons an hour, some of the cars being fitted for passengers. A ropeway in Argentina connects the mining town of Upalungos with Chilecito, 22 m. away; it works on the fixed carrying-rope system divided into eight sections, including one span of 2,177 ft., and has a total vertical rise of 12,500 ft. A ropeway serving an iron mine in Spain has a single span of nearly 4 m. and carries 85 tons of ore an hour. In the Swiss Alps many small ropeways have been constructed to carry skiers to the tops of the runs.

Rops, FÉLICIEN (1833-98). Belgian artist. Born at Namur, Belgium, July 7, 1833, he spent his youth in Brussels, contributing lithographs to a satirical journal during 1859-60. He lived in Paris after 1874 and his extensive output of drawings and engravings centred largely round political and social satire. Many, however, were erotic or macabre. He experimented with, and developed every technique of the graver and etcher, and was unrivalled in the use of dry-point and soft varnish. During his later years he devoted himself to book illustration, e.g. *Voltaire's Zadig*, *Gautier's Jeune France*, *Peladan's Le Vice Suprême*. He died Aug. 23, 1898.

Roquefort. Village in Aveyron dept., France. It stands on a height, 1,970 ft., among the limestone Causses, 44 m. N.W. of Beziers.

Ropeway. Systems of aerial cable transport. See text

The cheese made here has gained world-wide fame, and has been elsewhere imitated, but not matched because it owes so much to local conditions—the rich grazing land and natural caverns kept humid by underground sheets of water. Roquefort is a soft ewes'-milk cheese, though additions of cows' or goats' milk are sometimes made for commercial reasons. The morning and evening milk are mixed with rennet from lambs' stomachs. Layers of breadcrumbs moulded with a penicillium culture are introduced, and ripened in the caverns from one to five months at 46° F. The mould, as with Stilton, produces a characteristic blue in the white texture.

Roraima. Mountain of S. America, on the borders of Vene-

Roraima. A table mountain in S. America

zuela, British Guiana, and Brazil. Of tabular form, the upper part rises in precipices from 1,600 ft. to 3,000 ft. alt. There are numerous waterfalls, some descending nearly 2,000 ft. Of its several peaks the loftiest reaches an elevation of 8,625 ft. Several rivers tributary to the Essequibo, Amazon, and Orinoco flow from it.

Rorke, KATE (1866-1945). British actress. Born in London, Feb. 22, 1866, she was educated at a convent, and made her first stage appearance at the Court Theatre in 1878. She became a leading London actress during the 1880s, appearing with Hare,

Kate Rorke, British actress

Benson, Tree, and Forbes-Robertson during a long and distinguished career, and playing in Shaw's Candida in 1904. She became professor of dramatic art at Guildhall School of Music, London, in 1906, and later conducted her own dramatic school. She died July 31, 1945.

Rorke's Drift. Place on the Tugela river, Natal, S. Africa. It is 23 m. from Dundee and is famous for the stand made by a few British soldiers against a Zulu army, Jan. 22, 1879. After the disaster at Isandhlwana, the small garrison here was attacked by about 4,000 Zulus. Under Lieuts. Chard and Bromhead, 80 men of the S. Wales Borderers, of whom about one half were in hospital, beat back repeated attacks of the enemy, who finally withdrew. The British loss was 17 killed and 10 wounded. See Isandhlwana; Zulu Wars.

Rorqual (*Balaenoptera*). Small genus of toothless whales. In them the teeth of the cachalots and dolphins are replaced by fringed plates of baleen or "whale-bone," for straining off the small fish, crustaceans, and molluscs, upon which they feed. Of these plates there are more than 300 on each side of the upper jaw. Rorquals are of more slender form than some of the whales; the head is small compared with that of the sperm whale, and there is a dorsal fin.

The floor of the mouth and the throat are thrown into longitudinal folds, allowing of considerable distension when feeding. The females exceed the males in size. Four species are found around the British Isles, of which the common rorqual or finner (*B. musculus*) is from 50 ft. to 70 ft. in length, and feeds largely on herrings. Sibbald's rorqual or blue whale (*B. sibbaldii*) is the largest whale known, a length of 85 ft. being verified, but greater lengths have been reported. The lesser rorqual (*B. rostrata*) attains only about 30 ft.; a common British species, Rudolphi's rorqual (*B. borealis*), about 50 ft. long, is found in the English Channel and occasionally far up the Thames. The blubber yields large quantities of oil, but that of the finner is considered inferior. See Fin-whale; Whale.

Rorschach. Town of Switzerland, in the canton of St. Gall. It stands on the S. shore of Lake Constance, 62 m. by rly. E. of Zürich and 7 m. N.E. of St. Gall. It has excellent bathing facilities. Above it rises the abbey of Marienberg, built in the 15th century, and now used as a seminary. Various

machines, rayon, lace, and muslin are manufactured. Pop. 11,000.

Rosa, CARL AUGUST NICOLAS (1842-89). German operatic impresario. Born at Hamburg, March 22, 1842, his original name being Rose, he appeared in England as a violinist, 1854, studied music in Leipzig and Paris, and directed concerts at Hamburg, 1863-65.

Carl Rosa, German operatic impresario

In 1867 he married the singer Euphrosyne Parepa (1836-74), and toured in America and Britain. In 1875 he formed the Carl Rosa Opera Company (*q.v.*) to play opera in English in London and most provincial centres. Rosa, who actively promoted composition of English operas, died in Paris, April 30, 1889, but his company was continued. His remains were deposited at Highgate cemetery catacombs until a private mausoleum was completed, and he was finally buried on Oct. 15.

Rosa, MARTINEZ DE LA. Spanish statesman and author, properly known as Martinez de la Rosa (*q.v.*).

Rosa, SALVATOR (1615-73). Italian painter. Born at Arenella, near Naples, June 20, 1615, he studied under his uncle, Paolo Greco, and his brother-in-law, Francesco Francanzoro. Adventurous in temperament, he wandered much in the mountains of S. Italy, studying the wilder aspects of nature. Finding his way to Rome in 1635, he was commissioned by Cardinal Brancaccio to decorate his palace at Viterbo. In 1639 he was again in Rome, and distinguished himself at the carnival as actor, poet, and singer.

His success encouraged him to further efforts. Involved in Masaniello's revolution at Naples in 1647, he was a wanderer for the next few years, but returned to Rome in 1652. Having roused hostility by his satirical verses, he withdrew to Florence, where he lived nine years, painting and writing poetry. He died in Rome, March 15, 1673. Salvator was one of the founders of romantic landscape. His gloomy mountain and

Salvator Rosa, Italian painter

forest scenes, his wild seas and dramatic historical pieces are the reflection of his temperament. One may cite especially his Prometheus (Spada Palace), and a large battle picture in the Louvre.

Rosaceae. Extensive family of trees, shrubs, and herbs, natives of various climates throughout the world. The leaves are mostly alternate, and the flowers are of regular shape. The fruit varies greatly; it may be either a fleshy pome (apple and pear), a juicy drupe (plum and cherry), many drupes united (blackberry and raspberry), achenes or nutlets on a fleshy receptacle (strawberry), or on a dry receptacle (silverweed, etc.). About 2,000 species are known.

Rosalba. Signature of the Venetian painter, Rosalba Carriera (*q.v.*).

Rosalind. Heroine of Shakespeare's *As You Like It*, generally regarded as the sunniest and wittiest of his young women. Daughter of the banished duke, she is exiled by her usurping uncle and wanders in the forest of Arden, disguised as a boy, and accompanied by her cousin Celia and Touchstone the clown. There she meets Orlando, with whom she has already fallen in love at court, and teaches him how to woo. When the time is ripe, she reveals herself in woman's dress to Orlando and her father.

Rosamund OR **ROSAMOND**, called the Fair (c. 1140–c. 1176). Mistress of Henry II of England. A daughter of Walter de Clifford, a knight of the Welsh border, she was, according to tradition, maintained at Woodstock, where the king had a palace, and was acknowledged by him about 1174. On her death soon after, she was buried in the church of Godstow nunnery near Oxford. Legend told of a maze or bower built for Rosamund by Henry, to which Queen Eleanor penetrated with the aid of a silken clue, and forced her rival to drink poison. The ruins of the maze in Woodstock park were shown in the 17th century, and Rosamund's well, a rectangular pool or bath, is still to be seen there. She is introduced in Scott's novel, *Woodstock*.

Rosaniline OR **FUCHSINE**. One of the earliest synthetic dyes, originally made by oxidising a mixture of aniline and ortho and para toluidine with arsenic acid. The base is colourless, the aniline dyes being salts of the compound. See *Magenta*.

Rosapenna. Village and pleasure resort of co. Donegal, Eire.

It stands on an opening off the N. coast of the county, and can be reached from Londonderry by car and steamer. In the late 19th century its beautiful surroundings started to become popular. There are golf links, and it is a good centre for fishing.

Rosario. River port and second city of Argentina. It stands on a high bluff on the right bank of the Paraná river, 214 m. by river and

Rosario, Argentina. The law courts in this important Argentine city and river port

175 m. by rly. N.W. of Buenos Aires. Six rly. lines and many good roads radiate from it over the prov. of Santa Fé, of which it is the capital. Its wharves are reached by ocean and tramp steamers as well as by river vessels, and it is the principal port for the N. provinces. It has numerous grain elevators; wheat, hides, wool, linseed, and other products of the pampas, quebracho, metals, and ores are the main exports.

The city has an electric tramway service and electric lighting in its spacious streets and avenues. The chief industrial establishments are shoe factories, meat packing establishments, sawmills, breweries, tanneries, sugar mills, soap, candle, and grease factories, tobacco and cigar factories, foundries, paper and cardboard factories, brick, tile, and cement works. Pop. 518,515.

Rosary (late Lat. *rosarium*, chaplet of roses). Device for assisting in the repetition of prayers. Largely used by Hindus and Muslims, the practice of counting prayers by beads was probably introduced into Christendom by the Crusaders, though tradition says that a direct revelation for its institution was made to S. Dominic (*q.v.*). The form in common use in the R.C. church is a string threaded with 50 small beads divided into groups of ten by larger beads. The former represent Ave Marias, the latter Pater Nosters, and at the end of each decade is said the doxology. This series of prayers is itself called a

rosary, and many indulgences are attached to the repetition of it. Appended to most rosaries, which are formed in a loop, but not strictly a part, is a string with two large and three small beads, and terminated with a crucifix. The Pater Nosters and Ave Marias represented by these beads are repeated before the rosary is recited.

Rosas, JUAN MANUEL (1793–1877). Argentine statesman. Born at Buenos Aires, March 30, 1793. To safeguard his ranches against Indians he organized an armed force of followers, which ultimately gave him great power. He was made governor of the state of Buenos Aires, and in 1835 became dictator of Argentina. He ruled

with great cruelty, never sparing his enemies, and by mixing in the affairs of Uruguay he brought

Juan Manuel Rosas, Argentine statesman

about the intervention of Britain and France. In 1849 he secured peace with those powers, but in 1852 a rival, Urquiza, defeated him. Rosas fled to England, and spent his last years in retirement at Southampton, dying March 14, 1877.

Rosary used in the R.C. church, with five decades and crucifix attached

Roscher, Wilhelm (1817-94). German economist. Born at Hanover, Oct. 21, 1817, he studied at Göttingen, where he became professor of political economy in 1843, moving to a similar chair at Leipzig four years later. He wrote largely on his subject, his principal work being *System der Volkswirtschaft* (1854-94), which was widely translated, the first vol. pub. in English as *Science of Political Economy Historically Treated*, 1878. Roscher died June 4, 1894.

Roscius (d. 62 B.C.). Roman comic actor, whose full name was Quintus Roscius Gallus. He was born a slave at Solonium near Lanuvium, and reached a perfection in his art that became proverbial. He obtained the favour of the dictator Sulla and enjoyed the friendship of Cicero, who defended him in an action.

The name has been applied to many well-known actors, such as Richard Burbage; David Garrick; William Henry Betty, "the young Roscius"; and Ira Aldridge, an American Negro.

Roscoe, Sir Henry Enfield (1833-1915). British chemist. Born in London, Jan. 7, 1833, and

Sir Henry Roscoe,
British chemist
Elliott & Fry

educated at University College, London, and at Heidelberg under Bunsen, he was appointed in 1847 professor of chemistry at Owens College, Manchester, which afterwards became the university. With this university he was afterwards connected for the rest of his life. He first prepared pure metallic vanadium and conducted other original researches, but he is best known as a teacher of chemistry and an educationist.

Roscoe was a member of the royal commission on technical instruction which resulted in the passing of the Technical Instruction Act in 1889. He was knighted in 1884 and was M.P. for S. Manchester, 1885-95. His *Elementary Lessons in Chemistry and Treatise on Chemistry*, the latter written in collaboration with Schorlemmer, were for long among the most widely used textbooks of the science. He died Dec. 18, 1915. Consult his *Life and Experiences*, 1906; *Life*, E. Thorpe, 1916.

Roscoe, William (1753-1831). English historian. Born at Liverpool, March 8, 1753, he was an

After J. Lonsdale

attorney but abandoned law for literature. His chief works are his *Life of Lorenzo the Magnificent*, 1796, *Life and Pontificate of Leo X*, 1805, and a botanical treatise, 1828. His collected Poems were published in 1857. Roscoe died June 30, 1831. See *Life*, 2 vols., H. Roscoe, 1883.

Roscoff. Town of Brittany, in Finistère dept. It is 17½ m. N.W. of Morlaix. The church of Notre-

Roscoff, France. Belfry of the church of Notre-Dame-de-Croaz-Baz

Dame-de-Croaz-Baz, 1550, is noted for its minaret-like tower and spire. The chapel of S. Ninian, now in ruins, was built by Mary Queen of Scots to commemorate her landing here in 1548. The hospital dates from 1573, and among other interesting old houses is the mairie. There is a marine laboratory. About 2½ m. off the coast is the île de Batz. Pardons (g.v.) are held in summer.

Roscommon. Inland county of Eire, in the prov. of Connacht. Its land area is 951 sq. m., generally flat, save in the N., where there are hills rising to over 1,000 ft., and to a lesser extent in the E. The Shannon forms the E. boundary; another boundary river is the Suck, and there are the Arigna and the Boyle. Of many lakes the chief are Ree, Allen, Boderg, and Boffin, expansions of the Shannon, also Key and Gara. The chief occupation is rearing sheep, cattle, pigs, etc., but oats and potatoes are grown. The plain of Boyle is

famous for its pasture land. Iron is mined on the Arigna and the Connacht coalfield extends into the co. There are lines of the Eire state rlys. Roscommon is the co. town; other places are Boyle, Elphin, Castlereagh, and Strokes-

Roscommon, Eire. Church of the Sacred Heart

town. Until 1833 Elphin was the seat of a bishop. Roscommon as a co. was established about 1580. The name comes from Ros-Comain, a wood surrounding a monastery. Three members are sent to the Dáil. Pop. 74,062.

Roscommon. Market town and co. town of Roscommon, Eire. It is 18 m. N.W. of Athlone and has rly. connexion with Dublin. The chief buildings are R.C. and Protestant churches. There is a trade in cattle and agricultural produce. The town owes its name and origin to S. Coman, who about 700 founded a monastery here. Later a Dominican priory was founded. There are ruins of a castle, built by English settlers in the 13th cent. Until 1800 two M.P.s were returned to the Irish parliament. Market day, Sat. Pop. 1,900.

Roscrea. Market town of Tipperary, Eire. It stands on the Little Brosna river and near the Slieve Bloom Mts. About 47 m. N.E. of Limerick and 77 m. S.W. of Dublin, it is a rly. junction. There is a trade in agricultural produce, also flour mills, bacon curing, and coach building establishments. Roscrea owes its name and origin to S. Cronan, who in the 7th century founded an abbey here. It was once the seat of a bishop and had two castles built by English settlers, for its position was a commanding one. There is a round tower, partially intact, and in the premises of two churches are remains of two religious houses. Market days, Thurs. and Sat. Pop. 2,772.

THE ROSE: VARIETIES AND CULTURE

H. H. Thomas, Editor of Popular Gardening, 1907-47

For further information see the articles *Gardening*; *Grafting*; *Insect*. See also the two colour plates *Rose*, facing pp. 7096-97

The rose (the family Rosaceae), emblematic flower of England, is represented in gardens by species or wild roses from various parts of the world, and by numerous types and innumerable varieties of complex origin obtained by continued hybridisation or cross-breeding. The pink or white of the wild rose has been cultivated into a great range of colours, from white to deep crimson and from pale yellow to deep gold.

The chief types in cultivation are:

(1) *Rambler and climbing roses*, which are trained over pergolas, arches, and other supports. The favourite ramblers are the wichurianas; most of them are of rampant growth, and their pruning and training entail much labour. Climbing roses are less rampant than ramblers and better suited to small gardens. Climbing "sports" originated from dwarf or bush roses of the same name, e.g. Climbing Ophelia.

(2) *Hybrid tea and dwarf and hybrid polyantha or cluster roses*, which are of low growth and are grouped in formal flower beds and borders. The hybrid teas bloom more or less throughout the summer and autumn. Many are fragrant, some bear large, double, many-petalled blooms, others are semi-double.

The flowers of most of the dwarf polyantha or cluster roses and the taller hybrid polyanthas are single or semi-double; the plants bloom freely in summer and autumn.

(3) *Shrub roses* are treated in much the same way as other flowering shrubs. These roses need the minimum of attention. They grow into bushes varying in height from 3 to about 8 ft. Some flower in summer and autumn; others only in summer. Some true species or wild roses of the U.K. and other lands are suitable for cultivation as flowering shrubs.

Standard roses are budded on stems about 4 ft. tall; weeping standards are rambler roses budded on taller briars.

Roses do best in moderately heavy soil, though they can be grown successfully on light land if the roots are kept moist. The sites for the trees must be dug not less than 20 ins. deep and manured. The best time to plant is in early autumn, but the work may be continued into Dec., when

conditions are suitable, and begun again in Feb. or March.

Dwarf or bush roses should be pruned late in March or early in April. It is sound practice to prune newly planted roses severely, cutting back the shoots or branches to within two or three buds of the base. They will then make strong growth and bear good blooms. Pruning in succeeding years consists in cutting out thin, weakly shoots and shortening the remainder to within three or four buds of the base of the past summer's growth. The hybrid and dwarf polyantha roses may be pruned more lightly.

Newly planted rambler and climbing roses should be cut down to within about 6 ins. of the ground in late March. During the summer they will produce vigorous shoots which must be tied to the supports; they will bear flowers the following summer. In succeeding years these types should be pruned in Sept. or Oct.; old shoots for which there is no room are cut out to make way for those of the past summer's growth, for one-year-old shoots give the best display of bloom. Climbing "sports," however, should be pruned lightly the first year, the shoots or stems being merely shortened by about one quarter. If cut back hard they may revert to the dwarf type and fail to climb.

The roses grown as flowering shrubs need little pruning; old and weakly shoots should be cut out in the autumn, those of the past summer's growth being preserved intact or shortened only slightly.

The chief factor in successful cultivation of roses is the keeping of the roots moist in summer; roses do not flourish in ground that dries out in hot weather. Mulching or top-dressing the soil in spring, after pruning, with manure or material from the compost heap is of great benefit; the trees should be watered from time to time in prolonged dry weather. When the first lot of flowers has faded, the shoots should be cut back by about one third to help in the development of other strong shoots which will bloom later.

The worst trouble to which rose trees are subject is black spot disease. Mulching the soil in summer with grass cuttings or

other material, spraying with a suitable preparation, and gathering and burning diseased leaves are the best measures to take. Aphis, which invariably attacks rose shoots, can be destroyed by a nicotine insecticide. The rose maggot must be searched for and destroyed by hand.

Roses are propagated in late July or early Aug. by budding on briar stocks planted the previous autumn; the work is best done in cool, moist weather. They can also be increased by cuttings inserted out of doors in Oct. and Nov. To obtain early flowers, plant rose trees in large flower pots in Oct., keep them out of doors until the end of the year, and then place them in a greenhouse.

Bibliography. The publications of the National Rose Society, 117 Victoria Street, London, S.W.1, issued to members; *Roses, their History, Development, and Cultivation*, J. H. Pemberton, 1908; *Roses, their Culture and Management*, G. M. Taylor, 1945; *The Romance of Roses*, S. C. Bradford, 3rd. ed. 1974.

Rose. Heraldic emblem. Some shields bear the botanical, others a conventionalised, type of flower.

The latter are composed of four to six heart-shaped petals, with curved-in tips, golden seed centres, usually small green leaves between the petals (seeded and barbed). In cadency, it is the mark of the seventh son and his house. The rose is prominent in English heraldry, the white flower having been adopted as its badge by the House of York, the red by the House of Lancaster. The two were united when Henry VII married Elizabeth of York; he introduced the Tudor rose, first borne quarterly, red and white; then dimidiated red and white; and finally a red rose within a white one.

Rose, JOHN HOLLAND (1855-1942). British historian. Born at Bedford, he was educated at Owens College, Manchester, and at Christ's College, Cambridge, of which he was elected fellow in 1914. Reader in modern history at Cambridge university, 1911-19, he was appointed the first holder of the Vere Harmsworth chair of naval history there in 1919. A leading authority on the history of the Napoleonic period, his chief

Rose in heraldry

works include *The Rise of Democracy*, 1897; *Life of Napoleon I*, 1902; *William Pitt and the National Revival*, 1911; *Nationality as a Factor in Modern History*, 1916; and contributions to *The Cambridge Modern History*. He died March 3, 1942, leaving £2,000 to Christ's College, Cambridge, to endow a scholarship which should encourage the study of the recent history of the British Empire.

Rose and the Ring, THE. Burlesque fairy story by W. M. Thackeray, first published in 1855. Written and illustrated for the amusement of children, the story is the most successful of the great novelist's short Christmas books. In it he was at his happiest both as a master of literary burlesque and as comic draughtsman.

Rose Apple (*Eugenia jambos*). Evergreen tree of the Myrtaceae family. A native of Malaya, it

Rose Apple. Leaves, buds, and flowers. Inset, fruit

attains a height of 20-30 ft., and has oval or lance-shaped, stalked leaves. The four-petalled white flowers are borne on short leafy shoots in clusters of three or five, and are succeeded by more or less oval red fruits, about an inch across, containing one or two poisonous seeds embedded in rose-scented edible pulp. An allied species, known as the Malay Apple (*Eugenia malaccensis*), with red or pink flowers, has more fleshy fruit. A native of Malaya, it has become naturalised in the West Indies.

Roseau. Principal town of the island of Dominica, British W. Indies. Situated on the W. coast of the island, it is an export centre, doing considerable trade in coconuts, bananas, limes and other fruits, and rum. Pop. 9,600.

Rosebery, EARL OF. Scottish title borne by the family of Primrose since 1703. Archibald Primrose (d. 1679), a baronet, became a lord of session, and lord clerk register. His son, Archibald (1664-1723), a supporter of the union of

England and Scotland, was made an earl in 1703. The title passed to his descendants, and Archibald John, the 4th earl, was made a peer of the United Kingdom in 1828. His son and heir, Lord Dalmeny, a Whig M.P., predeceased his father, so when the latter died in 1868 his successor was his grandson. In 1929 the title passed to Albert Edward Harry Meyer Archibald Primrose (b. Jan. 8, 1882), who thus became 6th earl. Dalmeny, near Edinburgh, has been the property of the Primroses for 300 years. See Dalmeny.

Rosebery, ARCHIBALD PHILIP PRIMROSE, 5TH EARL OF (1847-1929). British statesman. Born in London, May 7, 1847, he was the son of Archibald, Lord Dalmeny (1809-51), by his marriage with Catherine (d. 1901), daughter of the 4th Earl Stanhope, who became duchess of Cleveland. Educated at a school at Brighton, and at Eton, and Christ Church, Oxford, he left Oxford in 1868 without a degree, and in the same year succeeded his grandfather as earl.

In 1871 the earl attracted attention by thoughtful speeches. A wealthy marriage and the friendship of Gladstone added to his importance in political circles, and in 1881 he took office as under-secretary to the Home office. He resigned in 1883, but in 1884 entered the cabinet as first commissioner of works, becoming in 1885 lord privy seal. Adhering to Gladstone when Home Rule was introduced, he became foreign secretary in 1886, but the speedy fall of the ministry placed him and his colleagues in opposition. In 1892 he returned to the foreign office, and in 1894, on Gladstone's retirement, became prime minister.

A small majority in the commons and the fact that he, as leader of the party, was in the lords were sufficient to impair the stability of his ministry, but the character and policy of Rosebery, his sympathy with the ideas summed up as imperialism, and his interest in horse-racing (he won the Derby in 1894 and 1895, while prime minister), made him suspect to many Liberals. The upshot was the resignation of the ministry in June, 1895. Rosebery retained the leadership of the party until 1896, when he formally resigned.

Lord Rosebery, British statesman

Rosebery never returned to regular political life, although there were occasions when it seemed as if he would. One such was after he had made a notable speech at Chesterfield in 1901, and another was in 1905, when, after some tentative advances on both sides, he definitely declined to accept Campbell-Bannerman's programme. To support the conclusion of the S. African War he placed himself at the head of the imperialistic section of the Liberal party, and later he came out in opposition to the fiscal proposals of Chamberlain. He denounced the budget of 1909, but his public appearances became fewer until he almost sank out of sight. He died May 21, 1929.

In 1889 Rosebery became the first chairman of the London County Council, but resigned in 1890. He attained eminence as a man of letters. His speeches on literary and kindred subjects were felicitous in phrase and full of thought, while his books show a wide historical knowledge, insight, judgement, and power. The chief are the monograph on Pitt; Sir Robert Peel, 1899; *Napoleon, the Last Phase*, 1904; *Lord Randolph Churchill*, 1906; and *Chatham*, 1910. His *Miscellanies, Literary and Historical*, appeared in 1921. His oratory, too, was full of charm and spontaneity.

He won the Derby again in 1905. In 1892 he was made a knight of the Garter. Lord Rosebery, who in 1911 was created earl of Midlothian, married in 1878 Hannah (d. 1890), daughter of Baron Meyer de Rothschild. She brought him Mentmore, but he preferred as a residence his Epsom house, The Durdans. Their elder son, Lord Dalmeny (b. 1882), was Liberal M.P. for Midlothian, 1906-10, and succeeded as 6th earl. Neil Primrose was the younger son. *Consult* Life, by the Marquess of Crewe, 2 vols., 1931.

Rose Chafer or ROSE BEETLE (*Cetonia aurata*). Species of beetle found in the S. of Britain. Metallic

Rose Chafer or Rose Beetle, actual size

golden green above and coppery beneath, the insect is about $\frac{1}{2}$ in. long. Its larvae feed among vegetable refuse or decaying wood, and are crescentic with hind end somewhat swollen. The adult feeds upon flowers and is often found among roses.

Rose Hip Syrup. Extract made from wild rose hips. Restriction on fruit imports during the Second Great War led to a search for new sources of vitamin C. Significant results were obtained with rose hips from which a palatable syrup was prepared to supply the vitamin to infants and young children who could not obtain enough from vegetables. Dried concentrated extracts were made. Vitamin C content of rose hips varies considerably according to their habitat. In hips from species native to Scotland the concentration of vitamin C is several times that in hips from S. England. At the request of the ministry of food, women's institutes and other bodies organized collections of the berries.

Rose-Mallow (*Hibiscus*). An extensive genus of herbs, shrubs, and trees of the family Malvaceae,

Rose-Mallow. Flower and leaves of *Hibiscus rosa-sinensis*

natives of tropical and temperate regions. Most of the species have showy flowers of various colours, with a double calyx. The name properly belongs to *Hibiscus syriacus*, *H. rosa-sinensis*, and *H. roseus*. *H. syriacus* is a shrub, a native of Syria, whence it was introduced to European gardens in the 16th century. *H. rosa-sinensis* is also shrubby, from China and Japan. It is known as shoe-flower, from a Javanese use of its petals for staining shoe-leather black. *H. roseus* is a N. American perennial herb, with flowers four inches across. Cuba-bast, formerly much used in gardens, was obtained from the inner bark of *H. elatus*, a West Indian tree.

Rose Marie. A musical play by Oscar Harbach and Oscar Hammerstein, Jun., with music by Rudolf Friml and Herbert Stothart. It was produced at the Imperial Theatre, New York, Sept. 2, 1924, where it ran for 581 performances, and at Drury Lane, London, March 20, 1925, when it

reached 851 performances. One of the most popular musical plays of its time, it was revived in London in 1929 and 1942.

Rosemary (Lat. *ros marinus*, sea dew). Hardy evergreen shrub (*Rosmarinus officinalis*) with fragrant leaves,

Rosemary. A flowering spike

member of the family Labiatae. It is a native of S. Europe, whence it was introduced into Britain in 1548. It attains a height of about three ft., and has purple flowers. It is raised from seed sown out of doors in pots, and transplanted into the open ground at a distance of three ft. between the plants. The leaves yield a valuable oil, one of the chief constituents of eau de Cologne. One cwt. of leaves yields over 20 oz. of oil.

Rosenbach, ABRAHAM S. WOLF (b. 1876). American book dealer and bibliographer. Born at Philadelphia, July 22, 1876, he was educated at Pennsylvania university, at which he founded a fellowship in bibliography in 1930. He became secretary of the firm of dealers in rare books and MSS. which bore his name and became internationally famous as a bibliophile, buying many rare books at sales all over the world. In 1898 he edited (with Austin Dobson) Dr. Johnson's Prologue, and compiled a catalogue of books and MSS. of R. L. Stevenson in the Widener library, 1913, writing also a Description of the Widener Four Folios of Shakespeare in 1945.

Rosenberg, ALFRED (1893-1946). German writer and politician. Born at Reval, Russia, Jan. 12, 1893, he studied architecture at Riga, and went to Munich 1918, after the First Great War, becoming one of the earliest members of the Nazi party. In 1921 he became editor of the then unimportant paper Volkscher Beobachter, and began to develop in articles, pamphlets, and books a Nazi ideology based upon mysticism, anti-Semitism, and anticlerical Teutonic mythology. Among his books the Myth of the 20th Century (1930) and an

appreciation of Houston Chamberlain (1927) were best known. Elected to the Reichstag 1930, he became head of the party's foreign policy office, and in 1941 was made minister of Occupied E. territories. At Nuremberg he was one of the chief war criminals condemned to death, and hanged Oct. 16, 1946.

Roseneath. Village of Dumbartonshire, Scotland. It stands on the S.W. side of Gareloch, 2½ m. from Helensburgh. Near the village is Roseneath Castle, a seat of the duke of Argyll. In the Italian style, it was built about 1800, near the ruins of an older building, the property of the Campbells. Roseneath features in Scott's Heart of Midlothian. Pop. est. 1,800.

Rosenheim. Town and dist. capital of Bavaria, Germany. It stands at the confluence of the Inn and the Mangfall, 40 m. S.E. of Munich. It is noted for its sulphur baths, and salt works, which give yearly about 200,000 cwt. of salt. The town was known in the 10th cent. and became part of Bavaria in 1247. It has long been noted for the strong Italian influence on its architecture. During the Second Great War, Rosenheim fell with little fighting to the U.S. 7th army May 3, 1945. After Germany's surrender it lay in the U.S. zone of occupation. Pop. (1935) 18,132.

Rosenkavalier, DER. Opera in 3 acts with libretto by Hugo von Hofmannsthal and music by Richard Strauss. Composed in 1909, and produced at Dresden, January 26, 1911, and at Covent Garden, 1913, this opera marks a modification in the composer's style compared to his preceding opera Elektra. Based on the rhythm of the Viennese waltz, the music contains also an element of Mozartian melody. The score is notable for its brilliant waltzes, the entry of the Rosenkavalier in act II. the trio of three female voices, and the soliloquy of the Princess at the end of act I.

Rosenheim, Germany. Street of the Holy Ghost

Rosenthal, MORIZ (1862-1946). Polish pianist. Born at Lemberg, Dec. 19. 1862 he studied there and

Moriz Rosenthal,
Galician pianist

in Vienna, where he made his first concert appearance in 1876. He studied also under Liszt, 1876-78, appeared in Paris and St. Petersburg, 1878, and retired from public playing, 1878-84,

in order to study classics and philosophy. His superb technique and great interpretative powers made him one of the foremost pianists of the day, and he toured widely in Britain, Europe and the U.S.A. He died Sept. 3, 1946.

Rose of Jericho (*Anastatica hierochuntina*). Annual herb of the family Cruciferae. A native of Syria and N. Africa, it has somewhat oval leaves and small white, four-petalled flowers. After flowering, the leaves fall off, and the stalks curve towards the centre of the plant, forming a lattice sphere, in which form the plant dies and dries, gets blown out of the ground, and bows along before the wind. On coming, perhaps many months later, into moist surroundings, all the parts straighten out—the so-called rose expands, and the seed-pouches open and disperse their contents.

Rose of Sharon. Name of an unknown flower, perhaps the autumn crocus, or a narcissus, mentioned in The Song of Solomon, ii. 1. The name is popularly given to *Hibiscus syriacus*, an ornamental shrub related to the mallows, and to *Hypericum calycinum*, the large St. John's wort (q.v.)

Roses, WARS OF THE. Contest between the rival houses of Lancaster and York for the crown of England, in the 15th century. It is so called because the Lancastrians assumed the red rose and the Yorkists the white as their badges. In 1447 Henry VI, by the death of his uncle, Humphrey, duke of Gloucester, became the sole legitimate representative of the house of Lancaster. The heir presumptive to Henry was Richard, duke of York, who through his mother, Anne Mortimer, represented Lionel, duke of Clarence, the second son of Edward III. Strictly speaking, if the Mortimer line be regarded as being in the royal succession, he was the rightful heir, but the house of Lancaster had been placed in a privileged position in 1399.

King Henry VI periodically became insane. Richard, as next

prince of the blood, claimed a leading place in the Council, and the foremost place when the king was incapacitated. Hence there was a continual struggle between Richard and his partisans on the one side and the queen and the Beauforts on the other. In Oct., 1453, an heir was born to Henry, and Richard's expectation of one day succeeding naturally to the throne was dashed.

Still there was no open collision until 1455, when York, realizing that he was in danger of being attainted for treason, took up arms in self-defence, and the first battle of St. Albans began the Wars of the Roses in May. York was victorious, and his ascendancy was temporarily secured. There was a superficial reconciliation, till again in 1459 he was driven to take up arms, but his followers were scattered, and he and his principal supporters, Salisbury and Warwick, had to fly the country. In the summer of 1460 they reappeared in arms. The king was defeated and taken prisoner at Northampton,

Rose of Jericho, showing, left, the curved stalks of the dead plant, and, right, the plant expanded for the dispersal of the seeds

July 10, and York, proceeding to London, startled his supporters by asserting that he himself was the rightful king, and that the reigning house were usurpers. Both he and Henry, however, were persuaded to adopt a compromise, recognizing Henry as king for life, but Richard, instead of the prince of Wales, as heir to the throne.

The queen, however, resolved to fight for her son's rights. On Dec. 30 York was defeated and killed at Wakefield. His son Edward defeated a Lancastrian force at Mortimer's Cross, Feb. 2, 1461, marched to London, and, supported now by Warwick, proclaimed himself king. On March 29, at Towton, Edward and Warwick shattered the Lancastrian forces; Henry and his queen both fled out of England. A Lancastrian rising was suppressed in 1464 by the battles of Hedgeley Moor and Hexham. But in 1469 Edward had completely alienated Warwick, the

man to whom he really owed his throne. In 1470 a revolt was raised which Warwick had fostered. The insurgents were defeated in the fight called the Battle of Lose-Coat Field, and Warwick fled to France, where he became reconciled to Queen Margaret. Henry had been caught and imprisoned in the Tower some time before. In September Warwick returned to England in arms. Edward was taken by surprise and was forced in his turn to fly the country; Henry was once more taken out of the Tower and proclaimed king.

End and Results of the Contest

But on March 14, 1471, Edward was back in Yorkshire; on April 14 he defeated and killed Warwick at Barnet; and on May 4, at Tewkesbury, shattered a second Lancastrian force, headed by Queen Margaret, killed the young Prince Edward, captured the queen, and then a few days later killed the unlucky Henry VI. The House of York was now firmly established on the throne, the only representative of the Lancastrians being Henry Tudor, earl of Richmond, son of Margaret Beaufort. Nevertheless the tyrannical government of Richard III (1483-85) gave the Lancastrians one more opportunity. In 1485, Richmond, who had been in exile, landed in England. Richard was killed at the battle of Bosworth, on Aug. 22, Henry Tudor was proclaimed king, and by his marriage in Jan., 1486, to Elizabeth, daughter of Edward IV, united the houses of Lancaster and York, thereby ending the contest.

The whole struggle had been one in which no principles were at stake, a war entirely dominated by the personal and family interests of the great nobles. To the people at large the victory of Yorkists or Lancastrians was a matter of indifference, and they took as little part in the contest as they could. But in the course of it the old noble families were nearly exterminated. Estates were forfeited and redistributed; on the ruins of the old system new fortunes were founded by a large number of small men instead of a small number of big men, and after the Wars of the Roses there was never again a danger that the crown would be held at the mercy of a new Warwick the Kingmaker. See England: History; Lancaster; York; consult also The Wars of York and Lancaster, E. Thompson, 1892; The Houses of Lancaster and York, J. Gairdner, 9th ed. 1896; The Strife of the Roses and Days of the Tudors in the West, W. H. H. Rogers, 1900.

Rosetta. Town in Egypt, on the Bolbitinic arm of the Nile delta, 15 m. N.E. of Alexandria. Once an important harbour, it is now, owing to the rise of Alexandria, unimportant. Pop. 25,684.

Rosetta Stone. Inscribed black basalt slab from Rosetta, lower Egypt. It was discovered by one of Napoleon's officers in 1799 and acquired by Great Britain at the capitulation of Alexandria, 1801. It reached the British Museum in 1802. It bears an inscription in three versions, hieroglyphic, demotic, and Greek, of which the Greek was translated by Weston, and the demotic partly deciphered by Akerblad, 1802. Thomas Young identified the hieroglyphic name Ptolemy, 1818; Champollion, by completing the decipherment, through modern Coptic, furnished the long-sought key to hiero-

Rosetta Stone. Inscribed slab of black basalt that furnished the key to hieroglyphic writing

woman, born in Guernsey. He published in 1840 a volume of translations from Byron, Voltaire, and Lamartine. During a ten years' exile in Paris, after the revolution of 1848, he devoted himself mainly to propaganda for the Rumanian revolution. In 1861 he returned to Bukarest, and became president of the chamber in 1876. He died April 20, 1885.

Rosewater. Water tintured with the essence of roses obtained by distillation. A rosewater dish is a bowl designed to hold rosewater which can be sprinkled over the hands. They are frequently used in the East after eating, and occasionally in Western countries replace the customary finger-bowl. Several examples belong to the Clothworkers' Company, including one presented by Samuel Pepys.

Rose Window.

In architecture, a circular window divided into a number of compartments by tracery. Large windows of this type are a feature of the fronts of the great cathedrals; they are

generally filled with stained glass. When the tracery radiates in a more or less definite pattern from the centre, the window is often called a catherine wheel window. See Architecture; Cathedral; York.

Rosewood. Commercial term applied to the dark coloured timber of many distinct species of trees. The American product is from *Dalbergia nigra*, and species of *Machaerium*. Burmese rosewood is *Pterocarpus indicus*; Canary rosewood is the striped wood of a shrub (*Convolvulus scoparius*); Dominica rosewood is *Cordia gerascanthus*; Indian rosewood, *Dalbergia latifolia* and *D. sissooides*; Jamaica rosewood, *Amyris balsamifera*; Moulmein rosewood, *Millethia speciosa*; New South Wales rosewood, *Trichilia glandulosa* and *Disocylon fraserianum*; Queensland rosewood, *Acacia glaucescens*. It is much used in the making of furniture.

Rosherville Gardens. Once popular London pleasure resort. It was formed in a chalk quarry, between Northfleet and Gravesend, on the S. bank of the Thames, and opened in 1837. The attractions included a theatre, dancing platform, a look-out tower with windows of coloured glass, and a restaurant. Advertising made the gardens familiar as "the place to spend a happy day," but their popularity waned. The gardens, named after Jeremiah Roshier, by whom they were established, were sold to an oil company, 1920.

Rosh Hoshanah. Jewish new year's day. It does not correspond regularly with any day of the calendar year, but falls in Sept. or Oct. The actual date of its occurrence is determined by

Rosewater dish and ewer, presented to the Clothworkers' Company by Samuel Pepys, Master, 1677-78

glyphic writing. Hieroglyphs missing from the fractured top were recovered from a Damanhur slab found in 1898, now at Cairo. The text records the priestly decree of Memphis, 196 B.C., in honour of Ptolemy V Epiphanes. See Hieroglyphs.

Rosetti, CONSTANTIN (1816-85). Rumanian poet and statesman. A native of Bukarest, he married in 1845 Marie Grant, an English-

Rose Window. Stained glass window, nearly 41 ft. in diameter, formerly in the façade of Reims Cathedral. It was destroyed during the First Great War

computation from the movements of the sun and the moon. It cannot be celebrated on a Sunday, Wednesday, or Friday, and if any of these days should be found as a result of the computation, the actual celebration is postponed to the following day.

Rosicrucians (Lat. *ros*, dew; or *rosa*, rose; *cruz*, cross). Name given to a secret brotherhood of which much has been written, but little is known. It did not attract wide attention in Europe until the early part of the 17th century, when it arose in Germany, and spread thence to France, and, through the agency in particular of Robert Fludd (*q.v.*), to England. The keystone of the Rosicrucian arch is an idealised form of alchemical philosophy. The sign of the order was a rosy cross, and its name is derived by some authorities from dew (*ros*), regarded as a solvent of gold, and identified with light because the figure of a cross (*cruz*) contains, in various presentations, the three capital letters of the word *lux*=light, or knowledge.

Rosicrucianism, in one form or another, still exists. The Societas Rosicruciana in Anglia has headquarters in London and has published Transactions. France has its Ordre de la Rose-Croix and other bodies claiming knowledge of Hermetic mysteries. In the U.S.A. a

that the kingdoms of grace and nature are governed by the same divine laws; that the world is a great musical instrument, and the "harmony of the spheres" a true thing.

Astrology, magic, and demonology were vaguely taught, and it is said that the initiated claimed the power of seeing and communicating with elementary beings, "children of the elements," invisible to grosser eyes, as well as the possession of the *elixir vitae*. To them, or to ideas associated with them, are attributed Shakespeare's Ariel, the machinery of Pope's Rape of the Lock, Fouqué's Undine, Lytton's

Zanoni and A Strange Story, and Scott's White Lady of Avenel. De Quincey Works, ed. Masson, vol. xiii) suggested that the foundation of Rosicrucianism was laid in a romance by a German theologian, John Valentine Andrea (1586-1654). See Freemasonry; Mystery. Consult The R., Their Rites and Mysteries, Jennings, 4th ed. 1907.

Roskilde. Seaport of Denmark, on the island of Zealand. It stands at the head of Roskilde Fjord, 20 m. by rly. W. of Copenhagen, a

friendly society called the Rosicrucian Order maintains at San Jose, Calif., a museum of Oriental subjects. The doctrines of the Rosicrucians, who were pledged to heal the sick without fee or reward, appear to have included the thesis that fire is the universal means of analysis;

Roslin, Scotland. Ruins of the castle. Top, left, interior of the chapel looking east

junction on the line to Konsör. It has a splendid cathedral, founded in 1074, and rebuilt in the 12th century, containing the tombs of many Danish monarchs. Until devastated by plague and fire, it was the most important town of Denmark, and the capital down to 1443. It gave its name to the treaty, 1658, by which Sweden secured all Danish possessions beyond the Sound. Pop. 23,497.

Roslavl. Town of R.S.F.S.R. It is in the region and 70 m. S.E., of Smolensk, on the Orel-Vitebsk rly. There is considerable trade in grain, skins, fat, and tobacco. Flax and hemp are cultivated in the district. Evacuated during the German advance in 1941, Roslavl was retaken by the Russians on Sept. 25, 1943. Pop. est. 23,000.

Roslin or **ROSSLYN.** Village of Midlothian, Scotland. It stands on the N. Esk, 6 m. S. of Edinburgh, with a rly. station. It has a castle built on the site of a seat of the Sinclair family. The chapel is celebrated for carvings, especially the beautiful prentice pillar; it was built in the 15th century and was the burial place of the lords. Roslin was made a burgh in 1456, but later its importance declined. There are some small manufactures. The place gives the title of earl to the family of St. Clair Erskine. In

1303 there was fighting between the English and the Scots on Roslin Moor. Pop. est. 1,500.

Rosmer, MILTON (b. 1881). British actor. Born at Southport, Nov. 4, 1881, and educated at Manchester grammar school, he made his stage debut in 1899. A leading member of Miss Horniman's company at Manchester, 1910-15, he appeared in London successes after the First Great War, e.g. *St. Joan*, 1924; *Many Waters*, 1929; *Gas Light*, 1939. Other rôles included *Cassius* in *Julius Caesar*, *Helmer* in *A Doll's House*, *Bluntschli* in *Arms and the Man*.

Rosmini-Serbatì, ANTONIO (1797-1855). Italian philosopher and theologian. Born at Rovereto,

March 25, 1797, he studied at Pavia and Padua, became a priest in 1821, and in 1828 founded the Institute of the Brethren of Charity, an

order more generally known as Rosminians. The English centre is S. Etheldreda's, Ely Place, London. For his philosophical views Rosmini was attacked by the Jesuits, for his advanced political and social ideas by the Austrians. Against empiricism and sensualism he propounded a system of idealism, issuing from the thinking self (psychologism). The knowledge of the real is conditioned by the ideas. He died July 1, 1855. His numerous works include *A New Essay on the Origin of Ideas*, 1830, Eng. trans., 3 vols, 1883-84; and *Psychology*, 1846-48, Eng. trans., 3 vols., 1884-88.

Ross. Market town and urban dist. of Herefordshire, England. It stands on the Wye, 12 m. from Hereford, with a rly. station. The

chief buildings are the church of S. Mary the Virgin, a fine old building in the Decorated and Perpendicular styles, and the picturesque market house. The man of Ross, John Kyrle (q.v.), is buried in the church. The town has manufactures of agricultural implements, boots, and flour. Market day, Thurs. Pop. 4,700.

Ross. Famous Scottish earldom. It came into existence about 1164, when a certain Malcolm was made, by King Malcolm IV, earl of the district now represented by Ross-shire. It passed from one lord to another until about 1430, when James I gave it to Alexander Macdonald, lord of the isles. In 1476, the Macdonalds lost it, and in 1481 it was given to James, a younger son of James III. He was made duke of Ross, but after his time the title died out.

Ross, SIR EDWARD DENISON (1871-1940). British orientalist. Born June 6, 1871, he was educated at Marlborough, and London

Sir E. Denison Ross,
British orientalist

university. After studying Oriental languages in Paris and Strasbourg, he visited Asia, and, after five years as professor of Persian at London university, in 1901 became principal of the Madrasah, Calcutta, a post which was combined in 1906 with that of curator of records (government of India). He promoted the study of Tibetan, and assisted in bringing about the cataloguing of the Khuda Baksh library at Bankipur, which contained the finest collection of Persian and Arabic MSS. in the world. In 1914 Ross became assistant in the prints and drawing department

of the British Museum, his section being the art of the East. During the First Great War he became director of the School of Oriental Studies, London university. He was knighted in 1918. In 1940 he was head of the British information bureau at Istanbul, where he died Sept. 20, 1940.

His publications included *A History of the Moguls of Central Asia*, 1898; *The Heart of Asia*, 1899, and contributions to Oriental journals.

Ross, SIR JAMES CLARK (1800-62). British explorer. Born in

Sir James Ross,
British explorer

London, April 15, 1800, he went to sea at the age of 12 and served in the Arctic expeditions of W. E. Parry (q.v.), 1821-27. Member of Booth's expedition of 1829-33, he discovered the magnetic pole in 1831. In 1839 he was given command of an Antarctic expedition with the *Erebus* and *Terror* vessels, discovering Victoria Land and Mt. Erebus, and reporting that the South Pole was unattainable. Knighted on his return, 1843, he published *A Voyage of Discovery in the Southern and Antarctic Seas*, 1847. He died April 3, 1862.

Ross, SIR JOHN (1777-1856). British explorer. Born June 24, 1777, he entered the navy when a

boy. In command of the *Isabella*, he was sent in 1818 to discover the north-west passage, but after passing Baffin Bay he returned. In 1829 he commanded the *Victory*, a

paddle steamer, on a similar voyage. After three years spent in the ice amid great hardships, he was picked up by a whaler and returned home. Ross was knighted for his services, and in 1851 was promoted rear-admiral, having taken part in a search for Franklin in the previous year. He died Aug. 30, 1856.

Ross, MARTIN. Pseudonym of Violet Florence Martin (d. 1915), Irish novelist. Educated at Alexandra College,

Martin Ross,

cousin Edith Oenone Somerville (q.v.). She died Dec. 21, 1915.

Ross, Sir Ronald (1857-1932). British physician and poet. Born May 13, 1857, he entered the

Sir Ronald Ross,
British physician
Elliott & Fry

Indian Medical Service in 1881. He investigated the connexion of mosquitoes and blood parasites during 1897-98, and in the course of an expedition to W. Africa in 1899 confirmed his findings as to the transmission of such parasites (see Malaria). For this work he received the Nobel prize for medicine in 1902. Throughout the First Great War he was War office consultant on malarial problems, and later became director of the Ross institute and hospital for tropical diseases at Putney. He was knighted in 1911, and died Sept. 16, 1932.

A poet of distinction and writer of romance, he wrote *Poems*, 1928; *The Revels of Osera*, 1930; *Lyra Modulata*, 1931. His memoirs appeared in 1923, and a biography by R. L. Méroz in 1931.

Ross, Sir (William) David (b. 1877). British scholar. He was born April 15, 1877, and educated at Edinburgh high school and university, and at Balliol College, Oxford. He held various posts at Oxford, becoming in 1923 professor of moral philosophy there. He also served on many government commissions, being chairman of the royal commission on the press which was appointed in 1947. Provost of Oriel from 1929 to 1947, vice-chancellor of Oxford, 1941-44. He wrote many books on philosophy, and was editor of the extensive translation of Aristotle's works sponsored by Oxford university and published during 1908-31.

Rossa, O'Donovan (1831-1915). Irish Fenian leader. Born at Ross-carbery, co. Cork, his real name was Jeremiah O'Donovan, and he early became connected with the Fenian brotherhood. Sentenced to 20 years' penal servitude for treason-felony in 1865, he was elected M.P. for Tipperary, 1869, and was released conditionally in 1871. He then resided in the U.S.A. and opened a fund for the support of dynamite outrages. He visited England in 1894, and attempted to address the house of commons. Expelled from the

Fenian brotherhood in 1886, he had little political influence in later days, and died in New York, June 29, 1915.

Rossall School. An English public school. It stands on the seashore at Rossall, Lancs, 3 m. S. of Fleetwood, the nearest rly. station, the school grounds having a frontage of $\frac{1}{2}$ m. Founded in 1844 as the North Church of England school, Rossall was incorporated in 1890. There are about 500 boys, accommodated in eight houses; there is also a separate preparatory school. The school chapel, enlarged after the First Great War, contains a carved reredos by Eric Gill.

Ross and Cromarty. County of Scotland. One of the largest in the country, its area being 3,089 sq. m., it consists of the two originally separate counties of Ross and Cromarty, which were united in 1889. It has a long, irregular coast-line, pierced by Dornock Firth, Cromarty Firth, and Beaulie Firth on the E., and by Lochs Broom, Ewe, Torridon, Carron, and Alsh, and the Gairloch on the W. It includes parts of Lewis and several of the smaller islands of the Hebrides.

The surface is very mountainous, the highest peak being Carn Eige (3,877 ft.), Mam Soul (3,862 ft.), Ben Wyvis, Ben Attow, and several others, all over 3,000 ft. Of the rivers the chief are the Orrin, the Oyckell, separating it

Rossall School. Main gateway and school buildings

from Sutherlandshire, and the Conon. Lochs are Maree, Fannich, Luichart, Glass, and many others. Most of the surface has been given up to deer forests; sheep and cattle are reared; the fisheries are valuable, and game is abundant. Dingwall is the county town, others being Stornoway, Tain, Cromarty, Fortrose, Invergordon, and Strathpeffer.

Ross and Cromarty originated as two earldoms, having previously been included in the province of Moray. Ross was made a county in 1661, and Cromarty in 1685. The latter consisted of detached pieces of territory scattered

Ross and Cromarty. Map of the large Scottish county. Inset, part of Lewis and smaller islands of the Hebrides included in the county

throughout Ross-shire, a fact which made their union desirable. One member is returned to parliament. Pop. 60,700.

Rossano. City of S. Italy, in the prov. of Cosenza. It is 28 m. N.E. of Cosenza near the Gulf of Taranto. A well-built walled city, it contains an old castle, a Byzantine cathedral, and a library with a valuable MS. of the Gospels, which escaped damage during the Second Great War. Silk, olive oil, marble, and alabaster are the chief products. Pop. est. 16,000.

Rosbach, BATTLE OF. Battle of the Seven Years' War. In it Frederick II inflicted decisive defeat on the German and French forces, Nov. 5, 1757. Rosbach is a small village of eastern Germany, 22 m. W.S.W. of Leipzig. The allied troops crossed the Saale with a view to attacking Leipzig, and took up a strong defensive position on the left bank.

Soubise attempted to outflank Frederick, who, making a feint of retreat, drew the allies from their strong position, and suddenly attacked. Within two hours the allied armies were completely scattered, the Germans retreating into Bavaria, and Soubise making northward. See Frederick II; Seven Years' War.

Rosberg. Mountain of Switzerland. In the cantons Zug and Schwyz, between the lakes of Zug, Lowerz, and Aegeri, its highest

1588 by Elizabeth to Sir Valentine Browne. In 1652 it was captured by Cromwell's soldiers. It was while visiting here that Tennyson wrote part of *The Princess*. See Killarney, Lakes of.

Rosse, WILLIAM PARSONS, 3RD EARL OF (1800-67). British astronomer. Born at York, June 17, 1800, he was educated at Trinity College, Dublin, and Magdalen College, Oxford. From 1821 to 1832 he represented King's County in parliament, resigning in the

latter year in order to devote himself to astronomical pursuits. He greatly improved the technique of casting speculum mirrors, and with a 6-ft. reflector, first mounted in 1845, made many valuable observations of nebulae and star clusters, and announced the discovery of spiral nebulae. He was president of the Royal Society 1849-54. He died Oct. 31, 1867.

The earldom dates from 1806, when it was bestowed upon an Irish baron. The family seat is Birr Castle, near Parsonstown, and the earl's eldest son is called Lord Oxmantown. In 1918 Laurence Michael Harvey Parsons (b. Sept. 26, 1906) became the 6th earl.

Rosselli, Cosimo (1439-1507). Italian painter. Born at Florence, he studied under Neri de Bicci, worked at Rome, where he was employed on the decoration of the Sistine Chapel, and at Florence, where his masterpiece is a fresco in S. Ambrogio. Piero di Cosimo and Fra Bartol-

ommeo were his pupils. He died at Florence.

Rossellino, BERNARDO (c. 1409-64). Italian sculptor and architect. Born at Settignano, he worked chiefly at Florence. One may cite among his sculptures the Beata Villana tomb in S. Maria Novella, Florence, and the mausoleum of Leonardo Bruzzi, of Arezzo, in Santa Croce. He built the Vatican for Pope Nicholas V, reconstructed churches in Rome, and executed important works at Sienna, Spoleto, and Pienza. He died at Florence.

Rossetti, CHRISTINA GEORGINA (1830-94). British poet. She was born in London, Dec. 5, 1830, and delicate in health from the age of 15. On the threshold of womanhood an unfortunate love affair made a deep impression on her mind, and helped to give to her writing its note of sadness.

She was a keen observer of nature. Her first poetry was written in 1842, and much of the best of it was the work of her earlier years. Her knowledge and affection for country scenes was gained from visits in childhood to Holmer Green, near Little Missenden, Bucks. As published, her works include *Verses*, privately printed 1847; *Goblin Market and Other Poems*, 1862; *The Prince's Progress and Other Poems*, 1866; *Singsong*, a book of nursery rhymes, 1872; *A Pageant and Other Poems*, 1881; *Verses*, 1893; *New Poems*, 1896. She also wrote some short stories and devotional prose, notably *Time*

3rd Earl of Rosse, British astronomer

Christina G. Rossetti

After D. G. Rossetti

Flies, 1885. Her death took place, after a long and painful illness, Dec. 29, 1894, and she was buried in Highgate cemetery. A memorial reredos-painting, designed by Burne-Jones and executed by T. M. Rooke, was afterwards placed in Christ Church, Woburn Square.

In English literature Christina Rossetti takes her place with Herbert, Crashaw, and Vaughan, and as a poet of the Oxford Movement, with Keble and Newman. While death, the grave, and renunciation are constantly her themes, and some of her lyrics, e.g. the poem beginning "When I am dead, my dearest," are poignant in their sadness, none of them is morbid or gloomy, and flashes of lambent

Rosberg, Switzerland. Village of Arth at the foot of the mountain Frith

point is Wildspitz, 5,190 ft. A road leads to the summit from Unter-Aegeri, a bridle path from Steinerberg, and a footpath from Sattel station on the Rothenthurm line. From it descended the landslide of 1806, a disaster which buried four villages and 457 people.

Ross Castle. Ancient tower or keep on Ross Island, Killarney, Eire. Built in the late 14th century, a stronghold of O'Donoghue Ross, head of clan under MacCarthy More, it was granted in

fancy recall a spirit that bore physical and mental trial with steady fortitude and abiding cheerfulness. Dr. Richard Garnett justly compared the imaginative quality of *Goblin Market* with *The Ancient Mariner*, and declared its insight Shakespearean. With *Goblin Market* may be recalled *The Prince's Progress*, *Monna Innominata*: a Sonnet of Sonnets, *Amor Mundi*, *Vanity of Vanities*, *Looking Forward*, and *The Convent Threshold*. (Christina Rossetti's work, remarkable for its simplicity, purity, and flexibility, possesses qualities that must always appeal to the sorrowful and afflicted. See *Poetical Works of C.R.*, with *Memoir and Notes*, W. M. Rossetti, 1904; *Lives*, Proctor, 1896; *Mackenzie Bell*, 1898; *Stuart*, 1930; *Sanders*, 1930; *The Family Letters of C.R.*, ed. W. M. Rossetti, 1908.

Rossetti, DANTE GABRIEL (1828-82). British poet and painter, whose full name was Gabriel Charles Dante Rossetti. Born at Charlotte Street, Portland Place, London, May 12, 1828, he was the eldest son of Gabriele and Frances Mary Rossetti, refugees from Naples. His father was professor of Italian at King's College, London, at the school attached to which Dante Rossetti was educated. He studied drawing under J. S. Cotman, and entered Cary's Academy in Bloomsbury, 1842, and the R.A. schools, 1846. His literary power developed in advance of his painting; *The Blessed Damozel* and several sonnets were composed about 1847. In 1848, however, he became the pupil of Ford Madox Brown, a step which led to his acquaintance with Holman Hunt and Millais, and incidentally to the formation of the Pre-Raphaelite Brotherhood. About 1852 he became engaged to Elizabeth Eleanor Siddal, the model for his *Beatrices* and of Millais's *Ophelia*. In 1855 he made the acquaintance of William Morris and Burne-Jones, and two years later took a leading part in the decoration of the Oxford Union, contributing *The Vision of Lancelot*. In 1860 he married Miss Siddal, but she died in 1862, and in 1867 his own health began to give way. He increased his nervous malady with doses of chloral, and, after an attempt to poison

himself with laudanum, 1872, and going through a severe illness in 1877, he was seized with partial paralysis in 1881, and died at Birchington, April 9, 1882.

Rossetti ranks higher as a poet than as a painter; the technicalities of the latter art presented difficulties which he evaded rather than grappled with. But inasmuch as his painting is the vehicle for the expression of his sensuous emotions, he is the true if not perfect artist in this, as in his other sphere of activity. His best known pictures are: *Ecce Ancilla Domini*, 1850 (Tate Gallery); *Meeting of Dante and Beatrice*, 1851; *The*

Self-portrait

Annunciation, 1855; *My Lady Greensleeves*, 1858; *Beata Beatrice*, 1863; *The Beloved*, *Monna Vanna*, and *Sibylla Palmifera*, 1866; *Pandora*, 1871; *The Blessed Damozel*, 1874; *Fiammetta*, 1878; and *Dante's Dream*, 1881 (Walker Art Gallery, Liverpool). Conspicuous among his writings are his translations of Early Italian Poets, published with Ruskin's financial help in 1861, and the two volumes of *Ballads and Sonnets*, issued in 1870 and 1880. See *Pre-Raphaelites*.

Rossetti, WILLIAM MICHAEL (1829-1919). British man of letters. Born Sept. 15, 1829, the

second son of Gabriele Rossetti and brother of Dante Gabriel and Christina, he was educated at a private school and at King's College, London, becoming a clerk in the civil service in 1844. In 1869 he became assistant secretary of inland revenue, and he retired in

W. M. Rossetti, British man of letters
Russell

the artistic and literary tastes which he shared with his brother and sisters. He was a member of the original Pre-Raphaelite Brotherhood, recording in his diary its proceedings, and editing *The Germ* (q.v.). His translation of *Dante's Hell*, 1865, was closely followed by *Fine Art*, Chiefly Contemporary, 1867; he wrote a *Life of Keats*, 1887, edited Chaucer and Shelley, William Blake and John Ruskin; wrote on the Pre-Raphaelites, and contributed on art to *The Critic* and *The Spectator*.

Rossetti's copious work, both as editor and memorialist, on his own family, including a *Memoir of his brother*, 1895, and a reprint of his father's autobiography, is illuminating. He died Feb. 5, 1919.

Rossi, FRANCESCO DEI (1510-63). Italian painter, known as Il Salviati. Born at Florence, he studied under Andrea del Sarto and Baccio Bandinelli. He worked at Rome for Cardinal Salviati, his principal patron; at Venice, Florence, and in France, at the château of Fontainebleau. An erratic and reckless disposition prevented his taking advantage of great opportunities. He died of fever at Rome. Two examples of his work are to be seen in the National Gallery, London.

Rossi, GIOVANNI BATTISTA DEI (1494-1541). Italian painter, commonly known as Il Rosso, and Maître Roux. Born at Florence, he evolved an inventive and original style from the study of Michelangelo and Parmigiano. From Florence he went to Rome, where he had a good reputation. When the town was sacked in 1527, he escaped to Volterra, then made his way to France, where he designed the great gallery at the château of Fontainebleau, and painted a series of frescoes illustrative of the life of Francis I. A charge of theft which in a hasty moment he brought against his friend Pellegrini led to the latter being put to the torture before

Elizabeth Rossetti
After D. G. Rossetti

being declared innocent, and this event so preyed upon Rossi's mind that he committed suicide.

Rossi, LUIGI DE (b. c. 1600). Italian composer. He was born in Naples. His opera *Le Mariage d'Orphée et d'Euridice*, 1647, was the first Italian opera given in Paris.

Rossi, COUNT PELLEGRINO LUIGI EDOARDO (1787-1848). Italian economist and statesman. Born at Carrara, July 13, 1787, he was educated at Pavia and Bologna. In 1815 he supported Murat, and on the latter's fall went to Geneva where he lectured on Roman law. He was made a citizen of Geneva because of his services to jurisprudence. Later he went to France, where he became professor of political economy at the Collège de France, 1833. Naturalised a Frenchman in 1834, he was made a peer in 1839, and became doyen of the faculty of law in Paris in 1843. Ambassador of France to Rome during 1845-48, he then became minister of the interior under Pius IX, but was assassinated Nov. 15, 1848, because of his opposition to union with Savoy.

Ross Ice Shelf. The largest of the Antarctic ice-shelves. It is roughly triangular in shape with its base on the 400-mile long Ross ice barrier which stretches from Marie Byrd Land to South Victoria Land in about 77° S., and its apex at Thorne Glacier, some 180 miles from the S. pole; its area is estimated at 160,000 sq. m. Having a comparatively smooth surface, it formed the most convenient road of approach for expeditions aiming to reach the South pole overland, and this route was used by Amundsen, Scott, Shackleton, and Byrd. Together with the Ross ice barrier it is sometimes known as the Great Ice Barrier. *See* Antarctic Exploration; Ice-shelf; Ross Sea.

Rossignol. Lake on E. half of the peninsula of Nova Scotia, Canada. The largest lake (21 m. by 8 m.) in the prov., it drains by the Liverpool river to the Atlantic.

Rossini, GIOACHINO ANTONIO (1792-1868). Italian composer. Born at Pescara, Feb. 29, 1792, he

studied composition and cello playing at Bologna, 1807, and produced his first opera, *La Camicia di Matrimonio*, 1810. His success was instant, and several light pieces followed, Tancred being produced at Venice in 1813. The Barber of Seville appeared at Rome, 1816, and became universally popular. Rossini composed twenty operas between 1815-23, these including *Otello*, 1816, *La Gazza Ladra*, 1817, *La Donna del Lago*, 1819, and *Semiramide*, 1823, as well as several cantatas, visited England, 1823, and settled for a time in Paris, where *William Tell*, his last opera, was produced in 1829. His famous *Stabat Mater* was written in 1832 and 1841, and first sung as a whole in 1842. After living in Bologna and Florence, 1837-55, he settled in Paris, but wrote little save church music and piano-pieces, dying Nov. 13, 1868.

Rossini had a great gift of flowing melody, and his work is highly characteristic of the Italian tradition. There is much that is turgid and cloying in his writing, but the best of it, such as *The Barber of Seville*, has unfailing freshness and charm. *See* Opera. *Consult* Rossini and *Some Forgotten Nightingales*, Lord Derwent, 1934; Rossini, F. Toye, 1934. *Prom. Rossee-nee*.

Rossland. Town of British Columbia, Canada. In the Kootenay dist., it is only 6 m. from the U.S. boundary and is served by the C.P.R. It is a centre of the W. Kootenay mining district, and was made a town in 1897. Pop. 3,890.

Rosslare. Seaport of co. Wexford, Eire. It is 6 m. from Wexford, and is served by the Eire state rlys. From its settlement by King John in 1210 to the founding

of the Irish Free State in 1921 successive rebellions against English authority occurred in the neighbourhood. Formerly only a fishing village and a coastguard station, with an old church, it came into use as a port in 1906, when the harbour was reconstructed to serve as a terminus for the route from Fishguard which was opened by the G.W. rly. in connexion with the then G.S. & W. line. Pop. 670.

Rosslyn, EARL OF. Scottish title borne by the family of Erskine. In 1801 the lawyer, Alexander Wedderburn (v.i.) was made earl of Rosslyn, a title which passed on his death, in 1805, to his nephew, James St. Clare Erskine (1762-1837), son of Sir Henry Erskine, Bart. He was an M.P., 1782-1805, and was a Tory minister under Wellington and Peel, being lord privy seal, 1829-30, and lord president of the council, 1834-35. His descendant, Anthony Hugh Francis (b. May 18, 1917) became the 6th earl in 1939. The earl's eldest son is known as Lord Loughborough. *See* Roslin.

Rosslyn, ALEXANDER WEDDERBURN, 1ST EARL OF (1733-1805). British judge, better known as Lord Loughborough. Born in Edinburgh, Feb. 13, 1733, the son of a Scottish lord of session, he was educated at Dalkeith and Edinburgh university. He became a

1st Earl of Rosslyn,
British judge
After Reynolds

Scottish advocate in 1754, but was called to the English bar at the Inner Temple, 1757. He was M.P. for Ayr burghs, 1761, and for Richmond, Yorks, 1768, and then joining the Whigs, sat for Bishop's Castle, 1769-74 and 1778-80. After violently attacking Lord North, he suddenly returned to the Tory party. He was made solicitor-general, 1771, attorney-general, 1778, chief justice of the court of common pleas and Baron Loughborough, 1780, and lord chancellor, 1793-1801, being on his resignation created earl of Rosslyn. He died Jan. 2, 1805, near Windsor, and was buried in S. Paul's Cathedral. An unscrupulous time-server, he punished seditious sympathisers with the French Revolution with great rigour.

Ross Sea. Part of the Arctic Ocean, lying between South Victoria Land and King Edward VII Land. It contains Ross Island,

Rosslare, Eire. Harbour and quays for the railway steamboat service from Fishguard, Pembrokeshire

and is blocked to the S. by the Ross Ice Shelf (*g.v.*). During summer it is usually free from ice, and thus formed a convenient entrance for the explorers of Antarctica. Scott and Amundsen both used its S. shore as a base. Sir J. C. Ross, when he led the expedition of the Erebus and Terror to the Antarctic in 1839-43, reached lat. 78° 10' S. Its coasts, with adjacent islands and territories, were annexed to New Zealand in 1923. See Antarctic Exploration.

Rostand, EDMOND (1868-1918). French poet and dramatist. Born at Marseilles, April 1, 1868, his

Edmond Rostand,
French poet

earliest play, *Le Gant Rouge*, was a failure, but in 1894 *Les Romanesques*, produced in England as *The Fantasticks*, made it clear that a writer had arisen who might restore the poetic drama to the French stage; the possibility seemed assured with the success of *La Princesse Lointaine* in 1895. In 1897 came Rostand's great triumph with *Cyrano de Bergerac*, which gave the author a world-wide success. *L'Aiglon* followed in 1900, and in 1901 the author was elected to the French Academy. In 1910 came, after various delays, *Le Chanteur*, the characters of which were the cock and other inhabitants of the farmyard. *Les Musardises*, a collection of his early poems, was pub. in 1911. Rostand died in Paris, Dec. 2, 1918. See *Bergerac*, *Cyrano de Bergerac*, *Edmond Rostand*, *J. Haraszti*, 1913; *Le Théâtre d'Edmond Rostand*, J. Suberville, 1919; *La Vie Profonde d'Edmond Rostand*, P. Apesteegny, 1929.

Rostock. City of E. Germany, in the *Land*, former free state, earlier grand duchy, of Mecklenburg. On the left bank of the navigable R. Warnow, which leads 6 m. N. to the port and seaside resort of Warnemünde (incorporated with the city) on the Baltic, Rostock contained monuments of outstanding historic importance. Among its churches were those of S. Mary (13th-15th centuries); S. Nicolas (early 14th century); S. Peter (early 15th century) with a tower 402 ft. high, and S. James's (15th century). The Gothic town hall dated from the 14th century and had an annex in the Baroque style. The university, oldest in N. Germany, was founded in 1419, and

contained a library of more than 500,000 vols. There were several museums, a teachers' academy, schools, and colleges. It was the birthplace of Blücher.

Of considerable importance industrially, the commercial area contained the Neptun shipyards, the Heinkel aircraft works, engineering and chemical factories. The port received and dispatched between 1,100 and 1,200 ships annually. Rostock was also a naval base, an important rly. junction, and an airport.

Originally a Wendish settlement, destroyed by the Danes in 1160, the city obtained urban rights in 1218. It fell to the Mecklenburg dynasty in 1352, was a leading member of the Hanseatic league in the 14th century, and later was frequently the residence of the dukes, though in conflict with them for centuries. Pop. (1950) 120,000.

By reason of its military and industrial significance, it was a target for air attack during the Second Great War, the R.A.F. bombing it on four consecutive nights, April 23-26, 1942, in the heaviest raids to that date. Rostock and Warnemünde were captured May 2, 1945, by Rokossovsky's 2nd White Russian army and lay after Germany's surrender in the Russian zone of occupation.

Rostopchine, FREDOR VASILIEVITCH, COUNT (1763-1826). Russian soldier. He was born March 23, 1763, and entered the army. After holding various military and civil offices, and winning the favour of Paul I, he was appointed in 1812 governor-general of Moscow, in which capacity he was publicly charged with having set fire to the city when the French occupied it. In 1823 he issued a vindication of himself entitled *The Truth About the Burning of Moscow*, but afterwards recanted a good deal of his denial. He attended the congress of Vienna, but soon retired. He died in Moscow, Feb. 12, 1826.

Rostov. Town of the R.S.F.S.R., in Yaroslav region. It lies 35 m. S.W. of Yaroslav, on Lake Rostov or Nero, and the Moscow-Yaroslav rly. It is also known as Rostov Velikiy or Great Rostov. One of

Rostock, Germany. University buildings with statue of Blücher in the foreground. Photographed before the destructive air raids in 1942

the most ancient of Russian towns, it was founded by the Slavs about 862, and is famous for its antiquities, chief of which are the Kremlin, and the Uspenski cathedral. It was formerly noted for the manufacture of ikons. Under the Soviet regime it developed rapidly; its industries include drying of vegetables, preparation of coffee and chicory, and flour milling. It was beyond the area invaded by Germany in the Second Great War.

Rostov-on-Don. City and port of Azov Black Sea area, R.S.F.S.R. It lies E. of the sea of Azov at the head of the Don delta. Before the Second Great War it was a centre of the grain trade, exporting wheat, rye, and barley, as well as wool, and an industrial centre with ship-building yards, its industries including heavy engineering and the making of agricultural machinery; there were extensive flour mills, iron works, tobacco, boot and shoe, zinc, and dyeing factories. Linked by rly. with the Volga and the Caspian Sea, it was an important junction, and in 1939 was the tenth city of the U.S.S.R. Pop. (1939) 510,253.

During the Second Great War it was the scene of violent fighting. German forces broke into the city, Nov. 22, 1941, when house-to-house fighting ensued. The Russians withdrew, leaving nothing of value; Timoshenko delivered a counter-attack that regained the city Nov. 28. The German retreat from Rostov was Hitler's first major reverse. After savage fighting the city was again evacuated by the Russians, July 27, 1942, during the German drive to the Volga and Caucasia. The battered shell of the city was recovered after several days' house and street fighting which terminated on Feb. 14, 1943, Cossack Guards completing its liberation.

Rostrum. In modern usage, any raised platform from which a speaker addresses an audience.

Rostrum. Reconstruction of the rostrum in the Forum of ancient Rome

In ancient Rome, only in the plural form, *rostra*, the word was used to indicate the tribunal or platform in the Forum. From it magistrates addressed the assembly of the people. It was so named because it was ornamented with the beaks or rams (*rostra*) of ships captured from the enemy in naval battles. See Forum; Rome.

Rosyth. British naval base on the firth of Forth 11 m. N.W. of Edinburgh, Scotland. Construction of Rosyth began in 1909 and was completed in 1916. The main basin, covering an area of 55 acres, is enclosed by a sea wall and entered through a lock. The largest warships can pass in and out at all states of the tide. There are three dry docks, and workshops, stores, and fuel installations for the repair and maintenance of all classes of warships. A garden city was built to house the civilian workers. In the First Great War Rosyth was the chief British naval base on the E. coast and the h.q. of the cruiser squadrons.

In 1925 Rosyth was reduced to a care and maintenance basis, but was reopened in 1939 to meet operational requirements of the Second Great War. It was the main port of assembly for the Norwegian expedition, April, 1940, when more than 1,200 vessels were armed and supplied with stores and equipment. All battle-ships of the King George V class and many fleet aircraft carriers completed their fitting-out there.

Rotary International. Movement among business men which takes for its motto "Service, not

self." The idea originated with Paul Harris, a Chicago lawyer, who in 1905 sought to establish a little club of men, each representing a different trade or profession,

for the interchange of opinion on business and other matters. Religion and politics were excluded from discussion.

The first Rotary Club was a uncheon club, but in a few years the number of Rotary Clubs was 200, and in 1911 the institution took root in Great Britain. Rotarians gradually evolved an ethic of their own, founded on their motto, "Service, not self," and are establishing a kind of modern Freemasonry, without its formalities and secrecy.

Rotarians, as they are called, hold a convention every year. The international headquarters are in Chicago. The governing body in the U.K. formerly called the British Association of Rotary Clubs, is now the Rotary International in Britain and Ireland, and has offices at Tavistock House, London, W.C.1.

Roten Turm. Shattered tower on the roadway through the pass in the Transylvanian Alps

Rotation. Action of moving round a centre or of turning round an axis. The axis round which a body revolves is called the instantaneous axis of rotation. Rotation may also be defined as the change of direction of a vector (*q.r.*). For the rotation of a bullet when fired from a rifled barrel see Ammunition. In plants the flowing of protoplasm within the cell wall is called rotation. Any return or succession in a series is also called a rotation, e.g. rotation of the seasons.

Rotation of Crops. Term used in agriculture for the system by which selected crops are grown in sequence on any one field. Its primary aim is to prevent the excessive drain on particular mineral nutrients in the soil which occurs when one kind of plant is grown on the same piece of land year after year. Since different plants tend to denude the soil of different nutrients, intervals between crops of similar plants allow time for the soil to undergo a natural process of recovery. Leguminous plants are valuable in a rotation since the bacteria in their

root nodules fix atmospheric nitrogen, and when the residues are ploughed in nitrogen content is increased. Shallow-rooted plants, such as barley, often follow deep-rooted ones, such as mangold, so that different layers of the soil are utilised. Crops used for human food usually alternate with those used as cattle food, so that ample manure is made available. Plants liable to attack by the same pests are separated in the sequence in order to reduce the likelihood of attack, and crops which can be weeded are intercalated among those which cannot. Farming operations necessary for various crops differ and are carried out at different seasons; rotation thus facilitates spreading the work over the year. See Ley Farming.

Roten Turm OR **ROTER TURM.** Pass in the Transylvanian Alps. It is 17 m. S. of Sibiu (Hermann-

stadt). The river Oltu has cut its way from S. Transylvania through the mountains, which are the S. section of the Carpathians, to the plains of Wallachia. The rly. follows the river gap, which is overlooked by the peak Negoi, 8,320 ft., to the E. The road follows easier but more elevated ground W. of the gap. The square Red Tower, from which the pass takes its name, was built in 1533 at the S. end. See Carpathians; Rumania: Conquest of.

Rotha, PAUL (b. 1907). British film director and writer. Born June 3, 1907, and educated at Highgate, and the Slade school, he became art critic to The Connoisseur during 1927-28, and during the 1930s directed documentary films for the Empire Marketing Board, Shell-Mex, and important industrial concerns. He formed his own companies in 1941 and 1944. He made such noteworthy films as The Face of Britain, The World is Rich, Land of Promise, A City Speaks, Today We Live, The Fourth Estate. He wrote much on film

Rotary International badge

technique and the history of the cinema, his books including *The Film Till Now*, 1930; *The Film Today*, 1931; *Documentary Film*, 1935; *Movie Parade*, 1936.

Rothamsted. Pioneer agricultural experimental station, near Harpenden, Herts. It was founded

Rothenburg, Bavaria. Siebersturm, a gate in the old city wall

by John Bennet Lawes (*q.v.*) in 1843, and endowed by him in 1889. With him from the first was associated Joseph Henry Gilbert (*q.v.*), and the two worked together until the death of Lawes in 1900. From the date of foundation until the present time a continuous series of most important researches has been carried out on the 500-acre Rothamsted estate and in the attached laboratories.

The personal experimental work of Lawes began when he succeeded to the estate in 1834, and led to the discovery of superphosphate. Wheat has been grown continuously on the Broadbalk field from 1843, and experiments have been made on different manures, including the question of loss in drainage water. It has been proved that this deep-rooted crop needs less manure than some others, and is particularly benefited by the action of nitrate of soda. Similar experiments have been carried out on barley, oats, root crops, etc. The classical experiments provided a broad basis for the effective use of fertilisers. Later came long-period experiments on rotation of crops, soil husbandry, and plant diseases. Consult the station's annual reports.

Rothbury. Urban district and market town of Northumberland, England. It stands on the Coquet 11 m. by rly. S.W. of Alnwick. Situated amid wild moorland scenery, it attracts many visitors. All Saints church is an old cruciform building restored. Rothbury has been in the possession of the Percys for 600 years. Near is Craggside, the residence erected

by the 1st Lord Armstrong. Market day, Mon. (alternate). Pop. 1,255.

Rothenburg. Name of several German towns, the most famous of which is Rothenburg ob der Tauber, 40 m. W. of Nuremberg. It is known all over the world as a perfectly preserved medieval town. It is situated on a height above the Tauber, 1,312 ft. above sea-level, and is surrounded by a wall built in the 14th and 15th centuries. There are a number of 16th century houses, and many fine churches, notably that of S. James (1393-1598) and that of

S. John (1393-1403). The town hall, which is richly decorated, is part Gothic, part Renaissance (13th and 16th century). There is a small spa, and some local industry. Known from the 10th century, Rothenburg became a town, 1172, was independent c. 1400, and was eventually incorporated in Bavaria in 1802. Overrun by U.S. forces in April, 1945, during the Second Great War, it escaped serious damage; after Germany's surrender it was in the U.S. zone of occupation. Pop. (1950) 11,200.

Rotenone. Colourless crystalline substance, formerly known as tubatoxin, contained to the extent of up to 10 p.c. in the Malayan plant *Derris elliptica*, but is probably present in other species of the genus. Rotenone, which is almost insoluble in water but soluble in some organic solvents, has been made synthetically. It is used as an insecticide, being extremely poisonous to insects, but only slightly toxic to mammals. The original use of derris root was as the source of a fish poison used by natives in the tropics. See *Derris*.

Rothenstein, JOHN KNEWSTUB MAURICE (b. 1901). British art director and writer. Son of Sir W. Rothenstein (*v.i.*), he was born July 10, 1901, and educated at Bedales school, Worcester College, Oxford, and London university. Assistant professor of art history at Kentucky university, U.S.A., 1927-28, and at Pittsburgh, 1928-29, he was director of the art galleries of Leeds, 1932-34, and Sheffield, 1932-38, after which he was, appointed director of the Tate

Gallery. His publications included *The Portrait Drawings of William*

John Rothenstein, British art director

Rothenstein, 1926; *19th Century Painting*, 1932; *Foreign Pictures in the Tate Gallery*, 1947. He wrote also biographies and critical appreciations of Conder, 1938; Augustus John, 1944; Edward Burra, 1945; and Manet, 1945, and edited the Phaidon edition of *British Artists*. He contributed to this Encyclopedia the entry on *Contemporary Painting*.

Rothenstein, SIR WILLIAM (1872-1945). British artist and art teacher. Born of Jewish stock at Bradford, Yorks, Jan. 29, 1872, he was educated at Bradford grammar school, and studied art at the Slade school under Legros, and in Paris under Constant. He became acquainted with most of the celebrated painters and writers of the day, and made his reputation as a painter with *The Doll's House*, now in the Tate Gallery. A notable series of Jewish studies was begun in 1904 with *The Talmud School* (1904), culminating in *Jews Mourning in the Synagogue* (1906). But he was chiefly famous for his many portraits, in pencil and chalk, of celebrities over a period of 50 years, which made him the Holbein of his time. These were not only examples of strong, sound draughtsmanship but an invaluable record. Thirty of the drawings were purchased for the National Portrait Gallery in 1935. During the Second Great War he drew over 200 portraits of airmen, exhibited in London in 1942.

Sir W. Rothenstein, British artist Russell

Rothenstein was professor of civic art at Sheffield University, 1917-26; principal of the Royal College of Art, 1920-35; Romanes lecturer, Oxford university, 1934. During 1931-38 he was a member of the Royal Fine Arts commission. Knighted in 1931, he published three vols. of *Memoirs*, 1931, 1932, and 1939. Other published volumes included *Twelve Portraits*, 1929; *Twenty-Four Portrait Drawings*, 1937. He died Feb. 14, 1945.

A description of Rothenstein as a young man is included in Max Beerbohm's *Seven Men*.

Rotherham. County and mun. borough and market town of the W. Riding of Yorks, England. It stands at the junction of the Rother and Don, 6 m. by rly. N.W. of Sheffield. The chief buildings are the fine cruciform church of All Saints, a Perpendicular edifice of

the 15th century, town hall, grammar school, etc. The main industries are ironworks, brassworks, and the like; there are also sawmills, works for making glass and chemicals, and it is a railway centre. On the old bridge across the Don are the remains of a chapel. In A.D. 54 the Romans built a bridge here. Rotherham existed in Anglo-Saxon times, but did not become a corporate town until

was a native; and Swift made it the birthplace of Lemuel Gulliver. Here the Fighting Téméraire was broken up in 1838. Jacob's Island was the scene of Bill Sikes's death in Dickens's *Oliver Twist*. See *Bermondsey*; *London*.

Rothermere OF HEMSTED, HAROLD SIDNEY HARMSWORTH, 1st Viscount (1868-1940). British newspaper owner. He was born at Hampstead, London, April 26, 1868. The younger brother of Viscount Northcliffe (*q.v.*), he entered his brother's publishing business at the age of 21, and was thenceforth for many years intimately associated in his great successes, founding with him the Amalgamated Press, reorganizing the London Evening News, and establishing the Daily Mail, the Daily Mirror, and the Anglo-Newfoundland Development Co.

In 1910 he founded and endowed with £20,000 a professorship of English Literature at Cambridge university in memory of King Edward VII. That same year he was created a baronet. He was raised to the peerage as Baron Rothermere in 1914, and in that year acquired from his brother sole control of the Daily Mirror. In 1915 he founded the Sunday Pictorial (*q.v.*), in 1922 acquired the Daily Mail, which he had relinquished in 1910, and in 1923 most of the publications of Sir E. Hulton, which were later sold to Lords Camrose and Kemsley.

He held government office in the First Great War, becoming in 1917 air minister, at Mr. Lloyd George's invitation, for the purpose of amalgamating the Royal Flying Corps and the Royal Naval Air Service. He resigned in 1918 as the result of ill-health, receiving a viscounty in 1919. After the war he conducted an energetic campaign in his newspapers for economy, writing many articles himself.

He died in Bermuda, Nov. 26, 1940, and was succeeded by his third son, Esmond Cecil (b. May 26, 1898), whose two elder brothers had been killed in the First Great War. The 2nd viscount was educated at Eton, and was M.P. for Thanet, 1919-29. He joined the board of Associated Newspapers in 1923, becoming vice-chairman in 1927 and chairman in 1932. He also held directorships of several film companies.

Roths. Police burgh of Morayshire, Scotland. It is near the river Spey, 10 m. from Elgin, and has a rly. station. Distilling is the main industry. There are remains of a castle which was formerly a seat of the Leslie family. Pop. est. 2,000.

Roths, EARL OF. Scottish title borne by the family of Leslie since 1457, or earlier. The 1st earl was George Leslie, who had estates in Fife. The 3rd earl was killed at Flodden. John, 7th earl, became lord chancellor of Scotland after the Restoration, and was made a duke in 1680. He died without sons in 1681, when his daughter

2nd Viscount Rothermere, British newspaper director

Rothermere

Roths arms

1st Duke of Rothés, Scottish royalist After Lely

obtained in 1663, re-granting the earldom, the estates having been sequestered in 1651. When the countess Mary, wife of Martin E. Haworth-Leslie, died in 1893, the titles passed to her grandson, who became 19th earl. Malcolm, 20th earl (b. Feb. 8, 1902), succeeded in 1927. His seat is Garstons, Wilts, and his eldest son is called Lord Leslie. *Pron. Roth-éz.*

Rothesay. Royal and mun. burgh and watering-place of Bute-shire, Scotland, also the county town. It stands at the head of Rothesay Bay, a fine opening of the sea, on the E. side of the

Rotherham arms

Rotherham, Yorkshire. Old bridge, with remains of chapel

1871. Since 1918 it has sent one member to parliament. Market days, Mon. and Sat. Pop. 80,890.

Rotherhithe. London district. A parish and division of the met. borough of Bermondsey, served by the British rlys. (S. section) and the Metropolitan line, it includes the Surrey Commercial docks (*q.v.*), and Southwark Park, 63 acres, which was opened to the public in 1869. The parish church of S. Mary, on the W. side of the entrance to the Thames Tunnel (*q.v.*), was rebuilt in 1715. Rotherhithe Tunnel, for foot passengers and vehicular traffic, connecting Jamaica Road, Rotherhithe, with Commercial Road, Stepney, is 1 m. 440 yds. long, 510 yds. being under the Thames, and was opened June 12, 1908.

Once part of the royal manor of Bermondsey, Rotherhithe was also known in the 17th century as Redriff. Admiral Sir John Leake

Isle of Bute. It is 40 m. W. of Glasgow, with a good modern harbour and pier. Rothsay is a

Rothsay arms

popular holiday centre. The chief building is the castle, restored by the marquess of Bute in 1871-77. Other buildings include those for town and county business, churches, schools, the Norman Stewart institute, and a museum. There are parks, tennis courts, golf and putting courses, and baths, while yachts and steamers

Rothsay, Scotland. Town and harbour from Chapel Hill

frequent the harbour. Rothsay was made a royal burgh in 1400, the castle, now the property of the burgh, being then a royal residence. Pop. 9,346.

Rothsay, DUKE OF. Scottish title borne by an heir-apparent to the British throne. It was created in 1398 for David, eldest son of Robert III, king of Scotland. He had previously been earl of Carrick. In 1399, owing to the illness of his father, he was made regent, but was soon superseded, and imprisoned in Falkland by his uncle, the duke of Albany. On March 27, 1402, he died there, it is said, of starvation. The title became one of those borne by the heir to the Scottish and in later years to the British throne.

Rothhorn, BRIENZER. Mountain mass of Switzerland. On the borders of the cantons of Berne, Lucerne, and Unterwalden, it attains an elevation of 7,715 ft., and the summit is reached by a rack and pinion rly. from Brienz (*q.v.*).

Rothley Temple. Elizabethan mansion in Leicestershire, England. It contains the chapel of a preceptory of the Knights Templars, is 5 m. N. of Leicester, and was the birthplace of Lord Macaulay. The parish of Rothley lies on the edge of Charnwood Forest, having a rly. station and a pop. of 2,734. See Macaulay.

Rothschild. Name of a family of Jewish financiers. They derive their name from the sign of the red shield (Ger. *roth Schild*) by which their house at Frankfort was known. The family was founded by Mayer Anselm Rothschild (1743-1812), a banker and money changer of Frankfort who made a fortune by providing the sinews of war for the anti-French party during the campaigns in Spain and Germany. His five sons, who were all made Austrian barons in 1822, extended the business through Europe. Anselm (1773-1855) continued at Frankfort, Solomon (1774-1855) went to Vienna,

Nathan Mayer (1777-1836) went to Manchester in 1798 and moved to London in 1805, Karl (1788-1855) set up in Naples, and Jacob (1792-1868) operated in Paris.

Nathan Rothschild in London made a large fortune by his financial activities, in which he assisted the British and other European governments. His eldest son, Lionel (1808-79), was best known by his labours for Jewish emancipation; elected M.P. for the City of London in 1847, he was allowed to sit, as a Jew, in 1858. A second son, Anthony (1810-76), a London banker, was created a baronet in 1847. Lionel's son, Nathaniel Mayer (1840-1915), was M.P. for Aylesbury from 1865 to 1883, when he was made a baron of the U.K. An ardent philanthropist, he was president of the British Red Cross Society when he died, March 31, 1915.

Nathaniel Mayer Victor (b. 1910), 3rd baron, grandson of the 1st baron, was born Oct. 31, 1910, and educated at Harrow and Trinity College, Cambridge. He engaged in research in biophysics until 1939, but during the Second Great War was in charge of counter-sabotage for the British and U.S. military authorities. He succeeded to the title in 1937.

James A. de Rothschild, son of Baron Edmond de Rothschild of

the French branch was educated at Lycée Louis le Grand, Paris, and Trinity College, Cambridge. He was Liberal M.P. for Isle of Ely, 1929-45, and joint parl. secretary at the ministry of Supply in 1945.

Another of the French branch was Baron Henri de Rothschild (1872-1947), great-grandson of Nathan Rothschild. Born July 26, 1872, he became a physician in Paris, where he founded a dispensary for treating children's diseases. He also wrote plays under the pseudonym André Pascal, *e.g.* *La Rampe*, 1909; *Le Grand Patron*, 1931; and built one of Europe's best equipped theatres, the Pigalle, Paris. He died Oct. 10, 1947. Consult *The House of Rothschild*, Count Corti, Eng. trans. 1928.

Rothwell. Urban district of Northants, England. It is 4 m. N.W. of Kettering and connected with it by rly. Boots, shoes, and clothing are manufactured. The chief buildings are the church of Holy Trinity in the Transitional style, with memorials to the Tresham family, and the market house, a Renaissance building which, begun by a Tresham in 1577, remained

in an unfinished condition until the 20th century. Pop. 4,516.

Rothwell. Urban dist. of the W. Riding of Yorks, England. It is 4 m. S.E. of Leeds. The chief church is Holy Trinity, a fine building which has been restored. The place has some

Rothschild. Prominent members of the family. 1. Mayer Anselm, 1743-1812. 2. Nathan Mayer, 1777-1836, founder of the English house, from an old print. 3. Lionel Nathan, 1808-79. 4. Nathaniel Mayer, 1st Baron, 1840-1915. 5. Lionel Walter (b. 1868), 2nd Baron

manufactures, while around are coal mines which provide employment for many. In the Middle Ages the family of Lacy built a castle here. Pop. 24,504.

Rotifera (Lat. *rota*, wheel; *ferre*, to bear). Large group of aquatic animals. It is regarded by most zoological authorities as constituting a separate phylum of the animal kingdom. The rapid movements of the cilia which surround the fore part of the body, when examined under a microscope, have the appearance of a revolving wheel. The creatures are all extremely small—the largest being just visible to the naked eye—and abundant in ponds, while a few species inhabit the sea. Some of them are fixed by stems to objects, and others swim freely. They consist of a body terminated anteriorly by a ciliated disk and posteriorly by a foot for attachment or a tail-like outgrowth. The transparency of the body usually allows the internal organs to be well seen. The alimentary canal consists of a tube passing to an anal aperture at the hinder end of the body, and it is partly armed with minute teeth which crush the food brought to the mouth by the action of the ring of cilia. This food consists of still more minute organisms and particles of vegetable matter.

The body cavity is filled with fluid in which the organs float, being more or less loosely attached by cells of connective tissue. In some species part of the oesophagus can be everted and the teeth brought to bear upon the algae on which the animal browses. There appears to be no definite respiratory system, but the organs are aerated by the diffusion of water through the body wall and its subsequent expulsion from a kind of bladder. It is remarkable that so lowly an organism should possess a bilobed brain, which often bears eyes. The sexes are separate, and the young are produced from eggs. In some species eggs are apparently produced parthenogenetically in summer, and are of two kinds—larger ones from which females are hatched, and small ones which result in males. In autumn the sexes pair and another type of eggs is produced. These have a thick shell and do not hatch out till the following spring.

About 700 species of rotifers are known, and several may usually be found by searching the weeds from any clear pond. They form interesting objects for examination

under the microscope, and some of their main features can be made out with a good pocket lens. One species, *Meliceria ringens*, builds a tube of minute balls of clay or of other matter that may be held in suspension in the water. Rotifers are grouped into four classes—those that live in tubes, those that creep like a leech, those that swim freely, and those that progress by leaps. See Animal. Consult The Rotifera, C. T. Hudson and P. H. Gosse, 1886; Rotifera, M. Hartog, Cambridge Natural History, vol. ii, 1896.

Rotomohana.

Lake of N. Island, New Zealand. On its shores until 1886 were hot springs and pink and white terraces of siliceous sinter of brilliant colour, the most beautiful of their kind in the world. They were destroyed by an eruption of Mt. Tarawera in 1886, and the lake is now a deep crater 2 sq. m. in area, in which a new warm lake has formed.

Rotor. Revolving portion of a machine. The term is most commonly applied to an electric generator or motor, where the rotor is the field magnet system of shaft, hub, magnet poles, field coils, and slip rings, the whole revolving inside a casing called the stator. That part of a turbine which carries the vanes and revolves is also called the rotor. A rotor ship is a vessel equipped with upright cylinders on the deck and having vanes; when the wind strikes the vanes, the rotor revolves and turns a propeller shaft. The first vessel of this type was built in Germany in 1929, but rotor-drive for ships was not successful, as speed is dependent upon wind. Later experiments converted the energy from the wind-driven rotors into electric power for charging batteries, which supplied power to motors driving the propeller shaft. Here the relays through which the power was obtained proved too complicated. The rotor arm of an internal-combustion engine revolves to make and break the ignition system and so convey to the sparking plugs in turn the correct firing order. Motor vehicles can be immobilised by removing the rotor arm; this had to be done in the U.K., under a defence regulation, during the

Second Great War if a vehicle was left unattended.

Rotorua. Lake of N. Island, New Zealand. Of volcanic origin, it is 20 m. N.W. of Mt. Tarawera, in the thermal spring region.

Rotorua. Town of N. Island, New Zealand. Near the lake of the same name, it is 171 m. by rail

Rotorua, New Zealand. Bath building at the Spa

S.E. of Auckland, in the midst of the 150-m. stretch of country of geysers, hot and cold lakes, fumaroles, etc., which make it one of the most wonderful natural features of the world. A Maori centre, it is owned and managed by the state as a health and tourist resort, within reach of fishing, deer stalking, and shooting of many kinds. Pop. 7,512.

Rotrou, JEAN DE (1609–50). French dramatist. The most important of the older contemporaries of Corneille, he was born at Dreux in Normandy, Aug. 21, 1609, and educated there and in Paris. He began by writing plays for various companies of actors; was for a time one of the five poets employed by Richelieu to carry out his dramatic ideas; and died, June 28, 1650, of the plague in Dreux, whither he went on learning that the mayor had fled from his post. His best work is to be found in his tragedies Saint-Genest and Venceslas.

Rotten Borough. Popular name given, in the early decades of the 19th century, to those English boroughs which, with populations reduced to a handful, retained the right of returning members to parliament. This anomaly, with many other abuses, was swept away by the Reform Act of 1832. See Borough; Commons, House of; Reform Act.

Rottenburg. Town of Württemberg, Germany. It stands at an alt. of 1,170 ft. above the Neckar, which separates it from the suburb of Ehingen, 6 m. S.W. of Tübingen. The buildings include the 15th century cathedral of S. Martin and the Bishophof, formerly a Jesuit convent.

The latter houses a museum, while another building contains a valuable collection of Roman antiquities found on the site of the Roman station of Sumelocenna. Around is an important hop-growing dist., and there are woollen and spinning factories, clockmaking and woodwork industries, and breweries. This place was added to Württemberg in 1805. After the surrender of Germany in 1945 it lay in the French zone of occupation. Pop. est. 7,600.

Rotten Row. London riding track, in Hyde Park (*q.v.*). It runs W. from Hyde Park Corner to Coalbrookdale Gate, and returns E. on the N. side of the carriage drive between Albert Gate and Alexandra Gate. The name is derived from the soft layer of tan which forms the surface, or, more probably, from *route du Roi*, a road kept sacred to royalty.

Rottenstone. Name given to a porous, friable, siliceous rock used largely for cleaning and polishing steel, brass, and other metals, and wood. The rock consists mainly of aluminium silicate and carbonaceous matter, and is a decomposed siliceous limestone. The best rottenstone is found in Derbyshire and S. Wales.

Rotterdam. City and seaport of the Netherlands, in the prov. of S. Holland. It lies on a section called the Maas of the Rhine-Maas delta, at a point where it is joined by a small river, the Rotte, 17 m. by rly.

Rotterdam arms

E. of the Hook of Holland, and 52½ m. by rly. S.S.W. of Amsterdam. The main part of the town, intersected by many quays and canals, is on the right bank; opposite lies the North Island, and the suburb of Feijenoord, with important harbours on the left bank. The long quay called the Boompjes (little trees) on the right bank was wrecked during the Second Great War.

Rotterdam, connected with the sea by the Nieuwe Waterweg, 1866-90, which admits large vessels from the Hook of Holland, before the Second Great War had a large transit trade to and from Germany, as well as its Dutch import and export trade. Imports include grain, metals, coal, petroleum, tobacco, coffee, rubber; about one-half of Dutch industrial exports pass through Rotterdam.

Shipbuilding with allied industries are of primary importance, and there are large manufactories of cigars, spirits, chemicals, cocoa, and sugar. The expansion of German overseas trade during the 19th and early 20th centuries greatly increased Rotterdam's transit trade. There are important steamship lines running to the Far East, the Americas, and Africa.

The Groote Kerk, or Church of S. Lawrence, begun in 1412, a large Gothic building, with unfinished tower, 1449-1651 (210 ft.), severely damaged in the Second Great War, stands at the edge of the central area of the city destroyed by the German air bombardment of May 14, 1940. The Exchange, 1772, with modern additions, and the Stadhuis or Town Hall, 1835, were destroyed in that raid, as were nearly all major business premises. The Boymans museum has a notable collection of Dutch paintings. Erasmus and Hendrik Tollens, the poet (1780-1856), were both natives of Rotterdam.

The city received its first municipal rights about the middle of the 14th century, but remained a place of minor importance until the mid-19th century. Pop. 660,000.

SECOND GREAT WAR. In the early hours of May 10, 1940, German troops landed at Rotterdam from transports which had made their way down the coast during the night, and established themselves in the port area. German parachutists seized the airport at Waalhaven, which the Dutch recaptured on May 11, only to lose it again as German reinforcements poured in. As in other places, the invaders received some assistance from fifth-columnists among the civilian population. German aircraft on May 14, without waiting for a reply to an ultimatum to surrender, bombed Rotterdam unopposed, the centre of the city being devastated (*see* illus. p. 6023) and thousands of people killed and injured. Under threat of similar attacks on other defenceless cities, the Netherlands army surrendered on the evening of the same day. During the German occupation of the Netherlands, Allied aircraft made frequent raids on the docks, oil depots, barge concentrations, and shipping at Rotterdam. On May 3, 1945, three British merchantmen, undersafe-conduct from the Germans, discharged cargoes of food and coal here for the starving population of the provs. of N. and S. Holland. The city was liberated only by the general German surrender on May 5. Navigation

of the Nieuwe Waterweg, blocked by demolitions and sunken shipping, was not restored until 1948.

Rotti. Island of Indonesia, lying off the S.W. of Timor. The people, chiefly Malays, produce rice, tobacco, sugar, cotton, soya beans, copra, and indigo. The only settlement of any size is Mokdale. Area, 653 sq. m. Pop. est. 70,000.

Rottingdean. Seaside village of Sussex, England. About 3½ m. E. and a suburb of Brighton, it is built in a valley of the South Downs. It contains a street of delightful old cottages, but during the 1930s many villas and blocks of flats were built close to the shore. S. Margaret's 13th century church was restored by Sir Gilbert Scott; it contains a stained glass window designed by Burne-Jones, who was buried here. The Elms, Rottingdean, was the home of Kipling for some years.

Rottlera (*Mallotus philippinensis*). Small tree of the Euphorbiaceae family. A native of tropical Asia, Malaya, and Australasia, it has large oval leaves, which are downy on the underside. The flowers have neither sepals nor petals, and are inconspicuous. The seed-capsule is three-lobed and coated with a red powder which has long been in use as a dye for silks. As kamala it has a place in the British Pharmacopoeia as a remedy for tape-worm. The Arabs also employ it in leprosy.

Rottweil. Town of Württemberg, Germany. On the Neckar, 68 m. S.S.W. of Stuttgart, it is a partially walled town of great antiquity. Within the town is the site of a Frankish camp, and ¼ m. S., in the village of Rottweil-Alstadt, are the remains of a Roman colony. The chief buildings are the 16th century town hall; the antiquarian museum; the chapel of S. Lawrence, c. 1579, which contains a collection of medieval pictures and wood-carvings, and a Roman mosaic pavement; and two churches, the Kapellen-kirche and the Heilige-Kreuz-kirche (13th-16th century). The former, built in the 14th-15th centuries and remodelled, 1721-29, has a lofty Gothic spire adorned with sculptures. Here was the main explosives factory of the German Dye Trust. There are also textile, ceramic, salt, and watch industries. After the Second Great War Rottweil was in the French zone of occupation. Pop. 10,856.

Rotuma. Small island of the S. Pacific Ocean. It lies about 250 m. N.N.W. of Fiji, to which it has belonged administratively since 1880.

Copra is the chief export. The principal settlement is Fangwot. The island is the seat of a British commissioner. Pop. 3,250.

Roualt, JOACHIM (d. 1478). French soldier. In the service of the dauphin (Louis IX), he fought in the Swiss and English campaigns of 1444 and 1448, and distinguished himself in many subsequent wars, becoming marshal of France in 1461. Ten years later he was made governor of Paris, and he fought against Charles the Bold.

Rouault, GEORGES (b. 1871). French painter. Born in Paris, May 27, 1871, he was apprenticed to a painter of stained glass and later studied under Moreau at the Beaux-Arts. The work of this most original artist was imbued with a deeply religious feeling, and his tragic tone combined with romanticism and absence of satire placed him in a class apart. In many pictures he used clear blues and reds with strokes of black edges, thus giving an effect of stained glass. His book illustrations were notable, e.g. *Danse Macabre*, *Les Fleurs du Mal*, and those for his own *Misère et Guerre*.

Roubaix. Town of France, in the dept. of Nord. It stands on the Canal de Roubaix, which connects it with the Schelde and the Deûle, 6 m. N.E. of Lille. An important industrial centre, Roubaix manufactures woollens, cotton, linen, shawls and velvets, and has iron and copper foundries and machine works. The 15th century church of S. Martin was rebuilt in 1849. Other public buildings are the national school of industrial arts and a modern town hall. The town dates its prosperity from 1469, when the duke of Burgundy granted a charter to its manufacturers to weave cloth. During 1914-18 it was occupied by the Germans. Overrun again by the Germans in May, 1940, it remained in their hands until liberated, Sept., 1944, in the British 2nd army's rapid advance on Brussels. Pop. 100,978.

Roubiliac or **ROUBILLAC**, **LOUIS FRANÇOIS** (1695-1762). French sculptor, a native of Lyons. He studied under Balthazar and settled in England at some date between 1730 and 1738. His first important work was a statue of Handel for Vauxhall. The Nightingale monument in Westminster Abbey, the Shakespeare, now in the British Museum, and the Newton at Trinity College, Cambridge, are conspicuous works of his. He died in London, Jan. 11, 1762. A Life, by K. Esdaile, appeared in 1929.

Rouble. Russian unit of currency, the international value of which has been nominal since the Revolution of 1917. It is divided into 100 kopecks.

Roucher, JEAN ANTOINE (1745-94). French poet. He was born at Montpellier, Feb. 22, 1745. A descriptive poem,

Jean A. Roucher, French poet

Les Mois, 1779, gained him considerable reputation in an age when the artificial poetry of nature was in fashion. A moderate republican, Roucher denounced the Jacobins, and was guillotined along with his friend André Chénier (*q.v.*), July 25, 1794. *Pron.* Rooshay.

Rouelle, GUILLAUME FRANÇOIS (1703-70). French chemist. Born near Caen, he was living in Paris in 1742, when he was appointed chemical demonstrator at the Jardin du Roi, among his pupils being Lavoisier (*q.v.*). He is best known as the first to define salts, and for his investigations into ancient Egyptian methods of embalming. He died Aug. 30, 1770.

Rouen. City and port of France, capital of the dept. of Seine-Inférieure. It lies on the Seine, 87 m. by rly. N.W. of Paris, 54 m. by rly. and 80 m. by river E. of Havre. The main part of the town is on the right bank of the river, which is lined with extensive quays. The chief industry of Rouen is the spinning, preparation, and dyeing of cotton, but there are many industries connected with the port. At the suburb of Sotteville are railway workshops.

It is one of the greatest ports of France, the total tonnage entered and cleared annually being

Louis Roubiliac, French sculptor
After A. Carnantiers

nearly 3,000,000. Many improvements of its shipping facilities were made during the First Great War, when Rouen was the chief British base in France.

Modern alterations have driven broad, handsome streets through parts of the old town, but Rouen remains a picturesque and interesting city. The large Gothic cathedral, which was partly gutted in the Second Great War, dated from the 13th century. The façade dated from the 16th century. Of its two unfinished towers, which are of unequal height, the finer is the Tour de Beurre, 252 ft. in height. It was built with the money paid for indulgences to eat butter during Lent, and so received its name. The venerable Tour S. Romain is 245 ft. high, and dates almost entirely from the 12th century. Of the two side portals that in the north possessed some elaborate sculpture representing the Resurrection and the Last Judgement.

The interior was in Early Pointed style, and there were beautiful rose windows, partly of 13th century glass, in the nave and transepts. The choir had double aisles, and the transepts were divided by columns and arches into middle and side aisles. There were 13th and 14th century monuments in one of the chapels, while another contained the tomb of the first duke of Normandy. Of the fine monuments in the Lady Chapel the most imposing was that of Cardinal d'Amboise, the minister of Louis XII, and his nephew, also a cardinal, with groups of statuary. The heart of Richard Coeur de Lion was buried in the cathedral.

The Gothic church of S. Ouen, 14th cent., is architecturally more remarkable, though marred by the W. portal and towers built 1848-51. S. Maclou (1440-1521) has doors carved by Jean Goujon. Both these were seriously damaged in the Second Great War, as was the Musée des Beaux Arts, opened 1888; while the church of S. Vincent, famed for its glass, and the Palais de Justice (15th-16th cent.), once the seat of the parliament of Normandy, were both totally destroyed.

Rouen was the Roman Rotomagus. The bishopric dates from about 260. It became capital of Normandy, 912, and the Norman

Rouen arms

parlement or Échiquier was fixed here in 1302. Lost by John of England, 1204, it was held from 1419-49 by the English, who burnt Joan of Arc in the market place, 1431. Resisting the siege of Henry IV, 1591-92, it surrendered to him in 1596. It was entered by the Prussians in Dec., 1870.

Soon after the outbreak of the Second Great War base reinforcement depots for the B.E.F. were established at Rouen. On June 9, 1940, German troops entered the city, which was in German occupation until on Aug. 30, 1944, it

was liberated by the 1st Canadian army. It had been evacuated by the Germans, much of whose transport, waiting to cross the river in the rapid retreat from the W., had been severely bombed from the air and left derelict. The city was found to have suffered heavily from Allied air raids and German demolitions.

Among many famous Rouennais may be mentioned Corneille, Bojeldieu, Géricault, and Flaubert. Pop. 107,739. See Normandy.

Rouergue. Medieval county of France. Originally inhabited by

the Rutheni, it lay between Auvergne, Guienne, and Langue-doc, corresponding roughly to the present dept. of Aveyron. It was made a crown land by Henry IV in 1589. The capital was Rodez (*q.v.*).

Rouge. Name given to a number of red colouring matters. The variety of rouge used for polishing glass and jewelry, on account of its freedom from grit, is the residue (iron oxide, Fe_2O_3) obtained in the manufacture of Nordhausen sulphuric acid from ferrous sulphate. It is also known as colcothar, and used as a pigment. The rouge employed in the toilet for the cheeks is usually a preparation of carmine, carthamin, or erythrosine.

Rouge et Noir (Fr., red and black). Gambling game with cards. It is played on an oblong table covered with green cloth, having at either end two large diamonds coloured red and black respectively, and a triangular space called inverse. In the centre are two divisions known as couleur.

Six packs are shuffled together, from which the dealer takes a convenient quantity in his hand each time a coup is dealt. Court cards count ten, and the ten down to ace bear their face value. The dealer first deals for noir until the pips on the cards faced in a line number 31 or not more than 40; and then does the same for rouge, the winning row being that containing pips totalling the nearest to 31. Should the pips number exactly the same (between 32 and 40) in both noir and rouge, the deal is void. In the event of both rows totalling exactly 31 each, half the stakes go to the bank, or the players have the option of leaving their entire stakes down for the next deal, the successful ones receiving their stakes back, but without any profit. In the case of the losers the bank takes all. This is called the *refait*.

Players who stake on couleur wager that the winning colour will be the same as the first card turned; those backing inverse, that it will be the opposite. Stakes placed on the red or black diamond denote the backing of that particular colour to win. The dealer holds the bank, and the other players are termed punters. The game is also known as *Trente et Quarante*.

Rouget de Lisle, CLAUDE JOSEPH (1760-1836). French soldier and poet. Born at Lons-le-Saunier, Jura, May 10, 1760, he owes his fame entirely to the song, *La Marseillaise*, which he wrote and com-

Rouen, France. West front of the Cathedral of Notre Dame, showing the ironwork spire; left, Tour S. Romain, and, right, the Tour de Beurre

Rouget de Lisle singing the Marseillaise. From the painting by Isidore Pils
Louvre, Paris

posed in 1792 while captain of engineers at Strasbourg. He had previously enjoyed some success as a singer and violinist. He was imprisoned under the Terror because, a son of royalist parents, he refused to take the oath to the Constitution which abolished the crown. Wounded at Quiberon, 1795, he left the army and lived in straitened circumstances until Louis Philippe granted him a small pension in 1830. He died June 26, 1836. See Marseillaise.

Roughrider. Originally one who rode or trained untamed horses, i.e. a horsebreaker. From that it came to be used for soldiers in the cavalry and artillery who did this kind of work, and who wore a spur on the sleeve as a badge. Still later, bodies of mounted men raised for service in time of war called themselves roughriders; among such were the City of London Yeomanry and the regiment raised by Theodore Roosevelt for service during the Spanish-American War.

Rougon-Macquart, LES. General title of a series of novels by Émile Zola. In them are followed the fortunes of various members of the inter-married Rougon and Macquart families. Twenty novels are comprised in this series: La Fortune des Rougon; Son Excellence Eugène Rougon; La Curée; L'Argent; Le Rêve; La Conquête de Plassans; Pot-Bouille; Au Bonheur des Dames; La Faute de L'Abbé Mouret; Une Page d'Amour; Le

Ventre de Paris; La Joie de Vivre; L'Assommoir; L'Oeuvre; La Bête Humaine; Germinal; Nana; La Terre; La Débâcle; and Le Docteur Pascal.

Rouher, EUGÈNE (1814-84). French statesman. Born at Riom, Nov. 30, 1814, he became a barrister and entered the constituent assembly for Puy-de-Dôme, 1848. Minister of justice, 1849-51, he tacitly supported the *coup d'état*, and in 1853 became minister of agriculture and public works. He negotiated the Cobden treaty, 1860, and, minister of state from 1863, was a leading champion of imperial policy, e.g. of the Mexican expedition and the suppression of press liberties. He resigned office, 1869, became president of the senate, and fled to England after the fall of the empire. Deputy for Corsica, 1872-75, he defended the Bonapartist cause. He died in Paris, Feb. 3, 1884.

Roulade (Fr. *rouler*, to roll). In music, a florid vocal passage, with many runs.

Roulers (Flemish, *Rouselaere*). Town of Belgium, in the prov. of W. Flanders. It lies on the small streams Vyverbeek and Mandel,

19 m. by rly. S.S.W. of Bruges, and is a junction for the Ypres, Menin, and Courtrai lines. An industrial town, it has few points of interest save the church of S. Michael, with a conspicuous Gothic tower. Linen is the chief manufacture, with industries in cotton, lace, chicory, tobacco, and pottery. Roulers was noted for its cloth as early as the 11th century and was at that time an important town. Its flourishing textile industries came to a standstill in the First Great War, but restarted soon after the armistice.

Near Roulers, on July 13, 1794, the Austrians under Clerfaut were defeated by the French under Pichegru and Macdonald. An important German centre during the First Great War, it was recaptured by French troops in Oct., 1918. Pop. 30,344. See Ypres, Battles of.

Roulette. Gambling game. The following is a description of roulette as played at Monte Carlo. The roulette wheel itself is sunk in the centre of an oblong table covered with green cloth. The base of the wheel is poised on ball-bearings, and by turning with the hand a small cross-bar rising from its axis, it can be made to revolve very rapidly.

The circular bed is divided into 37 compartments. Taking 0 (zero) as a starting point at the top of the circle, the numbers are arranged in this order, following round from right to left: 32, 15, 19, 4, 21, 2, 25, 17, 34, 6, 27, 13, 36, 11, 30, 8, 23, 10, 5, 24, 16, 33, 1, 20, 14, 31, 9, 22, 18, 29, 7, 28, 12, 35, 3, 26; zero being situated between 26 and 32. Zero is coloured green; the other compartments are black and red alternately; 32 being red, 15 black, and so on. A white ivory ball is thrown into the moving machine, the ball being spun in an opposite direction to that in which the wheel is rotating, in order to avoid all chance of cheating by sleight of hand on the part of the operator; the compartment in which the ball

Roulette table, showing arrangement of numbers in the lay-out

finally rests indicating the winning number.

At each end of the table is a lay-out marked off into various divisions. In the centre are arranged, in twelve rows of three, squares containing the figures from 1 to 36, and a square at the top for zero. On each side are spaces representing *Passe*, *Manque*, *Pair*, *Impair*, *Black*, and *Red*; and at the bottom are spaces marked *P 12*, *M 12*, and *D 12*. On this lay-out all stakes are placed, and indicate by their positions the nature of the various chances, which, with the odds paid, are as follows. *En plein*. Any one single number; odds 35 to 1. *À Cheval*. Two numbers; odds 17 to 1. *Transversale*. Three numbers in a horizontal position; odds 11 to 1. *Un Carré*. Four numbers; odds 8 to 1. *Transversale Six*. Six numbers (two sets of numbers in a horizontal position); odds 5 to 1. *Bas*. The twelve numbers contained in one of the three vertical columns; odds 2 to 1. *Bas à cheval*. Embracing the numbers in two of the three columns; odds 1 to 2. *Premier, Milieu, Dernier*. Stakes placed on the spaces marked *P 12*, *M 12*, and *D 12*; these embrace the numbers from 1 to 12, 13 to 24, and 25 to 36. Odds 2 to 1; if two of these are backed the odds paid equal 1 to 2. In the foregoing combinations of numbers or chances, they must be such as can be plainly indicated by the position of the stake upon the lay-out. The even chances are: *Rouge*. That the number will be red. *Noir*. That it will be black. *Impair*. That it will be odd. *Pair*. That it will be even. *Manque*. That the number will be from 1 to 18. *Passe*. That it will be from 19 to 36.

Zero is the equivalent of the *refait* at *trente-et-quarante*. The stake is imprisoned until the next coup is decided. If the latter is won the stake is released. Another feature operating against the player, and a great safeguard to the bank, is the maximum set by the administration to each variety of bet. A player may thus go on doubling his stake on a series of losing coups and eventually be compelled to return to a flat stake before backing a winning colour or number; in which event he would not succeed in recovering his previous losses. See *Complete Hoyle*, R. F. Foster, 1897; *Roulette: a Treatise on the Game*, by H., 1904.

Roumanille, JOSEPH (1818-91). Provençal author. Born at

Joseph Roumanille,
Provençal author

St. Rémy, Bouches-du-Rhône, he was for some time a teacher in a school at Avignon, where he set up as a publisher. In 1817 he published the first volume of his poems, *Li Marbarideto* (The Easter Daisies), and in 1854, with F. Mistral and other friends, established the *Félibrige* which was to restore the Provençal as a literary language. In the same year he collected his poems as *Lis Oubreto*. He started the Provençal journal, *L'Armana Prouvencau*, in 1855, and continued during many years to write stories and poems in the language he had done so much to re-establish. He collected his prose writings in 1889. A new edition of his *Oubreto en Vers* was issued in 1903, accompanied by a French translation and a biographical sketch.

Round. Literally, something circular or globular. In boxing the word is used for the periods or bouts during which no respite is allowed; each round is followed by a pause, and a contest is usually limited to 20 or some smaller number of rounds. (See *Boxing*.) A round is one stage in a sporting event, consisting of all the contests held simultaneously, whether the losers are eliminated or each contestant is to meet all the others. The word is also used for a discharge of firearms, a burst of applause, and the beat of a policeman or watchman. Postmen, milkmen and other vendors are also said to have rounds. Other uses are for a game of golf, the rung of a ladder, and a slice of bread or toast. In brewing, a round is a vessel for holding beer while undergoing fermentation. In the U.S.A. a round trip or round ticket is a return journey or ticket. Roundabouts is the name given to a number of mechanical horses or other devices, linked together, on which persons are carried round and round for amusement; and, by analogy, to a road-junction where the traffic moves circularly.

Round. In music, species of canon (*q.v.*) for equal voices, in which the performers all sing the same melody, but make their respective entries in succession. The earliest piece of concerted vocal music extant, *Sumer is icumen in*, is a round. (See *Catch*.)

Round is also the name given to a dance in which the performers stand in a circle.

Round, DOROTHY EDITH (b. 1909). English lawn tennis player, born July 13, 1909, at Dudley. She played in Wightman Cup matches against the U.S.A., 1931-36, and won the British hard court championship in 1933 and 1934. In the first of those years she lost the Wimbledon final to Helen Wills, but next year she won it against Helen Jacobs, and repeated the success in 1937 against J. Jedrzejowska.

Roundel or **ROUNDELAY** (Fr. *rond*, round). In music, the tune to which a poem of the same name was sung, and in which the first strain was repeated at intervals, thus giving the impression of a circle or round. In instrumental form this has developed into the *Rondo* (*q.v.*). Roundel was also the name of a dance in which the performers stood in a circle and joined hands.

Roundel. In heraldry, circular or rounded charges, having different names according to their tinctures, as follows: Gold or yellow, a bezant; silver or white, a plate; red, a torteau; blue, a hurt; green, a pomme or po-meis; black,

Roundel in heraldry

an ogress, a pellet, or a gunstone; purple, a golpe or wound; sanguine, a guze; tenné, an orange. In old heraldry these were all described as roundels, except bezants and plates, the tinctures being specified. A plate crossed by three horizontal blue bands is called a fountain. Shot, when so described, should be drawn as rounded balls, not flat; but the bezant and plate should always be mere disks. A shield strewn with gold roundels is said to be "bezanty," but if with other roundels, it should be described as "semée de plates," "semée de torteaux," and so on. See *Heraldry*.

Roundel. In aeronautics, identification mark on aircraft. Roundels are usually circular and made up of concentric rings in the national colours of the aircraft's country. Certain nation-

Dorothy Round,
English lawn
tennis player

alities have a device inside the roundel, such as the star in the American roundel and the crescent in the Turkish. The R.A.F. uses three roundels: one on the fuselage with four concentric rings of yellow, blue, and red; one on the upper surface of the wing, blue with a red centre; and one on the lower surface with concentric rings of blue, white, and red.

Roundel. As used by the R.A.F. on the fuselage of an aeroplane

Rounders. Ball-game which became popular in Great Britain early in the 18th century. Originally rounders was played in a somewhat free-and-easy fashion, there being no restriction as to the number of players on the "in" or the "out" side. The field was marked out in a regular pentagon with five bases 15-20 yards apart.

The feeder or bowler, standing near the centre of play, tossed the ball to the striker, who with a round stick endeavoured to hit the ball as far as possible, so as to complete the round of the bases before the ball was thrown up, thereby scoring a rounder. The striker was out if hit by the ball thrown at him whilst between any of the bases; if the ball were caught from a hit before touching the ground or on the first bounce; or if he missed striking the ball in three consecutive tosses.

In 1889 the Rounders Association of Liverpool and Vicinity and the Scottish Rounders Association were formed, and rules drawn up. The area of play was changed to the form of an elongated diamond; the number of players restricted to ten on each side; and the dimensions of the "bat" fixed at 35 ins. in length by 3½ ins. in diameter. The ball was made harder in substance, and thereafter, to put the striker out when running between bases, a fielder had to touch him with it instead of throwing it at him. The last man in might call for "three fair hits for the rounder," and if successful in hitting the ball to a sufficient distance for him to negotiate safely the whole round of the bases, he obtained another innings for his side. See Baseball.

Roundhay. Residential district of the N.E. of Leeds, England, served by tramway from the centre of the city. It is notable for Roundhay Park (372 acres, including a lake, 33 acres).

Purchased by the Leeds corporation in 1872, this is one of the largest and most beautiful public parks in the country. The first overhead trolley tramway service in the U.K. ran to the park in 1891.

Round-headed Rampion (*Phyteuma orbiculare*). Perennial herb of the family Campanulaceae. A native of Europe, it has a tuberous rootstock from which several stems arise. The leaves are ovalance-shaped, and the slender deep-blue flowers are gathered into a globose head, which gives them a superficial resemblance to the plant known as a scabious.

Roundheads. Name applied to the supporters of the parliamentary cause in the English Civil War in derisive reference to the close-cropped hair of the Puritans. Like the corresponding word cavalier (*q.v.*), it was first used in the rioting which took place outside the houses of parliament towards the end of 1641, and again, like the other, though first a word of reproach, was ultimately adopted as a title of honour. See Army, British; Cromwell.

Round Robin. Term applied to a petition or complaint signed by several persons. Strictly it is one in which the names are arranged in a circle to conceal the order in which they were written. The use of this circular arrangement dates from remote times, and is due to such motives as fear, respect, or delicacy; it was popular with

mutinous seamen. A well-known instance of a round robin is that signed in 1776 by Reynolds, Burke, Gibbon, and others praying Dr. Johnson to amend his epitaph for Goldsmith, and requesting him to write it in English instead of Latin. The name round robin is used for the angler (*Lophius piscatorius*) and other fishes, and in Devon for a small pancake.

Round Table OR **TABLE ROUND.** In medieval legend, the table at which King Arthur and his knights dined, also an order of knighthood maintained by Arthur. The table is first mentioned by Wace, and described at length by Layamon. It was made round so as to avoid rivalry for precedence. In the *Morte D'Arthur* it is said that the order was instituted by Arthur's father Uther Pendragon. When Arthur married Guinevere her father sent with her the Round Table and 100 knights. The full number of knights of the table was 150. At the table, according to some romances, was one seat known as the Siege Perilous, which was left vacant and reserved for the knight who was to achieve the quest of the Holy Grail; for any other it would prove fatal. King Arthur's round table preserved at Winchester is believed to be no older than the time of Stephen. See Arthur.

Round Table. British quarterly periodical. This non-party review of world politics, founded 1910, is pub. by an editorial committee, meeting at Rhodes House, Oxford. It specialises in Brit. Commonwealth affairs.

Round Table Conference. Term for any group of persons representing various interests which meets at a round table for discussion. It was used in particular of the three conferences held in London 1930-31 between British and Indian representatives which led to the drafting and passing of the Government of India Act, 1935.

Round Tower. Tall slender stone structure, of which there are notable examples in Ireland. Apparently erected in the 9th to 13th centuries, these towers served as detached belfries, watch-towers, and strongholds for ecclesiastics

Round Tower. Examples of the stone towers built by the ancient Celtic inhabitants of the British Isles
From drawings by C. G. Harper

and their valuables. Of 120 recorded, 10 still retain their conical caps, including Ardmore, co. Waterford, 95 ft.; Clondalkin, co. Dublin, 90 ft.; Devenish, co. Fermanagh, 85 ft.

Towers are also found at Peel, I.O.M.; Abernethy, Perthshire; Brechin, Angus, 85 ft.; Egilshay, Orkney. They had an ultimate Byzantine derivation, through the campaniles of early Ravenna, whence the Muslim minaret may also have sprung. Of greater antiquity are the shorter and wider megalithic round strongholds, as in Rabbath Ammon, Syria; the Balearic Islands; Scotland; and Sardinia. The Round Tower, Windsor Castle, was built by Edward III. See Antrim; Brechin; Broch; Glendalough; Ireland; Nuraghe; Talayot; Windsor. *Consult* The Round Towers of Ireland, H. O'Brien, 1834.

Roundway Down. Hill just N. of Devizes, Wilts, known for the battle fought here during the Civil War, July 13, 1643. After their losses at Lansdown Hill, the royalist force under Sir Ralph Hopton retired towards Oxford. The parliamentary force under Sir William Waller followed them and took up a position on Roundway Down which commanded the road from Devizes (where the royalist foot soldiers were) to Oxford. Under Prince Maurice a body of royalists, however, arrived to aid their comrades, and occupied the hill after Waller had led down his men to besiege Devizes. Thereupon Waller turned to attack the Down, but his horsemen were quickly repulsed, and in a few moments were in flight, while his infantry found themselves taken in the rear and, 1,800 in number, were all either killed or made prisoners. Waller himself escaped with his cavalry from the field. See Civil War.

Roundworm. Popular name for *Ascaris lumbricoides*, a parasitic worm belonging to the nematoda. See Ascaris.

Roukol. Typical low density explosive on the permitted list. The roukols contain 10-15 p.c. nitroglycerine; 43-57 p.c. ammonium nitrate; 10-13 p.c. sodium chloride; with stabilisers. The advantage of this type of explosive is that it acts over a great length of material and has a small shattering effect on coal when used in mines.

Roup. Common and serious disease attacking fowls which are too closely confined. In the catarrhal form the fowl shows symptoms

of a severe cold, with discharge from the nostrils and the mouth, which later dry up, producing what is known as dry roup. The disease is highly contagious, so infected poultry should be isolated. See Fowl; Poultry. *Pron.* Roop.

Roup. In Scotland, a sale by auction. The conditions of sale are called articles of roup and the seller is the exposer. See Auctioneering.

Rouse Case, THE. British cause célèbre. In the early morning of Nov. 6, 1930, a burning Morris Minor car was found near Hardingsstone, Northants. Inside it was a charred human body. Two passers-by saw a man walking away from the car, which was later identified as the property of Alfred Arthur Rouse, a commercial traveller from Finchley. Although the body was first thought to be his, it was soon found that he had been at home some hours after the fire, and he was arrested at Hammersmith on the evening of Nov. 7. At his trial the prosecution showed that he was in considerable financial and other difficulties and alleged that he had planned to disappear, or, in collusion, to draw £1,000 insurance money. Rouse claimed that the fire was accidental. He was sentenced to death at Northampton, Jan. 31, 1931, and hanged at Bedford, March 10. The victim, whom Rouse claimed to have picked up casually on the road and who was presumed to be a tramp, was never identified.

Rousseau, HENRI JULIEN OR DOUANIER ROUSSEAU (1844-1910). French painter. Born at Laval, May 21, 1844, he received no art training. During the Mexican War, 1861-67, he was an army musician, also serving in the Franco-Prussian War, 1870-71. Later he settled in Paris as a customs official; hence his pseudonym Le Douanier. He opened a stationer's shop where his pictures attracted the attention of well-known artists; also a school where he taught painting, music, and dramatics, exhibiting at the Salon des Indépendants during 1886-1910. He died Sept. 9, 1910. A simple bourgeois, Rousseau went back to nature without the critical restraint of the Impressionists or Cubists, restoring to the tactile elements all their former prestige. He painted landscapes, jungle scenes, and portraits in a naïve, genial manner. He is represented at the Louvre, Luxembourg, and other European galleries.

Rousseau, JEAN BAPTISTE (1670-1741). French poet. Born in Paris, April 6, 1670, the son of a

shoemaker, he produced several works for the stage without much success, but achieved considerable reputation by his lyrical poems. In 1712 he was banished from France on a charge of writing defamatory libels, and spent the rest of his life in exile, dying in Brussels, March 17, 1741. His odes and cantates, warmly admired by contemporary critics, are correct in form but lack fire and spontaneity.

Jean Baptiste Rousseau, French poet

Rousseau, JEAN-JACQUES (1712-78). French philosopher. The son of a watchmaker, who was also a dancing-master, he was born at Geneva. His mother died a fortnight after his birth, and his father, while he was still a child, quitted the town, leaving him in the charge of relatives. Apprenticed to an engraver, he ran away at 16 from Geneva to Savoy. A Mme. de Warens harboured him, and made arrangements for his reception into the R.C. Church. For many years he lived in her house, though he was often absent for considerable periods, first at Annecy and afterwards at Chambéry, performing the duties of an upper servant and enjoying the privileges of an adopted son. He states in his Confessions that he became her lover, but doubt has been thrown on this.

In 1741 Rousseau settled in Paris. He formed a connexion with Thérèse le Vasseur, a seamstress employed in the hotel in which he boarded, who remained his companion until his death. The statement in the Confessions that he eventually married her is untrue, the alleged marriage being an illegal ceremony. The five children whom she bore him were sent to a foundling hospital, where all trace of them was lost.

In Paris, Rousseau lived by literary and secretarial work. For some months he was in Venice as secretary to the French ambassador. He contributed, mainly on musical subjects, to the Encyclopédie edited by Diderot and d'Alembert; and in 1750 he woke up and found himself famous as the author of a prize essay on a theme propounded by the Academy of Dijon, "Has the Progress of the Arts and Sciences helped to Corrupt or to Purify Morals?" He answered the question para-

doxically in a sense hostile to art and science; and in 1753 followed up the same train of thought in an *Essay on Inequality*. Resolved thereafter to be "the man of his book," he cut himself adrift from the aristocratic society which sought to pet and pamper him, and lived a simple life, mainly in country places near Paris, supporting himself by copying music, while writing books which were to give him a permanent place in the history of French literature and philosophic thought.

The first of these was a novel, *La Nouvelle Héloïse*. Composed under the influence of Samuel Richardson, whose romances then had a great vogue in Paris, it marks

Jean-Jacques Rousseau,
French philosopher

a distinct stage in the development of French fiction, and may be said to have launched the romantic movement in French literature. Mme. de Staël's novels, and the early novels of George Sand, are largely modelled on it. *Le Contrat Social*, which came next, might be described as an impassioned version of Locke's *Treatise on Government*. It became, if not the bible of the Revolution, at least the bible of the Robespierre party among the revolutionists, since it justified not only the overthrow of the existing despotism, but also the creation of a new despotism, on a basis alleged to be rational. *Émile* is a treatise on education, a plea in the matter for home training.

In *Émile*, Rousseau advocated natural religion as a substitute for the doctrinal teaching of the Church, and consequently he was warned that if he did not leave the country he would be arrested. He fled to Switzerland, and, after

some wanderings, found refuge in what is now the canton of Neuchâtel, but was then a dependency of the king of Prussia. There, in the Jura, he lived from 1762 till 1764, when a local demonstration again drove him to flight. For a season he sojourned in the island of Saint-Pierre, on Lake Bièvre; but the Bernese authorities turned him out, and he decided to go to England, where Hume promised to find a quiet retreat for him.

His proceedings in England were odd, and can be explained only on the assumption that he was insane. He quarrelled with Hume, and with all his friends and benefactors, and returned to France in 1767. For about a year he lived in the prince de Conti's country house at Trye, near Gisors, under the assumed name of Renou, and, after other wanderings, settled in Paris in 1770. His life there was, at last, tolerably peaceful; his time largely occupied in composing and reading to his friends the *Confessions* which were published after his death. At the same time, his conduct gave accumulating indications of insanity; he had the fixed idea that he was the persecuted victim of a mysterious conspiracy. In 1778 he accepted an invitation to take up his residence in a house belonging to the marquis de Girardin at Ermenonville, near Paris, and there he died on July 2 of the same year. The suggestion that he committed suicide is not supported by conclusive evidence. Thérèse, who survived him, married a groom. See *Education*; *Social Contract*; *State*.

Bibliography. Works, 21 vols., 1820-24; *Confessions*, ed. G. Sand, 1847, Eng. trans. 1891; *Lives* (in French), A. Chuquet, 1893; L. Ducros, 1898; J. Lemaître, Eng. trans. J. Mairé, 1908; E. Faguet, 1910; (in English) F. Macdonald, 1906; Lord Morley, new ed. 1915; Rousseau jugé par les Français d'aujourd'hui, J. Grand-Carteret, 1890; Rousseau and the Women he Loved, F. H. Gribble, 1908; Rousseau, Child of Nature, J. Charpentier, 1931; Rousseau: Moralists, C. W. Hendel, 1934.

Rousseau, PIERRE ÉTIENNE THÉODORE (1812-67). French painter. Born in Paris, April 15, 1812, he studied under Rémond and Guillon-Lethière. Influenced at first by the Dutch landscapists, he soon went straight to nature for his subjects; travelled in Auvergne and Normandy; and in 1848 settled at Barbizon on the borders of the forest of Fontainebleau. For thirteen years from 1835 his pictures were regularly

rejected by the Salon jury on account of their departure from established conventions; in 1849, however, a new jury admitted

Théodore Rousseau,
French painter

his work and awarded him a first-class medal, and henceforward his progress was unimpeded. At Barbizon he lived an almost monastic life, caring only for his beloved forest and his art, and there he died, Dec. 22, 1867. Théophile Gautier called him the Delacroix of landscape. His colour, broadly handled, was always fresh and vigorous; his drawing admirable; and his example, not only as regards the Barbizon group, but all modern landscape, of lasting effect. See Barbizon; consult also *Souvenirs sur Rousseau*, A. Sensier, 1872; *The Painters of Barbizon*, J. W. Mollet, 1890.

Roussel, ALBERT (1869-1937). French composer. Born at Tourcoing, April 5, 1869, he studied music in Paris and eventually made his name with a ballet, *Le Festin de l'Araignée*, 1913. An opera-ballet, *Padmavati*, followed in 1923. He also wrote symphonies; three symphonic poems, *Évocations* (1910-11); an opera, *La Naissance de la Lyre*, 1921-23; and many songs. His music is colourful and shows the influence of Stravinsky. Roussel died in 1937, and an appreciation of the man and his work, by N. Demuth, appeared in 1948.

Roussillon. One of the provinces into which, before the Revolution, France was divided. It is now covered mainly by the dept. of Pyrénées-Orientales. Roussillon originated in a county surrounding the little town of that name, but Perpignan became its capital. The first count made his appearance about 900, and his successors added to its area, Cerdagne and Bésalu being joined to it and after a while sharing the common name. It gave its name to a wine.

Roussillon was subject to the crown of France, as it had been since the end of the Carolingian Empire, but in the 12th century the king of Aragon became, by inheritance, its actual ruler. This led to difficulties, and in 1258 Louis IX formally surrendered the county to Aragon. Later it became a little kingdom for a Spanish prince, but in 1344 was again united with Aragon. In 1462 it was

seized by Louis XI of France, and in 1493 was restored to Ferdinand and Isabella of Spain. Again in the 17th century it was in dispute between France and Spain, but in 1659, by the peace of the Pyrenees, finally became French. See Perpignan.

Routledge, GEORGE (1812-88). British publisher. Born at Brampton, Cumberland, Sept. 23, 1812, he

George Routledge,
British publisher

settled in London, 1833, after serving an apprenticeship to a bookseller in Carlisle. He started a business as retail bookseller with W. H. Warne, 1836, began publishing in 1843, and, joined by Frederick Warne, founded the firm of Routledge and Co. in 1852, a style altered to that of George Routledge and Sons in 1865, when his sons, Robert and Edmund, had been taken into partnership. He established a New York branch in 1854, retired in 1887, and died Dec. 13, 1888. He made a great success of a railway library which extended to well over 1,000 volumes, and in addition to publishing a series of British poets, and works by Lytton, Disraeli, Ainsworth, Mayne Reid, Longfellow, etc., issued Routledge's Universal Library, edited by Henry Morley. Later Herbert Read (q.v.) became a director.

Roux, PIERRE PAUL ÉMILE (1853-1933). French bacteriologist. Born at Confolens, Charente, Dec. 17, 1853, he studied medicine at Clermont-Ferrand, and worked under Duclaux. He entered Pasteur's laboratory in 1878, and became its director in 1904. In association with Pasteur, he experimented in many directions, inquiring especially into the nature and prevention of anthrax, hydrophobia, and diphtheria. Roux published his studies on diphtheria in 1889, and became known through his discovery of the antidiaphtheric toxin. He died in Paris Nov. 3, 1933.

Rouyn. A town of Quebec, Canada. It is near Lake Noranda, 425 m. N.W. of Montreal and 500 m. N. of Toronto, and owes its

existence to the discovery of rich deposits of copper and gold in the district in 1925.

It is served by the Nipissing Central rly. and by a branch of the C.N.R. Pop. 8,808.

Rovato. Town of Italy, in Brescia prov., Lombardy. It is a rly. junction 11 m. W.N.W. of Brescia, on the line from Milan to Verona. On the W. is the convent of San Michele, situated on the long ridge of Mont' Orfano, the southernmost section of the morainic deposits of the Franciacorta. Pop. est. 5,000.

Rovereto or **ROVEREDO.** Town of Italy, in the Trentino. On the Leno, and in the valley of the Adige, it is 15 m. S.S.W. of Trent by the Brenner rly. It is commanded by a castle, later used as a barracks, which, burnt down in 1487, was rebuilt by the Venetians in 1492. The buildings include the 15th century church of San Marco, that of Santa Maria del Carmine, built in the 14th century and now used as a sacristy to a later one, and the old palace of the counts of Arco, restored in 1906, and now a bank. Antonio Rosmini-Serbati was a native. The chief industrial

town of Tirol, this is a centre of the Tirolese silk trade. Leather and paper goods are manufactured; cereals, wines, and fruit are articles of trade. The town was heavily damaged in the First Great War. Pop. est. 14,000.

Rover Scout. Grade in the Boy Scout movement.

All scouts over 18 years of age may become Rover scouts on passing tests. Rovers are formed into crews, a rover crew forming part of every complete scout group. See Boy Scout.

Rove Tunnel. Tunnel on the Marseilles-Rhône Canal, France. It was begun in 1911, pierced in 1921, and completed in 1925. It lies under the hills N.W. of Marseilles in the peninsula between the Étang de Berre and the Gulf of the Lion. It is 4½ m. long, 72 ft. wide, 45 ft. high, and 13 ft. deep, and permits the passage in each direction of sea-going 1,200-ton barges. The tunnel makes the Étang de Berre (q.v.) an appendage to the important harbour of Marseilles. See Rhône map.

Rovigno. Adriatic seaport. It lies 40 m. S. of Trieste. The cathe-

dral of S. Euphemia is modelled on that of S. Mark at Venice, and has a campanile with a statue of the saint. Vines and olives are cultivated and there are manufactures of oil, tobacco, and cement, and tunny and sardine fisheries. Marble is quarried in the neighbourhood. Between the town and the rly. station is a zoological museum with special exhibits of Adriatic fauna. Off the coast are the Brionian islands, a favourite sea-bathing resort. Formerly in Austria-Hungary, Rovigno became Italian after the First Great War. Italy ceded it to Yugoslavia under the peace treaty of 1947.

Rovigo. Maritime province of N.E. Italy, in S. Venetia. It is traversed by the Adige, and the Po flows along the S. boundary. The surface is level, marshy by the sea, and much canalised. The chief products include rice, hemp, grain, silk, wine, and cattle. Its area is 684 sq. m. Pop. est. 250,000.

Rovigo. City of Italy, capital of the prov. of Rovigo. It stands on the Adigetto, and is a junction, 28 m. by rly. S. of Padua. It contains several old churches and palaces,

Rovigno, Yugoslavia. Quays in the fishing harbour

and portions of its ruined 10th century walls, and a medieval castle, also in ruins. Among other notable buildings are the town hall, picture gallery, and library. Manufactures include leather, silk, woollens, linen, and candles, and brewing and dyeing are carried on. First mentioned in 838, it belonged successively to the Este family, Venice, and Austria. The Duomo sustained damage to roof and windows in the Second Great War. Other damage was slight. Pop. 39,954.

Rovno (Pol. *Rowne*). Town of Ukraine S.S.R. It is 110 m. W.N.W. of Zhitomir, on the Usty, and is an important rly. junction. Its prosperity was built up largely by Jews, who carried on an extensive trade in grain timber, and cattle. It was promi-

Pierre Paul Roux,
French bacteriologist

nent in the First Great War, the Rovno-Vilna line being an objective of the Germans in their advance against the Russians in 1915. It was held by the latter, despite determined efforts to outflank it, until 1918. It went to Poland under the treaty of Riga, 1920, and came into Russian occupation at the partition of Poland in 1939. Taken by the Germans soon after they attacked the Russians in 1941, Rovno was for long the centre of administration of the German-occupied "eastern territories." It was recaptured Feb. 5, 1944, in a spectacular advance by armour and infantry of the 1st Ukrainian army. It was in the territory which reverted to Russia by the Russo-Polish treaty of 1945.

Rovuma. River on the boundary between Mozambique and Tanganyika Territory. It rises E. of Lake Nyasa, and flows 450 m. to the Indian Ocean, which it enters N. of Cape Delgado. It was explored by Livingstone and Kirk in 1862.

Rowallan, THOMAS GODFREY POLSON CORBETT, 2ND BARON (b. 1895). Chief Scout of the

British Commonwealth. Born at Gourrock, Dec. 19, 1895, he was educated at Eton and Sandhurst and commissioned in the Royal Scots Fusiliers, of which he commanded a

Lord Rowallan, Chief Scout of the British Commonwealth

battalion in France in 1940. He retired from the army in 1944, and in 1945 was appointed chief scout. He succeeded to his father's peerage in 1933.

Rowan. Variant name for the Mountain Ash (*q.v.*).

Rowe, FREDERICK MAURICE (1891-1946). A British chemist. Born at Stroud, Feb. 11, 1891, he was educated there, at Leeds university, and Brunswick technical school. Lecturer and head of the dyestuffs research laboratory at the college of technology, Manchester, 1916-25, he held the chair of colour chemistry at Leeds from 1926 until he died, Dec. 8, 1946. Rowe edited the journal of the Society of Dyers from 1932.

Rowe, NICHOLAS (1674-1718). English dramatist. Born in Bedfordshire, and educated at Westminster, he wrote eight plays, of which the best are *The Fair Penitent*, 1703, and *Jane Shore*, 1714.

The former contains the character of Lothario, who has passed into the currency of the language as the typical deceiver of women. Rowe was a master of pathos. He was a great student of Shakespeare, and published an edition of his works. In 1715 he received the poet laureateship, and he died Dec. 6, 1718.

Rowena. Character in Scott's novel *Ivanhoe*. Ward of Cedric the Saxon, she is in love with Cedric's son, *Ivanhoe*, who is banished because Cedric desires the beautiful heiress to marry his kinsman Athelstane. Chosen queen of the tournament at Ashby, she crowns the victor, *Ivanhoe*, and is captured by De Bracy, who threatens to kill both Cedric and *Ivanhoe* if she

Nicholas Rowe, English dramatist
After Kneller

refuses her hand to him. She is rescued, and finally married to *Ivanhoe*.

Rowett Research Institute. British field laboratory engaged in research on the nutrition of farm animals. It is a bureau of the executive council of the Imperial Agricultural Bureaux (*q.v.*), and its laboratory is at Bucksburn, near Dundee.

Rowfant. Locality in Sussex, England, 4½ m. W. of East Grinstead. In the old Tudor house here Frederick Looker-Lampson (*q.v.*) lived for the last 20 years of his life and stored his valuable library. Among the books in this famous collection may be noted a fine copy of the Shakespeare first folio, 1623; many early editions of Shakespeare's plays, Pope's copy of Chapman's translation of Homer, 1611, rare editions of the Elizabethan dramatists, and of the works of Bunyan, Defoe, Swift, Goldsmith, Fielding, Wordsworth, Thackeray, and Dickens.

ROWING: THE ART OF OARSMANSHIP

* Kenneth Payne. Rowing Correspondent, Daily Telegraph

The following is one of a group of articles, e.g. Boxing; Cricket; Football; Swimming; Sculling, dealing with sports. See also Boat

The history of the oar goes back fifty centuries, and the problems attending its use were worked out scientifically and practically by the builders of the ancient triremes and other war galleys. These have been fully discussed by Lord Desborough and by Dr. Warre. Now, however, except for its use by certain classes of fishermen and shore boatmen, rowing is almost solely a sport, and its history belongs to the last hundred years, centring as it does in the race rowed annually, since 1829, between crews representing the universities of Oxford and Cambridge, and the annual regatta which takes place at Henley. (See *Henley Regatta*.)

The first university boat race was held at Henley, and the Oxford boat is still preserved. She was 45 ft. 4 ins. long, with a beam of 4 ft. 4 ins., and a depth (forward) of 2 ft. 5½ ins. Her number 4 wielded an oar no less than 15 ft. 3½ ins. long, of which 4 ft. 2½ ins. were inboard. The whole equipment, indeed, in 1829, represented the first conscious change, not merely from pleasure-craft to racing eights, but from sea-boats to the fresh-water "shell."

Three typical inventions differentiate first-rate oarsmanship in racing craft on rivers from the rowing seen in pleasure boats or on the sea; the outrigger, the

smooth and keelless hull, and the slide.

Though the first rough sketch of an outrigger was known in 1828, it was not perfected for narrow racing boats by Clasper until 1844, and the first outrigger eight in the university race appeared in 1846. The first keelless boat used for racing, made with a smooth hull of polished cedar without any overlapping strakes, was Clasper's four-oar in 1847, and Oxford used a four of this build soon afterwards. At Henley in 1856 Matt Taylor's boat for Littledeale's winning Chester eight revolutionised racing craft construction. The 1829 model of 45 ft. by 4 ft. had not only been narrowed down by the invention of outriggers, but, to secure more flotation, had grown to a length of more than 65 ft., by less than 2 ft. broad. Matt Taylor's contribution was not so much the keelless hull for eights, which Clasper had already introduced in fours, as the shortening of the length to 56 ft., and more particularly the placing of the broadest beam well forward, instead of nearly amidships, as in the old, longer models. The boat used by Oxford in 1857 was only 55 ft. long by 25 ins. wide.

The third of these typical inventions, the sliding-seat, had been foreshadowed by the practice

Rowing with sliding seat. 1. Position of hands and wrists for beginning. 2. Beginning. 3. Just after beginning. 4. Half through stroke. 5. Position at finish. 6. Hands and wrists at finish. 7. Hands dropped for feathering. 8. Arms extending on recovery. 9. Body swinging forward and carrying slide. 10. Blade beginning to turn off feather

From *The Complete Oarsman*, by E. C. Lehmann, by courtesy of Methuen & Co.

among such north country scullers as Jack Clasper or Harry Kelley, of greasing their broad, fixed thwart, and moving to and fro on it as their body swung forward and backward. The first actual slide was invented in Chicago in 1857 by an American, who was investigating a wholly different detail in the stroke, and it was first seen in a six-oar in 1870, in the United States. The extraordinary improvement introduced was speedily recognized, and the university race of 1873 was the first rowed on slides, which gave a movement about 12 ins. or less. But the true combination of slide with swing, which is the essence of the best English style, was not so quickly understood. Hanlan, the famous sculler, was its first real exponent.

Yet even to-day many crews think that the slide only substitutes leg thrust for body swing, and forget that the increased labour the slide entails must inevitably tire a man's heart and legs in a mile, if it is not rightly applied, and if it is not assisted by the weight of the body swing. A man's strength gradually evaporates with every stroke. His weight remains the same from start to finish. This is why the true style always endeavours to combine the two.

Dr. Warre, who did so much to teach this style to Britain's best oarsmen, made a scarcely less valuable contribution to the sport in elaborating a theory of boat-building from the point reached by Matt Taylor. The professional builder had proceeded, from 1857,

for more than sixty years, on a rule-of-thumb method of instructive empiricism which proved, on the whole, marvellously successful. Sims, of Putney, for instance, built the boats for each university in the race of 1903, for crews averaging over 12 stone. They had a length of 63 ft., with a beam of 23½ ins., and a depth of 9½ ins. amidships; and the boat he designed for Cambridge against Harvard in 1906 weighed 277 lb., and carried over 1,500 lb. Neither he nor any of his successful contemporaries could give any real reason for these dimensions, and their master section was usually placed at a distance from the bow, representing 5-12ths of the whole length, leaving 7-12ths for tapering towards the stern. Sometimes their boats were fast, but this was not always the case.

Clearly it was necessary to try to arrive at some theory or formula which would at least prevent obvious error, and might lead to unexpected improvement. At first the yacht builders had their say; but they could contribute nothing useful to the theory of a racing eight, except the valuable fact that a boat at twelve knots, the pace seen in a race at Putney, must experience a resistance of skin-friction in the water, of a pound to every square foot of immersed surface. No other boat-builder has to face the problem of a dead-weight of 400 lb., with a motive power weighing over 1,400 lb., which not only swings to and fro, but moves 16 ins. or more backward and forward in each stroke.

It was therefore fortunate that Dr. Warre should have taken up Matt Taylor's model for investigation. He satisfied himself that slides did not produce sufficient longitudinal oscillation to justify any length over 60 ft. He propounded the proportion of $\frac{1}{3}$ to $\frac{1}{4}$ in a 56 ft. hull as the right indication for the master section, which put the broadest beam (27 ins.) well forward, 21 ft. from the cutwater, with a fine entry, bluff bows, and lines that tapered delicately from number three's stretcher to the stern; and he suggested the "twin-circle" theory for designing the curves of the hull. But even with Mark Barr's additions, this theory remained incomplete.

The matter was submitted to the astronomer-royal, Sir W. Christie, who put forward the theory of the involute of the circle. By the unwinding of the thread from a suitable reel of cotton (of 6½ inches diameter for a full-sized design, or 1½ inches diameter for a one-quarter size), the pencil at the

end of the thread produces a very beautiful curve, from which every section of a racing eight from bow to stern can be graphically drawn, and, by the use of templates, practically set out, even by anyone entirely ignorant of the mathematical principles involved. The one later development was in 1936 the introduction into the building of an eight of cross beaming in order to strengthen it. Sims's eights in 1948 had roughly the same dimensions as in 1903—60 ft. to 62 ft. total length, 23½ ins. beam.

Changes in the Oars

Oars have changed almost as much as boats—from more than 15 ft. long in 1829 to less than 12 ft. at the Henley regatta of 1919—if only winning crews are considered. In 1876 Brickwood records they were about 12 ft. 9 ins. In yet earlier years Woodgate said that out of 25 parts, seven were considered right for the proportion inboard and 18 outboard; and he continued to advocate a length of 12 ft. 6 ins., or more, as the most effective. This length was used by the New College crew of 1897.

Such long oars, however, tend to take charge of a man, instead of leaving him in full control. They imply more windage, and they also involve a slower stroke and a narrower blade. It is probable also that their blades tend to enter the water at an angle of less than 45° to the boat's side, which pinches her instead of driving her forward. For Putney, and for the University race of 4½ m., in which anything over a rate of 36 strokes to the minute is rarely seen and under 30 is a frequent average, they may be more successful than at Henley, where crews start at over 40 and stay as near that pace as possible. R. C. Lehmann's most speedy Leander crews (from 1891 to 1896) won with oars of a total length of 12 ft. (or at most 12 ft. 2 ins.), with 3 ft. 8 ins. inboard, and blades 2 ft. 7 ins. long by 6 ins. broad. Many winning Leander crews between the First and Second Great Wars used 12 ft. 3 in. oars with a 5½ in. blade and 3 ft. 8½ in. or 3 ft. 9 in. inboard. Tideway crews favour an oar of a total length of 12 ft. 1 in. with a 6½ in. to 6¾ in. blade and 3 ft. 8½ in. to 3 ft. 9 in. inboard. The weight of an oar should be less than 8½ lb. for Henley; but heavier oars have been used at Putney.

After the boat and oars comes the question of rig. Whereas before 1921 the measurement between the centre of the seat and the centre of the thole or swivel was

normally 30½ ins., the tendency after that was to increase it, sometimes to as much as 32 ins., with an average of 31½ ins. The rowlocks, in which the oars rest, should be 6 ins. or less above the seat, depending on the floatiness of the boat. The seat itself should be not more than 8½ ins. above the level of the oarsman's heels. The lower the oarsman can sit above his heels the better. Most men of ordinary suppleness can manage 8½ ins. Thames rowing club has been successful with 7½ ins., and the fine Swiss crews of the 1930s had measurements of less than 7 ins. The instrument devised by Col. W. A. L. Fletcher is the best for examining these details. Although Dr. Warre disapproved of "camber," the curve which brings the bow and stern of an eight higher out of the water than her middle, all boats came to be built with it.

In an eight, fixed rowlocks were generally used, and continue to be by both university crews and by Leander club. The majority of clubs, however, changed to swivels, and few of any foreign crews retained the fixed rowlock. Opinion differs as to which is the better for an eight. Swivels are used for fours, pairs, and sculling-boats. Of these last it is only possible to give average measurements and to suggest that the rigger-spread should be 5 ft., the length about 26 ft., the beam about 10½ ins., with a depth of about 6 ins. for a man under 12 stone. Sculling has, in the race for Doggett's Coat and Badge, a longer continuous history than any other form of watermanship, and at its highest, in the Diamonds or the Wingfield sculls, the amateur championship, it necessitates a finer combination of delicacy with endurance, and a longer period of practice, than any other sport of the kind.

Methods of Teaching

The art of rowing can be learnt only on the water, with the help of an experienced coach and by covering long distances. The ideal which all oarsmen strive to attain but few reach is to catch the beginning from the stretcher, to throw the weight from the feet on to the blade at the same time as the legs begin to shove the slide back, and to finish the body-swing exactly as the slide reaches the back stops.

In the process of learning crews rarely attain much speed. The old method of teaching was to get the oarsman to go through the motions correctly. In the early 1920s Steve Fairbairn initiated a

new approach to rowing. All thought at first had to be focused on driving the slide back with the legs; the blade became "rowed in" to the water. The theory was based on the fact that the point of greatest effectiveness in the stroke is when the loom of the oar has almost reached a position at right angles to the side of the boat. The portions of the arc on either side of this point produce less and less effective work as they approach the side of the boat at each end of the stroke. Thus, assuming the blade is wide enough to avoid "slip," the eight oars would strike the water a blow at the most effective point. This method was widely adopted, and undoubtedly produced higher speeds among average crews. Criticism was levelled at it, on the grounds that it produced fewer first-class oarsmen, and therefore fewer first-class crews.

Any reader interested in styles of rowing should visit an Olympic regatta where any number of different ways of rowing can be seen, many of them very effective. He will come away probably with the idea that there are three cardinal principles: the blade must be anchored in the water; the stroke must be driven through by the legs from the stretcher; these two essentials must take place perfectly together. No races, however, will be won unless the oarsmen are fit, and prepared to row hard over the whole course.

Bibliography. Records of Henley Royal Regatta, 1839–1902, H. T. Steward, 1903; *The Complete Oarsman*, R. C. Lehmann, 1908; *On the Grammar of Rowing*, Dr. E. Warre, 1909; *The Record of the University Boat Race, 1829–1909*, C. M. Pitman, 1909; *Rowing at Henley*, Sir T. A. Cook, 1919; *Rowing Notes*, S. Fairbairn, 1926; *University Boat Race Official Centenary History, 1829–1929*, G. C. Drinkwater and T. B. Sanders, 1929; *Henley Records, 1919–1938*, C. T. Steward, 1939; *The Rowing Almanac*, published annually.

Rowland, HARRY AUGUSTUS (1848–1901). American physicist. Born at Honesdale, Pa., Nov. 27, 1848, and educated at Rensselaer Polytechnic Institute, Troy, he was appointed professor of physics at Johns Hopkins university, 1876, a post he held until his death, April 16, 1901. Rowland was one of the most brilliant American physicists of his century. His diffraction gratings used in spectroscopy were a great advance on previous instruments of this type. The determination of the mechanical equivalent of heat, of the

value of the ohm and other electrical constants, and his discovery of the magnetic effect of electric convection attest his high powers. He wrote *Studies on Magnetic Distribution*, 1875; *On a Magnetic Effect of Electrical Convection*, 1876; *Research on the Absolute Unit of Electrical Resistance*, 1878; *On the Mechanical Equivalent of Heat*, 1880; *On Concave Gratings for Optical Purposes*, 1883.

Rowlandson, THOMAS (1756–1827). Jewish caricaturist. Born in Old Jewry, London, he studied at Barrow's academy in Soho, the R.A. schools, and in Paris. Until 1780 he painted and exhibited landscapes, portraits, and history in the grand manner; but his faculty for caricature had already displayed itself, and after 1787 he produced nothing else. The Westminster election of 1784 brought him into notice as a political satirist; the "delicate investigation" of 1809 into the conduct of Princess Caroline, and popular feeling against Napoleon, gave him further opportunities of exercising his art. Most of these drawings

Thos. Rowlandson
Self-portrait

for public consumption are crudely coloured and coarse, even according to the standard of the time. He is seen to greater artistic advantage in *Three Tours of Dr. Syntax*, with text by William Combe, which appeared in *Ackermann's Poetical Magazine*, the nucleus of a fine series of colour books. Rowlandson was a big handsome man and an inveterate gambler. He died in London, April 22, 1827. In 1945 a drawing by Rowlandson, *A Night at the Old Vauxhall Gardens*, was discovered in a Walthamstow antique shop and purchased for £1; it was later sold at Christie's for 2,600 guineas. This drawing, shown at the R.A. in 1784, was identified from contemporary engravings. See *Caricature. Consult R. the Caricaturist*, J. Grego, 1880; T. R.: *His Drawings and Water-Colours*, A. P. Oppé, 1923.

Rowlatt, SIR SIDNEY ARTHUR TAYLOR (1862–1945). A British lawyer. Born July 20, 1862, he was educated at Fettes and King's College, Cambridge, and was called to the bar in 1886. In 1900 he became junior counsel to the inland revenue, transferring to the Treasury in 1905. In 1908 he was chairman of the committee dealing with criminal conspiracies in India; his work led to the Rowlatt Act, designed to strengthen the powers of the government in putting down revolutionary crime. Rowlatt was made a knight and a judge in 1912. He was chairman of the commission on betting, 1932, and of the general claims tribunal during the Second Great War. He died March 1, 1945.

Rowley, WILLIAM (c. 1585–1642). English dramatist. Greatly in request as a collaborator, he was associated with Massinger, Middleton, Heywood, Ford, Dekker, Webster, and, possibly with Shakespeare. He joined the king's servants in 1623, and retired 1627. Rowley claimed sole authorship of four plays, of which *A New Wonder*, 1632, was declared to be his best work.

Rowley Manuscripts. Literary fabrications by Thomas Chatterton. This boy, who began to write at 10, had access to old parchments from the muniment room of the church of S. Mary Redcliffe, Bristol, of which his uncle was sexton. This led him to fabricate poems and prose fragments which he attributed to ancient sources. His first conception of the Rowley Romance dated from 1765 when he was thirteen; its central figure was an imaginary monk of the 15th century, Thomas Rowley. Milles, president of the Society of Antiquaries, published in 1782 an edition of the Rowley poems. Definite proof that these were the work of Chatterton was not forthcoming until in 1871 their spuriousness was established by Skeat.

Rowley Regis. Mun. bor. and market town of Staffs, England. It is near the Stour, 5 m. W. of Birmingham, served by rly. and canal. Surrounded by coal mines, it has ironworks, potteries, and works for the manufacture of chains, etc. It shares an M.P. with Tipton. Market day, Sat. Pop. 41,238.

Rowntree, BENJAMIN SEEBOHM (b. 1871). British social worker. Educated at the Friends' school, York, and Owens College, Manchester, he entered his father's chocolate business, becoming a director, and was chairman 1925–41. He was made C.H. 1931. A prominent social and Liberal worker. He was chairman of the Nat. Inst. of Industrial Psychology, and a trustee of the Nuffield Trust. He wrote *Poverty, a Study of Town Life*, 1900; *Unemployment*, 1911; *The Way to Industrial Peace*, 1914; *The Human Factor in Business*, 1921, rev. ed. 1937; *Poverty and Progress*, 1941.

Rowse, ALFRED LESLIE (b. 1903). English historian. A Cornishman, he was born Dec. 4, 1903, and educated at St. Austell. A scholar of Christ Church, Oxford, he transferred to Merton College as a lecturer in 1927, and during 1931–35 taught at the London School of Economics. Love of the Tudor period, a spirited local patriotism, and a preference for the form of the historical essay were shown in his writings. *Tudor Cornwall*, 1941, and a study of Sir Richard Gren-

B. S. Rowntree,
British social worker

Thomas Rowlandson. One of the artist's most delicate drawings, entitled *A Sailor's Family*

ville, 1937, contained original work; *The English Spirit*, 1944, and *Essays of a Decade*, 1947, were attractive collections. His bitter, honest autobiography, *A Cornish Childhood*, 1942, was the most discussed book by Rowse, who was also a poet, and a controversialist originally of Left-wing sympathies, later veering towards the Right.

Rowton, MONTAGUE WILLIAM LOWRY-CORRY, BARON (1838–1903). British politician. He was

Baron Rowton,
British politician
Elliott & Fry

born Oct. 8, 1838, and educated at Harrow and Trinity College, Cambridge, being called to the bar in 1863. His father, Henry Corry, was first lord of the Admiralty under Derby in 1867–68, and in 1866 Montague became private secretary to Disraeli. He retained that position until Beaconsfield's death, at which the Tory leader left him all his papers. In 1880 he was made a baron. He is known as the founder of the Rowton Houses (*q.v.*). Rowton died unmarried and without an heir Nov. 9, 1903.

Rowton Heath. Open space in Cheshire, England. It is 3 m. S.E. of Chester. Here on Sept. 24, 1645, the forces of Charles I were defeated by the parliamentarians. The king had just entered Chester, pursued by a body of horsemen under Sedenham Poyntz. On Rowton Heath the latter engaged and routed a detachment of the royalist cavalry. *See* Civil War.

Rowton Houses. Buildings designed to provide comfortable and cheap lodgings, the amenities of club and hotel life, to single men. The scheme was devised by Lord Rowton, and the first house was erected at his own cost in Bond Street, Vauxhall, with accommodation for 477 persons. It was opened Dec. 15, 1892, and its success, financial and social, was such that in 1894 a company was formed with Lord Rowton as chairman to extend the work. Between 1896 and 1910 similar institutions were opened in London at King's Cross, Newington Butts, Hammersmith, Whitechapel, and Camden Town (total accom. 4,000). The welfare club has obtained numerous successes in billiards and draughts; in 1948 both the British and world champions in draughts were residents at the Camden Town house. W. H. Davies (*q.v.*) lodged for two years in a Rowton house

while trying to start his literary career.

Roxana. Daughter of the Bactrian prince Oxyartes and wife of Alexander the Great. Her son, Alexander Aegus, born after his father's death, was acknowledged as the future king, and taken by his mother to Pydna in Macedonia, where she became intimate with Alexander the Great's mother Olympias. During the struggle for supremacy among the successors of Alexander, Pydna was captured by Cassander and Olympias put to death, Roxana and her son being removed to Amphipolis, imprisoned, and murdered by Cassander's orders in 311 B.C.

A Latin tragedy called *Roxana*, by W. Alabaster, was produced at Cambridge, about 1592, printed 1632, and praised by Dr. Johnson. *Roxana* is also the name of one of the principal characters in Nat. Lee's tragedy, *The Rival Queens*, or *Alexander the Great*, 1677. The full title of the romance by Defoe, usually called *Roxana*, is *The Fortunate Mistress*; or, *a History of the Life and Vast Variety of Fortunes of Mlle. de Belau*, afterwards called the Countess of Wintellsheim in Germany; being the Person known by the Name of Lady Roxana in the Time of King Charles II, 1724.

Roxburgh. Former town of Roxburghshire, Scotland. The burgh stood near where Kelso now stands, at the junction of the Teviot and the Tweed, and gave its name to the county. There was a castle here in the 11th century, and this, made into a great

Roxburgh, Scotland. Ruins of the castle at the junction of the Tweed and Teviot

fortress, was a favourite residence of the Scottish kings. Around it the town grew until it was one of the most important in Scotland. It had a church, court of justice, mint, and grammar school. The castle was besieged and taken several times by the English, James II being killed at one siege in 1460. Soon after this it began to fall into decay and it was finally dismantled in the 16th century. The town gradually became smaller until today nothing is left of it. A fair is held on the site on Aug. 5 every year. About 2 m. away is the village of Roxburgh, or New Roxburgh, with a rly. station. Pop. 698.

Roxburgh. Town of Otago, New Zealand. It is a borough on the Molyneux river, 100 m. N.W. by rly. from Dunedin. Fruit-growing is the main occupation of the neighbourhood. Pop. 479.

Roxburgh, WILLIAM (1751–1815). British botanist. Born at Craigie, Ayrshire, June 3, 1751, he was educated at Edinburgh. He entered the medical service of the East India Company and went to India, where he studied the flora, becoming in succession the Company's botanist and, in 1793, superintendent of the Botanic Gardens, Calcutta. He published *Plants of the Coast of Coromandel*, 1795, and *Hortus Bengalensis*, 1814. Roxburgh died at Edinburgh, Feb. 18, 1815. His *Flora Indica* was published in three vols., 1832.

Roxburghe, DUKE OF. Scottish title borne since 1707 by the family of Ker. Robert Ker, who was a leading member of a famous

Rowton Houses. The frontage of the institution at Camden Town, London

John, 1st duke of Roxburghe, Scottish statesman

Border family, was made earl of Roxburghe in 1616 by his friend James I. By special arrangement this title passed on his death to his grandson, William Drummond, who took the name of Ker, and his descendant John became the 5th earl in 1693. He was secretary of state for Scotland, and, having helped to bring about the union of the two kingdoms in 1707, was in that year made a duke. He was secretary for a period after the union.

John, the 3rd duke, formed a famous and valuable library, sold in 1812, and gave his name to the Roxburghe club. He died in 1804, and in 1805, when his cousin died, the titles appeared to become extinct.

However, in 1812, they were successfully claimed by Sir James Innes, Bart., a descendant of the 1st earl; he took the name of Innes-Ker, and from him the later dukes are descended, George Victor Robert John Innes-Ker (b. Sept. 7, 1913) becoming the 9th duke in 1932. Their chief seat is Floors Castle near Kelso, and the duke sits in the house of lords as Earl Innes, a title dating from 1837. His eldest son is known as marquess of Bowmont.

Roxburghiaceae. Small family of twining shrubs. Natives of Asia, Australia, and Florida, they have tuberous roots, leathery leaves, and large, showy flowers. There are only a few species, distributed in three genera: Crocmitia, Stemonia, and Stichoneuron. The tuberous roots of stemonia, after preparation with lime-water, are candied, but have little flavour.

Roxburghshire. Border county of Scotland. Its area is 666 sq. m., and it is sometimes called Teviotdale after the name of its chief river. The Tweed and Liddel also give their names to beautiful dales here, while smaller streams include the Gala, Ale, Jed, and many others. The surface is hilly in the S.E. where are the Cheviots, one peak rising to 2,382 ft., and in

Roxburghe
(3rd Duke)

After W. Hamilton

Roxburghshire. Map of this Scottish border county, N.W. of the Cheviot Hills

Jedburgh can show the houses where Mary Queen of Scots lay ill in 1566; where the Young Pretender lodged in the '45; where Robert Burns stayed when made a burgess of the town in 1787; and where Scott visited Wordsworth and his sister, and read to them part of the Lay of the Last Minstrel.

the N. where the Eildon Hills enter the county. Much land is devoted to grazing more than half a million sheep, while tweeds are manufactured. The rivers are noted for their fishing. Jedburgh is the county town; other towns are Hawick, Kelso, Melrose, and St. Boswells. With Selkirkshire it sends one member to parliament. The county is full of scenes of beauty and historic interest, the latter due, in part, to its position as a Border county. The castles or peel towers include Ferniehurst, Branksome, Harden, Hermitage, and others celebrated in song and story, while there are abbey ruins at Melrose, Jedburgh, and Kelso. There are fine examples of hill-forts. The Romans had stations in the district, which was made a county about 1160. Pop. 45,200.

Roxburghshire arms

Roxburghshire shared in the ballad and other literature that commemorates the history and romance of the district.

Sir Walter Scott spent his early years at Sandyknowe, near Smalholm Tower, and attended the grammar school at Kelso, where he first met James Ballantyne. Abbotsford was for a long time his home. The scenes of many of his poems and novels are laid in the county. Branksome or Branksome Tower is described in *The Lay of the Last Minstrel*; in the churchyard of the present village of Roxburgh is the grave of Andrew Gemmels, the original of Edie Ochiltree in *The Antiquary*; Bridgend, near Melrose, is described in *The Monastery*.

In Melrose Abbey is the reputed grave of Michael Scott, and in the neighbourhood is the Eildon tree, where Thomas the Rhymer met the fairy queen. Sir David Brewster, who was born at Jedburgh, lived at Gattonside. William Turnbull (d. 1454), bishop of Glasgow and founder of Glasgow university, is described as a native of the county; Samuel Rutherford (1600-61), principal of St. Mary's College, St. Andrews, was born at Nisbet, now Crailing; Mary Somerville, the mathematician, at Jedburgh; John Leyden at Denholm, and Jane Elliot at Minto, Teviotdale. Ednam is the birthplace of James

Thomson, who was educated at Jedburgh. Consult *Minstrelsy of the Scottish Border*, Sir Walter Scott, 1839; *Roxburghshire*, Sir G. Douglas, 1898; *Highways and Byways in the Border*, A. and J. Lang, 1913.

Roxbury. Place-name applied to many towns and villages in the U.S.A. The largest of these places, the former city of Roxbury, or Boston Highlands, has been since 1868 a S.W. suburb of the city of Boston, with a frontage on Massachusetts Bay. It was founded by the Puritans in 1630 and received a city charter in 1846. The Roxbury Latin School was founded as the "Free School in Roxburie" about 1644, and endowed by Bell in 1671. In 1841 W. Roxbury was the scene of the Brook Farm experiment, from which leading figures in 19th century American literature arose. C. A. Dana, Nathaniel Hawthorne, and Emerson all took part. The buildings were burned in 1846 and the farm sold in 1849. Here are hospitals and other similar institutions and factories for textiles, cordage, carpets, and shoes. Other places of this name are in the Catskill mts., New York state (pop. est. 2,000); and on the Shepang river, Conn. (pop. est. 1,000).

Roy, WILLIAM (1726-90). British soldier and archaeologist. Born in Lanarkshire on May 4, 1726, he was educated at Lanark grammar school, and in 1746 was employed on the Marshal Wade road-making works in the Scottish Highlands. His work secured him an army commission, and he rose to lieutenant-colonel's rank by 1762, seeing active service at Île d'Aix, 1757, and in Germany, 1759-61. In 1765 he became surveyor-general of the coasts and carried out many important fortifying works. Major-general, 1781, director of Royal Engineers, 1783, he died in London, July 1, 1790. He left many valuable accounts of his archaeological researches into Roman military works in Britain.

Royal (Fr. *roi*, king). Belonging to a king or queen. It is borne by a large number of societies as a mark of honour, and is prefixed to official bodies created by the sovereign, e.g. royal commission, royal courts of justice. Most of these are placed in this Encyclopedia under their distinctive names, e.g. Commission; Horticultural Society; Literature, Society of; Physicians, College of. In one or two cases, however, the word royal is the dominating one, and such entries, e.g. Royal Academy, Royal Air Force, Royal

Royal Academy. Burlington House, Piccadilly, London, where the Royal Academy exhibitions are held. The buildings shown are part of the original mansion of Richard Boyle, third Earl of Burlington, built in 1695-1743

Family, Royal Institution, and Royal Society, appear under the word royal. So do the various army corps which were honoured with the prefix Royal before Dec., 1946. But regiments so designated, e.g. county regiments, are described under their topographical or other designations.

Royal Academy of Arts. British art institution. It was founded Dec. 1, 1768, by George III, the royal "instrument" providing for the appointment of a president and forty Academicians, and for the holding of annual exhibitions. The Academicians were to include professors of all branches of the fine arts, thus inaugurating the educational side of the Academy's activity now represented by the Academy schools. In 1769 a class of 20 associates and six "associate-engravers" was created, the latter not being for several years made eligible for full Academic rank. At the present time these numbers are maintained at about the original figures, though the classes of "honorary retired" Academicians and associates and "honorary foreign" Academicians swell the aggregate.

In 1780 rooms in Somerset House were assigned to the Academy. In 1834 it was removed to Trafalgar Square, and in 1869 to Burlington House, Piccadilly.

The annual exhibition opens the first Monday in May, and lasts till over the following August Bank Holiday. Academicians and associates have the right to contribute six works apiece, but the outside artist may only submit three works. In addition, a winter loan exhibition of Old Masters is usually held at the galleries for a few weeks at

the beginning of the year. Included in the R.A. premises is the Diploma Gallery, so called from the fact that it consists of works presented by successive Academicians on their election, this event being signalled by the receipt of a diploma signed by the monarch. The administration of the Chantrey Bequest is vested in the president and council. See Academy; Chantrey, Sir F. Consult The Royal Academy and Its Members, 1768-1830, J. E. Hodgson and F. A. Eaton, 1908; *The Inner Life of the Royal Academy*, G. D. Leslie, 1914; *The Royal Academy*, W. R. M. Lamb, 1935.

Royal Aeronautical Society. British institution for the study and encouragement of aeronautics. Founded in Jan., 1866, as the Aeronautical Society of Great Britain, it is the oldest institution of its kind in the world having an unbroken record. The society first met on June 27, 1866, under the presidency of the duke of Argyle, and the opening paper read, *Aerial Locomotion*, by F. H. Wenham, which laid down the principles of mechanical flight, became a classic. In 1868 the society organized the first aeronautical exhibition, and later undertook research into aerodynamic theory, and built the first wind tunnel. In 1927 it amalgamated with the Institution of Aeronautical Engineers. Gold and silver medals are awarded for aircraft design and flying skill. The society's h.q. are at 4, Hamilton Place, London, W.1. Branches in the U.K. and in Australia and Canada. Its library of aeronautical literature is extensive.

ROYAL AIR FORCE: ORIGIN & DEVELOPMENT

G. D. H. LINTON, Former Lecturer to Army and R.A.F.

This contribution traces, from its origins in the First Great War, the history of Great Britain's third fighting service. Related articles deal with Air Defence; Air Fighting; Air Raids; and Air Warfare; with Bomber Command and other air formations; with specific aircraft, e.g. Hurricane; Spitfire; Wellington; and with the war commanders of the R.A.F., e.g. Harris; Portal; Tedder. For insignia of the service, see Rank illustration

Not until the First Great War had entered what proved to be its final year, 1918, was the long-urged step taken of merging the Royal Flying Corps and the Royal Naval Air Service into one independent fighting body—the first of its kind in any country. The effective date was April 1, and the creation of the Royal Air Force (commonly abbreviated to R.A.F.) caused an immediate improvement in administration; no longer did the War Office and the Admiralty compete for deliveries from the manufacturers. The system of directing the R.A.F. by means of an air council, with the secretary of state for Air and his under-secretary (both civilian ministers) representing the government of the day, and the chief of the air staff heading the service members, was also introduced early.

Strength in 1918

The young R.A.F. enjoyed an ever-growing mastery of the air on all fronts, and at the time of the armistice (Nov. 11, 1918) its strength in personnel was 27,333 officers and 263,410 other ranks, and in aircraft 22,647 aeroplanes and 103 airships, grouped in 188 operational squadrons—by far the largest air force in the world. By 1922, the effective strength had been reduced to 32 squadrons, composed of 350 first-line aircraft, 20 of which were kept overseas by imperial commitments (always an important factor in British air strategy). This reduction in the strength of the R.A.F. forced many aircraft factories to close; others barely existed on token orders for new equipment and replacements. But the R.A.F., under its creator, Sir Hugh Trenchard (*q.v.*), was kept at a high standard of training and efficiency and found in succeeding years in such areas as the N.W. frontier of India, Iraq, and Aden opportunities for active police and patrol work, and provided evidence of the value of air transport.

While Trenchard, first to attain the highest of the newly instituted R.A.F. officer ranks (air marshal, then air chief marshal, finally marshal of the R.A.F.), was still chief of the air staff, the achievements of the R.A.F. overseas in-

cluded the inauguration, 1921, of a regular air mail service between Bagdad and Cairo, and, 1928, the evacuation of 586 persons from the Afghan capital, Kabul. The "shop-window" of the R.A.F. at this period was the pageant (later termed display) at Hendon, held annually from 1920 to 1937; this was for a time replaced by Empire air day, but was revived in 1950, at Farnborough. Annual exercises were also a feature of training.

The air council realized, too, the value both to home manufacturers and pilots and in international prestige of success in world record attempts. The speed triumphs of the Supermarine seaplanes successful in the Schneider trophy races of 1927, 1929, and 1931, the long-distance record (5,340 m.) of the Fairey monoplane in 1933, and a number of alt. records were achieved by serving R.A.F. pilots.

The broad division of R.A.F. aircraft into fighters for home defence, bombers for offence, and reconnaissance aircraft (including seaplanes) for long-range coastal patrol, etc., was gradually evolved, as was grouping into squadrons (the smallest operational unit, usually 9–12 aircraft in two or three flights); two or more squadrons forming a wing; and a number of wings, a group. Each aerodrome or site of a R.A.F. establishment became a R.A.F. station, accommodating perhaps a number of squadrons, but also having its own h.q. staff, including commanding officer, adjutant, and station warrant officer. The highest formations were at first termed areas (inland area, fighting area, Wessex bombing area, etc.), and it was not until expansion came in the late 1930s that operational grouping into commands (Bomber Command, and so on) became the practice. Overseas, R.A.F. India, R.A.F. Middle East, etc., were geographical groupings.

Divided Control

Although the independence of the R.A.F. was never challenged, the correct relationship with the other two services where their work was closely linked remained a source of controversy until the test of war showed the answer. For many years, there were army co-

operation squadrons in the R.A.F., manned by the latter service and equipped with short-range two-seater utility aircraft. The Fleet Air Arm (*q.v.*), formed in 1924 as a seagoing branch of the R.A.F., was rather unhappily wedded to the navy; the Admiralty retained control even of the seconded R.A.F. crews while the units were afloat, but not when the carriers put in and the aircraft were flown off to land. This system existed until 1937, when the Admiralty assumed complete control, and the service (later called Naval Aviation) became an entirely naval responsibility. The "general reconnaissance" harbour-based flying boats—some of them of considerable range—remained a R.A.F. charge. British experience of large airships was unhappy, and with the loss of R.101 (*q.v.*) in 1930 development of lighter-than-air machines ceased.

Pre-War Expansion

In 1935, when there were only 40 squadrons for home defence, events in Europe forced a change in govt. policy; expansion and rearmament to raise the U.K. from her position as a poor fifth amongst the world's air powers then began. At that time the normal training of the future officer pilot (*n.c.o.* aircrew were still exceptional) at the Royal Air Force College, Cranwell, lasted two years, and even the numbers who qualified for short-service commissions failed to bring the total to what was required. Various classes of reserve were therefore built up. One of these, the Auxiliary Air Force (A.A.F.), had been formed in 1925; but its squadrons of "week-end airmen" now came to include the balloon barrage, as well as bombing and fighting units.

A notable innovation was the R.A.F. Volunteer Reserve (formed in 1936), in which civilian aircrew were trained at the government's expense at civil "elementary and reserve flying training schools," on undertaking to give their services in the event of emergency. When war did come, the R.A.F.V.R. became the normal method of entry for new aircrew recruits, with basic training at an "initial training wing" preceding that at the E.F.T.S.

In 1937, there were 120 squadrons in home commands, 20 overseas, and 20 in the Fleet Air Arm. This provided a total of 2,500 first-line aircraft. A considerable contribution to the manpower required was made by the revival in 1939 of the Women's Auxiliary Air Force (*q.v.*), releasing many men for more active duty; and later with the official adoption of the Air Training Corps as recognized pre-entry training for the R.A.F. (A.T.C. began as Air Defence Cadet Corps in 1938).

The period of expansion coincided with the introduction into service of radically new types of military aircraft. The open-cockpit biplane was being supplanted by monoplanes with retractable undercarriage, landing flaps, variable-pitch propeller, multiple machine-guns, and other refinements. The manufacture of Hurricanes, Spitfires, Blenheims, and Wellingtons required a new technique just as did their flying. Motor manufacturers were persuaded to set up "shadow" factories for the production of both aircraft and aero-engines, sub-contracting and decentralisation were organized, and an industry was built up of such proportions that in 1940 the ministry of Aircraft Production (*q.v.*) was set up to deal with it.

In the Second Great War the R.A.F. went into offensive action on the day Great Britain declared war (Sept. 3, 1939). Daylight raids proved costly, and night raiders were rarely called upon in the early months to drop anything except propaganda pamphlets. Regular patrols and convoy escort, however, were instituted by Coastal Command, with the hunting of U-boats on the sea approaches to the U.K. and far out over the Atlantic their chief concern.

A new command, British Air Forces in France, was set up in Jan., 1940; at the same time the Empire Air Training Scheme (*q.v.*) permitted large-scale training in areas unaffected by blackout or threat of siege. In April came the German invasion of Denmark and Norway; in May came the German invasion of the Low Countries; in June the declaration of war by Italy and the defeat of France. R.A.F. Fighter Command won the Battle of Britain (*q.v.*); Bomber Command in growing strength went out to attack German industry and transport; Coastal Command never ceased its less spectacular

work, both offensive and defensive. R.A.F. Middle East came into the picture, with the fluctuating fortunes of the North African Campaigns (*q.v.*).

New United States aircraft, supplied first on "cash-and-carry" terms and later under lease-lend (*q.v.*), were brought across both N. and S. Atlantic by Ferry Command, R.A.F., later merged into Transport Command.

The Japanese attack on Pearl Harbour (Dec. 7, 1941) brought the U.S.A. and her huge air potential into the war on the Allied side, but added the Far East and Burma to the R.A.F.'s battle fronts.

The principle of integrated inter-Allied commands was accepted, and the Mediterranean Allied Air Forces, Air Command South-East Asia, and the Allied Expeditionary Air Force were all inter-Allied bodies. All included both strategic and tactical components—the A.E.A.F. for the invasion of W. Europe in 1944 having under command from the R.A.F. the 2nd Tactical Air Force (T.A.F.) and units of Fighter Command. All the dominion air forces, the organization and training of which (with the single exception of the South African Air Force) were modelled closely on that of the R.A.F., also took part in the A.E.A.F. As an example of the work carried out, the 2nd T.A.F., formed for close support of the ground forces, carried out 214,169 sorties, and dropped 38,397 tons of bombs in the year 1944, losing 1,672 aircraft and their trained crews in these operations.

The development of airborne forces called into being the Army Air Corps; parachutists and glider pilots were trained by the R.A.F.; R.A.F. crews manned the glider tugs, and in many cases piloted the gliders into action.

Wartime developments in home R.A.F. organization were the division of Training Command into Flying Training and Tech-

nical Training Commands, and the formation of Army Cooperation Command (later disbanded), Maintenance Command (at one time having the most personnel), Balloon Command, which took part in the invasion of Europe as well as in home defence, and the Royal Air Force Regiment (*q.v.*). The Royal Observer Corps, though of military standard in efficiency, and operating under H.Q. Fighter Command, remained a civilian body (*see* Observer Corps, Royal).

Two new branches of R.A.F. activity were the P.R. (photographic reconnaissance) units, provided with specially equipped high-speed long-range aircraft, and Air-Sea Rescue, which used both aircraft and surface vessels for lifesaving work.

Royal Air Force. Left, First Great War officer of the R.F.C., in captain's uniform. Centre, a squadron leader of the R.A.F., and right, uniform of a R.A.F. aircrewman

The scientific advances of the war years were many and significant. The most notable was the introduction of Radar (*q.v.*), at first for the defence of the U.K., later for seeking out and destroying U-boats, and for precision bombing. Jet propulsion (*q.v.*) did not come to fruition until the last year of hostilities—too late to affect the course of the air war.

The R.A.F. was the first air force to use huge high-explosive missiles of 4 up to 10 tons in weight. The war-saving British aircraft were the Spitfire and the Hurricane; the war-winners were the Mosquito light bomber and the Lancaster and the Halifax "heavies." Armament developed from the single .303 machine-gun to the

60-lb. rocket projectile and the remote-controlled multi-gun power-operated turret.

After the surrender of Germany in 1945 an R.A.F. command called B.A.F.O. (British Air Forces of Occupation) was set up in British-occupied Germany; strength in other overseas theatres was concentrated under H.Q. MEDME and H.Q. South-East Asia Air Forces (later called Air Command, Far East). At home, the wartime framework continued, with the addition of Reserve Command, revived from pre-war days to embrace the newly honoured Royal Auxiliary Air Force (including Fighter Control Units and Royal Auxiliary Air Force Regiment), the R.A.F.V.R., the A.T.C., and the University Air Squadrons.

In 1944, production peak year of the war, the aircraft factories and their associates formed the largest of all British industries, producing 25,453 aircraft (plus 1,472 gliders) in the year. With the end of the war, there was an immediate drop in aircraft production; and all except regular airmen were gradually released to civilian life. The strength of the Royal Air Force in the 1950-51 estimates was 198,000. War casualties officially totalled 112,296.

After the Empire Air Training Scheme was wound up in 1945, a series of empire schools—Empire air armament school, Empire air navigation school, Empire flying school, and so on—providing liaison with the dominions and colonies, was retained until the formation, 1949, of the R.A.F. Flying College. Development of combined operations training and the study and practice of "land/air warfare," also continued.

Post-War Conditions

Officers for aircrew duties were commissioned as before into the general duties branch; the R.A.F. college was reopened, and wider opportunities than before were offered to potential officers. Candidates for entry to Cranwell must be between 17½ and 19; the course lasts about 2½ years, and on its successful completion cadets are given their "wings" and commissioned as pilot officers. Short-service commissions are granted to those selected from aircrew who have enlisted for five years' regular full-time service (plus four on the reserve). Candidates must have served at least 18 months in the ranks, and are required to see out six years' regular full-time service. Officer

aircrew are also selected from the ranks of the aircraft apprentices and administrative apprentices.

The aircraft apprentice, who is usually trained at Halton, is enlisted between the ages of 15½ and 17, and undertakes to serve 12 years from the age of 18. After three years' apprenticeship, he is qualified in one of more than 80 trades, grouped according to the degree of skill involved. The newer grade of administrative apprentice offers opportunities to the clerk and equipment assistant.

Simultaneously with a revised peace-time pay code (July, 1946), Marshal of the Royal Air Force Lord Tedder, first chief of air staff appointed after the war, announced new non-commissioned aircrew ranks. These, called "enlisted aircrew," were as follows: cadet pilot, navigator, signaller (primarily a specialised radio operator), engineer, gunner (under training); pilot, etc., IV; pilot, etc., III; pilot, etc., II; pilot, etc., I; and master pilot, etc.

Another post-war trend was the upgrading in size and status of the technical branch, while the secretarial branch was instituted to replace the former accountant, and administrative and special duties. The other branches for commissioned R.A.F. personnel were equipment, aircraft control, catering, physical fitness, marine craft, provost, education, and R.A.F. Regiment; there are also medical, dental, and legal officers, and chaplains. The W.A.A.F. became a permanent service, reverting to the title used during the First Great War, viz., Women's Royal Air Force (W.R.A.F.).

Further details of entry into the R.A.F. can be obtained from the Air Ministry, Whitehall, London, W.C.2. Conditions of service with the Royal Auxiliary Air Force can be obtained from any county territorial and air force association.

Bibliography. Birth of the Royal Air Force, J. A. Chamier, 1943; Royal Air Force, Jan. 1941-March 1942, L. E. O. Charlton, 1943; *Per Ardua*, H. St. G. Saunders, 1944; Royal Air Force in the World War. N. Macmillan, 3 vols., 1942-49.

Royal Air Force College. This training establishment for R.A.F. officer cadets is described under Cranwell.

Royal Air Force Regiment. Military formation of the R.A.F. Raised in Feb., 1942, from a nucleus of ground gunners enlisted into the R.A.F. in 1940 to

assist in the protection of airfields, the R.A.F. Regiment had by Sept., 1942, taken over the light A.A. defence of all British airfields. It was organized in squadrons, each squadron being divided into infantry, armoured, and A.A. flights. These last manned the Bofors and light automatic guns near airfields; the infantry and armoured flights formed a mobile reserve to defend the airfield against parachute or ground attack. Overseas, armoured and rifle flights operated with the army in the capture of enemy airfields, while some squadrons acted as infantry. At the N. Africa, Normandy, and other Allied landings, A.A. units of the regiment were among the first troops ashore.

Following the Normandy landings, a number of A.A. squadrons were attached to armoured divisions for anti-tank work. During the flying bomb attacks on England, 51 A.A. squadrons were deployed along the S. and S.E. coasts. Squadrons of the regt. served in all campaigns of the Second Great War, earning particular distinction in the defence of Cos, and taking part in commando raids. Some were airborne.

Officers and men are paid and maintained by the R.A.F., are subject to the discipline and conditions, hold the ranks, and wear the uniforms of the R.A.F. On active service, however, khaki battle-dress is worn. The regiment's maximum strength in the Second Great War was 80,000 officers and men. It has a peace-time establishment of 19,000.

Royal Air Force Volunteer Reserve. Auxiliary organization of the R.A.F. Formed in July, 1936, for the enlistment and training of men from civil life as aircrew, it had an annual intake of 600 men until 1938, when its ranks were opened to all categories of airmen. Men received flying and ground training at specified centres, and all volunteers were recruited from their neighbourhood. Instruction was given at week-ends, and volunteers had to attend an annual course of 15 days' duration. Aircrew volunteers received a retaining fee of £25 a year and appropriate allowances while training. Until 1944, when the R.A.F.V.R. was merged into the regular R.A.F., all wartime volunteers were enlisted into this body and all temporary commissions in the general duties (flying) branch of the R.A.F. were given to men

from its ranks. The R.A.F.V.R. was re-formed on its pre-Second Great War basis in May, 1947. Insignia consist, for officers, of the letters V.R. in white metal worn on the tunic lapel, and for other ranks V.R. in worsted worn below the eagle on the tunic shoulders.

Royal and Ancient. The governing body of golf in Great Britain is described in the second paragraph of the article Golf.

Royal Aquarium. Former London place of amusement, the site of which, between Prince's Street and Tothill Street, Westminster, S.W., is now occupied by the Methodist Central Hall, opened 1912. The Aquarium, built for the Royal Aquarium and Summer and Winter Garden Society, was opened by the duke of Edinburgh, Jan. 22, 1876, and closed in 1902. It was used almost entirely for variety shows (e.g. the shooting of a woman named Zazel from a cannon in 1877) and exhibitions.

Royal Arch Masonry. System of freemasonry (q.v.). In England it is closely allied to ordinary "craft" masonry, the grand master of the Grand Lodge of England being usually also the first grand principal of the Supreme Grand Chapter of the Holy Royal Arch. Brotherhood in "craft" masonry is a condition of admission to companionship in the royal arch degree.

Royal Armoured Corps. Organization of the British army. Formed in 1938, the corps includes for administrative purposes the Royal Tank Regiment and all mechanised cavalry regiments of the line. Each separate regiment has its own badge, but all recruits

Royal Armoured Corps badge

to such regiments pass through R.A.C. training centres, wearing the R.A.C. mailed fist badge until posted to individual regiments. This badge is also worn by personnel of the R.A.C. who are on the staff of various corps establishments common to all the regiments. Regiments of the R.A.C. provide the nucleus of armoured divisions. They served in all campaigns of the Second Great War.

Royal Arms. Heraldic device of the British royal house. The first English royal arms were designed in 1068 for William the Conqueror and consisted of a

shield with two lions; in 1189 Henry II added a third lion, the device of his wife Eleanor of Aquitaine. When Edward III claimed the French throne in 1340

Royal Arms. The armorial bearings of the British royal house, borne on a shield with supporters, motto, and crest

he quartered the fleur-de-lis on the shield. In 1405 Henry IV reduced the fleur-de-lis to three in each quarter, the arms remaining thus until 1603, when James I superimposed the Scottish lion on the fleur-de-lis in the second quarter and the Irish harp on it in the third quarter. In 1689 the arms of William and Mary, a small shield bearing the lion of Nassau, were placed in the centre of the James I shield, and retained until 1707, when the English arms were superimposed on the Scottish lion in the first and fourth quarters.

When George I came to the throne in 1714, he replaced the English and Scottish devices in the fourth quarter by the arms of Hanover. In 1801 the fleur-de-lis was dropped from the royal arms and replaced by the Scottish lion in the second quarter, while the arms of Hanover were placed on a small shield in the centre, their previous place in the fourth quarter being taken by the three English lions. The shield with the Hanover arms was removed in 1837, when the present royal arms were adopted. They may be worn only by the sovereign and certain royal officials.

Royal Army Chaplains' Department. Department of the British War office responsible for the spiritual welfare of the troops. Ministers of religion had been attached to military formations in an unofficial capacity since the time of Cromwell, but the office was then often a sinecure, and few chaplains actually went on active

service. In 1796 the present department was set up at the request of Wellington.

Until the end of the First Great War, chaplains were directly commissioned by the War office, but in 1940 new regulations restricted the Royal Army Chaplains' grant of Department badge commissions to clergy nominated by their bishops. The dept. received the prefix Royal in 1919.

Army chaplains are drawn from the Church of England, the R.C. Church, the principal Nonconformist bodies, and the Jewish faith. Jewish chaplains wear the Cross of David. Army establishment regulations provide that there shall be one chaplain to every 1,100 men of each denomination. The department is directed by a chaplain-general to the forces (ranking as a major-gen.). Chaplains have been attached to all expeditionary forces, and in the Second Great War accompanied troops in all operations, including commando raids and airborne landings. They work with welfare officers.

Royal Army Dental Corps. Details of this organization of the British army will be found under Army Dental Corps, Royal.

Royal Army Educational Corps. Details of this body, responsible for education in the British army, are under Army Educational Corps, Royal.

Royal Army Medical Corps. Corps of the British army responsible for the care of all sick and wounded army personnel.

Royal Army Medical Corps badge

Little effort was made towards the medical care of troops until Cromwell formed his model army in 1645, when a physician-general was appointed to supervise the civilian doctors who accompanied the troops in the field. At the end of hostilities the doctors returned to private practice. After the standing army had been established in 1661, regimental commanders were authorised to employ and pay at their own cost a doctor for their unit, but the attention of the regimental

doctor was seldom available for the common soldier; a wounded private or N.C.O. had to rely on the charity of his comrades or local inhabitants.

Early in the 18th century a physician-general was appointed to the War office and made responsible for the medical care of troops in the field, but the small monetary grant at his disposal made impossible any large-scale provision of medical services. Army doctors were on a regimental basis, and many were not even qualified to practise. In 1796 army doctors were granted captain's commissions, and in the Peninsular War Wellington put the medical service on a more efficient basis. Later it deteriorated, and the scandals of the Crimean War led to the formation of the Army Hospital Corps, of trained orderlies. In 1873 a department was formed to select doctors for regimental duties and to train them in the branches of their profession peculiar to an army in the field. In 1884 the Army Hospital Corps became the Medical Staff Corps, and in 1898 it was amalgamated with the Army Medical Department as the Royal Army Medical Corps. This was the first administrative corps to be granted the title Royal. The R.A.M.C. was reorganized following criticism of its treatment of the sick in the S. African War. In 1921 the dental branch was set up as a separate unit under the title of Army Dental Corps (*q.v.*) and in 1946 granted the prefix Royal.

The R.A.M.C. is responsible for the health of the troops in peace, care of the sick, and removal and treatment of the wounded in wartime, as well as for the hygienic welfare of troops, lay-out and inspection of barracks, camps, and billets, and advice on water supply, cooking, rations, and latrines. It is the authority for the rationing and pay of sick and wounded in its charge, and for the disposal of the arms and ammunition carried by the men it receives into casualty clearing stations and hospitals.

Under the terms of the Geneva Convention officers and men of the R.A.M.C. rank as protected personnel.

Royal Army Ordnance Corps.

Corps of the British army responsible for munitions. Formed as a unit in 1881, the corps originated in 1350 as a company of the siege train based at the Tower of London, and was

specially enrolled in wartime. In 1450 the company was superseded by the board of ordnance, which was partly military and partly civilian, the master-general of the ordnance being the head of this body from the time of Henry VIII. The board managed all affairs of artillery and engineers.

Its administration was shown to be defective after the Crimean War, and reorganization resulted in its duties being vested in the minister for War. In 1870 it became a branch of the Army Service Corps as ordnance store companies; these companies were constituted a separate unit, the Ordnance and Store Corps, in 1881. The title was in 1889 changed to Army Ordnance Corps, the prefix Royal being granted in 1918. The badge is a shield bearing three cannon balls in a horizontal row over three cannon one above the other.

The duties of the corps consist in providing, receiving, holding, and issuing munitions of war and military vehicles and material of all descriptions, clothing for camps, and clothing and necessities for use in the field. It is not a manufacturing organization, but receives all stores whether made in government arsenals or by private firms, arranges for their inspection, and holds them until required for issue to any unit. Its vocabulary of stores is a list of all articles in current supply and contains some 350,000 entries.

Until the formation of the Royal Electrical and Mechanical Engineers (*q.v.*) in 1942, the R.A.O.C. shared with the Royal Engineers and the Royal Army Service Corps responsibility for the maintenance and repair of mechanical transport, fighting vehicles, and electrical and mechanical equipment. Originally classed as non-combatants, personnel of the R.A.O.C. are now trained as infantrymen. The corps is directly under the director-general of ordnance and its officers belong to the Army Ordnance Department. The peace strength is 11 companies and one depot company.

Royal Army Pay Corps. Corps of the British army. Established in 1878 as the Army Pay Corps, the corps developed from a department formed in 1868 to establish on a regimental basis the unit

paymasters, one of whom was attached to each regiment. The unit paymasters held military status, replacing the civilian pay clerks who until the early 19th century accompanied troops in the field.

As now constituted, the R.A.P.C. (it received the prefix Royal for services in the First Great War) is responsible for keeping individual accounts of officers and other ranks; providing funds in the appropriate currency for the payment of the army and for army services throughout the world; paying allowances to dependents of soldiers; and compiling cost accounts for all forms of costed establishment.

Most officers of the corps are qualified accountants, while other ranks are recruited by selection from men who have attained a good educational standard and completed their basic military training. Every recruit receives six months' initial training in book-keeping, costing methods, and clerical and accounting duties. The corps is divided between command pay offices and regimental pay offices; the former are concerned with receipts and disbursements relating to military services, while the latter are responsible for the pay accounts of soldiers.

A considerable proportion of the clerical personnel is on attachment from the Women's Royal Army Corps. During active operations, detachments of the R.A.P.C. accompany forces in the field to deal with exchange and banking.

Royal Army Service Corps.

Corps of the British army responsible for supply, transport, and barracks services. Early transport and supply arrangements were improvised by regimental commanders, who employed

and paid civilian contractors. In 1794 a Corps of Waggoners was formed, and in 1799 this was replaced by the Royal Waggon Train, which was disbanded in 1833. For the Crimean

Royal Army Ordnance Corps badge

Royal Army Pay Corps badge

Royal Army Service Corps badge

War a Land Transport Corps was established, which in 1856 became the Military Train, organized as a cavalry regiment. In 1870 an Army Service Corps was formed, but in 1889 this was split into two separate units: the Commissariat and Transport Corps, and the Ordnance and Store Corps. In 1889 the latter became the Army Ordnance Corps, and the former was reorganized as the present Army Service Corps, receiving the prefix Royal for services in the First Great War.

The principal duty of the R.A.S.C. is to provide all road transport for the army. It operates every type of mechanised transport vehicle from motor cycles to tank transporters. Personnel of the corps man the DUKW, wheeled amphibious ship-to-shore vehicles which proved so successful in the Sicily, Italy, and Normandy landings; operate the Buffaloes, tracked amphibians which carry infantry and supporting arms into the assault on defended beaches or across rivers; and supply and maintain airborne troops, as during the Arnhem battle, when the R.A.S.C. loaded supplies on the aircraft in England, flew with them to the dropping zone, and distributed the stores on landing. Besides its normal rôle of goods transport, the corps provides the drivers of ambulances and other R.A.M.C. transport, and the drivers of headquarters staff cars. It has its own workshops for maintenance and immediate repair of vehicles.

For coastwise distribution of military supplies, the R.A.S.C. mans a fleet of motor launches, self-propelled barges, and ocean-going steamships of 250 tons. These vessels fly the blue ensign with crossed swords in the fly. R.A.S.C. vessels were the first ships to enter Bizerta after its capture in 1943, and R.A.S.C. launches took part in the Normandy landings.

On the supply side the R.A.S.C. is concerned primarily with the provision of food, so that personnel are trained as butchers, bakers, storemen, and clerks. It operates field butcheries and mobile field bakeries which can produce each 30,000 lb. of bread daily. The corps also maintains and operates petrol supply installations, tankers, and pipe-lines. Barracks services include all domestic requirements, such as housing, heating, lighting, and laundry.

For administrative and operational purposes, the R.A.S.C. is

divided into companies according to their specific function; i.e. troop carrying, water transport, tank transport, bakery, butchery, ammunition, amphibians. The strength of the corps accounts for about 14 p.c. of the army establishment, and all personnel are trained as combat troops, prepared not only to defend themselves, their depots, and vehicles, but also to fight as infantry if occasion demands. In the Second Great War the R.A.S.C. suffered heavier casualties in proportion to strength than any other corps.

Royal Army Veterinary Corps. Corps of the British army responsible for the provision, training, and issue of animals required by any branch of the service, and for the treatment of sick and wounded animals, and for their care and maintenance in health. Until the end of the 18th century,

Royal Army Veterinary Corps badge

the army veterinary service consisted of farriers attached to each cavalry squadron, each of whom carried an axe with which to dispatch horses wounded beyond recovery. In 1796 veterinary surgeons were attached to cavalry regiments, and in 1856 a department was formed to include all regimental veterinary officers. In 1903 the corps was placed on a regimental basis as the Army Veterinary Corps, receiving the prefix Royal in 1919.

Mechanisation has greatly reduced the use of animals in warfare, but animal transport remains in some countries an essential part of army supply systems. In the Second Great War, the R.A.V.C. was responsible for thousands of pack mules employed in Italy and Burma. It trained and kept in health all dogs used by the army for guard duties and mine detection. In peace the R.A.V.C. breeds livestock for units overseas; provides meat inspectors at military stations; and carries out research in the prevention and cure of animal diseases communicable to man.

Royal Artillery. Regiment of the British army responsible for manning all guns moving on wheels or tracks, and on static sites. Until the regiment was established in 1716, guns in the

British army were served by civilians, but in 1682 the gunners were brought under the ordnance department for pay and discipline, while the drivers remained civilians and, with their horses, were employed only for the duration of a

campaign. It was unsatisfactory serving of the guns in the operations against the Old Pretender in 1715 that led to the formation of the Royal Artillery, two companies being established on a regimental basis and the gunners enlisted into the ordnance department. The War office then had no control over the artillery, and officers did not purchase commissions, but were gazetted only after graduating from the academy at Woolwich.

In 1727 the regiment was given its present title of Royal Regiment of Artillery. In 1790 its drivers ceased to be civilians and were enlisted into the regiment. The regiment was divided into Royal Horse, Royal Field, and Royal Garrison Artillery in 1793. After the Napoleonic wars it passed under the control of the War office, and in 1925 the field and garrison branches were amalgamated. As units have served in every British campaign, there is justification for the regimental motto, Ubique (Lat. Everywhere).

Until the Second Great War, the R.A. was organized in brigades, the brigades in batteries, and these in sections. The brigade has now been replaced by the regiment and the section by the troop. The main regiments of artillery are: field regiments, whose 25-pdr. gun either have tractors or are self-propelled, to provide close support fire for infantry or armour in attack or defence; anti-tank, to deal with enemy armour; medium and heavy, armed with howitzers and long-range guns; heavy and light A.A.; rocket-firing; coast defence; searchlight; and ranging and survey. The R.A. is now completely mechanised. In the Second Great War its personnel comprised 25 p.c. of the British army's total strength.

Royal Assent. Particulars of the way in which the king's assent is given to a parliamentary Act will be found under Assent, Royal.

Royal Australian Air Force. Body formed at Point Cook, Victoria, in 1911 as the Australian Flying Corps. The R.A.A.F. is the senior dominion air force. In 1915

it sent a fighter squadron to serve with the British forces in Mesopotamia. By 1918 the R.A.A.F., having received the prefix Royal in 1917, possessed one squadron in Palestine, three in France, and a training wing in Great Britain. Between the wars considerable expansion took place, and in 1937 the R.A.A.F. became largely responsible for the air defence of Singapore. Shortly after the outbreak of the Second Great War it moved a flying-boat squadron and a fighter squadron to the U.K., while continuing to maintain the defence of Australia and British New Guinea. Heavy losses were suffered in the Japanese invasions in the Far East, but the R.A.A.F. was quickly reorganized and had a prominent part in the island-hopping campaign that preceded the Japanese surrender. Uniform is similar to that of the R.A.F., but is a darker blue, and officers wear miniature wings on the sleeve above the rank rings. In 1947 the establishment was fixed at 15,000 officers and men, and consists of three types of squadrons: long-range heavy bomber, fighter, and transport. See Australia in the Second Great War, p. 795.

Royal Australian Navy. Established in 1909 to replace the Royal Navy squadron which had been stationed in Australian waters since the first settlement of the country and the cost of which, since 1887, had been shared by the British and Australian govts. In 1914 the Royal Australian Navy possessed one battle cruiser, five cruisers, twelve destroyers, six submarines, and four sloops. During the First Great War, its ships served in the North Sea, Mediterranean, Dardanelles, and Pacific. After the Washington naval treaty of 1922, the fleet was reduced to two cruisers and a few destroyers and submarines. In 1928 two cruisers, two submarines, and a seaplane carrier were added.

At the outbreak of the Second Great War, the R.A.N. comprised six cruisers, 12 destroyers, a seaplane carrier, three submarines, and four sloops. Ships served in all theatres of the war and suffered heavy losses. Australian bases provisioned and maintained the British Pacific fleet in the war against Japan. (See Australia in the Second Great War, p. 795.) In 1947 the R.A.N. had four cruisers, eight destroyers, nine frigates, six submarines, and auxiliary craft. Personnel numbered 13,500 officers and men, nearly all Australian. The R.A.N. is administered by a

naval board under the federal minister of Defence. Training and organization are on the same lines as those of the Royal Navy, and in wartime the R.A.N. becomes an integral part of the latter although it may not be used outside Australian waters without concurrence of the Commonwealth govt.

Royal Automobile Club. Recognized authority and governing body of motoring in the U.K.

Royal Automobile Club badge

Founded in 1897, it became known in 1907 as the Royal Automobile Club of Great Britain and Ireland. The headquarters is 89-91, Pall Mall, London, S.W.1. Its estimated total membership is 300,000. In Paris there is the Automobile Club of France, the h.q. of motoring and motor racing.

Royal Auxiliary Air Force. British flying unit, established in 1924 as the Auxiliary Air Force. Its squadrons are in peace time recruited through the county Territorial Army and Air Force associations. Recruits are drawn from the district in which squadron headquarters is situated, and training is carried out after working hours on week days and during week-ends. Squadrons have annually a fortnight's intensive training in camp. Officers serve for a minimum period of five years followed by five years in the reserve; other ranks for four years on the active list and four in the reserve. The force has flying and barrage balloon squadrons. Its insignia is a white metal A worn on the lapels of officer's tunics and a worsted A on the sleeve of the tunics of other ranks.

At the outbreak of the Second Great War, when the Auxiliary Air Force was merged into the R.A.F., the force had 20 flying squadrons and 44 balloon squadrons. On Oct. 16, 1939, an A.A.F. Spitfire pilot brought down the first German bomber to fall in Great Britain. In 1947 the A.A.F. was re-formed on pre-war basis, and granted the prefix Royal in 1948.

Royal Bounty. Sum of money from which the British sovereign makes official donations and subscriptions to charities. It forms an item of the civil list and was fixed at an annual amount of £13,200 in 1837, since when it has remained unaltered. The king's bounty, a monetary grant made by the sovereign to those of his subjects whose wives are delivered of three

or more children at a birth, is paid from the royal bounty.

Royal Canadian Air Force. Established in 1924 from a nucleus of squadrons which had flown in the First Great War, the R.C.A.F. was under army control until 1938, when it became an independent service. At the outbreak of the Second Great War, the force had a mobilised strength of 3,500 officers and men, and immediately sent to Great Britain two army cooperation squadrons, one of which was converted to fighters early in 1940, taking part in the battle of Britain. During the war the R.C.A.F. underwent rapid expansion, eventually having 45 operational squadrons serving in various theatres. Squadrons based in Canada provided air cover for Atlantic convoys, and Canadian training schools provided large numbers of airmen under the Empire Air Training Scheme (g.v.). In 1947 the R.C.A.F. had an establishment of 30,600 officers and men organized into five commands, administered by the Canadian department of defence. See Canada at War, p. 1704.

Royal Canadian Navy. Established in 1911, this force was formed from two over-age cruisers which had been purchased in 1910 and stationed at Halifax and Esquimalt, two bases taken over from the R.N. At the outbreak of the First Great War the R.C.N. consisted of two cruisers and two destroyers which served on Atlantic patrol. Large flotillas of auxiliary vessels were mobilised, performing all convoy protection in Canadian waters. In 1922 the R.C.N. passed under the control of the Canadian department of defence, but there was little expansion, and in 1939 the force had only five destroyers and a few minesweepers, personnel totalling 1,972 officers and men.

During the Second Great War, the R.C.N. increased to a total of 373 vessels of all types up to cruiser category and provided Atlantic escorts and patrols. In 1947 its strength was fixed at 10,000 officers and men, and the establishment comprised one aircraft carrier, two 8,000-ton cruisers, eleven destroyers, 18 frigates, and eleven minesweepers. The R.C.N. cannot serve in wartime outside dominion waters without sanction of the Canadian govt. See Canada at War, p. 1704.

Royal Corps of Signals. Corps of the British army responsible for providing and maintaining telephone, telegraph, and radio communication. Signalling in the British army was on a regimental

basis and by flag and heliograph until 1872, when a telegraph battalion of the Royal Engineers was formed; this served in the Egyptian campaign of 1885. After the S. African War, R.E. wireless companies were established, and in 1912 the telegraph and wireless companies were re-formed as signal companies. In 1920 the signal sections were organized as the present Royal Corps of Signals.

Royal Corps of Signals badge

Its duties extend from the War office to theatres overseas and thence to battalion headquarters, at which point responsibility for communications is taken over by each unit's regimental signallers. The corps also provides land signal communication for the R.N. and R.A.F. in operations outside Great Britain. It carries out field maintenance of all signal equipment used by itself or other arms; trains regimental signalling instructors; enciphers and deciphers messages; and in action furnishes signal sections for assault troops in combined operations.

Royal Electrical and Mechanical Engineers. Corps of the British army responsible for maintenance and repair of fighting vehicles and electrical and mechanical equipment. Established in 1942, the corps was formed from personnel of the Royal Engineers, Royal Army Service Corps, and Royal Army Ordnance Corps who had specialised in technical work on armoured vehicles, fire control equipment, radiolocation, telecommunication, and A.A. equipment. Tank recovery companies, operating with the forward troops, salvaged and repaired fighting vehicles on many battlefields of the Second Great War. Privates in the corps are given the title of craftsmen, and all personnel are trained as combatant troops, as well as in their appropriate trades. Craftsmen are of three classes according to their trade proficiency. The R.E.M.E. administrative unit is the field or base workshop.

Royal Electrical and Mechanical Engineers badge

Royal Empire Society. Body founded as the Royal Colonial Institute in 1868. The name was

changed at the diamond jubilee in 1928. Its objects are to promote the preservation of a permanent union between the mother country and all parts of the British Empire; and to maintain the power and best traditions of the Empire. King George VI and Queen Elizabeth are patrons and the duke of Gloucester is president. Spacious headquarters in Northumberland Avenue, W.C.2, include a magnificent library and an information bureau. Weekly talks are given by distinguished authorities in the Empire. Membership, 24,000.

Royal Engineers. Corps of the British army. Established in 1856, it is responsible for the army's constructional work, bridging, mine clearing, for manning assault vehicles, surveying and making maps, and other technical duties.

Royal Engineers badge

In 1300 a chief engineer was appointed to maintain the army's engines of war stored at the Tower of London, but there were no specific companies of engineers or artificers to serve with troops in the field. The Plantagenet kings employed gangs of Cornish miners when there was a town to be invested or troops to be entrenched; in later reigns Yorkshire colliers were engaged and paid by contract. In general, however, such military engineering tasks as building bridges and causeways were undertaken by the infantry. In 1345, Henry of Lancaster enlisted artisans into military engineering companies to construct tunnels in the campaigns in France, but the companies were later disbanded.

About the middle of the 15th century an ordnance department was created to develop the army's artillery branch, and companies of artisans called sappers were attached for the purpose of building emplacements and other fire positions for the guns. Sappers eventually became wholly responsible for manning the guns, and so continued until 1716, when the Royal Artillery was established. Next year the creation of a corps of engineers was ordered, but commissions were not granted until 1757, and the corps continued part of the artillery establishment.

During the siege of Gibraltar (1779-83), Sir William Green, chief army engineer with the garrison, enlisted a company of military artificers to construct galleries

and repair defences. In 1788 similar companies were raised in Great Britain; the officers commanding them became the Corps of Royal Engineers. The men were regimented as the Royal Military Artificers, renamed the Corps of Royal Sappers and Miners in 1813; and in 1856 united with the Corps of Royal Engineers.

Every major campaign has brought new duties to the R.E. In the First Great War they manned searchlights and had special companies for the investigation of gas warfare. Other tasks included camouflage, meteorology, and providing personnel for the army post office. Throughout the Second Great War, the work was increasingly onerous. Royal Engineers went with the forward troops in all operations, and when the armies were advancing they cleared minefields. Bridging companies spanned such rivers as the Chindwin and Rhine. Until the R.A.F. enlisted its own constructional units, the R.E. built hundreds of airfields at home and overseas. They were the first troops ashore when the Allies invaded Normandy on June 6, 1944, landing as an assault brigade equipped with modified Churchill tanks. These vehicles were armed with a petard for throwing explosives through pillbox loopholes, and carried a bridge for crossing anti-tank ditches. Equipped with Buffaloes, the assault brigade carried the infantry to the attack on S. Beveland, and later transported commandos across the Rhine.

Personnel of the R.E. are mostly skilled tradesmen, but they receive a basic infantry training and form a reserve of fighting troops to be used in emergency. In wartime the corps does not take the field as a unit, but as companies attached to divisions to organize bridge and road building, constructional work, and minelaying and clearing. The R.E. have also founded separate units, e.g. the Royal Flying Corps (g.v.), and the Royal Corps of Signals, established in 1920 from the signal section.

Royal Exchange. London building for merchants and bankers. It is between the Bank of England and Cornhill, E.C. The third on the same site, it was built from designs by Sir William Tite. The prince consort laid the foundation stone, Jan. 17, 1842, and Queen Victoria opened the building, Oct. 28, 1844. A flight of steps, from which a new sovereign is proclaimed on accession, leads to the Corinthian portico, 96 ft. wide,

Royal Exchange, London. The fine Corinthian-style portico of the exchange, near the Bank of England

74 ft. high, and with eight columns 41 ft. in height. In the centre of the sculptures of the tympanum, by Westmacott, is a crowned figure of commerce holding the charter of the Exchange, with a lord mayor and other civic dignitaries on one hand and representatives of foreign nations on the other. Dean Milman selected the text, Ps. 24, v. 1, on the architrave. An inscription, in Latin, along the frieze, commemorates the foundation. At the E. end is a campanile, 180 ft., with statue by Behnes of Sir Thomas Gresham and a vane reproducing his crest, a gilded grasshopper, preserved from the first Royal Exchange. The vane was temporarily removed during the Second Great War.

There are many statues, including those of Victoria, by Thornycroft; Elizabeth, by Watson; Charles II, by Gibbons; and Wellington, Chantrey's last work, cast from captured cannon. The memorial to Londoners who fell in the First Great War was designed by Sir Aston Webb, the sculptures being by Alfred Drury and the carving and lettering by W. S. Frith. On the walls of the ambulatory of the interior colonnaded quadrangle are more than 30 spirit varnish frescoes, depicting the history, especially the commercial history, of London. Among the artists whose work is represented here are Leighton, Edwin Abbey, Sir Frank Brangwyn, Frank O. Salisbury, and Stanhope Forbes. The rooms at the W. end are devoted to the Royal Exchange Assurance Association.

The first exchange in London was erected by Sir Thomas Gresham in 1566-67, and named and opened by Elizabeth, Jan. 23, 1571. Destroyed in the Great Fire, 1666, it was rebuilt, 1669, by Jarman; but of the second structure all but the clock tower was burnt

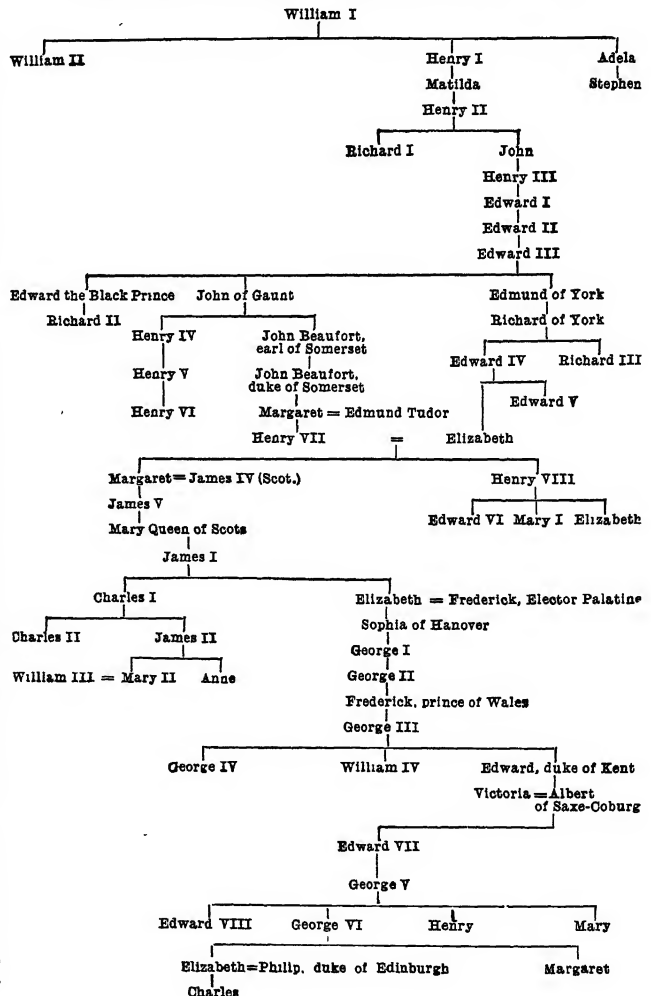

on the night of Jan. 10, 1838. The tessellated pavement of Turkey stone in the interior is a survival from Gresham's day. See *Exchange*; Gresham, Sir Thomas.

Royal Family. Term used in Great Britain for the sovereign and the members of his family, including uncles, aunts, and cousins. It is used in other countries ruled by kings; in those ruled by emperors, imperial family

was substituted. Since 1917 the name of the British royal family has been Windsor, taken by royal proclamation. Queen Victoria belonged to the family of Guelph and her husband Albert to that of Wettin, but these names were not used save by genealogists. As commonly used, the term royal family includes only those near relatives of the sovereign who have retained their British nationality. Thus the last German emperor, although a grandson of Victoria, was not a member of the British royal family.

Members of the royal family enjoy precedence on state occasions and certain social and other advantages, but have also some disabilities, for instance under the Royal Marriages Acts.

GENEALOGICAL TABLE OF THE BRITISH ROYAL FAMILY

The royal family traces back its descent to William the Conqueror, and through Matilda, the wife of Henry I, to Anglo-Saxon kings who preceded him. The line of the Norman kings was continued, through the intervention of a female, Matilda, daughter of Henry I, through the Plantagenet sovereigns, of which house both York and Lancaster were branches, until this ended with Richard III. The house of Tudor was descended, again in a female line, from John of Gaunt, a son of Edward III. A daughter of Henry VII and his wife Elizabeth, a Yorkist princess, married James IV of Scotland, and from that union sprang James V of Scotland and his grandson James VI of Scotland and I of England. The Scottish kings were also descended from Edward III because one of the Beauforts, descendants of John of Gaunt, had married James I of Scotland. Elizabeth, a daughter of James I of England, married the Elector Palatine, and their daughter Sophia was the mother of George I. His descendants included the succeeding Georges, William IV, and the duke of Kent, the father of Victoria. See Civil List; Edward VII; George V; George VI; Stewart; Tudor; Victoria, etc.

Royal Fern OR **FLOWERING FERN** (*Osmunda regalis*). Large, handsome fern of the family Osmundaceae. A native of Europe, Asia, Africa, and America, it has a large rootstock, branching off into several heads. The fronds are of leathery consistency, 10 or 12 ft. in length and about 3 ft. broad, broken into large, paired leaflets, which are again divided into many pairs of oblong leaflets. At the upper part of the fertile fronds these leaflets are more or less contracted and concealed by the confluent clusters of spore-cases, which have the appearance of red-brown flowers. This plant lives in bogs and damp woods.

Royal Flying Corps. Former unit of the British army. Established in 1912, it developed from the balloon companies of the Royal Engineers created in 1880 to operate army observation balloons. The companies later manned the first military aircraft and airships until the R.F.C. was set up. R.F.C. aircrew were at first officers of cavalry and infantry regiments who had learned to fly at their own expense, but soon flying schools were organized to train officers, who were commissioned direct into the corps. There was a naval wing, which in 1914 became the

Royal Naval Air Service. At the outbreak of the First Great War, the R.F.C. had an establishment of 2,000 officers and men and 82 aircraft; most of these last were totally unfit for military purposes. In 1915 the corps was greatly expanded and equipped with efficient machines. In 1918 it was re-organized as the Royal Air Force (*q.v.*), when officers had the option of transferring to the new force or retaining their army commissions.

Royal Free Hospital. Group of London hospitals. The one which gives its name to the group

Royal Free Hospital, London. The buildings and main entrance in Gray's Inn Road

was established in Greville Street, Hatton Garden, 1828, and moved to its present site in Gray's Inn Road, 1842. At later dates the Sussex wing and the Victoria wing were added, and the older buildings rebuilt and enlarged. One wing was destroyed by German bombs in the Second Great War. The Royal Free Hospital, built for the sick poor, is largely staffed by women, and is associated with a school of medicine for women, students of which can take the complete course of study necessary for obtaining the medical qualification. Many scholarships and prizes are offered annually. Other hospitals in the group are the Hampstead General, Hampstead Children's, North-Western, London Fever, Elizabeth Garrett Anderson.

Royal Fusiliers. Regiment of the British army. Raised for James II in 1685 by Lord Dartmouth, master-gen. of ordnance, the regiment was enlisted from Londoners. Its duty was to garrison the Tower of London and provide escorts for the ordnance or artillery, a circumstance that led to its being called the Ordnance

Regiment. In 1687 it was re-armed with fusils and designated the 7th (Royal Fusilier) Regiment of Foot. It saw its first active service with William III in Flanders and won its first battle honour at Namur. It was one of the

regiments that suppressed the Jacobite rising, 1715. In 1718 the regt. was shipped to sea and served as marines at Messina and Copenhagen.

Ten honours were gained in the Peninsular War, where the regiment captured the heights of Albuera; and in the Crimean War it was in the charge at Alma, adding three more honours. It was in the Afghanistan campaign of 1879-80. In 1881 the regiment was retitled The Royal Fusiliers (City of London Regiment). In the South African War it was at the relief of Ladysmith, and in 1904 took part in the expedition which marched to Tibet and into the forbidden city of Lhasa.

Forty-seven battalions were raised by the Royal Fusiliers in the First Great War, in which the regiment gained the honours: Mons; Marne, 1914; Ypres, 1914, '15, '17, '18; Somme, 1916, '18; Arras, 1917, '18; Cambrai, 1917, '18; Hindenburg Line; Struma; Landing at Helles; Palestine. Two Jewish battalions, the 38th and 39th, were specially raised for the Palestine campaign. In the Second Great War, battalions served in France, 1940; E. Africa; Syria; N. Africa; Italy; Burma; and the liberation of Europe.

For many years after its formation, the regiment's lowest commissioned rank was full lieutenant; its junior officers were gazetted from other units as lieutenants, hence its nickname, The Elegant Extracts. This is one of four regiments privileged to march through the City of London with bayonets fixed, colours flying, and drums beating. See Fusil.

Royal George. British man-of-war. She capsized and sank at Spithead, Aug. 29, 1782. Rear-Admiral Kempenfelt (*q.v.*) and

Royal Fusiliers. Badge of the regiment

Royal George. Man-of-war, which capsized with Kempenfelt and about 800 souls aboard, Aug. 29, 1782
From a print

about 800 officers, men, and visitors perished. Cowper's poem, beginning Toll for the brave, commemorates the disaster. A later Royal George was a yacht, built for George IV. Victoria used it occasionally during the earlier years of her reign, but for many years the vessel lay in Portsmouth Harbour as a hulk before being broken up. Part of her fittings are preserved at Virginia Water.

Royal Horse Artillery. Branch of the Royal Artillery. It was formed in 1793 to provide highly mobile batteries to operate with cavalry, the gunners being mounted on horseback instead of riding on the gun limbers, then the usual practice. Shortly before the Second Great War the R.H.A. was mechanised except for one battery, which remained horsed for ceremonial duties.

Royal Household. Term applied to attendants of the sovereign. The existing system of government in monarchical countries, and even to some extent in those which are no longer so, has developed largely from the sovereign's household, and today in the British kingdom there is a connexion between the government of the day and the royal household. For instance, the lord chamberlain, the lord steward, and other officials are party politicians who leave office with the government. One reason for the persistence of this connexion is the obvious desire of ministers to prevent the sovereign from being surrounded by influence hostile to themselves. Many countries had little administration save that controlled by the king's household. Thus the marshal, the constable, the chancellor, and the treasurer evolved from being merely members of the royal household to important personages in government.

In the U.K. today the king's household is a large one, divided into several departments. Under

the lord chamberlain are the seven lords in waiting, the seven grooms in waiting, and the gentlemen at arms, and many others. Other high officials are the lord steward and the master of the horse. There is an ecclesiastical household, called the college of chaplains, and a medical house-

hold. The master of the household and the crown equerry have each a department. For more personal matters there is the department of the treasurer and the private secretary's office. There is a ceremonial department under a comptroller. The king has also a separate household in Scotland, mainly of honorary officials.

Other members of the royal family have households. Those of the queen and the queen mother are under a lord chamberlain, and include a mistress of the robes and ladies of the bedchamber. Other royal households are under comptrollers. *See King.*

Royal Institution. British institution founded in London, 1799, for the encouragement of research and "the application of science to the common purposes of life." The house, No. 21, Albemarle Street, W., still in the occupation of the institution, was purchased 1799, and refronted 1838. Incorporation by royal charter was granted in 1800, and a modified constitution was effected ten years later by Act of parliament. The institution possesses a laboratory, established 1800, and modernised 1872; a library started 1803; and a museum containing the apparatus used by Rumford, Davy, Faraday, Tyn-dall, Dewar, and others. There are four professorships—of natural philosophy, chemistry, physiology, and astronomy. The Davy-Faraday research laboratory was established and endowed by Ludwig Mond in 1894.

Royal Insurance Co., Ltd. A British insurance company. Founded in 1845, it transacts all kinds of insurance business, life, fire, accident, marine, etc. Its head office is 1, North John St., Liver-

pool, and its London office 24-28, Lombard St., E.C. It is represented in some 100 countries. The company has an annual income of over £32,000,000, and its total funds amount to £68,000,000.

Royal Mail Lines. British steamship line. Chartered in 1839 as the Royal Mail Steam Packet Company, two years later it obtained the mail contract for the West Indies, and a fortnightly service of paddle steamers was instituted from Falmouth. In 1851 the service was extended to S. American ports. During the Crimean War the company's vessels were used as transports. Extensions were made to Morocco, the Canary Islands, and Madeira, and in 1910 the company purchased the Pacific Steam Navigation Co. Other lines were absorbed and the company now has a fleet operating to most parts of the world. The offices are in Leadenhall Street, E.C.3.

Royal Marines. Soldiers raised and trained by the R.N. for service with the fleet or in amphibious operations. In the fleets of the 17th century detachments of soldiers were embarked to provide a trained and disciplined nucleus at a time when crews were often forced into service by press-gangs. The first regiment to be raised specifically for sea service was the Duke of York and Albany's Maritime Regiment of Foot, otherwise known as the Admiral's Regiment, which was authorised by an order in council of Oct. 26, 1664. The regt. was recruited from the trained bands of the City of London, whose nickname of "Jollies" has persisted, and from whom is derived the privilege still exercised by the Royal Marines of marching through the City with drums beating, bayonets fixed, and colours flying.

Regiments of marines were raised and disbanded as required throughout the following century, and an independent tradition was firmly established with the capture of Gibraltar in 1704 and then with its subsequent six months' defence by six

Royal Mail Steam Packet flag, white with red cross

battalions of marines. From Gibraltar dates the conception of a military force, serving as an integral part of the fleet at sea and trained to undertake land operations to further naval strategy.

Throughout the naval wars of that century, in particular the Seven Years War, marine detachments played a leading part in innumerable small raids on enemy coasts. The corps acquired, in 1755, a permanent organization of three divs.

During the blockade of Brest the marines distinguished themselves in the assault on Belle Isle in 1761, for which they were granted the badge of the laurel wreath, still worn. During the wars with France, 1793-1815, the strategy of small coastal raids was continued, and the marine corps grew in strength to 31,000 men. As a consequence of the marines' excellent conduct during the naval mutinies at Spithead and the Nore, in 1802 the king authorised the corps to bear the title royal.

In 1827 George IV granted the Royal Marines the badge of the globe as the symbol of their world-wide service, to be worn with their earlier distinction of the laurel, the *Per Mare, per Terram* motto, and the battle honour Gibraltar, which completed the Royal Marine crest.

Royal Marine Artillery

In 1804, at Nelson's request, Royal Marine artillerymen were raised, originally for the purpose of manning the armament of the bomb ketches with which the navy bombarded enemy coast defences. A company of these Royal Marine artillerymen was maintained at each div. as a separate arm of the corps. They were the "blue" marines, the infantry being "red" marines. Before the institution of the naval gunnery school at H.M.S. Excellent, the R.M. artillery was the only branch of the naval service systematically trained in gunnery, and in 1862 became a separate corps, the infantry becoming the R.M.L.I. a title earned during the Crimean War.

With the introduction of regular service into the R.N. in 1857, the original function of the marines disappeared, but the intense *esprit de corps* and tradition of discipline of the marine detachments provided in a battleship a spirit that was of value. By 1914 the marines manned one turret of the main armament of a battleship and a portion of the subsidiary armament besides forming a trained landing force. The development of weapons such as the mine and

the torpedo, and the increasing strength of coastal defences limited their opportunity for small scale raids, a limit further accentuated by their gunnery responsibilities.

In the First Great War the corps was expanded to nearly 57,000 by 1918. Its primary task remained service with the fleet, and marines took part in every major naval action, 5,832 being present at Jutland where they suffered 589 casualties and won a V.C. An R.M.L.I. bde. was formed and took part in the operations at Antwerp, in the Gallipoli landings, and on the Western front. At Gallipoli more than a thousand marines were engaged in the first naval attempt to force the strait, while in the attack on the pen. the Plymouth battalion was the first to attempt a landing and the last to leave during the evacuation.

In this fighting the R.M. bde. formed part of the Royal Naval div., commanded by a Royal Marine, Gen. A. Paris. This div. moved to the Western front in 1916, taking part in the fighting on the Ancre, in particular the attack at Beaumont Hamel. Here the 1st R.M.L.I. went into action 400 strong and only 138 returned. The bde. continued in France until the armistice, and since it was thus already committed the landing force at Zeebrugge was drawn from the fleet; this was the "immortal fourth" battalion, which stormed the mole on St. George's day, 1918, with such gallantry that King George V, as col.-in-chief of the corps, ruled that no other battalion should bear that number; two V.C.s were won by marines on this occasion.

The Royal Marine Artillery formed howitzer and A.A. batteries for service in France, and also the trained nucleus for the heavy batteries that served in the campaigns in S.W. and E. Africa. The marines laid submarine mines, manned the armament of defensively equipped merchant ships, and provided labour battalions on supply ships maintaining the army in France. A marine officer was one of the first four pilots trained in 1911 for the Royal Naval Air Service, in which marines served throughout the war. The Royal marine bandmen in action manned the fire control apparatus directing the fire of the main armament.

By 1923 the R.M.A. and R.M.L.I. had been amalgamated to form one corps again, 9,000 strong. As a result of the Gallipoli failure, it came to be considered that amphibious attack on a coast-

line defended by minefields and modern batteries was impossible, and the *per terram* activities of the marines were narrowly restricted. Indeed, they often did longer time at sea than sailors. A nucleus formation called the mobile naval base defence organization, consisting of A.A. and coastal defence batteries, signallers, searchlights, a landing and maintenance unit, and a land defence force was, however, maintained, the purpose of which was to establish and temporarily defend a shore base for the fleet.

Mobile Naval Base Defence

In 1939 this nucleus was almost the only force left for shore service so that, when it was decided once more to form a Royal Marine bde. for amphibious operations, few regulars could be spared for it. When the campaign in Norway demanded landing operations, sea-service marines made the first landings at Namsos and Aandalsnes. The first trained battalion of the bde. was ready to carry out the occupation of Iceland.

The mobile naval base defence organization (M.N.B.D.O.), after its A.A. gunners had distinguished themselves in the battle of Britain (one battery shooting down 44 German aircraft in 40 days), sailed for Crete to establish a fleet anchorage at Suda Bay. Before the whole formation reached the island the German airborne invasion forced the marines from their positions to fight in the rearguard which covered the retreat to Sphakia and the consequent evacuation. The formation later did valuable work in the Middle and Far East, and a second M.N.B.D.O. took part in the invasion of Sicily.

The Royal Marine bde. began to expand during 1940 into a Royal Marine div., the first two bdes. of which stood by during the period when German invasion of the British Isles threatened. In the autumn they sailed for W. Africa on the abortive Dakar expedition. After Dunkirk, however, combined operations became the principal field of Allied war effort. By 1943, the R.M. div., instead of being a specialised body, was duplicating the function of several army divs. which had been trained for amphibious operations. For this reason the R.M. div. was broken up into six Royal Marine Commandos—two already existed, and had been in action at Dieppe, in Sicily, at Salerno, and Termoli. The remainder of the divisional troops were then trained to man assault landing craft, and to provide guns' crews for special craft

which supported landing operations from close inshore—an interesting revival of the original function of the R.M.A. The M.N.B.D.O.s were also disbanded and their personnel was used to form another commando and to carry out various landing craft tasks. In these rôles the Royal Marines took part in the invasions of Normandy and Burma, operations of the Italian campaign, the amphibious guerrilla warfare in the Dalmatian islands, and the assault on the Westkapelle dyke in Walcheren.

Marines were again engaged in every major naval action. Their A.A. batteries formed part of the defence against the flying bomb attacks on London and Antwerp. Marines manned the heavy cross-Channel naval guns near Dover, and Royal Marine Engineers were employed in every theatre, rehabilitating captured ports and carrying out essential engineering work at remote naval bases. Numbers grew from 10,000 in 1939 to 78,000 (including R.M.E.s and bands) in 1945.

The provision of commandos, of crews for assault landing craft, and gunners for support craft, in addition to service with the fleet, were made regular functions of the corps, normal peacetime enlistment in which is for 12 years with the option of re-engagement for a further nine. Ranks and titles are the same as in the army, but marines may qualify for specialist naval ratings.

Training for recruits covers all branches of infantry work, naval gunnery, and seamanship. The senior squad of recruits under training is known as the king's squad, and the best recruit is awarded the king's badge, inaugurated by King George V in 1918. The king's badge is worn by the man who earns it throughout his service, no matter what rank he may attain. The uniform is blue, with a red stripe on the trousers, the headgear a forage cap of blue with a red band or a beret with a red flash. Royal Marine Commandos wear khaki battledress with the Royal Marine beret. The distinctive feature of the full dress uniform is the white pith helmet surmounted by a gold spike, which is worn by the divisional bands, who also retain the broad red trouser stripe of the old Royal Marine artillery.

Wilfrid Sendall

Royal Marriage Act. Law passed by the British parliament in 1772 with the object of preventing members of the royal family

from marrying without the king's consent. The measure was demanded by George III, because his brothers, the dukes of Cumberland and Gloucester, had contracted secret marriages with ladies of comparatively humble birth. It forbade any descendant of George II, except the issue of princesses married to foreigners, to marry before the age of 25 without the king's assent; if over 25 they could marry by giving notice 12 months beforehand to the privy council, unless parliament decided against the proposed union. The bill was carried into law in spite of much opposition, and is still in force; but by His Majesty's Declaration of Abdication Act, 1936, it does not apply to Edward VIII or his descendants. See Royal Family.

Royal Military Academy. Military college maintained at Sandhurst, Berks, for training cadets before they are commissioned in the army and R.A.F. Regiment. Until 1939 the title was borne by the Royal Artillery and Royal Engineers college at Woolwich. Woolwich was closed at the outbreak of the Second Great War, and in 1946 was amalgamated with the Royal Military College to form the present academy. This trains candidates for commissions in the Household Cavalry, Royal Armoured Corps, Royal Artillery, Royal Engineers, Royal Corps of Signals, brigade of Guards, infantry, R.A.O.C., R.A.S.C., R.E.M.E., and R.A.F. Regiment.

Cadets spend eighteen months at the academy, and there is an intake every six months. Candidates must have served six months in the ranks of a regular regiment or corps and must be between 18½ and 19½, or they may enter direct from school if they are between 17½ and 18½ and have passed an examination similar to the civil service entrance examination. No fees are chargeable and text books are free. Cadets are paid 5s. a day. The academy is divided into three colleges, each accommodating 500 cadets. See Commission; Military Academy; Officer.

Royal Military Police. Details of this body will be found under Military Police, Royal.

Royal Naval Air Service. Former component of the Royal Navy. Originally part of the Royal Flying Corps, it was transferred to the Royal Navy in July, 1914, and made responsible for manning and maintenance of airships and seaplanes operating with the fleet. During the First Great War the

R.N.A.S. provided anti-submarine patrols and carried out raids on enemy bases in Belgium and Germany. In 1918 it was incorporated with the R.A.F. In 1922 the Fleet Air Arm (*q.v.*) was created.

Royal Naval Reserve. Component of the Royal Navy. Established in 1861, it is recruited from officers and men of the merchant navy. Officers may join as midshipmen during their apprenticeship or as sub-lieutenants up to the age of 30. They undergo a year's training aboard a warship and take short courses of instruction at gunnery, torpedo, and signal schools. Ratings are enrolled for a period of five years and may re-engage for a maximum of four further periods each of five years; the last term is for shore and harbour duties only. In both Great Wars, R.N.R. personnel served with the main units of the fleet, but mostly they manned auxiliary vessels, armed merchant cruisers, escort vessels, and minesweepers.

Royal Naval Volunteer Reserve. Component of the Royal Navy. Established in 1903, it was recruited from yachtsmen and other civilians interested in the sea and who received part-time training and were liable to be called up for service with the Royal Navy in the event of war. During the First Great War the R.N.V.R. had a strength of 38,000 officers and men, the majority of whom served in motor torpedo boats and patrol craft. In 1936 the Admiralty instituted the Royal Naval Volunteer Supplementary Reserve to provide a reserve of officers. No qualifications were required from candidates and no provision was made for training in peace, but personnel underwent three months' training on mobilisation. The R.N.V.R. greatly expanded in the Second Great War, when officers and ratings served in every class of ship. All temporary wartime officers were commissioned in it and, to the number of 48,000, formed 80 p.c. of all naval officers serving. They commanded destroyers, submarines, escort vessels, minesweepers, and the majority of coastal craft.

In 1946 the R.N.V.R. was reorganized in five geographical divisions: Ulster, Sussex, London, Forth, and Tay. Members train with the fleet for 14 days annually. Ratings receive an annual bounty of £5. The R.N.V.S.R. was reconstituted, and restricted to officers who held temporary commissions in the war. In 1947 four R.N.V.R. air squadrons were formed.

THE ROYAL NAVY: SENIOR BRITISH SERVICE

GORDON HOLMAN, Author of *The King's Cruisers*, etc.

In conjunction with this general article, readers should refer to Atlantic, Battle of; Coastal Command; Dutch Wars; Fleet Air Arm; Mediterranean Sea; Navy; Submarine, etc., and to entries on sea battles of the First and Second Great Wars and other wars, e.g. Coral Sea; Jutland; Matapan; Plate; Trafalgar.. See also colour plates facing pages 7144-45

Fighting vessels guarded England's shores even before King Alfred's time. Offa, King of Mercia, had a fleet. But it was Alfred who created the first fleet, of long ships—square-sailed vessels, some with as many as 60 oars also. Canute and Harold both maintained fleets; but England's first permanent sea defences were provided by the barons of the Cinque Ports (*q.v.*). Their fishing craft, busses and cogs for the most part, were constantly ready to turn over to the king's service in time of emergency.

Comings and goings between England and Normandy in the early part of the 12th century entailed the use of ships of war. William, son of Henry I, was drowned when the White Ship went down in 1120. Henry II made use of sea power to disperse a fleet off the Flemish coast when faced with rebellion in France and England.

Before 1200, Richard I had carried the fame of English ships and sailors into E. Mediterranean waters. When some English sailors were murdered in Cyprus he deposed the ruler and established a government in the island. Richard himself fell into hostile hands when shipwrecked while returning from the Crusade, and was imprisoned for more than a year. In John's reign French and Flemish vessels were destroyed in the port of Damme by an English fleet commanded by William Longsword, earl of Salisbury; and sailors were among the few who remained loyal to John to the last.

Edward III's Victories

The Hundred Years War broke out in 1338, and in the autumn of that year a French fleet moved along the S. coast of England, burning parts of Southampton and Portsmouth. In 1340, however, Edward III attacked a French fleet which had gathered at Sluys with about 200 ships and gained a notable victory. His successful siege of Calais seven years later was backed by a fleet of more than 700 ships; and in 1350 Edward inflicted heavy losses on a powerful Spanish fleet in the Channel. The English fleet suffered a defeat by the French at La Rochelle in 1372.

During the following centuries English ships were steadily im-

proved as fighting units. They also made voyages of discovery to the west and to the east as the 15th century ran out and the 16th dawned: in 1497, for instance, John Cabot and his son Sebastian sailed from Bristol and reached the N. American mainland. Gunpowder came into regular use in ships, Henry VII introducing 225 small guns, called serpentes, into the four-masted ship *Regent*. Portsmouth and the dockyards at Woolwich and Deptford became the centres from which England's new sea power developed.

Defeat of the Spanish Armada

A glorious chapter opened in 1558 with Elizabeth's ascent of the throne, her "sea-dogs" engaging in stirring exploits that successfully demonstrated English hostility and indifference to the papal gift of the Americas to Spain and Portugal. Philip V of Spain made ready for war with England, his invasion fleet gathering in Cadiz harbour, where Drake visited it, "singeing the king of Spain's beard," by burning his ships and stores.

The Spanish threat led Elizabeth to improve the fighting organization of English shipping, a committee of officers of state, including the lord high admiral, shipwrights, and seamen, meeting in 1583. When news of the approach of the Armada (*q.v.*), which sailed on July 12, 1588, reached England, a wave of national feeling caused every man to muster to the queen's support, and created great enthusiasm for the fleet. In a six-day running fight up Channel the smaller English ships, expertly handled, inflicted heavy damage and casualties on the Spaniards, who reached Calais to find English and Dutch ships blockading the Flemish ports (then forming part of the Spanish domain). English fire ships drove the Spaniards off and they suffered a further defeat off Gravelines. The demoralised Armada fled north, and foul weather completed its dispersal, 53 ships out of more than 130 being all that reached Spain again.

At Elizabeth's death in 1603, the navy was down to 39 men-of-war and 4 galleys. Almost as soon as he came to the throne, James I issued a proclamation recalling all privateering vessels, and all Span-

ish prizes taken within a month of Elizabeth's death were declared illegal. Fresh life came to the navy with the interest shown by Henry, the young prince of Wales. In 1608, construction of the Prince Royal, largest ship in the navy, started at Woolwich. Phineas Pett, master-shipwright, received the support of Prince Henry; but neglect was still common in many ships, dishonest dealings in the service were frequent, and the navy was unable to deal even with the pirates off the English coast.

A commission appointed by James in 1618 to survey the navy and examine abuses in the administration was established in the following year as a permanent body for the government of the navy. It was said at the time that of the 25 ships which formed the first line of naval defence, "few could safely go farther than Plymouth."

The first public appearance of Charles I in 1625 was a visit to the fleet at Blackwall, but this did not herald an improvement in naval administration, which became more and more complex and increasingly corrupt. Some new ships were built, however, including the *Sovereign of the Seas*, first of the three-deckers. Little concern was shown for those who manned the ships and it was said that "foul weather, naked bodies, and empty bellies made the seamen voice the king's service worse than galley slavery." This, and the memory of disastrous expeditions to Ré and Cadiz, no doubt influenced the mariners' decision against Charles in the month before he raised his standard in Nottingham in 1642.

Expansion by Cromwell

Under the Commonwealth, big efforts were made to abolish corruption in the dockyards and naval establishments. The fleet increased rapidly in numbers, and a permanent organization was set up in all departments. Parliament's control of the navy during the Civil war had enabled its forces to sustain the resistance of Gloucester, Plymouth, and Hull, ports in the heart of royalist country.

In 1651, the Navigation Act, designed to curb Dutch maritime development, was passed by the

English parliament. A few months later the first Dutch war began. Even before the formal declaration, Blake and Tromp had clashed; and late in 1652 Blake was defeated off Dungeness. Victory enabled the Dutch to pass a convoy of 400 sail through Dover Strait in safety. Four months later Blake and Monk defeated Tromp off Portland Bill. Seventeen Dutch ships were taken in another English victory, and then, in a battle fought by Monk off Texel, Tromp was killed. In the subsequent peace, the Dutch agreed to recognize the supremacy of England's flag in English seas.

The internal organization of the fleet was strengthened after the Restoration, when James, duke of York, became lord high admiral. Men of wide sea experience directed the affairs of the navy, and Pepys was clerk of the acts.

Second and Third Dutch Wars

During the second Dutch war, which began in 1665, New Amsterdam, later renamed New York, was taken by an English naval force, while de Ruyter, the Dutch admiral, successfully attacked English forts on the coast of Guiana. In June, 1665, the Dutch were severely beaten off Lowestoft. Just a year later, there was a long drawn out and indecisive battle off the N. Foreland. After refitting, the English fleet sailed boldly along the Dutch coast and destroyed 150 ships in Terschelling roads. Peace negotiations broke down, and in 1667 de Ruyter and a Dutch fleet entered the Thames, burned English men-of-war there, and sailed up the Medway to Rochester. The third Dutch war (1672-74) was marked by a fierce naval battle off Southwold, where, despite the fact that the English had the aid of the French, de Ruyter was again victorious.

Towards the end of the 17th century, the English navy numbered upwards of 170 ships, including 9 first-rates, 11 second-rates, and 39 third-rates; but the battle of Beachy Head, fought on June 30, 1690, saw the French gain supremacy in the Channel. Afterwards, the French planned a large-scale invasion of England, but when they were ready, the English fleet, under Russell, inflicted a crushing defeat on Tourville in the battle of Barfleur and at La Hogue.

The navy, with Dutch assistance, captured Gibraltar in 1704. The war of Jenkins's Ear (*q.v.*) opened in 1739. British naval

forces were employed against Porto Bello and Cartagena, and a great seaman, Anson (*q.v.*), sent to attack Spanish territories in the Pacific, sailed round the world, returning after four years with many Spanish prizes and much treasure. As first lord of the Admiralty from 1751, he chose for high appointment such men as Hawke, Boscawen, Rodney, Howe, and Keppel.

Victory of Quiberon Bay

When the Seven Years' War (*q.v.*) began the press gangs were sent out to get the men needed to man British ships. It was a far-reaching war with sea action spreading from the Channel to the N. American coast and from the Mediterranean to India. In 1759 a French fleet at Lagos was defeated by Boscawen, and Hawke's Quiberon bay triumph was the decisive action of the war. Pocock's success at the expense of d'Ache, in an action off the Coromandel coast, hastened the decay of French power in India; and in Canada the French were unable to get assistance through to Montcalm at Quebec.

When the American colonists rose against British rule, Lord Cornwallis, leading his forces along the coast towards New York, was in 1781 surrounded at Yorktown. With his back to the sea, he looked for relief by an English squadron. Instead, a French fleet appeared, and Cornwallis was forced to surrender. Almost at the same time, British possessions in the W. Indies were threatened by the French, Gibraltar was besieged and Minorca captured by the Spaniards. Admiral Rodney defeated de Grasse near Dominica, and saved Jamaica, Howe relieved Gibraltar, and the U.K. emerged from the struggle with a navy brought to a high state of efficiency.

"The Glorious First of June"

The French Revolutionary and Napoleonic Wars made fresh calls on the Royal Navy. On "the glorious 1st of June," 1794, Howe virtually destroyed the French fleet, under Villaret Joyeuse, off Brest. Other great victories followed, notably those of Admiral Jervis and Commodore Nelson over the Spanish fleet off Cape St. Vincent, and Admiral Duncan over the Dutch at Camperdown.

Soon after, a mutiny occurred among the sailors at Spithead, who sought higher pay. Howe promised to meet the men's case and the trouble there ended; but, almost at once, a further mutiny began at the Nore. For more than a

month the movements of the fleet were held up. Public sympathy was not with the men and no help was forthcoming from Spithead. The mutiny broke down and the ringleaders were later hanged.

In 1798, at the battle of the Nile (*q.v.*) in Abukir bay, Nelson destroyed the French fleet, and Bonaparte and his army found themselves cut off in Egypt. A peace that was really only a truce was signed in 1802. War came again the following year and Napoleon prepared to invade England. Cornwallis and his admirals blockaded Brest and the Atlantic ports. Sir Robert Calder, attacking against heavy odds, took two French ships. On Sept. 15, 1805, Nelson left Spithead and arrived off Cadiz 13 days later. On Oct. 21, Villeneuve left harbour with 33 ships, and the battle of Trafalgar (*q.v.*), in which Nelson laid down his life, followed. The French fleet was cut into three divisions by the 27 ships under Nelson and Collingwood, and before the smoke of battle died away 20 French ships had been either sunk or captured.

Chesapeake and Shannon

The Royal Navy had heavy tasks in the Peninsular war. The 1812-14 war with the United States of America revealed weaknesses in British frigates, although the British ship won in the notable fight between the Shannon and the Chesapeake.

The modern Royal Navy may be said to date administratively from the 1830s when Sir James Graham and Sir Thomas Masterman Hardy were at the Admiralty. Strong naval action in 1882 gave the U.K. power in Egypt: following an uprising in which British residents in Alexandria were murdered, the British fleet, under Admiral Seymour, bombarded the city. The Suez canal was then seized, and Cairo occupied.

In the early days of steam, the Admiralty saw no virtue in this method of propulsion. Even at the time of the Crimean War, most of the vessels of the British fleet were still sailing ships. In 1860, H.M.S. Warrior, first of the "iron-clads," was launched. Of 9,210 tons, she had a radius of action of 1,210 m. at 10 knots. Her main armament was four 9-ton muzzle-loading rifled guns. She carried square yards on all her three masts and had a complement of more than 700. It was from the Warrior that new ships were evolved, until the Dreadnought set a fresh standard in 1906.

The frigate gave place to the cruiser, and the invention of the torpedo led to the building of a host of destroyers and torpedo-boats. Pioneer destroyer was the Havock, built in 1893. Of only 240 tons, she was nevertheless a big advance on the torpedo craft that had preceded her. In less than 14 years, the fleet included a destroyer of 1,800 tons, capable of 35 knots, compared with the 26 of the Havock.

Under and Over the Sea

Submarines were experimental until a comparatively short time before the First Great War. The Alose, built by the French in 1903, was only 60 tons. British craft of 1906-09 had grown to 316 tons, and the D-class, of 1912, were vessels of 620 tons. The advent of the aeroplane also affected the navy. While scientists, technicians, and naval architects worked to keep ahead in these new fields, the naval service provided skilled officers and ratings to man novel types and handle fresh weapons.

Lord Fisher of Kilverstone (*q.v.*), as first sea lord 1904-10, gave the navy its big gun ships, and instituted a sweeping reorganization and re-disposition of the navy. There was a political crisis over the navy estimates of 1909, but Fisher succeeded in getting the ships and the men the navy needed. Winston Churchill, appointed first lord of the Admiralty in 1911, continued the expansion of the navy. Nevertheless, when the First Great War came in 1914 the speed of ships and the range of guns made the task of Jellicoe (*q.v.*), *c.-in-c.* of the grand fleet, infinitely more difficult than those that had been faced by earlier British admirals. Opposing fleets at Trafalgar approached each other at a relative speed of six knots. At Jutland, in poor visibility, the relative speed was 40 knots. The difference in armament was if anything more striking. From the bridge of the Iron Duke, Jellicoe controlled 24 battleships in six columns. The moment of deployment into battle line of such forces called for one of the greatest decisions of any admiral in history. But the chief sea battles of the First Great War were fought against the U-boats. By ruthless sinking of merchant ships, these had by April, 1917, brought the U.K. to within six weeks of starvation. The Royal Navy opposed the German submarines not only with anti-submarine vessels but with new agents, such

as the depth charge and the hydrophone. Booms and barrage nets were installed in all narrow waterways, and the strait of Dover was closed to shipping. "Q" ships, which decoyed the enemy into the range of powerful guns hidden in apparently harmless merchantmen, had considerable success. Under Vice-Admiral Roger Keyes, one of the most daring and successful assaults of any war was made on Zeebrugge in order to block the canal and so deprive the Germans of their advanced U-boat bases on the Belgian coast.

The Royal Naval Air Service (*q.v.*) (later absorbed into the Royal Air Force) was developed during the First Great War; and later the fast light battle cruisers Furious, Glorious, and Courageous were converted into aircraft-carriers. They proved invaluable in the training of naval airmen between the two Great Wars.

Naval strength in personnel fell from 415,000 at the time of the 1918 armistice to 127,500 in 1921-22. The capital ship building programmes of the maritime powers were abandoned as a result of the Washington conference, 1922, the British Empire retaining 14 battleships and four battle-cruisers. The London Naval treaty, 1930, set new limits to cruiser strength. At the end of 1934, Japan gave notice of her intention to withdraw her adherence to this treaty; and in March, 1935, Hitler repudiated the disarmament clauses of the Versailles treaty, entering the same year into the Anglo-German naval agreement which gave the Germans the right to build up to 35 p.c. of the total tonnage of the British Commonwealth navies.

Rearmament and War

The efforts made in the 1920s to promote world disarmament having failed, the Admiralty set itself to the task of rearmament, and the maintenance of an efficient and up-to-date nucleus in all branches. A special study was made of night action at sea, with its problems of identification and communication. Anti-aircraft gunnery was developed, and new cruising formations, to meet the dangers of air attack, were worked out. The fleet was mobilised at the time of the Munich Crisis (*q.v.*), and thereafter the building of naval ships was speeded up. But when war broke out again in Sept., 1939, the Royal Navy was still dangerously short of some classes of vessels. In the main fleet at Scapa Flow were four

battleships, three battle-cruisers, and five cruisers. Ten older cruisers operated on the Northern patrol, and two battleships formed the main unit of a Channel force based on Portland. In the Mediterranean fleet were three battleships, three 8-inch cruisers, and several smaller cruisers. The convoy system was put into operation at once, stretching escort force resources to the utmost.

Naval Record, 1939-45

Throughout the Second Great War the Royal Navy, despite heavy losses, successfully hunted down large and small units of the German navy; set up a vast network of convoys all over the world, but in particular to N. America and, later, Russia; extricated and conveyed armies; and performed exploits similar to that of Zeebrugge by *e.g.* planting the old destroyer Campbeltown, filled with explosives, on the gate of the great dry-dock at German-occupied St. Nazaire. Of the many wartime developments, the coming into general use of radar (*q.v.*), which gave the sailor "sight" in darkness, fog, and foul weather, was one of the most remarkable, and was an important factor in *e.g.* the destruction of the Scharnhorst. Great advances in the air were accompanied by the production of fresh types of aircraft-carrier. Midget submarines were developed. The Fleet train, evolved by the Americans, which made it possible for fighting ships to be sustained at sea for long periods, was adopted by the Royal Navy when the main naval battle moved to the Pacific. Great Britain lost altogether 49,305 naval officers and ratings, and five battleships, eight aircraft carriers, 29 cruisers, 139 destroyers, 74 submarines, and more than 500 other war vessels.

Nearly half a million men joined the navy during the six years of war. Portsmouth, Devonport, and Chatham, the three great naval centres of England, were supplemented by scores of wartime training establishments, many far from the sea.

The general depots of the navy date from 1891—the press gangs had disappeared some 75 years earlier. From 1815, captains of newly commissioned ships obtained most of their crew by recruiting at a rendezvous—usually a public house—near the dockyard gates. A hulk was attached to each ship fitting out, and in the hulk the men had to live until their ship was ready. "I think

these hulks are the curse of the navy; they are uncomfortable and there is no discipline," said Admiral Sir Charles Napier, in 1858. Five years earlier, a class of petty officers had been established, on the recommendation of an Admiralty committee.

A naval barracks at Portsmouth was proposed in 1862, but the scheme was postponed and not revived until 1876. In 1879, the building of the Royal Naval Barracks at Devonport was begun; 24 years later, 4,000 officers and ratings marched from H.M.S. Duke of Wellington to take possession of the newly constructed barracks at Portsmouth. At that time, the fleet was still victualled on the old service system. The daily ration consisted of a fixed quantity of provisions for every man, valued at 9½d. A change was made to the "standard ration" system in 1907. A little later, general messing was introduced in ships and in barracks. Before the Second Great War, a rating putting in 22 years' service could expect to spend just over 8 years abroad, nearly the same time on home sea service, and 6 years on home shore service. After it, overseas commissions were reduced in length. New opportunities of promotion put flag rank within the reach of those beginning on the lower deck. There were also improvements in pay and conditions; but considerations, such as the opportunity to see the world and to qualify for a pension, were still emphasised in naval recruiting.

Tradition has played an important part in the development both of the navy, and of the Admiralty, which controls it. The lords commissioners of the Admiralty are the governing body, and the Admiralty is still the office of the lord high admiral. The board of Admiralty consists of the first lord (a cabinet minister), the first sea lord and other sea lords, who are admirals, the junior ministers, and the secretary to the Admiralty. There has been very little change in the organization of the board of Admiralty from the time of Pepys.

Corbett, 1898; The Royal Navy, 7 vols. W. L. Clowes, 1897-1903; Short History of the Royal Navy, D. Hannay, 1909; The Navy under the Early Stuarts, C. D. Penn, 1913; The Times Book

of the Navy, 1914; Royal Navy, Lieut.-Commander Allan Baddeley, R.N., 1942; The Naval Heritage, David Mathew, 1944; Naval Broadcasts, Rear-Admiral R. K. Dickson, D.S.O., R.N., 1946; The British Navies in the Second World War, Admiral Sir W. M. James, G.C.B., 1946.

Royal New Zealand Air Force. Formed in 1926 from a nucleus of two squadrons of fighter aircraft lent by the R.A.F. This body was a component of the New Zealand military forces until 1937, when it was reconstituted as a separate organization under an air board. It had been granted the prefix Royal in 1934. At the outbreak of the Second Great War the R.N.Z.A.F. had a mobilised strength of 1,260 officers and men; most of its aircraft were army co-operation and training machines. The bulk of the personnel was transferred at once to Great Britain, where bomber and fighter wings were formed. R.N.Z.A.F. squadrons served on all battle fronts, notably in the bomber offensive against Germany and in the campaigns against Japan. In 1948 the strength of the force was fixed at two medium bomber squadrons, one flying boat, one fighter bomber, and one transport squadron, totalling 3,420 officers and men.

Royal New Zealand Navy. Fighting unit created in 1941 to replace the New Zealand squadron of the Royal Navy responsible to that date for maritime defence of the dominion, and paid for jointly by the British and New Zealand govts. By 1945 the R.N.Z.N. consisted of three cruisers, two destroyers, an armed merchant cruiser, minesweepers, and armed trawlers. N.Z. naval personnel totalled 10,000, of whom 5,000 served on dominion vessels, 4,000 with the Royal Navy, and 1,000 with the Fleet Air Arm. The Achilles, a cruiser of the N.Z. squadron, took part in the battle of the River Plate, Dec. 13, 1939. Other N.Z. ships served in the Mediterranean and the Pacific. In 1947 the strength of the R.N.Z.N. was established at 2,200 officers and men; the vessels included one cruiser, two corvettes, seven armed trawlers, and four light coastal craft. Except these last, all vessels are lent by the Royal Navy, and maintained by the N.Z. govt.

Royal Oak. Former British battleship. Completed in 1916 as a ship of the Royal Sovereign class, she displaced 33,500 tons on a length of 614½ ft. and a beam of 102½ ft. and was powered by

geared turbines developing 40,000 s.h.p. to give a maximum speed of 22 knots. She mounted a main battery of eight 15-in. guns and secondary armament of twelve 6-in., eight 4-in., four 3-pdr. guns, and 15 multiple machine-guns. She carried two aircraft and a complement of 1,234 officers and men. The Royal Oak took part in the battle of Jutland. In 1934 she was reconditioned at a cost of £1,000,000. While on non-intervention patrol in the Spanish Civil War she was hit by Nationalist A.A. fire. On Oct. 14, 1939, she was at anchor in Scapa Flow when a German submarine penetrated the defences and hit her with a salvo of torpedoes; she capsized and sank in 20 mins. with the loss of 800 officers and men.

Royal Opera House. Theatre in Covent Garden, London, built for the presentation of Italian opera. See Covent Garden.

Royal Parks. Enclosed spaces, laid out for pleasure and recreation, which are or were formerly part of the estates of the British royal house. They are administered by the ministry of Works and, within certain limitations, are open to the public. Notable are Windsor Great Park, and Hyde and St. James's Parks, London.

Royal Pioneer Corps. Corps of the British army. Established on Nov. 10, 1939, as the Auxiliary

Royal Pioneer Corps badge

Military Pioneer Corps, it was the successor to the labour battalions raised in the First Great War. It was placed under command of Major-Gen. L. W. Amps, and by the end of 1939 more than 1,000 men had been trained and joined the B.E.F. in France. Recruiting was at first restricted to men between 35 and 50 and to those, because of slight disability, below the medical standard of front line troops. Age and physical standards were later made the same as for other regiments.

Only 25 p.c. of the A.M.P.C. serving in France was armed, but the corps did splendid work in the defence of Boulogne and Dunkirk, once fighting a German armoured column with picks and shovels. Re-formed after Dunkirk as the Pioneer Corps, it became a fully combatant unit to work in cooperation with the Royal Engineers. In campaigns overseas

its constructional and docking companies were frequently called upon to fight beside the infantry. They manned the defences of the Kasserine Gap in Tunisia, 1943, and landed with the first assault troops at Salerno, 1943, and Anzio, 1944. Other units served in Burma, and an airborne battalion was formed as part of the Allied expeditionary force for the liberation of Europe.

In the U.K. the corps constructed depots, airfields, roads, railways, and anti-invasion defences and handled the greater part of the army supplies for D-day. Special companies were formed for clearance of air raid bomb damage, while units were in charge of smoke screen equipment used to hide vital targets from the air. The corps found most of the guards for prisoner of war camps. By 1945 it had a strength of 430,000 men, of whom 160,000 were recruited in the U.K. and included volunteers (used for home service only) of foreign birth, most of them German refugees, and 270,000 enlisted overseas, principally in Cyprus and Palestine.

In 1946 the corps was granted the prefix Royal and established as permanent.

Royal Regiment of Artillery. Official title of the British military unit described as Royal Artillery.

Royal School of Mines. London teaching institution. See Mines, Royal School of.

Royal Scots. Regiment of the British army. Raised in 1672 for the Scottish establishment, it became part of

Royal Scots.
Badge of the regiment

of the Scots brigade of Gustavus Adolphus in 1613. After the death of that monarch in 1632, it entered the French service and was amalgamated with a body of Scottish infantry raised in 1590 for the service of Henry of Navarre. While in the French service the regiment received its nickname, Pontius Pilate's Bodyguard, after a dispute about precedence with a Picardy regiment. It fought at Dunkirk in 1658, and at the Restoration was transferred to the English establishment by Charles II, who designated it the Royal or Scots Regiment and settled its precedence by numbering it the 1st Foot and senior infantry regiment of the line.

The Royal Scots served in Tangier in 1680 and with William III at Namur in 1695. It was with Marlborough at Blenheim, Ramillies, Oudenarde, and Malplaquet. It gained seven honours in the Peninsular War, and when conflict broke out with the U.S.A. in 1812 the regiment was shipped across the Atlantic to take part in the battle of Niagara. Back on the Continent it was in time for Waterloo. Further honours were won in the Crimean, Chinese, and South African Wars.

Thirty-five battalions of the Royal Scots were raised for service in the First Great War, and earned the battle honours: Le Cateau; Marne, 1914, '18; Ypres, 1915, '17, '18; Loos; Somme, 1916, '18; Arras, 1917, '18; Lys; Struma; Gallipoli, 1915, '16; Palestine, 1917, '18. In the Second Great War, remnants of the 2nd Royal Scots were captured after the fall of Hong Kong; the other regular battalion and the territorial battalions served in France, 1940, N. Africa, Italy, and the liberation of Europe. The regimental depot is at Glencorse, Midlothian.

Royal Societies Club. London club. Founded in 1894 at 63, St. James's Street, it now has a house at 35, Dover Street, W.1. Members must have some qualifications in the domain of literature, art, or science, or must belong to a university or other learned society.

In the early part of the 18th century there was a Royal Society Club, a dining club composed of a number of literary men. Its president was the president of the Royal Society, and its members included Gibbon, Reynolds, and Lawrence. The dinners were held until late in the 19th century, the places of meeting being Pontack's in Abchurch Lane, the Devil's Tavern, the Mitre, the Freemasons' Tavern, and the Thatched House Tavern.

Royal Society, THE. Premier scientific society in the U.K., and oldest in the world with a continuous existence. It originated in a meeting in London, 1645, of a number of learned inquirers after knowledge, for the discussion of various speculations in natural philosophy and of experiments connected therewith. In 1648-49 some of the members

removed to Oxford, where they met in Dr. Wilkins's rooms at Wadham College. About ten years later most of them returned and resumed their meetings, with others who had stayed in London, at Gresham College, E.C., becoming organized in 1660 as a society, which, on April 22, 1662, was incorporated by Charles II under the title of The President, Council, and Fellowship of the Royal Society of London, for improving Natural Knowledge.

The Philosophical Transactions first appeared March 6, 1665, and the whole series presents a complete survey of the progress of scientific knowledge down to the present day. The society continued to meet at Gresham College, except for a short time at Arundel House, 1666-73, until 1710, when a move was made to Crane Court, Fleet Street. In 1780 the society moved again to rooms provided by the government in Somerset House, and in 1857 to its present home in Burlington House, Piccadilly. Since 1848 the honour of admission to the society has been jealously guarded.

Several medals are awarded each year in encouragement of scientific research and discovery. The Copley medal dates from 1731; the Rumford medal, for discoveries in light and heat, 1797; two Royal medals, 1826: Davy medal, 1877; Darwin medal, 1890. The list of presidents includes many famous names, from Newton, 1703, and Davy, 1820, to Huxley, 1883, Thomson (afterwards Lord Kelvin), 1890, Lister, 1895, and Rayleigh, 1905. See Academy; Burlington House; consult History of the R.S. to the end of the 18th century, T. Thomson, 1812; History of the R.S., 2 vols., C. R. Weld, 1848; The R.S., 1660-1940, Sir H. Lyons, 1944.

Royal Society of Arts, THE. Abridged name of a British learned society, the Royal Society for the Encouragement of Arts, Manufactures, and Commerce. Founded in 1754 and incorporated in 1847, it assists scientific and kindred interests by inviting eminent men of many schools of thought to lecture, by issuing a fortnightly journal, and by conducting examinations in commercial subjects and foreign languages. In 1936 the society inaugurated the distinction of royal designer for industry (R.D.I.), which can be held by not more than 40 people at any one time. The fine lecture hall at the society's h.q., 6-8, John Adam

Royal Society
arms

Street, Adelphi, London, W.C.2, was damaged by bombs during the Second Great War, but was reopened in 1947, when the number of fellows was some 5,000.

Royal Society of Edinburgh. Scottish learned society. It developed from a philosophical society founded in Edinburgh in 1739. In 1783 it received a charter of incorporation. Its constitution and aims are similar to those of the Royal Society in London. Headquarters are at 22, George Street, Edinburgh, and members are known by the letters F.R.S.E.

Royal Standard. Personal flag or banner of the British sovereign. It carries the Royal Arms (*q.v.*), and is flown with the three lions in the upper staff. This standard may be flown only from buildings and ships in which the sovereign is resident or which he is visiting. Use by private individuals, even as a street decoration, is illegal. See Flag colour plate facing p. 3392.

Royal Tank Regiment. Unit of the British army. It was established in 1916 as the Tank Corps

and was formed from a nucleus of Machine Gun Corps personnel to man the tanks used for the first time at the battle of the Somme. At the end of the First Great War it counted 35,000 officers and men and 2,000 armoured vehicles. In 1923 it was granted the prefix Royal, and in 1939 was incorporated in the Royal Armoured Corps as the Royal Tank Regiment. See Armoured Vehicles in Warfare; Tank.

Royalty. Originally a revenue or right belonging to the sovereign. There were a number of these in England in early days, among them treasure trove, and some remain today. The word is more generally used, however, for payments made to the owners of mining leases, patents, and copyrights for the right to work and sell such. Other royalties are fixed sums on each article or book sold. The word is also used for the state of being royal, and sometimes for the king and his family. See Royal Family; Wayleave.

Royalty Theatre. A former London playhouse, in Dean Street, Soho. It was built originally in 1840 for Miss Kelly's school of acting. Known later as The Soho and the New Royalty, it was

rebuilt in 1882-83, and again before it was reopened on Jan. 4, 1905, by Gaston Mayer, who gave several seasons of French plays in which Sarah Bernhardt appeared. The theatre closed in 1938.

Royal Ulster Constabulary. This body is described under Ulster Constabulary, Royal.

Royal Warrant. See Warrant.

Royal William. First vessel to cross the Atlantic under steam only. The Savannah, which made

a fortress church, built in the 10th-12th centuries, and remains of a Roman bath. Alkaline and arsenical thermal springs, and beautiful environs, attract many visitors. Pop. 1,700.

Royce, SIR (FREDERICK) HENRY (1863-1933). British engineer. Born March 27, 1863, he was first apprenticed to the Great Northern rly., and later employed at a Leeds gun factory. He studied electricity with such success that

he was made an electrical engineer for the city of Liverpool. At 21 he founded in Manchester his firm of mechanical and electrical engineers. His first two-cylinder 10 h.p. motor car appeared in 1904. He met C. S. Rolls, a racing motorist, who entered into partnership with him, and in 1907 there came into being

Rolls-Royce, Ltd., which developed as the manufacturers of the world's finest car. Royce was created a baronet in 1930, and died April 22, 1933. A Life by Max Pemberton appeared in 1934.

Royce, JOSIAH (1855-1916). American philosopher. Born in California, Nov. 20, 1855, he was educated at the university of California, and in Germany. In 1878 he returned to his own university as a tutor, first in English and then in philosophy, and in 1892 was made professor of philosophy. In 1914 he went to Harvard as Alford professor of natural religion and moral philosophy. Royce taught objective idealism, that the relation between the subject and the object of thought is one of absolute identity and of logical voluntarism. All logic is logic of the will; truth is instrumental so far as it is a means of obtaining the object of all human willing. There is no pure understanding; thinking is a mode of action and an idea is a plan of action. Morality consists in free, active loyalty to a thing or community. Royce died Oct. 4, 1916.

Royden, AGNES MAUDE (b. 1876). British social worker and preacher. Daughter of Sir T. Royden, Bart., she was educated at Cheltenham and Lady Margaret Hall, Oxford, and worked at the Victoria women's settlement, Liverpool, and lectured in English

Royal William. The first vessel to cross the Atlantic under steam only, 1833

By courtesy of the City of Dublin Steam Packet Co.

the voyage in 1819 from Georgia to Liverpool, although fitted for steam, sailed two-thirds of the way and steamed the remainder. The Royal William, built at Quebec in 1831 by John Goudie, a native of Greenock, Scotland, was 176 ft. long over all, 43 ft. 10 ins. in beam, and 17 ft. 9 ins. deep inside the hold. Under command of Capt. John McDougall, she left Quebec Aug. 4, 1833, and reached Liverpool in 25 days. On the voyage she consumed 330 tons of coal. Sold for £10,000 at the end of 1833, the vessel was first chartered by the Portuguese government, who declined to purchase her for their navy. Next year she was bought for the Spanish fleet, and under the name of Ysabel Segunda became the first war steamer the Spaniards possessed.

Royan. Fishing village of France, in the dept. of Charente-Inférieure. At the mouth of the Gironde, its S. aspect and its fine sands made it a popular bathing resort, attracting annually thousands of visitors. There was a small harbour, and sardine fishing and a coasting trade were carried on. The village was completely wrecked during the Second Great War. See Gironde, La. Pop. 9,300.

Royat. Health resort of France, in the dept. of Puy-de-Dôme. It stands on the Tiretaine, at an alt. of 1,495 ft., about 2 m. by tram S.W. of Clermont-Ferrand. It has

Royal Tank Regiment badge

literature to the Oxford university extension delegacy. In 1908 she became an active member of the

Maude Royden.
British social worker

women's suffrage movement, editing *The Common Cause* until 1914. She preached at the City Temple, 1917-20, and at the Guildhouse, Eccleston Sq., London, 1920-36, founding with Percy Dearmer the fellowship services at Kensington. She became C.H. in 1930. In Oct., 1944, Maude Royden married the Rev. G. W. H. Shaw, who died Nov. 30 in the same year. Her many books on religious and sociological subjects included *Women and the Sovereign State*; *Prayer as a Force*; *Here and Hereafter*. An autobiographical work, *The Threefold Cord*, appeared in 1947.

Royde-Smith, NAOMI GWLADYS. Contemporary British writer. Educated at Clapham high school and Geneva, she was literary editor of the *Westminster Gazette* during 1912-22, attracting attention by setting ingenious competitions. Retiring from journalism, she made her reputation as a novelist with *The Tortoiseshell Cat*, 1925; other stories included *The Delicate Situation*, 1931; *The Queen's Wigs*, 1934; *Mildensee*, 1943; *Fire-Weed*, 1945. Of her biographies the best-known was *Portrait of Mrs. Siddons*, 1933. She married the actor Ernest Milton.

Royer-Collard, PIERRE PAUL (1763-1845). French philosopher and statesman. Born at Sompuis, Marne, June 21, 1763, he at first supported the Revolution, but was proscribed and in hiding during the Terror. In 1797 he was

P. P. Royer-Collard, on the council French philosopher of 500. Professor of philosophy in Paris, 1811-13, he founded the *Doctrinaire (g.v.)* school in philosophy and politics, being himself a speculative rather than a practical politician. He led the reaction against the sensualism of Condillac, and introduced the views of the Scotsmen Reid and Stewart to France. He sat in the chamber of deputies, 1815-39, becoming president 1828,

and was president of the commission of public instruction, 1815-20. He died Sept. 4, 1845.

Royston. Market town and urban dist. of Herts, England. It is 12 m. N.E. of Hitchin, with a station on British rlys. (E. section). An Augustinian priory was founded here in the 12th century, and its church is the existing parish church of S. John the Baptist. The town has a market house. In 1742 there was discovered a hermit's cave, containing carvings of the Crucifixion, etc., and many relics of the Romans have been found. James I built a palace here. The Royston crow is another, and local, name for the hooded crow, a species that visits towns in winter. Annual fairs are held. Market day, Wed. Pop. 5,000.

Royston. Urban dist. of the W. Riding of Yorks, England,

Ruapehu, New Zealand. Distant view of the volcanic cone in North Island

4 m. N. of Barnsley, with a rly. station. The chief buildings are the church of S. John the Baptist, restored in 1859, and the grammar school, founded 1607. Pop. 7,750.

Royston. Urban dist. and market town of Lincs, England. It is 3 m. by rly. N.W. of Oldham. The chief industry is cotton manufacture. Market day, Thurs. Pop. 15,000.

R.S.F.S.R. Largest republic in the Soviet Union, covering about three-quarters of the total area and stretching from the Arctic to the Black Sea and from Leningrad to the Far East. The Russian Soviet Federal Socialist Republic was given its first constitution in 1918 and this was a model for all republics later incorporated in the union. New constitutions were adopted in 1925 and 1937. In 1948 the republic was organized in six territories, 51 regions, five autonomous regions, and twelve autonomous republics. For topography, history, industry, etc., see Russia.

Ruabon OR RHUWABON. Town of Denbighshire, Wales. It is 5 m. by rly. S.W. of Wrexham. The chief building is the church of S. Mary, in which are monuments to the Wynn family, whose seat,

Wynnstay, is near. Bricks, tiles, and chemicals are manufactured, while coal and iron ore are mined in the vicinity.

Ruanda-Urundi. Territory, formerly in German E. Africa, assigned to Belgium as mandatory by the League of Nations. Administratively it was united with the Belgian Congo 1925, the frontiers having been ratified in 1924. It is now bounded N. by Uganda, E. by Tanganyika Territory, and W. by Lake Kivu. It is inhabited by three races, the Bak-utsi, the Bahutu, and the Batwa. The N. is a volcanic area with large subterranean caves. Usumbura is the capital. The total territory transferred from German to Belgian administration covered about 19,000 sq. m. Pop. 3,386,362.

Ruapehu. Mt. of North Island, New Zealand. A volcanic cone, 9,068 ft. alt., it was in eruption in

1895 and 1945. With Mt. Tongariro and other peaks, it constitutes a national park, the territory of which was given to the New Zealand government by the Maori chief, Te Heuheu Tukino, in 1887.

Rubáiyát. Plural of rubai, a Persian word meaning quatrain or verse of four lines in which the first two and fourth lines rhyme. One quatrain or stanza is a rubai, and a number of verses or complete poem is a Rubáiyát. The best known is the Rubáiyát of Omar Khayyam, translated into English by Edward FitzGerald. Another well-known example is the Rubáiyát of Abu Said. See FitzGerald, E.; Omar Khayyam.

Rubato (It., robbed). Musical term. It indicates a subtle variation of the tempo which the performer is to use at his discretion in order to gain in expressiveness and grace, as time which is inflexibly strict sounds mechanical and stiff. Rubato is thus a necessity in all artistic performance, but some composers, notably Chopin, call for it more than others. Without a sensitive appreciation of rhythm and a keen insight into the structural balance of the composition, it may degenerate into an exhibition of bad time and poor musicianship.

RUBBER: NATURAL AND SYNTHETIC

This article deals with the various stages in the production of natural rubber from planting to manufacture, and describes also the development and uses of synthetic rubber. See also Macintosh, C.; Motor Car; Plastics; Tire

The first known references to rubber occur in a work of P. Martyr of Anghiera, published in 1525, which contains a description of some rubber balls he had seen used by the people of Mexico for their sports. Sahagun described the balls as having been made from a black resin obtained from certain trees. Not until the year 1736, however, did La Condamine, a member of an expedition sent to S. America, bring back specific information about rubber-bearing trees, and the methods by which the natives obtained rubber from them. Dr. Priestley in his work on Perspective (1770) mentions it as useful for "wiping from paper the marks of a blacklead pencil" (hence its name, for rubbing out pencil marks was the first use to which the material was put in Europe), and that a cubical piece of about half an inch could be obtained for 3s.

Towards the close of the 18th century the first known attempts were made to use rubber in industry. In 1791 Samuel Peel, a citizen of London, patented a process for waterproofing cloth by spreading rubber dissolved in turpentine over it; but the garments produced by this means were both sticky and smelly. Many other unsuccessful attempts were made before in 1823 Charles Macintosh, of Glasgow, succeeded in producing waterproofed garments free from the objectionable defects of previous attempts. This success laid the foundations of the rubber industry. Independently (c. 1842-43) T. Hancock, of London, and C. Goodyear, of Newhaven, U.S.A., discovered that by vulcanisation, i.e. subjecting rubber to the combined action of sulphur and heat, it could be freed from stickiness, gained greatly in strength and elasticity, and would withstand climatic influences.

Original Sources of Supply

For a considerable time S. America, more especially Brazil, was the sole source of supply. The rubber was procured in a rough and ready fashion by the natives who slashed the wild rubber trees with small axes, and collected the latex which dropped from the cuts in small cups. Later in the day the contents of these cups was emptied into buckets, and the rubber was cured by repeatedly dipping a

paddle into the buckets of latex, and revolving the paddle over a smoky fire of bark and nuts. The principal tree from which rubber was obtained was *Hevea brasiliensis*; but other trees in various localities also yielded rubber, e.g. various species of *Manihot*, producing cerea rubber, and the *Castilloa elastica* of central America. Later it was discovered that there were many rubber-bearing trees and vines in Africa and Madagascar, in particular in the Congo district (*Landolphias*). On account of the general excellence of its quality fine hard Para was preferred above all other rubbers.

Seedlings Grown at Kew

But there was a limit to the quantity of rubber procurable by haphazard gathering from wild trees, and the authorities at Kew Gardens determined to try to procure seeds of *Hevea brasiliensis* from the Amazon districts and transplant them in British possessions in the Far East. Of 70,000 seeds brought from Brazil in 1876, less than 2,000 produced seedlings; but these were sent to Ceylon in 1877, and from them have come the hundreds of millions of rubber trees grown and growing in Malaya, Indonesia, and Ceylon. (By 1910 some half million acres had been planted; by 1947, about 8½ million acres, some 40 p.c. in Malaya.) During the Second Great War, after Japan had overrun the rubber plantations in Malaya and the Netherlands Indies, 1941-42, collection of wild rubber was stimulated both in S. America and central Africa, and search was made for suitable rubber producing plants of quicker growth than *Hevea brasiliensis* both in central America and Asiatic Russia; but the production from these sources remained relatively small, and both the Allies and Germany met most of their wartime needs for rubber with the synthetic product (*v.i.*).

The serious demand for rubber began to develop with the invention of the pneumatic bicycle tire in 1888; but it was the rapidly expanding need for rubber for motor car tires, dating from the opening decade of the 20th century, that stimulated the development of rubber plantations in the Far East, particularly in Malaya and Java. In 1850 the output of rubber was estimated at 1,000

tons. In 1900 it had risen to 30,750 tons, and in 1920 to 295,000 tons. In 1927 the output was estimated at 643,000 tons, 605,000 from plantations; in 1937 1,135,000 tons, almost all from plantations. The world's 4 million motor vehicles in 1937 required about 750,000 tons for tires.

There is scarcely any art or industry or sport in which rubber is not used in some form or other. Thomas Hancock, a pioneer in the rubber industry, put india-rubber to use for e.g. elastic springs for gloves and braces. The invention of rubber thread was an important development, for this can be woven into fabrics from which a great variety of surgical and domestic apparatus and apparel is made. Other important uses of rubber are for hose pipes and tubing, valves, buffers and engine packing, hot water bags, gas bags, cushions, belting, gloves, electrical fittings, rubber balls, sponges, vulcanite combs, boot soles and heels, and the insulation of telegraphic wires and cables.

PLANTATION RUBBER. The laying out of a rubber plantation requires first the felling and burning of the jungle, and the digging out of tree roots. Rubber seeds, seedlings, or stumps, i.e. large seedlings grown in nurseries and stumped by cutting off the top and the end of the tap root, can be planted. The last is a very convenient form of planting, as while the ground is being cleared seedlings can be grown close together in large numbers ready for planting out as stumps as opportunity offers. One hundred trees per acre is a convenient number to plant; later on, when they have developed their root system and foliage and have become crowded, they must be thinned to about 70 per acre.

Method of Tapping

The young plants grow rapidly, and by the time they are five or six years old should have attained a girth of about 20 ins. at 3 ft. above the ground. This is a suitable size of tree on which to begin tapping, i.e. paring away thin shavings of bark with some simple instrument, usually a farrier's knife. Two or 3 ft. above the ground a V-shaped cut is made in the bark along the trunk of the tree at an angle of 45° to a channel which runs vertically down the trunk of the tree to the ground, where the latex, a milky fluid which flows from the cut, is received in a cup or cups. The average rubber content of latex is 35 p.c., the

highest recorded content of *Hevea* latex being 69.5 p.c. taken from 30-year-old trees after a long rest period. Raw rubber is a hydrocarbon (isoprene) polymer, and has the empirical formula C_5H_8 .

In early years it was thought that the more cuts on the bark, the more rubber would be collected, but it was soon found that after a first cutting the bark did not renew itself well, and that overtapped or badly tapped trees were apt to become overgrown with warty growths and to be attacked by various fungoid

diseases. The usual system adopted later was to make successive V-cuts, first on one half of the tree trunk, then on the other. This means that it is 6-8 years before tapping begins again on the first side, which allows time for the bark to renew itself. A good yield from a young tree of from 20 to 25 ins. in circumference 3 ft. from the ground would be 2½ to 3 lb. of dry rubber per annum. Trees are usually tapped on alternate days. Tapping is started early in the morning, and when the tapper has

finished his task of, say, 300 to 350 trees, he empties the contents of all the cups into a galvanised iron bucket and carries it to the factory. The latex is carefully strained through sieves into a large receptacle tank, where a small percentage of formic or acetic acid is added and well mixed to cause coagulation. The latex rapidly coagulates into white cheesy slabs which are washed in water and then rolled into sheets. These sheets are hung on racks in the shade to dry. More frequently than not, during

this process they are well smoked. When thoroughly dry the sheets are carefully packed in chests each containing about 2 cwt. and are then ready for export.

The use of "reclaimed rubber" recovered from old tires, etc., corresponds to the use of "shoddy" in the woollen industry. The rubber so recovered has not the same high degree of tensile strength as has new rubber, but is useful for many purposes, such as rubber heels and rubber tiling for floors.

SYNTHETIC RUBBER. Relatively simple hydrocarbons can be caused to polymerise under certain conditions to yield rubber-like masses. The processes involved are relatively costly, so that it was only in Germany, the U.S.A., and the U.S.S.R. that serious attempts were made during the 1930s to put "synthetic" rubber on a fully commercial basis. With the over-running of the rubber producing areas in the Far East by the Japanese in 1941-42, what had been an expensive luxury became an essential war material, and in the U.S.A. plans were made for producing more than 1,000,000 tons per annum.

Uses of Synthetic Rubber

According to a statistical survey made in 1938, synthetic rubber could already be substituted for the natural product 769 times out of 1,000 in the mechanical goods field; but while the intensive development of the war years established the synthetic material for peace as well as war purposes, experience has demonstrated that the natural material could hold its own. Natural rubber is superior in processing properties, resilience and elasticity, resistance to tears and cuts, and reasonable maintenance of elastic properties at low temps. The synthetic materials, on the other hand, are superior in their resistance to deterioration by oils and organic solvents, resistance to ageing, and low permeability to liquids and gases.

The term synthetic rubber is applied somewhat indiscriminately to 40-50 different synthetic products having rubber-like properties sometimes called elastomers. Early attempts to synthesise rubber started with isoprene, but energy was soon diverted in other directions, and in particular to butadiene. A derivative of this was the basis of the first commercial synthetic rubber produced, 1931, in the U.S.A., neoprene, the polymer of chloroprene which is chemically

2-chloro-1:3-butadiene. It was found that the properties of the products varied considerably according to the method of polymerisation (*q.v.*) and this gave rise to different commercial types, the most important being neoprene E, G, and G.N.

Butadiene Elastomers

A large number of elastomers have been prepared from butadiene, which is obtained from petroleum or alcohol. According to American statistics the U.S.S.R. was producing 60,000 tons of these elastomers in 1939 under the designations S.K.A. and S.K.B.; the corresponding German grades buna 85 and 115 were then regarded as virtually obsolete. By far the most important member of this family is buna.S, which under the designation GR.S. accounted for the bulk of American wartime output. Buna.S is a co-polymer of butadiene with 25 p.c. styrene, and has a specific gravity of 0.92. It is said to be far superior to rubber in heat and abrasion resistance, and a buna.S tire tread is said to be 35 p.c. better than the best natural rubber tread.

Another interesting series comprises the co-polymers of butadiene and acrylic nitrile. The material, which has a nitrogen content of 7 p.c. and corresponds to 25 p.c. acrylic nitrile, is called perbunan.

Allied to the elastomers are materials styled elastenes, obtained by the polymerisation of ethylene, propylene, and isobutylene. The solid polymers of ethylene are known under the generic name polythene; this is more wax-like than rubber-like, but its properties can be modified by co-polymerisation with isobutylene. Polymers of this material are of considerable commercial significance. Chemically, however, they have no relationship whatever to rubber or to any of the elastomers.

Another important group of materials having only the limited amount of unsaturation required for vulcanisation are called generically butyl rubber. They are co-polymers of olefinic materials with a small amount of diolefin. Butyl rubber describes a hydrocarbon product with an unsaturation less than 5 p.c. of that found in natural rubber, and having a molecular weight between 40,000 and 80,000.

The ethenoid plastics include the polymers and co-polymers of vinyl chloride, alcohol and acetate, vinylidene chloride, and the

acrylic ester polymers. These are called by a variety of trade names, but the name P.V.C. (polyvinyl chloride) is the most common synonym for synthetic rubber. P.V.C. has been widely used for cable coverings, and in sheet form is used for curtains, waterproof garments, etc.

Thioplasts, or thiokols, are rubber-like plastics based on ethylene polysulphide. With few exceptions these materials possess the pungent and characteristic odour associated with sulphur compounds, so that they are in the main limited to purely industrial applications. They are characterised by their extreme chemical inertness. They are thermoplastic and can be applied as coatings by means of the Schori flame "gun."

Sometimes included with the rubber-like materials are the soft plastics obtained from highly plasticised ethyl cellulose, but such a classification is neither accurate nor logical. Such materials are tough and soft, but they lack the elasticity of the true synthetics. They have nevertheless attained considerable commercial success as coating compositions for fabrics and braids, and also as "strip-coatings" for metal tools and plant.

MODIFIED RUBBER. This is obtained by compounding natural rubber with some of the synthetic products. For certain applications such compounds have been found to have qualities which make them superior to both the natural and the synthetic products. A mixture of butadiene and natural rubber vulcanised in the presence of lampblack is used for motor car tires.

Bibliography. Rubber: Physical and Chemical Properties, Rubber Research Association, 1935; Handbook of Plastics, H. R. Symonds, 1943; Modern Synthetic Rubbers, H. Barron, 1945.

Rubber Regulation Committee, INTERNATIONAL. Established in 1934, representing Great Britain, France, the Netherlands, India, and Siam, to limit rubber production so that it would not exceed consumption. Production had for some years been rapidly increasing, and the price had therefore fallen so heavily that both growers and financiers were faced with ruin. The committee agreed on a total production figure for a period, and on the quota to be produced by each country. It regulated stocks held by producers, and the amount of fresh

planting. The price of raw rubber, which was 2½d. a lb. in 1931, was stabilised at about 7d. a lb. The agreement was renewed for five years from 1938, but the conquest of Malaya, 1941, and the N.E.I., 1942, by Japan stopped the committee's activities.

Rubble. Masonry built of unwrought or partly-wrought stone. Dry rubble, built without mortar, is used in many parts of Great Britain for low walls, sometimes with a coping bedded in mortar. Rubble built with mortar is also common in some districts. Random rubble is built without courses, the stones being arranged irregularly so as to afford bond, and the bond aided by longer stones which go entirely or partly through the wall at intervals. At angles and openings, wrought stone quoins (angle stones) generally occur. In coursed random rubble the stones are built in to level off at vertical heights of 12 to 18 ins. Rubble may be built entirely in courses, when every row of stones is roughly squared, though different courses may vary in height. In polygonal rubble no attempt is made to arrange the stones in horizontal courses, but they are fitted together approximately on the face of the wall. Sneaked rubble is of squared stones varying in height and length and arranged horizontally. Rubble is also used as a filling behind stone in walls and piers. See Ashlar; Masonry.

Rubbra, EDMUND (b. 1901). British composer. Born at Northampton, May 23, 1901, he began composing at 14, and attracted the attention of Cyril Scott, who gave him lessons. He later studied at Reading university and the R.C.M., where he was a pupil of Holst. His works included five symphonies; Triple Fugue; La Belle Dame Sans Merci (chorus and orchestra); The Mystic Trumpeter (double chorus and orchestra); Sinfonia Concertante (piano and orchestra); choral settings of medieval Latin lyrics; orchestral version of Brahms's Handel variations; and numerous songs.

Rubefacients (Lat. *rubefacere*, to make red). Drugs which, when applied to the skin, cause it to become red owing to dilatation of the peripheral vessels. They are used in medicine as constituents of ointments to produce counter irritation in inflammatory conditions. Iodine, camphor, carbolic acid, and volatile oils are those most frequently employed.

Rubellite (Lat. *rubellus*, reddish). Pale red or pink variety of tourmaline (*q.v.*). When pure in colour and transparent it is sometimes cut as a gemstone.

Rubens, PAUL ALFRED (1875–1917). British composer. Born in London, April 29, 1875, he was educated at Winchester and studied law at the Inner Temple. His real talent, however, was for writing tuneful lyrical music for the stage, and he became one of the most successful composers of musical comedy. Among his successes were musical numbers for *Florodora*, 1899; *A Country Girl*, 1902; *The Cingalee*, 1904; *Miss Hook of Holland*, 1907; *The Balkan Princess*, 1910; and *The Girl from Utah*, 1913. He died at Falmouth, Feb. 5, 1917.

Rubens, PETER PAUL (1577–1640). Flemish painter. Rubens was born June 29, 1577, at Siegen, Westphalia, where his father, a prominent citizen of Antwerp, was living in exile. After his father's death, 1587, Rubens went to Antwerp, where he served for a

Peter Paul Rubens,
Flemish painter
Self-portrait

time in the Lalaing household and began his artistic studies. He worked under Verhaeght, van Noort, and Otto van Veen or Voenius, the last an influential court painter who helped him to go to work further in Italy, 1600. He painted in Venice, Mantua, Rome, Florence, Milan, and Genoa, returning to Antwerp in 1608.

His Italian experience brought his powers to maturity. Before long he was recognized as one of the greatest painters of the day, and commissions came to him from every part of Europe. He had extraordinary energy, and executed paintings and cartoons in bewildering profusion, and with growing ability. At the same time Rubens was a man of wide culture, and several times engaged in diplomacy. In 1605 he had been sent on a mission to Madrid, and he carried out missions at Delft, 1626, Madrid, 1628, London, 1629, where he was knighted by Charles I, and at The Hague, 1632. His wives, Isabella Brant (d. 1626), and the beautiful Helena Fourment, whom he married as a girl of 16 in 1630, appear in many of his pictures. He died May 30, 1640.

Rubens is credited with about 1,250 authentic works; most of the world's great galleries contain examples of the master. Brussels, Antwerp, and Vienna have some great masterpieces, and the National Gallery, London, contains over 30 works. His painting marks the highest development of the Flemish school: elaborate composition, often on a large scale, a glowing richness and variety of colour, and a quickness of imagination which overcomes the formalism of many of his subjects. Seen in galleries, his work sometimes may impress the spectator by a rhetorical quality, but it should be remembered that he painted, as it were, for large spaces and crowds, designing his effects for the walls of churches and palaces. Among the famous pupils who carried on his tradition, and in their youth helped the master with his work, were Van Dyck, Jordaens, De Vos, and Teniers. See Ambrose, S.; Arundel, Earls of. *Consult Life*, Max Rooses, 1903, Eng. trans. 1904; Rubens, Painter and Diplomat, E. Cammaerts, 1932; *The Sketches of Rubens*, L. van Puyvelde, 1948.

Rubiaceae. Extensive family of trees, shrubs, and herbs. Mostly natives of the tropical and sub-tropical regions, they have undivided leaves, opposite, or in whorls. The flowers are regular, funnel-shaped, wheel-shaped, salver-shaped, or bell-shaped. The order includes many economically important plants, such as coffee, Peruvian bark, madder, and such ornamental plants as the bouvardia and gardenia; also the bedstraws and woodruff of the countryside.

Rubicon (mod. *Rugone* or *Urgone*). In ancient geography, a stream forming the boundary between Italy and Cisalpine Gaul. Its crossing by Julius Caesar began the Roman civil war, 49 B.C. In modern language, the phrase to cross the Rubicon is equivalent to burning one's boats, taking an irrevocable step. See Caesar, Julius.

Rubidium (Lat. *rubidus*, dark red). One of the rarer metal elements. Its chemical symbol is Rb; atomic weight, 85.43; atomic no., 37; specific gravity, 1.52; melting point 38° C.; and boiling point 696° C. It is silvery white in colour and is soft and wax-like in consistency, even at very low temperatures. It closely resembles potassium, though it is more fusible and volatile and its reactions more vigorous. It is widely distributed in minute quantities, mainly in lepidolite, in which approximately 1 p.c. can be

present. It also occurs in the Stassfurt salt deposits and can be extracted from them while extracting potassium chloride. Its name comes from the deep red colour of its lines in the spectrum. The Germans Bunsen and Kirchhoff discovered it in 1861 by spectroscopic investigation of spring water at Dürkheim, Bavaria.

Rubini, GIOVANNI BATTISTA (1795-1854). Italian singer. Born at Romano, near Bergamo, April 7, 1795, the son of a musician, he sang in public as a boy, and then, beginning as a chorus singer, gradually developed a wonderful tenor voice which earned for him the title

Giovanni Rubini,
Italian singer

of the king of tenors. After achieving fame in Italy, he visited Paris in 1825, and England in 1831, where he frequently appeared in opera and oratorio. In St. Petersburg, in 1843, his singing so charmed the tsar Nicholas I that he was made director of singing. Both Bellini and Donizetti wrote special parts for Rubini in some of their operas. He died at Romano, March 2, 1854.

Rubinstein, ANTON GREGOROVICH (1829-94). Russian pianist and composer. Born at Wechwo-tyetzn, in Besarabia, Nov. 28, 1829, he studied piano-playing in Moscow and Paris, and in 1840 played in Paris before Liszt and Chopin. He studied composition in Berlin, 1844-48, and

Anton Rubinstein,
Russian pianist

settled in St. Petersburg, where he became court pianist, 1858, and director of the imperial conservatoire, which he founded, 1862-67. During 1867-73 he toured widely in Europe and America, and died near St. Petersburg, Nov. 20, 1894. His 18 operas he counted as his most important work, but they are seldom played, though many of his piano compositions, fluent and melodious, such as the famous Melody in F, and a few songs, are well known. He published his memoirs in 1889. *Consult* Rubinstein, a Biographical Sketch, A. MacArthur, 1889.

Rubinstein, ARTHUR (b. 1890). American pianist. Born in Warsaw, then in Russian Poland, Jan.

18, 1890, he studied in Berlin under Leschetizky and Bruch, and gave his first recital at 11. One of the world's most brilliant pianists, he made his American début with the Philadelphia orchestra in 1906, and gave 75 concerts in three months. He first toured S. America in 1918. Returning to Europe in 1927 he lived there ten years, after which he settled in Los Angeles.

Rubric (Lat. *ruber*, red). Term for an ecclesiastical injunction, with special reference to the instructions or rubrics to ministers in the old service books, which were written or printed in red. It is applied to the directions for the order of service in the Book of Common Prayer, now commonly printed in italic type. These rubrics are partly based on pre-Reformation directions contained in the Ordinale, Consuetudinary, and Pica. Many rubrics, some of which have become obsolete through changes in social conditions, were added concerning the parochial duties of the clergy, and there are a few explanations of doctrinal points. While the specific directions of the rubric are authoritative, nothing can be inferred from their silence. Following Roman legal custom, the title of a statute is called the rubric.

Ruby (Lat. *rubeus*, red). Red transparent variety of corundum, Al_2O_3 . To be distinguished from similar stones, e.g. garnet, spinel, etc., by being dichroic by transmitted light, it is inferior only to the diamond in hardness, and has the advantage of appearing equally brilliant in natural or artificial light. The finest rubies possess a deep, clear, carmine colour, and are called pigeon's blood rubies. As a rule the deep red stones are more valuable than the paler varieties, which are comparatively common. The best dark red rubies come from Mandalay in Burma, where the ruby occurs in crystalline limestone in association with spinel and garnet, and from Siam and Ceylon.

Those found in Ceylon are pinker, and those in Siam a deeper red even than pigeon's blood stones. Large rubies are far more uncommon than large diamonds, and are consequently exceedingly valuable. The largest ever found weighed 2,000 carats, but had a number of flaws detracting from its value.

Large rubies have been made artificially by fusing together small stones, and by fusing pure aluminium oxide with a small quantity of chromium oxide. The

former varieties can always be distinguished from the natural stones, but the latter are virtually indistinguishable. A number of so-called rubies are not varieties of corundum. Many are garnets, e.g. Australian rubies and Cape rubies. The Siberian ruby is a tourmaline, and Balas ruby a spinel. *See* Precious Stones.

Ruby Silver. Red silver ore minerals, pyrrargyrite and proustite. The ruby silvers often occur just below the enriched zone in silver deposits associated with other silver-bearing minerals.

Rucker, SIR ARTHUR WILLIAM (1848-1915). British physicist. Born in London, Oct. 23, 1848, he was educated at Clapham and Brasenose College, Oxford, of which he became a fellow. In 1874 he was made professor of physics at the Yorkshire College, Leeds, removing in 1886 to London as professor at the Royal College of Science. From 1901 to 1908 Rucker was principal of London university. In 1902 he was knighted, having been president of the British Association in 1901. He died Nov. 1, 1915.

Rückert, FRIEDRICH (1788-1866). German poet and Orientalist. He was born May 16, 1788, at Schweinfurt, Bavaria, and after studying law was professor of Oriental languages at Erlangen, and at Berlin, during 1826-48. He was acclaimed by contemporaries as the

Friedrich Rückert,
German poet

most original and powerful of German poets, perhaps more because of the scope and the variety of his work than to any inherent quality in most of it. He adapted many Oriental works, especially Persian and Arabic, to German verse-forms, but is best remembered by his lyrics *Liebesfrühling* (The Spring of Love), 1844. His *Ich Liebe Dich* has been set as a song by Grieg; *Barbarossa* is another well-known poem. Died at Neuses, nr. Coburg, Jan. 31, 1866.

Rudagi (d. 954). Persian poet. The date of his birth is unknown, though the place is generally agreed upon as Rudag, in Transoxiana. Rudagi became attached to the court of Samanid Nasr II bin Ahmad, and though he wrote over 1,000,000 verses only fragments have survived. His genius was such that he practically fixed the

forms of Persian verse which still survive. He died in poverty.

Rudd OR **REDEYE** (*Scardinius erythrophthalmus*). Common freshwater fish, found throughout Great

Rudd. Small fresh-water fish, resembling the roach

Britain and Europe. It has red fins and eyes, and closely resembles the roach; but the dorsal fin is placed rather farther back. It seldom exceeds 1½ lb. in weight, and is of small value for the table.

Rudder (A.S. *rōðer*, paddle, from *rōwan*, to row). Device for altering the course of a ship or aircraft. In the earliest ships the rudder was an oar over the stern, with the aid of which the vessel could be rowed on a new course. Later a large oar-blade was fixed to each side of the stern and the ship paddled to a fresh course. In

Greek and Roman galleys, which had prows at both ends, steering blades were fitted fore and aft, so that as the pitching of the ship lifted the afterpair

out of the water, the foremost pair could act. The steering oars passed through a metal ring on the ship's hull and were connected by ropes to a bar helm or tiller. Medieval ships had one steering oar, fixed on the right side; hence the term starboard, or steerboard, for the right side of a ship looking forward. Oar rudders are still normal for rowing boats used in surf or against wind and tide, as such steering devices bring the boat's head round quickly. Helm (A.S. *helf*, a handle) is frequently used as a synonym for rudder, but the helm is actually the handle by which the rudder is moved. Similarly, tiller is not a synonym for rudder, but (derived from an English dialect word meaning spade) has the same meaning as helm. In the 14th century the oar rudder was generally replaced by the flat-framed rudder hinged to the sternpost and operated by a tiller bar passing through the rudder head or by ropes passing over a wheel. With certain mechanical refinements this type of rudder remains basically that used today.

In steamships the rudder may weigh several tons, steam steering gear, controlled by a small wheel on the bridge, operating it. Certain types of steamers, particularly those navigating in confined river waterways, have rudders fore and aft. A pair of vertical rudders, one on either side of the stern, is used on submarines to control course when submerged or on the surface, while hydroplanes, or horizontal rudders, are used for depth and horizontal control when navigating under the surface.

Vertical rudders are used on aircraft for control of lateral direction. They consist of a flap hinged to the stern post, and are operated by wires attached to foot-pedals in the cockpit. In larger aircraft two or more rudders are fitted and are operated by motors actuating connecting rods. A marine rudder acts by offering resistance to the fluid around it, so causing the stern to move away from the surface receiving the extra pressure, and the other end of the craft, the bows, to turn in an opposite direction; i.e. towards the side to

Rudder. Type used by: 1. Merchant-ship. 2. Rowing boat. 3. Aeroplane

which the rudder is swung. With aircraft a similar object is achieved by turning the rudder so that it offers resistance to the slip stream flowing past the fuselage.

Ruddigore, OR **THE WITCH'S CURSE**. Comic opera by Gilbert, with music by Sullivan. First produced at the Savoy Theatre, London, Jan. 22, 1887, it had a run of 283 performances. Later it disappeared from the Gilbert and Sullivan repertory for many years, being revived at the Prince's Theatre, London, Oct. 24, 1921, since when it has been among the most popular of the operas. In Ruddigore the librettist had a greater share than usual, but the song *The Ghosts' High Noon* is an outstanding feature of the musical score.

Ruddle. Red variety of haematite (*q.v.*), known as reddle (*q.v.*).

Rude, **FRANÇOIS** (1784-1855). French sculptor. Born at Dijon, June 4, 1784, the son of a smith, he studied at Dijon, and at the Beaux Arts, Paris. After a period of exile in Brussels, he returned to Paris in

François Rude, French sculptor

1827, and produced a number of works constituting a revolt against the prevailing classicism. His chief achievement was the monumental *La Marseillaise* for the Arc de Triomphe. He died in Paris, Nov. 3, 1855.

Rüdesheim. Town of Hesse, W. Germany, picturesquely situated at the foot of the Niederwald and on the right bank of the Rhine, 16 m. W. of Mainz. Known as a town since 864, it has remnants of 10th and 11th century fortifications. It is celebrated for its wine from the surrounding vineyards. Pop. 6,000. Overrun by the U.S. 7th army in March, 1945, after the Second Great War it came within the U.S. zone of occupation.

Rudini, **ANTONIO STARRABA**, **MARCHESE DI** (1839-1908). Italian statesman. Born at Palermo, April 6, 1839, he conspired as a young man against the Bourbon government, and after Garibaldi had delivered Sicily, 1860, became mayor of Palermo and, in 1868, prefect of Naples. The following year he was minister of the interior for a few months. After some years spent out of office he was summoned to form a government in 1891.

As a result of Adowa, 1896, the Liberals were driven from power, and Rudini formed another Conservative cabinet, which held together till 1898. Rudini never inspired the confidence of his own party nor that of the Liberals, whom, at different times, he tried to placate. He died Aug. 6, 1908.

Rudnik. Ridge of hills in Northern Serbia, Yugoslavia, called also Suvobor. The highest point is 3,835 ft. alt.

Rudok. Town of Tibet. It is situated close to the frontier of Kashmir, and is the caravan centre for the trade by Leh and the Indus valley with N.W. India. It stands at an alt. of 15,000 ft. overlooking the S.E. end of the depression occupied by Lake Pagong.

Rudolf. Lake of Africa. Partly in British East Africa and partly in Abyssinia, it occupies an extension of the Rift Valley and forms the centre of an inland drainage system. Its length is about 185 m., with a maximum width of 37 m., and its alt. 1,240 ft. Lake Rudolf was discovered in 1888 by Count S.

Teleki and Lieut. von Höhnel. *Consull* Discovery of Lakes Rudolf and Stephanie, Count S. Teleki, 1894.

Rudolph I (1218-91). German king and Roman emperor. Born at Limburg, May 1, 1218, he was a son of the count of Hapsburg, and in 1239 became head of the family. Germany was then the scene of endless disturbances due to the quarrel between emperor and pope. Rudolph, however, managed to get possession of the family estates in S.W. Germany, and in 1273 he was chosen German king, his election ending the interregnum that had begun in 1250, and starting a new era. He was crowned at Aix-la-Chapelle, and was recognized by the other princes and by the pope.

By his victory over Ottakar, king of Bohemia, in 1278, Rudolph secured Austria and Carinthia, and in 1282 he gave these over to his sons. He died at Spire, July 15, 1291. Rudolph is famous in history as the real founder of the house of Hapsburg.

Rudolph II (1552-1612). German king and Roman emperor. The eldest son of Maximilian II and Maria, daughter of Charles V, he was born in Vienna, July 18, 1552, and educated in Spain. Made king of Hungary, 1572, and German king and king of Bohemia, 1575, he succeeded his father as emperor, Oct. 12, 1576.

Fanatical, irresolute, and slothful, he reversed his father's policy, persecuted the Protestants, and neglected public affairs for the pursuit of magic and alchemy. The Turks invaded the empire in 1593, and in 1604 Hungary revolted. In April, 1606, Rudolph was declared by the archdukes incapable of ruling. His brother Matthias, who assumed the government, restored order in Hungary, and on June 29, 1608, Rudolph ceded to him all his dominions except Bohemia, Silesia, and Lusatia (Lausitz). In 1609 he was forced to grant religious liberty to the Bohemians in the so-called Letter of Majesty. This, however, did not prevent his deposition from the throne of that country in 1611. Rudolph died unmarried at Prague, Jan. 20, 1612. A man of cultured tastes, the emperor patronised Brahe and Kepler, the latter of whom dedicated to him his Rudolphine Tables. It has, however, been suggested that he was insane.

Rudolph (1858-89). Crown Prince of Austria. Born Aug. 21, 1858, the only son of Francis Joseph, emperor of Austria, he

was educated for the throne and showed considerable ability as a naturalist and a linguist, while his travels led him to write two books: *Fifteen Days on the Danube*, 1881, and *A Journey in the East*, 1884. In 1881 he married Stephanie, daughter of Leopold II,

Rudolph, Crown Prince of Austria

king of the Belgians. On Jan. 30, 1889, Rudolph was found shot at Mayerling, near Vienna. In 1900 his widow married Prince Elemer Lónyay, whose nephew Count Carl Lónyay published Rudolph: the Tragedy at Mayerling, 1950.

Rudolstadt. Town of Thuringia, E. Germany, on the Saale, 18 m. S. of Weimar. The chief buildings are the castle of Heidecksburg, rebuilt after a fire in 1735, and the Ludwigsburg, which housed a natural history collection. The manufactures have included porcelain, pianos, oils, and chemicals. The town was founded in the 7th century by Rudolf, duke of Thuringia, hence its name, and passed to the counts of Orlamünde in the 13th century. In 1340 it passed to the counts, later the princes, of Schwarzburg, one of whom built the castle of Heidecksburg. Pop. (1950) 23,100. In an area seized by U.S. forces during April, 1945, after the Second Great War it came within the Russian zone of occupation.

Rudra. Hindu god. As the god of storms he appears in the Rig-Veda, where he is described as

Ruff. Male bird, showing the shield of feathers on the throat, grown during the breeding season W. S. Berridge, F.Z.S.

shooting fiery darts at the earth. He also had beneficent attributes, with power over cattle, and revealed the uses of certain curative herbs to mankind.

Rudyard. Parish and hamlet of Staffs, England. It is 2 m. S. of Leek, with a rly. station. Here is Rudyard Lake, a sheet of water 2 m. long, which forms a reservoir for the Trent and Mersey canal.

Rue OR **HERB OF GRACE** (*Ruta graveolens*). Perennial sub-shrub of the family Rutaceae. A native of S. Europe, it has alternate, much-divided, bluish-green leaves, the ultimate leaflets being oblong. They are plentifully supplied with oil-glands, from which proceed the powerful odour characteristic of the plant, and the bitter taste. The small yellowish flowers grow in clusters. Rue has long been used in medicine as a stimulant and narcotic.

Rue. Leaves and flowers

Rueda, LOPE DE. Spanish dramatist. See Lope de Rueda.

Ruff. Collar of linen or lace worn in the 16th century, and a characteristic part of Elizabethan dress. Ruffs were starched, stand-

Ruff. Circular ruff of starched lace, as worn in the 16th century Portion of a picture by Franz Hals

ing stiffly away from the neck, and some were wired to keep their folds in place, while costly lace, sometimes of gold and silver, and the finest embroidery, went to make them magnificent. At first the ruff was circular, fastening closely round the neck, but later assumed another form, called a whisk, usually made of wired lace, standing high at the back, and open in front. The circular ruff still forms part of the official dress of many Lutheran clergy.

Ruff (*Machetes pugnax*). Bird of the sandpiper sub-family. The plumage is of mottled brown, grey,

and black, with pale buff underparts, and the length is about 12 ins. In the breeding season the male develops a tuft of long feathers on either side of the head, and a broad ruff or shield of feathers on the throat, whence the name is derived. The female, or reeve, is without these appendages.

These ruffs, which vary greatly in colour, practically all the neutral tints between black and white occurring, are constantly distended and displayed during courting time, when the male performs curious antics to commend himself to the females. The ruff is polygamous. Its nest is made of coarse grass and placed among rushes. The bird was formerly abundant in marshes in many parts of England, but has now been almost exterminated. In winter it migrates from N. Europe and Asia to the Mediterranean, Africa, and India.

Ruffe OR **POPE** (*Acerina cernua*). Fresh-water fish. It is very much like a perch, to which it is closely

Ruffe. Small fresh-water fish found in England and Central Europe
W. S. Berridge, F.Z.S.

allied, but lacks the vertical stripes of that fish, and has spots on the dorsal fin, and seldom exceeds five ins. in length. It is found in clear running streams throughout southern and middle England and Central Europe, and feeds upon worms and insects.

Rufford Abbey. Former seat of Lord Savile in Notts, England. It is 2 m. S. of Ollerton in what was formerly Sherwood Forest, and the estate extends along the banks of Rainworth Water. The existing house, built of red sandstone in the Elizabethan and Jacobean styles, incorporates some remains of the abbey and the residence which took its place. Valuable pictures and tapestry were collected. Here in 1148 an abbey for Cistercian monks was founded by the earl of Lincoln. After the dissolution of the monasteries this passed to the Talbots and then to the Saviles, and the abbey was converted into a residence in 1648. It was the home of the great marquess of Halifax, passing on the death of his son in 1700 to

another branch of the family. In 1784 it came to the Lumleys, afterwards earls of Scarbrough, and was left by the 8th earl in 1856 to his natural son John (1818-96), who was made Baron Savile.

Ruff's Guide to the Turf. Annual publication for students of racing. It was founded in 1842 by William Ruff (1801-56), and was annually revised by him until 1854. It contains a complete record of flat racing and steeplechasing in Great Britain and Ireland for the year, as well as entries for the principal races for the coming year, racing statistics, bloodstock sales, and the official rules governing racing and betting.

Rufiji OR **LUFIJI.** River of Tanganyika Territory, E. Africa. Rising N.E. of Lake Nyasa, it flows N.E. to its junction with the Rwaha just above Pangani Falls. From this point the direction is E. to the coast opposite the island of Mafia. The river is navigable in parts, and with its affluents forms the principal drainage system of the central and S. portions of the territory. Here in 1915 the German cruiser Königsberg was destroyed by a British naval detachment.

Rufinus (d. A.D. 395). Chief minister of the emperors Theodosius and Arcadius. A Gaul by birth, he entered the service of Theodosius and received the command of the East. After the emperor's death he was appointed guardian of the young Arcadius, but his harshness made him universally hated. He was assassinated by an agent of Stilicho (q.v.).

Rufinus, **TYRANNIUS** (c. 360-410). Italian theologian. Born probably in Venetia, he studied theology for a time with S. Jerome and at Alexandria, and was involved in the persecution of the Catholics by the Aryans. He became a presbyter in 394, having previously founded a monastery on the Mount of Olives, quarrelled with S. Jerome over the Origen controversy, and settled in Rome, 397, and later in Sicily. His translation of such Greek theologians as Origen, Pamphilus, and Gregory

Rufus Stone,
New Forest

of Nazianzus were widely known in the early Church.

Rufus Stone. Rough monument which marks the spot where William Rufus, king of England, was killed by an arrow while hunting in the New Forest, Aug. 2, 1100. It is near Stony Cross, just N. of the

road from Cadnam to Ringwood.

Rug. Term now applied to a piece of heavy woollen cloth, often of many colours, used as a travelling wrap; also a small carpet. In the 16th and 17th centuries rug was the name of a coarse woollen frieze, and also of a garment made of such material. See Carpet.

Rugby. Borough and market town of Warwickshire, England. It stands on the river Avon, 30 m. by rly. S.W. of Birmingham. It is connected with Birmingham and London by canal. The buildings include the modern churches of S. Andrew and Holy Trinity, also the R.C. church of S. Marie by the elder Pugin. With a famous school (v.i.), Rugby is a railway junction and a hunting centre. Here is the post office radio telegraphy transmitter. The manufactures include electrical appliances, while cattle, horse, and sheep fairs are held. It gives its name to a co. constituency. Market day, Mon. (cattle) and Sat. Pop. 45,000.

From the town was derived the title of Baron Rugby, taken in 1947 by Sir John Loader Maffey (b. July 1, 1877) who was educated at the school and became a governor. He was governor-general of the Sudan, 1925-33, and U.K. representative in Eire 1939-49.

Rugby School. English public school. It was founded in 1567 by Lawrence Sheriff, a native of Rugby and a courtier, also a member of the Grocers' Company.

Rugby town arms

Rugby, Warwickshire. Hospital of St. Cross

Rugby school has property around Rugby and in London, and is managed by a governing body of 14. The first building was near the parish church and the school was removed to its present site about 1750. In 1809 the present buildings were begun, and many additions have since been made. The number of boys is about 640, accommodated in 10 houses. The school is divided into lower middles, upper middles, and upper school. The upper school has three sides, classical, modern, and science. There are scholarships to the school and from it to the universities. Buildings include chapel, library, observatory, reading-room, museum, laboratories, and gymnasium. There are extensive playing fields.

Rugby became a great public school mainly under the direction of Thomas Arnold (*q.v.*), headmaster, 1828-42. Tait, Temple, and Percival were other famous headmasters. It gained fame with the popularity of Tom Brown's Schooldays, and from the fact that it was the first home of Rugby football. In the First Great War 682 Rugbeians lost their lives; 352 in the Second Great War.

Rugby Football. This game is described under Football.

Rugby League. For the history of this association, see Football.

Rugby Union. For the history of this association, see Football.

Ruge, ARNOLD (1802-80). German reformer. Born on the island of Rügen, Sept. 13, 1802, he studied at Jena and Halle, taking an active part in the student societies at both places, which cost him six years' imprisonment in a fortress. At Halle, where he obtained a professorship, he founded the important critical journal *Hallesche Jahrbücher für Deutsche Kunst und Wissenschaft*, afterwards renamed *Deutsche Jahrbücher*; then removed to Dresden. In 1848 he took part in the attempted revolution, published for a brief period a revolutionary paper, *Reform*, in Berlin, and was obliged to flee to England, where he met Mazzini. He died at Brighton, Dec. 31, 1880.

Arnold Ruge,
German democrat

Rugby School. The old quadrangle

Rugeley. Urban dist. and market town of Staffs, England, 7 m. N.W. of Lichfield, near the Trent and Mersey canal. The church, dedicated to S. Augustine, is a 19th century building. There is a 17th century grammar school. The principal industry is coal mining and others include tanning and clothing and boot and shoe manufactures. Pop. 8,500.

Rügen. Largest German island, in the Baltic Sea. It is separated from Pomerania by the mile-wide strait of Stralsund, and is 33 m. by 26 m., with an area of 373 sq. m. Steep chalk cliffs reach an alt. of over 500 ft. near the E. coast. The coastline is very irregular. Grain, fish, and cattle are the chief products. Bergen is the chief town. The island, which takes its name from a German tribe, the Rūgi, was Danish from 1168, Pomeranian from 1325, Swedish from 1648, and Prussian from 1815. Units of the 2nd White Russian Army captured the island on May 6, 1945, occupying Sassnitz, the terminus of the train ferries to Sweden. After the war Rügen was in the Russian zone of occupation. Pop. 54,000.

Ruggiero, GUIDO DE (1888-1948). Italian historian and philosopher. Born in Naples, he was professor of philosophy at Messina university, 1923-25, then at Rome university until 1927, when he was dismissed for his refusal to take an oath of allegiance to the fascists. Following the liberation of Rome in 1944 he became rector of Rome university. His *History of European Liberalism* appeared in 1925, but his great *History of Philosophy* (17 vols.) was still uncompleted at his death. Dec. 30, 1948.

Ruhleben. Racecourse near Berlin. During the First Great War it was converted into a huge internment camp for civilian prisoners, who included many British merchant seamen.

Ruhmkorff, HEINRICH DANIEL (1803-77). German electrician. He was born at Hanover, Jan. 15, 1803. At the age of 22 he went to

Paris, where he carried out extensive experiments with induction coils, eventually perfecting one with a very long secondary coil, containing 6 miles of fine wire, insulated with silk and shellac. This became known as the Ruhmkorff coil. Its inventor died Dec. 20, 1877. See Induction Coil.

Ruhnken, DAVID (1723-98). German scholar. Born at Stolp, Pomerania, Jan. 2, 1723, he was educated at Wittenberg, and went in 1743 to Leyden, where in 1757 he became lecturer in Greek. Chosen a professor in 1761, he did not receive the chair, but in 1774 he was elected university librarian. He died May 14, 1798. Ruhnken, who edited Plato, Homer, and Xenophon, was one of the scholars who helped to restore Greek to a high place in secular studies.

Ruhr. River of Germany. Not to be confused with the Roer (*q.v.*), the Ruhr rises in the Winterberg and flows for 145 m. in a W. direction to join the Rhine at Duisburg-Hamborn. The last 46 m. are canalised, with 10 locks. The Ruhr traverses a rich iron and coal field, and gives its name to the Ruhr basin (Ger. *Ruhrgebiet*, Ruhr district), the most important district in Europe specialising in heavy industry, and covering an area of about 1,800 sq. m., with a pop. (1939) of some 4½ millions. Before 1939 the Ruhr area produced 75 p.c. of Germany's coal, 85 p.c. of her iron, and 80 p.c. of her steel.

The three principal industrial towns of the area are Essen, Dortmund, and Bochum (*qq.v.*), and here were centred, from before the First Great War, Germany's principal armament industries. By the treaty of Versailles, Germany undertook to disarm, and the war industries in the Ruhr were converted to peaceful objects. France, however, continued to fear this source of war strength in the German economy. In an unsuccessful attempt to force Germany to pay reparations, French and Belgian troops occupied the Ruhr, 1923-25, when the Dawes plan (*q.v.*) was accepted. After Hitler came to power in 1933, with the connivance of the industrialists of the area he secretly built up the war potential of the Ruhr again.

During the Second Great War, the Ruhr was a constant object of attack for the R.A.F. (which bombed Essen for the first time Aug. 29, 1940) and later for the U.S.A.A.F. From mid-Feb., 1945, Allied strategic air attack was concentrated on isolating the Ruhr. The R.A.F. destroyed the

Ruhr. Map showing the Ruhr river; the Ruhr hard coal mining area; and the area the French wished to be under international control

two rly. viaducts at Bielefeld on March 14, the Arnsberg viaduct on the 19th, and rendered the Vlotho bridge impassable, effectively cutting the three main rly. routes to the E. .

After the Allied crossing of the Rhine (*q.v.*) on March 24, the German high command decided to hold the Ruhr. Encirclement of the area, which became one of the first objects of Allied strategy, was effected April 1, the U.S. 9th army from the N. and the U.S. 1st army from the S. meeting near Lippstadt. In the pocket were one whole German army group and two corps of another. F.M. Model, who was in command, made abortive attempts to fight his way out from Hamm and from Siegen. The ammunition factories were forced to cease production; and on April 14 the pocket was split at Hagen. The E. part collapsed on the 16th, the W. on the 18th, by which time the front was 100 m. farther E. Prisoners numbered 325,000, including 30 generals.

The Ruhr lay in the British zone of occupation after the surrender of Germany in May, 1945. A proportion of such machinery as survived was dismantled and distributed among the Allies as reparations; and the problem of housing the large pop. and keeping it fed and occupied was one of the gravest of the British zone. Joint British-U.S. control of the coal mines replaced British control in Nov., 1947, when responsibility for production and distribution was transferred to the Germans. Production of coal at the end of 1948 had risen to

eight million tons a month, compared with 10 million in 1938.

France, who wanted the Ruhr detached from Germany and placed under international administration, objected strongly to the restoration of responsibility to the Germans. But differences between her and the other Western Allies as to the future of the Ruhr were resolved in an agreement of Dec. 28, 1948, to set up an international authority to supervise production and distribution of coal, coke, and steel from the area. The Benelux countries had one vote each, France, the U.K., the U.S.A., and Germany three votes each on this body, eight favourable votes carrying a decision. It met for the first time in London, 1949. From Dec. Germany had its own federal govt. representatives. *See* Krupp.

Ruhrort. Former German town merged in 1929 in Duisburg-Hamborn (*q.v.*).

Ruislip. Residential district of Middlesex, England. It lies between Harrow and Uxbridge, and is well served by rly. Its history goes back to the time of Edward the Confessor. The ancient flint and stone church of S. Martin, restored in 1869-72 by Sir Gilbert Scott, has a tower with a peal of eight bells; Nelson's daughter lies buried in the churchyard. To the N. runs the brook Pin, and near is an expanse of woodland, Ruislip Common stretching towards Northwood; and Ruislip Lido on the banks of Ruislip reservoir, 80 acres, formed to supply the Grand Union Canal. Ruislip now forms

part of the Ruislip-Northwood urban dist. and bor. constituency Pop. 65,710. *Pron.* Rye-slip

Ruiz, JUAN (c. 1283-c. 1350). Spanish poet. Born at Alcalá de Henares, he was ordained, and in spite of his irregular life became arch-priest of Hita or Fita, Guadalajara. The last 13 years of his life appear to have been spent in prison, where in 1343 he wrote a poem known as *El Libro de Buen Amor* (the book of good love), or *El Libro de los Cantares* (the book of songs). A miscellany, mainly erotic, and masterly in metrical technique, it is full of vigorous satire and realistic character-drawing, recalling the work of Chaucer.

Rukwa, RUKWA, OR LEOPOLD. Lake of Africa. In the Langenburg district of Tanganyika Territory, it lies N.W. of Lake Nyasa, near the border of N. Rhodesia, about 2,500 ft. above sea level.

Rule (Lat. *regula*). Principle, formula, or order of any kind. The word has come to be used for regulations of minor importance, not sufficiently serious to be known as laws. Thus a society or school has its rules. The word is also used for the regulations of monastic orders, e.g. the rule of S. Benedict; and for something which is generally done, an established custom being the rule. In printing, a rule is a strip of rolled brass or lead alloy, employed to form an edge or border to a page, or to make the punctuation mark colloquially called a dash. (*See* Monasticism; Printing.)

In English law rules of court are rules governing the procedure in all branches of the supreme court. They prescribe for all the steps necessary to be taken in every kind of action, except probate, divorce, and admiralty suits, and bankruptcy matters, all of which are governed by rules of their own. They tell the litigant how and in what form he must issue his writ or summons; how to serve it; what pleadings (*q.v.*) are to be delivered, what they must and must not contain; how to obtain discovery of documents, and how proceedings are to be taken, and within what time.

Rule OR REGULUS. Legendary saint in Scotland. Bishop of Patras, in Greece, where S. Andrew was martyred, whose relics he is said to have brought to Scotland, where he met a Pictish king, Angus McFergus, and with him dedicated Muckross, now St. Andrews, to the saint. S. Rule's Tower is a prominent erection in

that city. The king reigned either 731-61 or 822-34. Rule has been confused with another S. Regulus or Rieul, a Greek who, according to the Bollandists, became first bishop of Senlis in the 4th century.

Rule, Britannia. British national song. Written by James Thomson, and composed by Arne, it was a number—six stanzas for tenor solo and choral refrain—in a masque, *Alfred*, produced Aug. 1, 1740, for Frederick, prince of Wales, as part of an entertainment given at Cliefden (later Cliveden) House, nr. Maidenhead, to commemorate the accession of the house of Hanover, and to celebrate the third birthday of the prince's daughter Augusta. The song immediately attained great popularity, and it eventually became almost a second national anthem.

Rule of Faith (Lat. *regula fidei*). In theology, the source or sources accepted by a church as authoritatively determining its doctrines. To the R.C. church the rule of faith is given by Scripture, the tradition of the church, and the fathers. To most Protestant churches it is Scripture alone.

Rule of Law. Constitutional principle that the executive has no arbitrary power over the individual and that the executive may be called on to justify all its actions towards an individual before the ordinary courts of law. The principle is of very great legal importance in the U.K.

Rule of the Road. Regulation enforceable by law to ensure safety in the use of thoroughfares by vehicles and riders. In the U.K. the rule of the road, unlike that prevailing in most Continental countries and America, is to keep to the left, and to pass in that position all traffic coming in an opposite direction; but on overtaking any vehicle, to draw towards the centre of the road, and pass on the right side of the vehicle overtaken. Such rules do not apply to one-way streets, where traffic may use both sides of the road. Traffic about to enter or cross a main road from a side road must halt before crossing or turning. At roundabouts in Great Britain traffic moves in a clockwise direction; where the rule of the road is to keep right it is anti-clockwise. (See Highway Code.)

At sea the rule of the road is a convention for the guidance of a ship when meeting another. Port means the left-hand side of a ship, and starboard the right. The rule of the road is for ships to pass port

to port. At night a green light is shown on the starboard, and a red light on the port. Steamers give way to sailing ships.

Aircraft observe a similar rule of the road when flying at the same alt. On busy routes, the air is divided into alt. zones or corridors, to one of which aircraft flying in a particular direction must keep.

Rum. Alcoholic spirit distilled from fermented cane sugar. It is made in the W. Indies. Its brown colour is imparted by caramel, by storing in sherry casks, or by both. High quality rum is made from mashes containing some scum, but cheaper varieties come from skimmings and the waste products of cane sugar factories. Like wine, rum depends largely

on soil and climate, its essential qualities being due to the presence of esters. Rum is usually distilled at some 40 p.c. overproof, though it varies between 30 and 66 p.c. overproof. Occasionally guavas or pineapples are thrown in the still, to flavour the rum, or sliced fruit is added to the spirit, to give it a distinctive flavour. Much rum which finds its way to the market is artificial, made from beet or "silent" spirit, flavoured with rum essence. See Alcohol; Distilling; Proof Spirit.

Rum. Island of the Inner Hebrides, Inverness-shire, Scotland. It is 15 m. N. of Ardnamurchan Point, is 8 m. long and $7\frac{1}{2}$ wide; area, 42 sq. m. Important geologically, it had an active volcano in Tertiary times. Pop. 250.

RUMANIA: A COUNTRY OF THE BALKANS

Edgar Stern-Rubarth, Ph.D.

This general sketch of the physical features and history of Rumania is supplemented by articles on the towns and areas of the country, e.g. Bukarest; Constantia; Dobruja; Moldavia; Transylvania. See also Balkan Wars; Bessarabia; Russo-German Campaigns, etc.

Rumania (sometimes spelled Romania or Roumania) took its name from the fact that it was,

during c. A.D. 101-275, a part of the Roman empire. As Dacia (q.v.), a name taken from that of the Daci, its chief tribe, it was conquered by Trajan, whose

memorial column in Rome gives valuable pictorial information about the Dacian people. Dacia was rapidly latinised and developed a language which, alone in E. Europe, is based upon Latin. Though infiltrated by Goths, Bulgars, Huns, Avars, later Turks, this mixed people developed into a distinct ethnic type of tall alpine-dacianer shortheads, numbering within Rumania slightly more than 13 millions; the rest of the pop. of Rumania is made up of people of Magyar, German, Jewish, Ukrainian, Turkish, Gypsy, etc., origins.

In the form in which it emerged from the Second Great War Rumania comprised the former principalities Moldavia and Wallachia, and Transylvania. The changes in Rumania's size and pop. during the 20th century are shown in the table.

	Area	Population
1914	50,710 sq. m.	7,650,000
1939	113,884 " "	19,933,802
1940	94,532 " "	16,318,869
1941	75,866 " "	13,551,756
1947	88,715 " "	16,400,000

Rumanian arms

The country's spine is the great arc of the Carpathian mts., embracing the plateau of Transylvania (the former Siebenbürgen), which itself is a hilly country lying at an elevation of between 1,000 and 2,600 ft. The Carpathians reach 8,480 ft. in the S. (Mt. Negoi), 7,690 in the N. (Mt. Pietros). N. and W. of Transylvania's hills and S. of the Carpathian mts., Rumania is a country of fertile plains whose greatest width is about 50 m., bordered on the S. by the river Danube, which forms most of Rumania's frontier with Bulgaria. The country is watered by a number of tributaries of the Danube, one of which, the Prut, became the

Rumanian Flag.
Blue, yellow,
and red

boundary with the U.S.S.R. in 1940. Rumania possesses one of Europe's richest wheat and maize-growing soils, and produces petroleum, natural gas, salt, iron, gold, silver, and other minerals. Its wooded mountains produce great quantities of timber, mostly floated down the rivers, and there are large lignite deposits. The majority of the people are engaged in agriculture and forestry; there is an important fishing industry, most of it state-controlled, and a number of vineyards. The climate is central European, protected

from Mediterranean influence by the Balkan ranges, but open to influence from the E. At the mouth of the Danube, *e.g.* temps. vary from 30° F. in winter to 110° F. in summer; at Bukarest the mean range is from 26° F. in Jan. to 73° F. in July. Rainfall varies from 15 ins. in the mts. to 30 ins. in the S.E. part of the plains. The lower Danube is frozen during about 40 days of the year; snow covers the valleys for an average of 65 days, the mountains, according to their height, much longer. Drought, up to a hundred days, occurs occasionally in the steppes near the Black Sea.

FLORA AND FAUNA. The forests of Rumania were, before the Second Great War, estimated at between 15 and 17 million acres, 38 p.c. consisting of beech, 25 p.c. of conifers, 24 p.c. of oak, the rest being birch, elm, lime trees, etc. Some Mediterranean plants, *e.g.* acanthus, manna-ash, thrive in the S. plains. The fauna is rich: in the Carpathians chamois, bear, eagle, elsewhere wolf, fox, lynx, wildcat, marten, badger, boar, and stag. Bustard and ground-squirrel live on the steppes; heron, crane, and many other birds and a great variety of fresh-water fish, such as carp, sheat-fish, and sturgeon (producing the famous Orsova caviar) in the Danube delta.

POPULATION. Rather more than a fifth of the people live in towns, of which, however, only 14 exceed 50,000. The most important are:

Bukarest (1945)	..	984,619
Cluj	"	110,956
Jassy	"	108,987
Timisoara	"	108,269
Ploesti	"	105,114
Braila	"	97,293
Galati	"	93,229

Among the non-Rumanian elements in the country, the Germans number some 750,000; the so-called Siebenburgen "Saxons" have occupied for many centuries the heart of Transylvania, the "Suabians," the Banat (split 1919 between Rumania and Yugoslavia). Up to the Second Great War, about 1.5 million Magyars lived in Rumania, mostly in the E. of Transylvania and along the Hungarian border; their number was considerably reduced during and after that war, as was that of the Jews, only a few thousands of the pre-war 850,000 remaining. Census figures for 1935 gave the religious composition of the people as 70 p.c. Orthodox, 10 p.c. Greek

Catholic, 8 p.c. R.C., 7.2 p.c. Reformists and Lutherans, 3.3 p.c. Jews, 0.5 p.c. Unitarians, 0.3 p.c. Mahomedans, 0.7 p.c. unclassified.

Of Rumania's total area, 43 p.c. is under the plough, 24 p.c. forest, 14 p.c. meadow and pasture, 2 p.c. vineyards and fruit-gardens; about 17 p.c. is unused. Drastic agrarian reform in 1921 left barely 12 p.c. of the soil in the hands of the Bojars, large estate owners, while 88 p.c. passed, in comparatively small lots, to the peasants who worked it. After 1944, even the remnants of a former feudal system were eliminated. In normal years maize and wheat each yield between 3.5 and 4.5 million tons a year; barley, 1.5 to 2.4 million

in 1935. There are 2,000 m. of pipe-line in Rumania. Next in order of value were exports of grain products, about £18 million in 1930, with a subsequent drop. Before the Second Great War the U.K. was Rumania's best customer, and biggest supplier, chiefly of machinery and textiles.

INDUSTRIES AND TRANSPORT. Rumania's industries include the production of chemicals based upon petroleum and lignite or coal, leather and textile goods, wood working, especially the manufacture of cheap furniture, metal working, machinery making, and food preserving; some of them, especially mining, are backward in development. Embroidery and

Rumania. Map of the Balkan country showing boundaries under the 1947 treaty

tons; oats, about 1.1 million tons. All these yields fell heavily during the war years.

In 1930 Rumania produced more than 2 million tons of lignite, 300,000 tons of coal; both fell by about 25 p.c. during the war years. Production of petroleum was: 1930, 5.8 million tons; 1932, 7.3 million tons; 1943, 5.3 million tons; 1944, 3.5 million tons; 1945, 4.6 million tons. The consumption of natural gas went up from 1,206 million cub. metres in 1930 to about 2,000 million in 1945, and its possibilities were by no means then fully exploited. Foreign capital was chiefly responsible for the exploitation of Rumania's oil before the Second Great War. It was the principal export and accounted for roughly one-half the value of its foreign trade in 1930, when oil, oil products, etc., were exported to a total of £30 million; export value was about half that

other luxury goods were formerly exported.

The chief means of transport is the Danube and its tributaries; the river port of Galati is the main shipping place for timber, that of Braila for grain, while the Black Sea port of Constanta handles in particular petroleum and its products. The state rlys. were 5,962 m. long in 1945. The Rumanian Airways Co., incorporated in 1945 in a Russian-Rumanian co., flew nearly half a million miles in 1944 and carried more than 12,000 passengers. Air services exist between Bukarest and Belgrade, Warsaw, and Istanbul.

EDUCATION. Rumania had some 11,800 primary and nearly 1,000 secondary schools in 1945. Education is by law free and compulsory, but there was nevertheless a good deal of illiteracy still in the remoter parts of Wallachia and Moldavia. Practical farming

took a high place in the curriculum everywhere. Minorities had to fight hard for cultural autonomy and, if successful, to bear its costs.

There are four universities: Jassy, founded 1860, Bukarest, 1864, Cluj, 1872, and Timisoara, 1945, the last founded after the transfer of Cernauti to Russia in 1940. These universities have together about 3,000 professors and lecturers, and 30,000 students. Rumania's press before the Second Great War comprised about 1,200 publications, more than 100 of them dailies, and most of them published in the capital. Their number was heavily curtailed, however, during and after the war. There were five or six German and as many Magyar dailies, and a number of German and Magyar periodicals of some importance.

LITERATURE AND ART. The oldest existing documents in Rumanian belong to the 15th century: up to that time ecclesiastical Slavonic had been used, but then, under the influence of Hussite, Lutheran, and Calvinist teachers, religious writings were translated into what became the Rumanian language, though for another three to four centuries it was written and printed in the Cyrillic alphabet. During the 17th century, the Bible was translated into Rumanian, and historians, e.g. Demeter Cantemir (1673-1723), used it for works of international importance. A period of Greek influence under the Phanariots followed, until, towards the end of the 18th century, the national spirit asserted itself, proud of the Roman period of their country, writers joined in promoting the latinisation of their language, which, however, retained many Slavonic elements. George Sincai (1753-1816), Peter Maior (d. 1821), George Lazar (1779-1823), Heliade Radulescu (1802-72), paved the way for the literary awakening of the 19th century.

Gregor Alexandrescu (1821-90), Demeter Bolintineanu (1819-72), and the literary circle of the "Junimea," which included Rumania's leading poet Mihail Eminescu (1849-89), Anghel (1877-1917), Sadoveanu (b. 1880), Zamfirescu (1859-1922), Bibescu (b. 1878), N. Jorga (b. 1871), and others gave Rumania a place in world literature. With but 23 Latin letters, printed and written, Rumanian has numerous diacritical marks; the language preserves some few antique remnants, and many traces of the non-Romance languages of the Balkans, and has

borrowed many words, e.g. from Italian and French. There are four distinct spoken dialects, one of which is used in N. Greece.

Traditional crafts play a considerable part in the life of the Rumanian people. The peasants have preserved their old way of dressing in narrow white trousers, belted white shirt, and, according to season, either a sort of wide waistcoat or a sheepskin jacket; their womenfolk wear richly ornamented and embroidered garb.

Rumania. 1. Peasant woman of Kalotaszeg, Transylvania, with her wooden jugs. 2. Girl of the Eastern Carpathians wearing a linen dress and leather waistcoat. 3. A cattle-breeder in his sheepskin coat

Usually in red, black, and yellow, these embroideries are often of high artistic value and enjoy an international reputation. Similar good taste is shown in Rumanian hand-made carpets and rugs, influenced by, but not copied from, oriental designs; wood-carving and pottery are also good. Rumanian musicians range from born Gypsy artists to highly trained pianists and violinists. Though the mass of the people live on cooked maize (*mamaliga*) and drink a weak plum-brandy (*tuica*), the Rumanian cook vies with the best of France or Vienna. Folk-dancing

and popular songs accompany all official and local functions; the *hora*, Rumania's national group dance, is everywhere popular.

HISTORY. The Dacian tribe, a branch of the Thracians, first appear in history under the name of Geti (Getae) fighting under Darius I against the Scythians; as Daci under Philip V of Macedonia they fought the Romans and, from about 200 B.C., remained a power under their own kings until the Roman emperor Trajan, in two campaigns between A.D. 101 and 107, defeated and subjected them to the Roman rule. The prov. of Dacia, as it was called, was settled by a large colony of political and criminal exiles (Ovid, at Tomi, now Constanta, A.D. 8-18, was one of the earliest Roman exiles). Between 258 and 275 Dacia fell to Teutonic assailants. They held it, as the kingdom of the Gepidae, until they in turn were vanquished, 567, by Turkish nomads—the Avars, 6th to 8th centuries, the Petshegs, 10th to 11th, the Cumani 12th to 13th. With the Turks, Slavonic tribes penetrated into the fertile country; yet the remnants of a Roman civilization and language remained.

Of their territorial lords, the Voivods, Prince Besarab created Wallachia about 1330, and Prince Bogdan Moldavia, about 1350. Wallachia came under Turkish suzerainty in 1460, Moldavia in 1511, having previously enjoyed Hungarian and Polish protection. Under Prince Michael the Brave (1593-1601) both these territories were united for a short period with his conquest Transylvania, and the Turks were expelled: this was the first time that the area now Rumania became a sovereign, political unit. Other Bojar dynasties, e.g. the Cantemir and the Ghika, were subsequently installed as rulers tributary to the sultans; from 1716 Phanariots, descendants of the Byzantine nobility who had accepted the Turkish rule in Constantinople, succeeded them, exploiting the principalities in their own and the Turkish interest.

Russia's expansion in the 18th century and her success in several wars with Turkey changed the situation. The peace of Kuchuk-Kainarji, 1774, stipulated that the administration of Wallachia and Moldavia should be improved; the Peace of Adrianople, 1829, replaced Turkish by Russian suzerainty. This lasted until 1856 when, after Russia's defeat in the Crimean war, a plebiscite of the

people was held to decide their future government. The *divans* (popular assemblies), formed in both principalities, favoured their union under a hereditary monarchy. Although the great powers on Aug. 19, 1859, at Paris decided to keep them separate, the two principalities nevertheless elected as their common ruler Prince Alexander Couza and, Dec. 9, 1861, were united under this ruler. Couza tried to enforce by a *coup d'état* reforms, among them one abolishing the serfdom of the peasants. The Bojars, fearing impoverishment, plotted with officers of the army and overthrew him, Feb. 23, 1866.

Rumania Becomes a Kingdom

In his place Prince Carol of Hohenzollern-Sigmaringen—of the R.C. branch of the Prussian dynasty—was elected by plebiscite April 20, and he in turn enforced a new, liberal constitution, July 12, 1866. He established the new state as the principality of Rumania, ruling it alternately with a Conservative government under Bojar premiership, such as that of Catargiu, or a National Liberal one, headed by a member of the Bratianu (*q.v.*) family. During the Russo-Turkish war, 1877-1878, he ceased to pay tribute to Turkey, and lent military aid to the Russians in their dramatic fight at Plevna (*q.v.*). At the Berlin congress of 1878, Rumania secured full independence and, while forced to yield Bessarabia to Russia, gained N. Dobruja, thus securing a link between the Black Sea and its Danubian water system.

A parliamentary decision of March 26, 1881, elevated the principality to the rank of a kingdom; four years later the church of Rumania was proclaimed a separate national church. Relations with Russia deteriorated, and Rumania pursued a policy of "rapprochement" with Austria-Hungary and Germany, with whom special treaties were signed in 1883. The Junimea movement gained political as well as literary ascendancy, its leaders, Carp and Mairoescu making a chief point of agrarian reform. The Liberals, against their leader Demeter Sturdza, took a similar line when peasant revolts in 1907 proved that the liberation of the peasants enforced by Prince Couza was insufficient. Ion Bratianu, prime minister from 1909 with brief intervals until his death in 1927, played safe during the Balkan Wars (*q.v.*) first by staying neutral

and, after Turkey's defeat, by joining the other Balkan states against Bulgaria; the attack from behind by the Rumanians forced Bulgaria to sign the Bukarest peace, Aug. 10, 1913, yielding the southern Dobruja also to Rumania. This comparatively easy success, and a rankling dispute with Hungary over her allegedly bad treatment of the numerous Rumanians in Transylvania, estranged Bukarest from Vienna and Berlin; when the First Great War broke out, popular opinion, fostered by propaganda from both sides, anticipated that the country would join the Entente. King Carol resisted that trend and decided on neutrality, Aug. 3, 1914. He died on Oct. 10 and his nephew Ferdinand, a weaker man influenced by his British wife and by Bratianu, gave in when the Russian armies seemed to be successful against his great northern neighbour, declaring war on Austria-Hungary Aug. 27, 1916, and promptly receiving a German declaration of war in turn, followed by a lightning attack, from Transylvania, by German-Austro-Hungarian armies under the command of Gen. von Falkenhayn, and from Bulgaria, by F.-M. von Mackensen.

German Occupation, 1917-18

By Jan., 1917, nearly the whole of Rumania had been overrun. The Bolshevik revolution in Russia deprived the Rumanian forces of Russian backing. Bratianu had to resign, and Rumania was forced to sign the peace of Bukarest under which, while regaining Bessarabia from Russia, Rumania lost the Dobruja, yielded frontier positions in the Carpathians to Hungary, and was to remain under German-Austro-Hungarian occupation for many years. The defeat of the central powers, six months later, saved Rumania from the fulfilment of these terms; provisional regional governments formed in the wake of the retreating forces of the central powers in the Bukovina and in Transylvania proclaimed their union with Bukarest, and the Rumanian forces advanced to the river Tisza (Theiss), and occupied Budapest Aug. 4-Nov. 13, 1919. They retreated, under Allied pressure, after a good deal of looting. Though a conflict over the Banat brought but partial satisfaction, Rumania secured by the treaties of St. Germain and Trianon (*q.v.*) the Bukovina, Transylvania, and the eastern Banat, in the treaty of Neuilly the whole Dobruja with the consent of the western Allies,

but without that of Russia. Rumania also occupied Bessarabia and thus more than doubled its pre-war territory and pop. King Ferdinand had himself crowned king, Oct. 15, 1922, at Alba Julia (Ger. Karlsburg) in Transylvania.

Rise of the Peasant Party

Under the new premier, Gen. Averescu, leader of the Populist party, Rumania in March, 1921, concluded an alliance with Poland against Russia, and in April signed the pact of the Little Entente (*q.v.*) with Czechoslovakia and Yugoslavia. Fundamental agrarian reform was carried through, large estates being confiscated and their lands distributed to the peasants and smallholders. State control over the petroleum wells was extended, and a new constitution, based upon direct and equal electoral rights and the secret ballot, was adopted March 28, 1923. Ion Bratianu was again prime minister, an office he continued to hold with nearly dictatorial powers until 1927. Growing dissatisfaction, not only among the minorities, still strong in the new parts of the kingdom, but also of the peasantry, and a critical attitude to the crown prince's private life (see Lupescu, Magda), led to a rapid growth in strength of the National Peasant (Zarani) party under Dr. Julius Maniu.

The resignation of the succession by Crown Prince Carol, 1926, the death of Ferdinand, July 20, 1927, of Bratianu, Nov. 24, followed by that of his brother Vintila, and the defeat of the Liberal government, Nov., 1928, by the Peasant party, ended a regime that, with some outward variations, had existed nearly as long as the state of Rumania. A regency council of three acted for Carol's six-year-old son Michael, while Maniu became prime minister and tried to cope with the political and economic difficulties that beset the country. He helped to bring Carol to the throne, June 8, 1930; but Carol was soon in conflict with him and, after his resignation, appointed Jorga, leader of the small National Democratic party, as head of the government. The world economic crisis hit Rumania hard, and Jorga was replaced Oct., 1932, by Maniu who was followed Jan., 1933, by his deputy Vajda-Voevod. A non-aggression pact was signed with Russia in 1933, and diplomatic relations, suspended because of Moscow's refusal to recognize the incorporation of Bessarabia with Rumania,

were resumed. But though in Titulescu, Rumania possessed a clever and esteemed foreign minister, Rumanian resistance to Nazi encroachment in the economic and political affairs of the Balkans weakened steadily between 1934 and 1939. Trade agreements were signed making Rumania more and more dependent upon Berlin, and the iron guard, Rumanian counterpart of Himmler's S.S., led by the ambitious Col. Ion Antonescu, began to acquire power.

Antonescu attempted a *coup d'état* in 1938, but failed. Arrested, and subsequently released by a semi-democratic govt. set up under Dr. Cristea, patriarch of Rumania, Antonescu continued his fascist activities, was arrested again in July, 1940, for his plotting with Berlin, but Sept. 5 was, under Nazi pressure, entrusted with the formation of a government on the German pattern. Next day he forced Carol to abdicate in favour of his son Michael, and was soon collaborating openly with Hitler.

Territorial Losses

This complete defeat of democratic forces in Rumania followed a series of territorial losses; June 26, 1940, a Russian ultimatum detached Bessarabia and N. Bukovina, about 19,300 sq. m.; Aug. 21, the Craiova agreement ceded S. Dobruja, about 3,000 sq. m., to Bulgaria; Aug. 30, Northern Transylvania, about 17,370 sq. m., passed to Hungary under the Vienna Award (*g.v.*) dictated by Ribbentrop. Antonescu was soon under the control of Manfred von Killinger (*g.v.*), Hitler's ambassador with special powers; the whole economic system of the country—its grain, timber, and petroleum in particular—was needed to serve the Nazi war machine; and as soon as Germany decided to attack Russia, Rumania was made to join the Axis and wage war also against that country, the prize offered being the recovery of Bessarabia and Bukovina, and of a territory of similar size called "Transnistria" comprising Podolian and Ukrainian soil between the rivers Dniester and Dnieper, and including Odessa.

In the ensuing years, Rumania had at first about 15, later more than 40 divs. engaged on the Russian front and used, *e.g.*, during the bitter struggle for Sevastopol and the Crimea, as cannon-fodder by the Germans, Rumanian losses being relatively very heavy indeed. At home there were forced labour, imprisonment or execution without trial, and an

annihilation of the large Jewish population; and from 1943, when Allied forces established themselves on Italian soil, heavy air raids, especially upon the oilfields of Ploesti and the ports, added to the sacrifices made by the people. The temporary recovery of Bessarabia and the Bukovina and an ephemeral conquest of Transnistria proved a poor recompense. When the Russian counter-offensive reached Jassy and Constanta, a new Rumanian government accepted the Allied terms for an armistice, Aug. 24, 1944, and joined the Allies. This fight also proved costly in men, Rumanian losses being estimated at 150,000.

Michael's Coup d'État

King Michael, with the support of the opposition leaders Maniu and Bratianu, though virtually held a prisoner by Antonescu and von Killinger, took an important part in his country's timely surrender. Von Killinger committed suicide and Antonescu, with his retinue, was gaoled. Several short-lived coalition govts. were formed, but did not last in face of Communist determination, with Russian backing, to secure control, and in March, 1945, Petru Groza, leader of the Ploughman's front, a small, pro-Communist offshoot of the Peasant party founded in 1934, became premier. The Communists, though a small minority in the country, rapidly usurped all power. Under the continued presence and pressure of Vyshinsky, Russian vice-commissioner for foreign affairs, a new land reform confiscated all properties of more than 50 hectares (125 acres) with merely nominal compensation, charges of treason were made not only against Antonescu and his supporters, but also against the opposition leaders; and in Nov., 1946, elections held on allegedly falsified registers gave the Groza government 348 supporters to 29 opposition deputies.

Under the peace treaty between Rumania and the Allies, agreed at Paris Feb. 10, 1947, and ratified Aug. 23, Transylvania was restored to Rumania, Bessarabia and N. Bukovina to Russia, S. Dobruja to Bulgaria. Reparations to Russia were set at \$300,000,000 (£75,000,000), payable over eight years from Sept. 12, 1944, in oil, timber, grain, machinery, etc.

In spite of protests by the western powers, an internal terror campaign continued; many democratic politicians fled during 1947 to Istanbul; the venerable Maniu was arrested in July and

sentenced in Nov. to solitary imprisonment for life. Some hundred of his followers were also arrested and condemned to varying terms of imprisonment. Four members of the National Liberal party, including the foreign minister, resigned from the cabinet, Nov. 6, and were replaced by Communists and Socialists associated with them in the United Workers' party, formed Oct. 1. The reconstituted govt. forced Michael to abdicate, Dec. 30, and the National Assembly the same day passed a bill proclaiming Rumania a republic.

Rumba. Dance which originated in Cuba. It was typified in its early form by its frankly sexual nature. Musically it arose from the *habanera*. Its ancestry shows the influence of the Spanish invaders, African slaves, and the original Indian natives. Inter-marriage was much more general in the Latin settlements of the new world islands than on the mainland farther N., so that Spanish folk songs (already affected by African music from the time of the Moorish invasion of Spain) blended without difficulty with African slave songs. Long before the early slave ships reached the N. American mainland, new types of Afro-American dances had become established on the mainland of S. America and in the West Indies, each locality developing its own distinctive type.

In its ballroom form it was accepted in the U.S.A. between the two Great Wars. Brought to the U.K. for the first time in 1930 by José Norman, it gained sudden popularity during the Second Great War, when it became usual for night clubs to feature two bands alternately—a white swing and a coloured rumba. The music

of the rumba makes use of national idiomatic ideas in orchestration, and is basically in 2-4 tempo, while the various rhythm instruments such as string bass, guitar, maracas, clavies, bongos, and timbales produce polyrhythms of great complexity and charm. In its original form the melody was carried by voices, but its translation to the ballroom has necessitated the addition of trumpet and/or flute, clarinet, fiddle. The piano, sometimes used, is redundant.

Rumelia, EASTERN. District of Bulgaria. The middle portion is the wide level of the Maritza; it lies between the Rhodope Mts. in the S.W. and the Balkans in the N. The chief town is Plovdiv. The dist. was formerly an autonomous Turkish province under a Christian governor, an arrangement due to the Berlin treaty of 1878. In 1886, except the dist. of Kirjaby, the prov. became Bulgarian. It included the depts. of Burgas, Plovdiv, and Stara Zagara, which have an area of 17,375 sq. m. and a pop. of 2,169,335. Sheltered from the N. by the Balkans, it forms the more fertile and productive part of Bulgaria. It is noted for the culture of roses, especially in the valley of the Tunja. Burgas, on the Black Sea, is the principal port of the dist. See Bulgaria; Plovdiv.

Rumford, SR BENJAMIN THOMPSON (1753-1814). American physicist. Born at Woburn, Mass., March 26, 1753, he studied medicine and physics in his spare time. He left America during the Revolution and received an appointment in the colonial office in London, becoming under-secretary of state. He entered the service of the elector of Bavaria, 1784, and became minister of war. As a physicist he is remembered for his many discoveries on the phenomena of heat. He was the founder of the Rumford medal of the Royal Society. He died Aug. 21, 1814.

Sir Benjamin Rumford, American physicist

Ruminant (Lat. *ruminare*, to chew the cud). Name given to those even-toed hoofed mammals which chew the cud. In these animals the stomach is divided into a series of chambers. The hastily eaten and swallowed food passes into the rumen or paunch, whence it is later regurgitated to the mouth and thoroughly chewed, after

which it passes to another division of the stomach for digestion. This provision meets the needs of animals which in a wild state graze largely and hastily by night, and then lie up under cover, where the food can be masticated at leisure. Oxen, sheep, goats, deer, and camels are ruminants.

Rummy. Card game for several persons. Its rules vary widely in several versions, but the basic principles are that each plays for himself and tries to develop the hand originally dealt him (of seven or eight cards) by drawing from the pack and discarding in such a way as to collect groups of cards either of the same denomination (e.g. three or four kings) or in sequence in a suit (e.g. 8, 9, 10 of diamonds). In some variations the player may put down combinations as they are completed; in others he fills his hand and then "knocks," which allows only one more draw to each opponent. He may be allowed to take up the discard of his previous opponent; or, in a good three-handed variety, all the discards down to the one actually used to complete a combination. When any player has gone "out," the others are debited points according to the ungrouped cards in their hands. In gin rummy, a game for two, it is permissible to knock when the pipson such cards (termed deadwood) total less than ten.

Rump. End of the backbone of an animal with the adjoining parts. The name Rump Parliament is given to the remnant of the Long Parliament, left sitting after Pride had expelled the Presbyterian members in 1648. It continued to sit until expelled by Cromwell in 1653. In 1659, after the fall of Richard Cromwell, the members of the Rump were recalled. See Cromwell; Long Parliament; Pride; Restoration.

Rumpelstiltskin (Ger. *Rumpelstiltschen*). Folk-tale retold as a fairy story by the brothers Grimm. A miller's daughter is set by the king the task of spinning straw into gold. This is performed for her by Rumpelstiltskin, a dwarf magician, on condition that she gives him whatsoever he may ask; he makes her promise that in the event of her marrying the king she will give him her child. The miller's daughter becomes queen, and on the birth of a child the dwarf reappears to claim it. Having learnt his name from a messenger, the queen pronounces it, whereupon Rumpelstiltskin, after stamping his right foot into the earth, "seized his left foot with both

hands with such violence that he tore himself in two."

Runciman, WALTER RUNCIMAN, 1ST VISCOUNT (1870-1949). British politician. The eldest son of the future Baron Runciman, he was born at South Shields, Nov. 19, 1870. From Trinity College, Cambridge, he entered his father's shipping firm. He was Liberal M.P. for Oldham,

1st Visct. Runciman, British politician

1899-1900, defeating Winston Churchill 1899, losing to him 1900; for Dewsbury, 1902-18. Parl. sec. to the local govt. board, 1905, financial sec. to the treasury, 1907, in 1908 he entered the cabinet as president of the board of education. President of the board of agriculture, 1911-14, and of the board of trade, 1914-16, he resigned with Asquith in 1916 and lost his seat in 1918. During 1924-29 he was M.P. for W. Swansea, being one of the Liberal leaders in parliament. In 1929 he became M.P. for St. Ives and as president of the board of trade, introduced protective tariffs. In 1938 he headed a mission to Czechoslovakia which tried to reconcile Czechs and Sudeten Germans (see Munich Crisis), and on his return was lord president of the council until the outbreak of war. He had been raised to the peerage as Viscount Runciman of Doxford in 1937. In 1933 his father had become Baron Runciman of Shroston; on his death in 1938 this title descended to Walter, who died Nov. 14, 1949. His son Leslie (b. 1901) succeeded as 2nd Viscount and 3rd baron.

Runcorn. River port, market town, and urban dist. of Cheshire, England. It stands on the Mersey, 16 m. from Liverpool and 28 m. from Manchester, with a rly. station. Here the Bridgewater Canal falls into the Mersey, while the Manchester Ship Canal also passes by. Runcorn has docks and wharves; its industries include shipbuilding, tanning, chemicals, soap, rope, etc. A rly. viaduct and a transporter bridge cross the Mersey to Widnes. It gives its name to a co. constituency. Pop 23,400. See Bridge illus. p. 1423

Rundstedt, KARL RUDOLF GERD VON (b. 1875). German soldier. He was born at Aschersleben, Dec. 12, 1875, and joined the German army in 1892. In

1909 he was a captain on the general staff, and during the First Great War served in France, Poland, and Turkey. In 1938 he was col.-gen. in charge of army group IV, organizing the invasion of the Sudetenland; he retired at the end of Oct. on the outbreak of the Second

Karl von Rundstedt.
German soldier

Great War he was given command of an army group in Poland and was responsible for the fall of Warsaw. In 1940 he was in command of the army group which broke the French lines in the Ardennes and along the Meuse, being promoted F.-M. for his services in this campaign. He took part in the Russian campaign, 1941, but after his defeat at Rostov, he was transferred to France, being supreme commander of the W. front during 1942-44. Disagreeing with Hitler on the strategy required to meet the Allied invasion of France, he was replaced by von Kluge in July, 1944, but was reinstated in Sept., and organized the Dec. counter-offensive in the Ardennes (*g.w.*). Relieved of his command in March, 1945, he was captured May 2 at Bad Toelz, near Munich, and spent the next three years in internment in England, being repatriated in 1948. The British intention to charge him with war crimes was abandoned in 1949 on medical evidence that he was unfit to stand trial, and he was released.

Rune (Old Norse, *rún*, secret counsel). Any character in the pagan Scandinavian script. Derived, directly or indirectly, from a pre-Christian W. Greek alphabet, the first six characters in this system of writing denoted f, u, th, o, r, c. Runic alphabets are hence sometimes called futhorcs or futharks. The characters comprise uncurved strokes, adapted at first for woodcarving, and to avoid following the grain they were made upright or slanting, later proving suitable for incising bone, metal, and stone.

The old or Gothic futhorc, comprising 24 characters arranged in three groups of eight, for magical purposes, reached Scandinavia not later than the 3rd century A.D. The futhorc was ultimately replaced by the late Scandinavian system of 16 characters, represented in most extant inscriptions, as well as in MSS. Out of the earlier futhorc arose the Anglian, varying from 25 to 40 characters, and used especially in Northumbria in the 7th-9th centuries, an outstanding example being a whale-ivory casket in the British Museum.

Stone inscriptions, introduced by Norway, were adopted in Great Britain, and especially in Sweden, where more than 2,000 remain. Inscriptions, usually brief, appear upon rock-surfaces, sepulchral monuments, weapons, ornaments, utensils, and coins. Mostly—except in Iceland—older than the 11th century, when Christianity and the Latin alphabet reached Baltic lands, their use lingered in remote places to the 18th century.

In Britain runes appear on a few Jutish brooches and other objects from Kent. The Hunterston brooch, now in Edinburgh, was in the 10th century runed on the back, perhaps by Norse settlers in Man, which has yielded 24 inscribed crosses. There are 7th century runes on the Collingham stone in Yorkshire and the Bewcastle cross in Cumberland; the Ruthwell (*g.v.*) cross in Dumfriesshire is somewhat later. The earliest English coin, a gold solidus attributed to 460, bears runic characters.

Runic calendars, or primstaves, are wood or bone tablets or rings bearing characters representing the days of the year, the prime or golden numbers, and seasonal symbols. They were the precursors of the Staffordshire clog-almanacs.

The third runic stave, th (*þ*), was used in early English writing to supplement the Latin alphabet. In careless calligraphy it came to resemble y, and so appears in early printed books, although denoting in that connexion the sound th. To this is due the mispronunciation of

such sham-antique phrases as *Ye olde Englyshe faire*. See Anglo-Saxon Antiquities. Consult Catalogue of Runic Literature, H. Hermannson, 1918.

Runeberg, JOHAN LUDVIG (1804-77). Finnish poet. Born in Jakobstad, Feb. 5, 1804, he

J. L. Runeberg,
Swedish-Finnish
poet

was educated at Vasa and Abo (Turku) universities. He went in 1828 to Helsingfors (Helsinki), and in 1832 started a bi-weekly literary paper, *The Helsingfors Morning News*.

In 1837 he was appointed lecturer in Latin, and afterwards in Greek, at the college at Borgå, where he lived for the rest of his life, which ended May 6, 1877. Runeberg's first book, 1830, consisted chiefly of lyrical poems, but *The Elk-hunters*, 1832, and his masterpiece, *King Fjalmar*, 1844, are epic poems of great beauty, and among the finest achievements in Swedish literature. His most popular work, *The Tales of Ensign Stål*, 2 vols., 1848 and 1860, contains the beautiful poem, *Our Land*, adopted as the national song of Finland.

Running. Sport which may be subdivided into track running and cross country running. Marathon racing is an extension of the latter. Track running may be subdivided into short, middle, and long distance racing.

Short distance racing is popularly known as sprinting. A sprint may occur at any time during a race longer than short distance, though generally at the finish. Sprinting differs from ordinary running, not in degree, but in kind. The distinguishing factor is a powerful forward thrust of the leg, delivered with all the energy of which the physique is capable, that helps to carry the body with it. Starting is also an essential attribute. Formerly runners used to start in a more or less upright attitude, but, as the art became specialised, they learned to crouch with their fingers on the mark, and from this position sprang at once into their stride. In a short distance race the maximum speed is attained at the start and sustained till the finish. A furlong was formerly considered the greatest top-speed distance; then H. C. L. Tindall, of Cambridge, went far to show that it was possible to sprint a quarter-mile.

Rune. Stone found at Kallerup, Denmark, inscribed *The Stone of Hurnbura, son of Svitha*. It dates from c. 800

Roughly speaking, middle distance running begins with the half-mile race, and concludes short of 3 m. Middle distance races are generally combination events, i.e. the second or third "string" starts at a pace he cannot maintain throughout the course, with his companions as near to him as avoidance of undue effort will permit. When he falls back exhausted, the principal takes up the running, until the race nears its end, when the best runner comes to the front and finishes at the utmost speed of which he is capable, frequently at a sprint. Sometimes the first string will be his own pacemaker throughout, but combined tactics, calling for judgement and generalship, are brought into play.

Long distance races, 3 m. and upwards, are run on the same principle, save that the first strings of the opposing teams, for some two-thirds of the distance, often keep a considerable distance behind the leaders. Sound judgement and mutual understanding are required, as otherwise the second string of one team may obtain such an advantage that it cannot be wrested from him. For long distance racing the pace for the most part should be a long, natural, springy stride. Beyond 10 m. running approximates more and more closely to pedestrianism.

These races are run on elliptical cinder tracks, of equal breadth at either end, with a sufficient length on either side to admit of a straight course of at least 100 yds. Cross country racing, steeplechasing, harriers, paper-chasing, are varieties of the sport. Some British and Olympic records accompany the article Athletics. See Cross Country Running; Hurdling.

Runnymede. Name given to a meadow lying along the S. bank of the Thames, near Egham, in Surrey, and some 20 m. W.S.W. of London. There, on or Charter

Island in the stream, King John sealed Magna Carta, June 15, 1215. There are gates by Lutyens commemorating the event, and the meadow is now national property.

Runway. Hard-surfaced track on an aerodrome along which air-

Rupee (Skt. *rupya*, silver). Unit of currency of India and Pakistan. It is divided into 16 annas. In 1950 the Indian rupee was worth ls. 6d., the Pakistan 2s. 1d. It was first coined in 1542. A lac of rupees is written 1,00,000 ru-

Runway. Aerial view of London Airport at Heathrow, showing the main east to west runway

craft land or take off. Runways are generally laid out and built like roads, a surface of asphalt being laid on a concrete foundation. Concrete surfaces are rarely used, not being resilient enough. Most aerodromes have runways laid out in different directions so that at least one may suit the wind of the moment. In the Second Great War, prefabricated runways made of sections of steel mesh were used on advanced airstrips. See Aerodrome; Airport; Airstrip; London Airport.

Damon Runyon, American humorist

Runyon, ALFRED DAMON (1884-1946). American humorist. Born at Manhattan,

Kansas, he spent his boyhood in Colorado and was in the Spanish-American War of 1898. He wrote for Hearst newspapers in San Francisco and New York, and after the First Great War became a sports columnist and feature writer. His first publication, 1911, was *Tents of Trouble* (verse), but his fame rests on short stories, in a style partly vernacular but largely invented by himself, to suit his eccentric characters. *Guys and Dolls*, 1932; *The Best of Runyon*, 1935; *More Than Somewhat*, 1937, were popular collections. He died Dec. 10, 1946.

pees, a crore 1,00,00,000. See Crore; Lac.

Rupert. English form, through the Latin *Rupertus*, of the German name *Rupprecht*. The O.H.G. form *Ruodperht* means bright, or illustrious, in fame, and is identical with the Fr. and Eng. *Robert*. Through S. Rupert (c. 650-717), who became the Apostle of the Bavarians and founded the bishopric of Salzburg, the name became especially popular in Bavaria. Its adoption as an English name appears to be due to Prince Rupert (q.v.). From the prince's qualities as a cavalry leader the description "frank, haughty, rash, the Rupert of debate" was applied to the 14th earl of Derby, by Bulwer-Lytton, in *The New Timon*, 1845.

Rupert. River of Canada, in Quebec prov. It drains Lake Mistassini and flows W. to the lower end of James Bay. Its length is 300 m. At its mouth is Rupert House, one of the earliest posts of the Hudson's Bay Company.

Rupert, PRINCE (1619-82). Son of the Elector Palatine, Frederick V, by Elizabeth, daughter of James I of England. He was born at Prague, Dec. 17, 1619, and after some experience of fighting in the Thirty Years' War on the Protestant side, came to England in 1642. Rupert fought for his uncle Charles I at Worcester, Edgehill, Marston Moor, and Naseby, proving him-

Runnymede. Magna Carta House, built on the supposed site of the signing of the charter

Prince Rupert, Royalist soldier After Van Dyck

self a dashing if somewhat erratic leader of cavalry. In 1648 he received the command of the royalist fleet and continued in that capacity until most of his ships were destroyed by Blake, off Malaga, in 1650. Thenceforward he kept away from England until the Restoration, when he returned and saw further naval service against the Dutch. He devoted his last years to science and art, and introduced into England the mezzotint process of engraving. Prince Rupert's Drops were pear-shaped globules of molten glass which, when scratched, burst with a small explosion; they were the result of an experiment by the prince. Rupert died, Nov. 29, 1682. *Consult* Lives, J. Cleugh, 1934; C. Wilkinson, 1934; M. Irwin, 1938.

Rupert of Hentzau. Romantic novel by Anthony Hope, published in 1898 as a sequel to *The Prisoner of Zenda* (q.v.). Rupert Hentzau was a prominent character in the earlier book, but there was no "of" in his name there.

Rupert's Land. Former name for that part of Canada around Hudson Bay to which the charter of Charles II gave (1670) the Hudson's Bay Company rights of possession. Named after Prince Rupert, it was sold by the company in 1869 to the dominion, and is now divided among the provinces of Quebec, Ontario, and Manitoba and the North-West Territories. One of Canada's five Protestant archbishops is still known as the archbishop of Rupert's Land.

Rupture (Lat. *ruphura*, breaking). In medicine, the intrusion of an organ or tissue through an abnormal opening. The situation can be controlled by the pressure of a pad built in a specially constructed belt, or by a curative operation. The term is also used in the sense of breaking or bursting, e.g. rupture of a blood vessel. *See* Aneurism; Hernia.

R.U.R. (Rossum's Universal Robots). Title of a play by Karel Capek, first produced in 1923. Its theme is amplified under Robot.

Rural Dean. Ecclesiastical functionary. Known to Saxon England by 800, and well established by 1050 in France and Germany, he was introduced into Italy in the 17th century. Rural deans dealt with wills and marriage cases and tested ordination candidates; they still report to the bishop on the behaviour of clergy and laity and the condition of church fabrics, and attend episcopal synods as representatives of the rest of the clergy in their respective deaneries.

After a time their duties were virtually absorbed by the archdeacons; but during the 19th century the office again came into prominence. *See* Diocese.

Rural District. Unit of local government in England and Wales, usually a less populous area than an urban district. *See* England, p. 3078; Local Government.

Rural Rides. Descriptive and discursive work by William Cobbett. After having appeared in his *Political Register*, it was published in 1830 with the full title: *Rural Rides in the Counties of Surrey, Kent, Sussex, Hampshire, Wiltshire, Gloucestershire, Somersetshire, Oxfordshire, Berkshire, Essex, Suffolk, Norfolk and Hertfordshire: with Economical and Political Observations relative to matters applicable to and illustrated by the State of those Counties respectively*. Cobbett indulged in scathing comment, and his favourite name for London was the Great Wen.

Rurik (d. 879). Reputed founder of Russia. Various described as a Viking from Sweden or a Ruso-Varangian, he and his brothers, Sineus and Truvor, with a large band of followers, invaded N. Russia in 862. He settled at Ladoga on the Volkhov, his brothers establishing themselves at Bielozersk and Izborsk in 864. Both died, and Rurik assumed sole sovereignty. He moved his headquarters to Novgorod, built a citadel there, and soon assumed mastery over the town. Novgorod under his dominion became the capital of a powerful state, extending from Lake Ladoga to the Dvina, and from Lake Peipus to the Upper Volga.

Ruritania. Imaginary small kingdom of Central Europe which is the background to Anthony Hope's romantic novel, *The Prisoner of Zenda* (1894) and its sequel *Rupert of Hentzau* (1898). The

adjective Ruritanian has passed into the language to describe romantic political intrigue.

Rush (*Juncus*). Large genus of perennial and a few annual herbs of the family Juncaceae. Natives chiefly of the temperate and cold regions, they have smooth, round-

Rush. Leaves and flowers of sea-rush

ed stems either hollow or stuffed with white pith. The leaves are flat, or rounded like the stems, or reduced to sheaths closely pressed to the stems. The green or brown flowers are very small, but rendered conspicuous by being clustered at the ends or sides of the stems. They

grow on wet soils, marshes or bogs. The pith was formerly used as wicks for rushlights; and the flattened stems are plaited into mats.

Rushcliffe. HENRY BUCKNALL BETTERTON, BARON (1872-1949). British politician, born Aug. 15, 1872. From Rugby he went to Christ Church, Oxford, and was called to the bar in 1896. Conservative M.P. for Rushcliffe, S. Notts, 1918-34, he became a baronet in 1929 and minister of Labour in 1931. He introduced the Unemployment Act, 1933, which imposed the "household means test," and retired from parliament to become, 1934-41, chairman of the assistance board that it set up. He was raised to the peerage in 1935, and died Nov. 18, 1949. A committee presided over by Lord Rushcliffe worked out the Rushcliffe scale of salaries for nurses and midwives, which was accepted by the govt., and another examined means of extending the legal aid system. *See* Nursing; Poor Persons Procedure.

Rushden. Urban district of Northants, England. It is 4 m. E. of Wellingborough and 66 N.N.W. of London, having a rly. station. S. Mary's church is a fine building, mainly in the Decorated style. Boots and shoes are manufactured. Pop. 15,100.

Rush Nut (*Cyperus esculentus*). Perennial sedge of the family Cyperaceae, native of S. Europe. It has a tuberous rootstock and grass-like leaves. The greenish flowers are clustered. The tubers are used as food in S. Europe, and

Rush Nut. Grass-like leaves and flower cluster. Inset, left, roots, showing tubers; right, flowers

when roasted are said to form a substitute for coffee.

Rusholme. District of Manchester. In the S. of the city proper, it is mainly a residential area. See Manchester.

Rushworth, JOHN (c. 1612-90). English historian. A Northumbrian, educated for the law, he

John Rushworth,
English historian

became solicitor to Berwick-upon-Tweed in 1638, and was called to the bar at Lincoln's Inn nine years later. He was a close student of the events which led up to the Rebellion, especially on being appointed clerk assistant to the commons in 1640. Secretary to the council of war, he followed Fairfax, 1645-46, and supplied parliament with news of the army's doings, an employment he continued until the conclusion of Cromwell's Scottish campaign. Rushworth was M.P. for Berwick, 1679-81, and agent for Massachusetts. He died May 12, 1690, having spent six years in a debtor's prison. His *Historical Collections, 1659-1701*, is a valuable contemporary history.

Ruskin, JOHN (1819-1900). British writer and art critic. Son of a Scottish wine merchant settled in London, Ruskin was born Feb. 8, 1819, and was educated privately. Before entering Christ Church, Oxford, in 1836, he travelled widely in France, Switzerland, and Italy, and showed active interest in art. His able draughtsmanship was revealed in architectural and floral studies carried out under Harding and Copley Fielding. In 1839 he won the Newdigate poetry prize.

An essay on Turner's painting, 1841, led the way to the first volume of *Modern Painters*, 1843, the second attracting wider attention in 1846, others appearing in 1856 and 1860. In 1851 his *Pre-Raphaelitism* championed the work of Millais and Holman Hunt; and the first volume of *The Stones of Venice* gave a careful study of the great buildings of that city. Among other publications of this period were *The Seven Lamps of Architecture*, 1849; *Lectures on Architecture and Painting*, 1853;

the comprehensive catalogue of Turner's drawings, 1857; and *The Political Economy of Art*, 1857.

In the *Seven Lamps*, Ruskin set himself to show that all good architecture was the outward expression of "certain right states of temper and moral feeling." In *The Stones of Venice* he expanded this characteristic theme, urging that the Gothic architecture of Venice was born of pure faith and domestic virtue, whereas the Renaissance work sprang from "infidelity and domestic corruption." Good architecture, he maintained, though not necessarily ecclesiastical, was essentially religious.

Ruskin became actively interested in social reform, and was an early supporter of the Working Men's College founded by Maurice, Kingsley, and others in 1854. In 1860 *Unto This Last* appeared in the *Cornhill Magazine*. It was the first of an important series of writings, supplemented by lectures, in which Ruskin attacked the materialist philosophy and the "dismal science" of political economy which seemed to overshadow his age, thus giving powerful support to Carlyle, to whom he dedicated *Munera Pulveris*, 1862. *Time and Tide*, 1867, upholds the importance of "honesty of work and honesty of exchange," and paints a new social Utopia. *Sesame and Lilies*, 1871, consists of lectures delivered

Fred
Hollier

Ruskin

in 1864 and 1865, deals with reading and education, deplores the crushing influence of industrial civilization upon art and morality; summing up much of Ruskin's most characteristic thought. *The Crown of Wild Olive*, 1866, is full of fierce denunciation, and *The Queen of the Air*, 1869, was a study of Greek myth and art.

In 1869 Ruskin was elected Slade professor of art at Oxford. He held the post until 1879, and again during 1883-84. Many of his lectures there appeared in book form as *The Eagle's Nest*, 1872; *Ariadne Florentina*, 1872; *Val d'Arno*, 1873; and *The Art of England*, 1883. *Fors Clavigera*, 1871-84, consists of nearly a hundred letters addressed "to the labourers and workmen of Great Britain," dealing with characteristically varied topics of ethics, art, politics, trade, books, legends, etc. Intensely personal and illuminated often by his most vivid phrase-

ology, it is one of Ruskin's most remarkable achievements. He followed it in 1885-89 with the autobiographical *Præterita* (new edn., with introduction by Sir Kenneth Clark, 1949).

Among the episodes of his chequered life, mention should be made of his unhappy marriage, 1848, with Euphemia Gray, who obtained a decree of nullity in 1855 and married Millais; and his later tragic and thwarted infatuation with a girl 30 years younger than himself. In 1864 his father left him over £150,000, but he lived on the proceeds of his writings and devoted his fortune to educational and social reforms. In 1878 he was sued by Whistler for libel, having written that he never expected to see "a coxcomb ask 200 guineas for flinging a pot of paint in the public's face." In later years his mind suffered severe disturbances, and he lived in comparative retirement on his estate at Brantwood, Coniston, where a Ruskin museum is maintained. He died Jan. 20, 1900.

Much of Ruskin's teaching was too nebulous to have an influence more lasting than its magnificent prose expression could give. But his disinterested idealism marks him as one of the greatest Victorians, and he left his mark on the development of English art and architecture. Even if much of his vociferous dogmatism is today discounted, Ruskin will be honoured as one who succeeded in showing that, through art, everyday life must rule itself by moral standards.

Ruskin College. British educational institute. Situated in Walton Street, Oxford, it was founded in 1899 by two Americans, Walter Vrooman and Charles Beard, to enable working men and women to undertake social studies of a university standard. It offers facilities for tuition in social and industrial history, economics, local and national government, etc. Its aim is to give opportunity for wide understanding to students

who have started work without advanced education. Students reside in the college; and there is a correspondence system of education for non-residents.

Ruskin College, Oxford. Buildings of the college for adult education, erected in 1913

Walter Vrooman was also responsible for the foundation of another Ruskin College, in the U.S.A. Founded in 1900 at Trenton, Mo., it was moved to Glen Ellyn, Ill., and in 1907 was established at Ruskin, Fla.

Russel, ALEXANDER (1814-76). Scottish journalist. He was born in Edinburgh, Dec. 10, 1814, son of a solicitor, and having

Alexander Russel, Scottish journalist

gained a practical insight into printing, became editor of *The Berwick Advertiser*, 1839. He joined the staff of *The Scotsman* (q.v.), of which he was editor from 1848 until his death, July 18, 1876. A Liberal in politics, Russel, one of the greatest journalists of his time, championed the objects of the Anti-Corn Law League, helped to secure the election of Macaulay as M.P. for Edinburgh in 1852, and opposed the participation of ministers of religion in politics. A book on *The Salmon*, 1864, reflects his enthusiasm as an angler.

Russell. Name of a famous English family. Early in the 15th century Henry Russell, a merchant, represented Weymouth in parliament, and before that date persons of this name had been prominent in the affairs of that town. His great-grandson John Russell enjoyed the favour of Henry VIII, saw military service abroad, married an heiress, and in 1539 was made a baron. His wife brought him the estate of Chenies, Bucks, and on the dissolution of the monasteries he secured large estates in London and in the

counties of Bedford, Cambridge, and Devon. In 1550 he was made earl of Bedford, and from him the later earls and the dukes are descended. Branches of the family

hold the titles of Earl Russell and Baron Amphil. See Bedford, Earl and Duke of.

Russell, JOHN RUSSELL, 1ST EARL (1792-1878). British statesman. A youngson of the 6th duke of Bedford, he was born Aug. 18, 1792. Except for a year at Westminster, he was educated privately before 1809, when he went to the university of Edinburgh. His travels included a visit to Wellington, in Portugal, after which in 1813 he entered the house of commons as M.P. for the family borough of Tavistock.

Hereditary connexions, ability, and an enthusiasm for reform combined quickly brought Lord John to the front. He was a frequent critic of the repressive legislation passed by Lord Liverpool, and in 1819 introduced his first motion for parliamentary reform. He declared for the repeal of the Test Act and for R.C. emancipation. From 1820 he represented successively Huntingdonshire, Bandon Bridge, Tavistock, Devon, Stroud, and the City of London. In 1830 he joined Grey's Whig ministry as paymaster-general and, although not in the cabinet until 1831, he was closely associated with the passing of the Reform Act of 1832, which he introduced. In 1835 he became Home secretary and leader of the house, and he remained in office until the fall of the Whigs in 1841, having been colonial secretary since 1839.

In 1845 Lord John, in a manifesto known as the Edinburgh letter, declared for free trade; and when in 1846 Peel resigned, he became premier. Palmerston was his foreign secretary, but the resignation of that minister was followed by that of the government in 1852. Of the coalition ministry under Aberdeen, Russell was a member, being foreign secretary

for a year and leader of the house. From 1855 he was out of office, but in 1859, having become reconciled with Palmerston, took under him the post of foreign secretary. In 1861 he was made an earl. He succeeded Palmerston as prime minister in Oct., 1865, but resigned in June, 1866, on the failure of his reform bill. Resigning the party leadership in 1867, he went into retirement at Richmond, where he died, May 28, 1878.

Russell was a keen reformer, to whom the cause of ordered political progress owes much. He believed in all Whig principles and sympathised with Liberal movements on the Continent, but his policy had elements of weakness. His small figure, with its large head, lent itself readily to caricature. His numerous tasteful writings include an *Essay on the English Constitution*, 1821; *Lives of Lord William Russell*, 1819, and *C. J. Fox, 1859-66*; *Recollections and Suggestions*, 1875. *Consult* *Lives*, Sir S. Walpole, 1891; S. J. Reid, 1895.

Russell's title passed to his grandson, John Francis Stanley Russell (1865-1931). Eldest son of Viscount Amberley, he became an engineer and a barrister, and was prominent through his efforts to alter the divorce law, and was also known as a Fabian and a motorist. The 2nd earl's third wife was Countess Arnim, who receives a separate entry as Russell, Mary Annette. The 3rd earl was the philosopher Bertrand Russell (v.i.).

Russell, BERTRAND ARTHUR WILLIAM RUSSELL, 3RD EARL (b. 1872). British philosopher. The younger brother of the 2nd earl, whom he succeeded in 1931, he was born at Treleek, Monmouth, May 18, 1872. He was educated at Trinity College, Cambridge, where he had an exceptionally brilliant career, securing "firsts" in mathematics and moral science, a dual approach to knowledge which was reflected in his later life. He became a lecturer and a fellow of his college. One of the leaders of symbolic or mathematical logic he attracted attention with his *Principles of Mathematics*, 1903. His chief work in this field was the massive *Principia Mathematica*, 1910, written in collaboration with A. N.

1st Earl Russell, British statesman

3rd Earl Russell, British philosopher

Whitehead (*q.v.*), which rapidly became a standard work on higher mathematics. He also wrote more popular treatises, on the mathematical basis of atomic theory and on relativity. He soon showed, however, that he had wider interests than the purely mathematical, his *Problems of Philosophy*, 1911, and *Our Knowledge of the External World*, 1914, establishing him as one of the most brilliantly clear exponents of philosophical theories. His own approach to the problems of philosophy slowly veered from an early Platonist realism to a type of mathematical logic which he made peculiarly his own and which he advocated in a series of books, the most noteworthy being *Mysticism and Logic*, 1918, and *Introduction to Mathematical Philosophy*, 1919. Throughout his career he maintained a generally sceptical approach which gave his writing a somewhat astringent flavour.

In his less academic moods he became famous with many works on general political and sociological subjects, *e.g.* *Roads to Freedom*, 1918 (partially a product of his experiences during the First Great War, when he was imprisoned as a conscientious objector); *The Prospects of Industrial Civilization*, 1923 (written in collaboration with his second wife, Dora Russell, who herself was the author of *The Right to be Happy*, 1927; *In Defence of Children*, 1935); *On Education*, 1926; *Education and the Social Order*, 1932; *Let the People Think*, 1939.

Before and during the Second Great War Russell lectured in the U.S.A., and in his writings showed a tendency to return to the more academic aspect, publishing *An Inquiry into Meaning and Truth*, 1940; a huge *History of Western Philosophy*, 1946; *Human Knowledge, its Scope and Limits*, 1948. He received the O.M., 1949.

Bertrand Russell was called the most versatile genius of his day. The mathematical work which he did in his youth may well be longest remembered; but to his contemporaries, at any rate among the general public, he was the most brilliant philosophical populariser of his time, equally attractive as a writer and as a broadcaster.

John Rowland

Russell, Sir (Edward) John (b. 1872). British agriculturist. Born at Frampton, Glos, he went to Aberystwyth university college and Manchester university, where as lecturer in chemistry 1898-1901 he specialised in fertilisers. After

running the chemical department at Wye agricultural college, he moved in 1907 to Rothamsted (*q.v.*) experimental station, of which he was director over 30 years, retiring 1943. Sir John, who was knighted in 1922, advised on food production in the First Great War, and was employed by U.N.R.R.A. in 1941 to preside over its sub-committee on agriculture. He wrote standard works on soil chemistry.

Russell, George William (1867-1935). N. Irish poet, best known by his pen name of A. E.

Born at Lurgan, Armagh, April 10, 1867, he spent his early years in Dublin, entering its school of art in 1883. He worked as an accountant, meanwhile painting, writing lyrical poems of great beauty, strongly influenced by the Eastern mystics, and in 1897 began his work with Plunkett in establishing the Irish agricultural organization society. Russell became widely known as a leader in cooperative enterprise, and no less famed as a leader in the Irish literary revival and a pioneer of the Abbey Theatre, Dublin, where his play *Deirdre* was produced, 1902. His first poems, *Homeward*, appeared in 1894; his collected poems in 1913. A. E. was overshadowed by his friend Yeats, yet such lyrics as *Hope in Failure*, *The Twilight of Earth*, and *On Behalf of Some Irishmen Not Followers of Tradition*, are likely to live. He wrote in prose *Co-operation and Nationality*, 1912; *Imaginations and Reveries*, 1915; *The Candle of Vision*, 1918; *The Interpreters*, 1922; *The Avatars*, 1933. He died July 17, 1935.

Russell, George William Erskine (1853-1919). British politician and author. Born Feb. 3, 1853, the younger son of Lord Charles

G. W. E. Russell, British politician

Russell. Prevented by ill-health from taking orders, he lived mainly in London society. An earnest Radical, he secured the

Aylesbury seat, 1880, and in 1883 became parliamentary secretary to the local government board. In 1885 he lost his seat, but representing N. Bedfordshire in the Liberal ministry of 1892-95 he was under-secretary for India, and for the home department.

As a writer Russell began by contributing a weekly column to the *Manchester Guardian*, and this developed into a series of books, personal recollections of people he had met, and genial criticisms on manners and politics. A Londoner's Log Book is fiction, while Russell also wrote a *Life of Sydney Smith*, 1905. He died March 17, 1919.

Russell, Henry (1813-1900). British singer and composer. Born at Sheerness, Dec. 24, 1813, he first appeared in public at three, and, aided by a benefactor, studied singing at Bologna. He worked in the U.S.A., 1833-40.

In England he became well known as a singer and composer of tunes to popular lyrics. Among his songs, numbering over 800, may be mentioned *Cheer, Boys, Cheer* (to Charles Mackay's words) and *A Life On The Ocean Wave*. In 1895 he published his memories as *Cheer, Boys, Cheer*, and he died in London, Dec. 7, 1900. He was the father of Sir Landon Ronald (*q.v.*).

Russell, Sir Herbert William Henry (1869-1944). British war correspondent. Born March 28, 1869, the son of the novelist W. C. Russell (*q.v.*), he was educated at the royal grammar school, Newcastle-on-Tyne, and was on the staff of the *Newcastle Chronicle*, and of the *Daily Express* from its foundation in 1900. As correspondent to Reuters he reported the Gallipoli campaign of 1915 and was on the western front until the armistice of 1918. He accompanied the prince of Wales on a tour of India and Japan. He published novels and wrote on naval subjects, his *Ark Royal*, 1942, being a memoir of the celebrated aircraft carrier. Russell died March 23, 1944.

Russell, John (1745-1906). British painter. Born at Guildford, March 29, 1745, he studied under Francis Cotes in London, was elected A.R.A. in 1772, R.A. in 1788, and became king's painter in 1789; the last appointment leading to his production of portraits of the royal family. He also painted Wesley, Whitefield, and Wilberforce. Russell had strong evangelical convictions and a taste for argument which made

him unpopular and may have accounted for his comparative lack of notable sitters. He also dabbled in astronomy. His portraits, almost wholly in pastel, are extraordinarily interesting both in pose and facial expression, soft and graceful in outline, and harmonious in colour; he was specially successful with children. He died at Hull, April 20, 1806. See Herschel, W.; Inchbald, E.; Newton, J.

John Russell,
British painter

Russell, JOHN SCOTT (1808-82). Scottish engineer. Born at Parkhead, near Glasgow, May 8, 1808, and educated at Edinburgh, St. Andrews, and Glasgow universities, he became professor of natural philosophy at Edinburgh in 1832.

John Scott Russell,
Scottish engineer

In 1835 he read a paper before the British Association on the nature of waves, in which he had carried out a series of researches, and suggested new designs of ships as a result. He came to London in 1844 and was one of the chief organizers of the Great Exhibition of 1851. Builder of the Great Eastern and other vessels, he died June 8, 1882.

Russell, MARY ANNETTE, COUNTESS (1866-1941). British novelist. Daughter of H. H. Beauchamp, she married Count von Arnim (d. 1910) and until 1914 lived in E. Prussia. In 1898 she wrote *Elizabeth and Her German Garden*, which became a minor classic. The "Elizabeth" series included *The Solitary Summer*, 1899, and *The Adventures of Elizabeth in Rügen*, 1904. Then followed *Princess Priscilla's Fortnight*, 1905; *Fräulein Schmidt and Mr. Anstruther*, 1907. Later novels were *Vera*, 1921; *The Enchanted April*, 1922; *Father*, 1931. They were characterised by humour and malicious wit which, compounded with unsentimental philosophy, made everyday events vivid. The Countess von Arnim's works were collected in 14 vols., 1929. She married in 1916 the 2nd Earl Russell (1865-1931), and died at Charleston, S.C., Feb. 9, 1941.

Russell, SIR THOMAS WALLACE (1841-1920). British politician. Born at Cupar, Fife, Feb. 28, 1841, of humble parentage, he emigrated at 18 to co. Tyrone. In 1864 he became secretary of the Irish Temperance League, in which capacity he came into touch with Parnell in the lobby of the house of commons. When Gladstone declared for Home Rule, Russell became his vehement opponent, and as Unionist M.P. for S. Tyrone, which he represented 1886-1910, had many a sharp passage with the Parnellites. In the Salisbury

Sir T. W. Russell,
British politician
E. N. Miles

ministry of 1895-1900 he was parliamentary secretary to the local government board. In 1911, sitting as Liberal M.P. for N. Tyrone, he became vice-president of the dept. of agriculture and technical instruction in Ireland. Knighted on his retirement from public life in 1918, he died May 2, 1920.

Russell, SIR WALTER WESTLEY (1867-1949). British painter. Born at Epping, May 31, 1867, he studied at Westminster art school, and exhibited at Burlington House. Elected A.R.A. 1920, and R.A. 1926, he was knighted in 1935. His works include six pictures in the Tate Gallery; *Donkeys and Kites*; *Mr. Minney*; *The Blue Dress*; *The Amber Beads*; *Cordelia*; *The Farmyard*. He is also represented at Liverpool, Edinburgh, Dublin, and Johannesburg. He died April 16, 1949.

Russell, LORD WILLIAM (1639-83). English politician. He was born Sept. 29, 1639, third son of the duke of Bedford, and went to Cambridge. After the Restoration he became M.P. for Tavistock, and in 1679 for Bedfordshire. In 1669 he married Rachel, daughter of the earl of Southampton and widow of Lord Vaughan. Identifying himself with the country party in the commons, he became prominent as an opponent of the Cabal and an advocate of the Exclusion Bill. In 1683 he was arrested as participant in the Rye House Plot (q.v.), and, on the flimsiest evi-

Lord William Russell,
English politician
After Kneller

dence, found guilty of treason and beheaded in Lincoln's Inn Fields, where a small tablet marks the spot, July 21, 1683. His fearless honesty and tragic fate made him a hero, and by the Whigs he was regarded as a martyr in the cause of civil and religious liberty. The prime minister, Lord John Russell, wrote his *Life*, 4th ed. 1853.

Russell, WILLIAM CLARK (1844-1911). British novelist. Born in New York, Feb. 24, 1844, a son of Henry Russell (q.v.), the composer, he spent seven years in the British merchant service, and retiring in 1866, took to journalism. In 1874 he produced his first

W. Clark Russell,
British novelist

novel, *John Houldsworth*, Chief Mate, the forerunner of some 50 others, among which are *The Wreck of the Grosvenor*, *An Ocean Free Lance*, *Jack's Courtship*, and *List, Ye Landsmen*. His last book, *The Yarn of Old Harbour Town*, was pub. 1905. These stories, mostly concerned with the sea and with seafaring life, enjoyed great vogue, for though the characterisation is indifferent and the plots somewhat mechanical, the power of description is great, and won the praise of Swinburne. Russell died at Bath, Nov. 8, 1911.

Russell, SIR WILLIAM HOWARD (1821-1907). British war correspondent. Born at Lily Vale, co.

Sir W. H. Russell,
British journalist

Dublin, March 28, 1821, and educated at Trinity College, Dublin, he joined *The Times* as a reporter, and on the outbreak of the Crimean War was sent on behalf of the paper to the East. His vivid dispatches which first called attention to the appalling sufferings of the troops during the winter of 1854-55 did splendid work in drawing attention to the disgraceful mismanagement of the commissariat and the medical service, and contributed largely to the fall of the Aberdeen ministry. The complaint was made, however, by the commander-in-chief, Lord Raglan, that Russell frequently divulged information to the enemy. Russell was also a war correspondent in the Indian

Mutiny, and the American Civil War, in which his truthful description of the Federal rout at the first battle of Bull Run, 1861, made him exceedingly unpopular in the North; the Austro-Prussian War of 1866; the Franco-Prussian War of 1870; and the Zulu War, 1879. He accompanied the prince of Wales on tours through the Near East in 1869 and India in 1875-76. Knighted in 1895, he died Feb. 10, 1907. *Consult Life*, 2 vols., J. B. Atkins, 1911.

Russell Divorce Case. Action leading to a legal decision in the house of lords, 1924. This decision (reversed by the Law Reform (Miscellaneous Provisions) Act, 1949), laid down that neither a husband nor a wife was permitted to give evidence of absence of sexual intercourse between them if such evidence would prove illegitimacy of a child born to the wife during the marriage. During and after the First Great War, many husbands had obtained divorces on giving evidence that their wives had borne children who must have been conceived at a time when there was no opportunity of sexual intercourse between husband and wife because the husband was on active service. The basis of the rule was the very strong presumption that the child of a married woman is begotten by her husband. A husband might still call some third person—e.g. his commanding officer—to prove that at the date when a child born to his wife must have been conceived, he could not have had sexual intercourse with her because, e.g., he was serving abroad; but he might not give such evidence himself.

The detailed day by day reports in the press of evidence in the case of *Russell v. Russell* led parliament to act on a recommendation made in 1912 by the royal commission on divorce by passing the Judicial Proceedings (Regulation of Reports) Act, 1926. This includes a declaration of the common law on the offence of publishing indecent matter in reports of judicial proceedings, and restricts newspaper reports of matrimonial proceedings to the names, addresses, and occupations of the parties and witnesses, a short statement of the charges and counter-charges in support of which evidence has been given, legal submissions, summings-up, verdicts of juries, and observations of the judge in giving judgement.

Russell of Killowen, CHARLES RUSSELL, BARON (1832-1900). British lawyer. Born of R.C. parents

Lord Russell of Killowen, British lawyer

at Newry, Nov. 10, 1832, he became a solicitor in 1854. In 1859 he was called to the English bar, practising first in Liverpool, where his ability and eloquence speedily brought him to the front. He was equally successful in London, and in 1872 became a Q.C. In 1880 he entered parliament as Liberal M.P. for Dundalk, and in 1885 was returned for S. Hackney. In 1886 Russell, now known as an ardent Home Ruler, was appointed attorney-general, a post he held again, 1892-94. Then he was made a lord of appeal and a life peer, and the same year lord chief justice. He died Aug. 10, 1900, leaving five sons. He was a great patron of racing.

Russell was one of the greatest British advocates and judges of the 19th century. From the time he took silk until his death he figured in nearly every important criminal trial. His greatest forensic feat was, perhaps, his appearance for the Irish leader before the Parnell commission; he spoke for six days and showed profound knowledge of Irish land legislation, and power of cutting criticism and of emotional appeal which has never been surpassed. He defended Mrs. Maybrick in 1889, one of his few failures to obtain a verdict in his favour; and in 1893 represented Great Britain with Sir R. Webster on the Bering Sea arbitration, speaking for 11 days. As lord chief justice, Russell presided at the trial of the Jameson raiders, 1896, and in 1899 was an arbitrator on the Venezuelan boundary commission. (See Parnell, C. S.)

His son Francis Xavier Joseph Russell (1867-1946), was born July 2, 1867, and educated at Beaumont and Oriel College, Oxford. Called to the bar, 1893, he was quickly successful as a chancery junior. He became a judge in 1919, and in 1929 a lord of appeal in ordinary, when he received a life peerage, assuming the title his father had held. He retired in 1946, and died on December 20.

Russell of Liverpool, EDWARD RICHARD RUSSELL, 1ST BARON (1834-1920). A British journalist. Born in London, Aug. 9, 1834, he became editor of the *Islington Gazette*, 1857, assistant

editor of the *Liverpool Daily Post*, 1860, and leader writer and dramatic critic of the *Morning Star*, 1861. He edited the *Liverpool Daily Post* from 1869 until his resignation through illness in 1915. M.P. for Bridgeton, 1885-87, he was knighted in 1893, and raised to the peerage in 1919, but he died Feb. 20, 1920. Russell wrote a volume of reminiscences, *That Reminds Me*, 1889; *An Editor's Sermons*, 1901; *Arrested Fugitives*, 1912; *Speculation on Hypothesis in Religion*, 1915. The title of 2nd Baron fell to his grandson Edward (b. 1895).

1st Baron Russell, British journalist

Russell Square. A London square. It is in Bloomsbury, on the Bedford estate, to the N.W. of the British Museum, and was laid out by Humphry Repton in 1801-04, on Southampton or, as they were known later, Long Fields. After the Second Great War, in which the N. side was damaged by bombs, the gardens were laid out afresh. On the S. side of the central garden is a statue of the 5th duke of Bedford (1765-1805), by Westmacott. The Russell and Imperial Hotels now dominate the E. side, where at No. 62, demolished 1905, lived Cowper when going to Westminster school. What remains of Baltimore (later Bolton) House recalls a celebrated abduction case in which Frederick, 7th Lord Baltimore, for whom it was built, figured at the Kingston assizes in 1768. Of many lawyers who have lived in the square, Wedderburn, 1st earl of Rosslyn, better known as Lord Loughborough, was an occupant of Bolton House. Sir Samuel Romilly killed himself at No. 21. Sir Thomas Lawrence lived at No. 65, since demolished; and at No. 56, since rebuilt, Mary Mitford. No. 30 is the address of the Institute of Chemistry. The square figures in Thackeray's *Vanity Fair*.

Russell's Viper Venom. Substance used in medicine as a local haemostatic. It is generally applied to the bleeding point in freshly-made 1 in 10,000 solution by means of a pledget of cotton wool, or it may be dropped on the bleeding point from a fine needle. It is particularly valuable for haemophilic patients.

RUSSIA: THE EMPIRE AND THE REPUBLIC

GEORGE SOLOVEYITCHIK, Author of *Russia in Perspective*, etc.

Here the geography and history of Russia are traced from the earliest known times, and some account is given of the literature, art, and music of this immense country, which has grown to cover a sixth of the world's land. See also articles on cities and rivers, rulers and men of letters, e.g. Boris; Don; Lenin; Leningrad; Moscow; Peter the Great; Stalingrad; Tolstoy; Volga, etc. For the Second Great War, see *Russo-German Campaigns*

Russia, officially called the Union of Soviet Socialist Republics since 1922, emerged from the Second Great War, after an initial loss of territory following the revolution, covering the whole area of the former Russian empire

Russian flag.
Yellow on red

up to 1917 and some substantial additional territories. It covered about 8,800,000 sq. m. spread over two continents from the Gulf of Finland to the Pacific and from the Arctic to the Afghan frontier. The U.S.S.R. is nearly three times the size of the U.S.A., and, occupying more than one-sixth of the earth's land surface, is the largest country in the world. Its most easterly and westerly points lie 6,500 m. apart. The distance between Cape Chelyuskin (beyond the Arctic Circle) and the town of Kushka is over 3,000 m. The distance from Moscow to Vladivostok is equal to that from the Equator to the Pole; it takes nine days and nights in an express train to cover it.

Geographers no longer divide Russia into European Russia and Asiatic Russia with the Ural mts. constituting a natural boundary. Russia is one country geographically, divided into four parallel zones which stretch across the whole territory from W. to E. The northernmost is the tundra, the next a very much larger zone of forests, the third consists of plains and steppes, the fourth, in the S.E., is desert.

The U.S.S.R. is bounded on the N. by the Arctic Ocean, beyond which lies America, separated in the N.E. by a mere 36 m. of water, the Bering Strait; on the S. by Turkey, Persia, Afghanistan, China, Mongolia, and Japan; on the W. by Norway, Finland, the Baltic sea, Poland, Czecho-Slovakia, Hungary, and Rumania; on the E. by the Pacific, and beyond by Canada and the U.S.A.

The huge quadrilateral area thus enclosed, despite its many long sea coasts, must be considered an

essentially landlocked country. Though linked by sea routes with every part of the world, Russia is poor in natural harbours. Leningrad, Kronstadt, Riga, Tallinn, Liepaja, Jelgava, and Kalinin-grad are the chief Baltic ports; Odessa, Sevastopol, and Novorossiisk the principal Black Sea ports. But the straits leading to the Baltic and the Black Sea are not in Russia's possession. Moreover, both these seas are blocked by ice for part of the winter. In the Far East the port of Nikolaevsk is frozen for six months a year, that of Vladivostok for three to four months. The Sea of Okhotsk, which separates the Kuriles (acquired by Russia in the Second Great War) from Siberia, likewise freezes every winter.

Ports have been developed at the mouths of the principal Siberian rivers, but climatic conditions reduce their period of use to a few months in the summer; the best known and largest is Igarka on the Yenisei.

In the N.W., the important and ancient White Sea port of Archangel is blocked by ice for six months

tionally long (often over 2,500 m.) and broad. W. of the Urals the principal rivers are: the Volga, with its Kama set of tributaries from the Urals, which flows into the Caspian; the Don, which flows into the Sea of Azov; the Dnieper, Bug, and Dniester, which flow into the Black Sea; the West Dvina and the Niemen, which flow into the Baltic; the North Dvina, which flows into the White Sea. E. of the Urals, the principal rivers are the Ob, the Yenisei, the Lena, and the Kolima flowing into the Arctic Ocean; the Amur flowing into the Pacific; the Amu-Daria and the Syr-Daria, flowing into the Aral.

Great lengths of all these mighty streams are navigable and are widely used for inland transport, but they all freeze in the winter. In the spring, when the ice melts, they usually flood the adjoining flat land. About ten p.c. of Russia's total goods traffic—especially timber, grain, oil, and other heavy or bulky commodities—is transported by river and canal. Some of these waterways, especially the Dnieper, are also exploited for hydro-electric power; the potentialities they offer in this field are virtually unlimited.

The principal lakes are the Caspian Sea (163,660 sq. m.—the largest lake in the world) whose surface is 85 ft. below sea level; L. Ladoga, L. Onega, L. Peipus, and L. Ilmen, all W. of the Urals; L. Balkal (5,714 ft. deep—presumed to be the deepest in the world), L. Balkhash, L. Issik-Kul, E. of the Urals.

Fish is extremely abundant in all the seas, lakes, and rivers of Russia. The Caspian Sea alone has in the N. more than 30 varieties of fish, of which the sturgeon with its black roe (caviar)—caught chiefly in the Volga near Astrakhan—enjoys world renown. Kamchatka's

shores provide about 95 p.c. of the world's crab. The mountain streams of the Caucasus abound in trout and salmon.

The birds of the rivers and lakes include every known north temperate variety: while plant life varies from the lichens and mosses of the tundras to the lilies of the sub-tropical south.

REPUBLIC AND CAPITAL	AREA IN SQ. M.	EST. POP. 1945
R.S.F.S.R. (Moscow)	6,609,000	109,280,000

Total	8,708,070	193,035,000

in the year. Only Murmansk—a port developed during the First Great War and subsequently much expanded—remains ice-free all the year round, thanks to the Gulf Stream, thus constituting Russia's sole permanent and undisputed outlet to the world's oceans.

The U.S.S.R. is rich in lakes and rivers, many of which are excep-

Apart from the Valdai hills, which lie about half-way between Leningrad and Moscow, there are no mts. in the N.W. In the S. there are the Carpathians (over 6,540 ft.), the Crimean mts. (up to 5,084 ft.), the Caucasian mts. (up to 18,490 ft.). In the centre are the Ural mts., rising to 6,022 ft.

E. of the Urals the principal mt. ranges are the Tien-Shan (up to 22,975 ft.) and the Altai (up to 15,163 ft.). In central Asia, the Pamirs—"the roof of the world"—have the Stalin and the Lenin peaks (24,598 and 23,390 ft., respectively); S.E. Siberia is bordered by the Sayan (to 11,457 ft.), the Yablonovy or Yablonoi (to 5,284 ft.), the Verkhoyansk (7,205 ft.), the Sikhota-Alin (about 6,560 ft.), the Stanovoi, the Kamchatka (up to 15,680 ft.) with its many volcanoes, and a few lesser ranges.

CLIMATE. The climate of the U.S.S.R. is continental. The greater part of the huge land area is too far away from the ocean to be influenced by it, and in general Russia has the average temps. to be expected in its latitude. The difference between maximum and minimum temps. varies from N. to S. and from W. to E., but there are periods of the year when the climate of Russia is almost identical everywhere. There is an old saying that in the winter it is possible to go by sledge from the Baltic to the Pacific or from the White Sea to the Black Sea, while in the summer peasants work in their shirt sleeves in the Crimea and in Siberia. Winter is extremely cold even in the S.; in Jan. mean temps. range from 5° of frost around Odessa to some 15° of frost around Leningrad; while in Siberia there are often 30° and even 40° of frost. Summer is very hot; July temps. vary from about 70° F. along the Black Sea coasts to about 50° F. along the Arctic. The remoteness of oceans also results in a comparatively low rainfall with maximum averages of 24 ins. in the N. and less than 12 ins. in the S. Snowfall is usual for less than three months at Odessa and up to six months at Archangel or in the Siberian N. The small quantity of moisture is marked in the plains of the Ukraine and W. Siberia.

The most fertile soil, the black earth (*chernozem*), is found in a huge area which stretches from the Polish border to the Caspian and has made the Ukraine the granary not only of Russia, but in normal times of a large part of Europe. Its staple product is wheat. Fairly

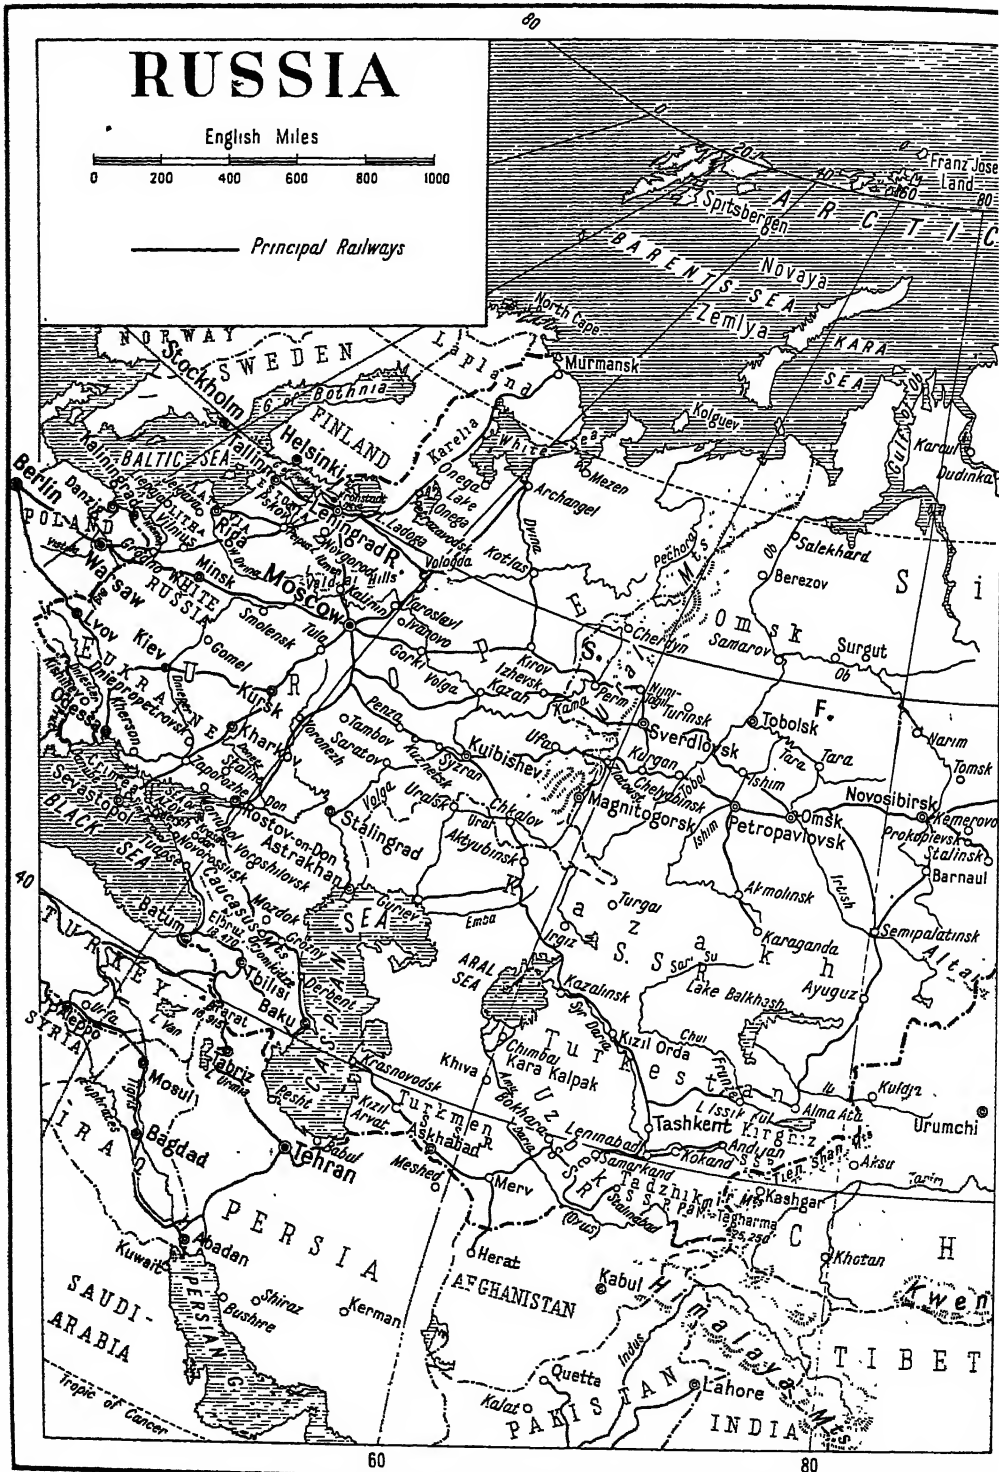

Russia. Representative types of work and workers. 1. Picking tea at the Chakva state farm in the Adzharian Autonomous Republic. 2. Newspapers on the bulletin board at the Kirov collective farm. 3. Sorting grain at the Budenny collective farm, Krasnodar Territory. 4. Meat packing plant in Moscow; boiled sausages being taken by conveyor to the cooling-shop. 5. Uzbek worker at the textile mill at Tashkent. 6. Grinding machine operator in the Stalingrad tractor works

fertile grainlands lie also between the Baltic and the Urals; they are, however, more suited to more quickly maturing crops, such as rye, oats, barley, flax, and hemp. Beyond the Urals a variety of cereals is cultivated throughout the S. regions, especially between the Urals and L. Baikal, but here climatic conditions are less favourable. In the sub-tropical climate of the Crimea, the Caucasus, and Turkestan, tobacco, the vine, tea, and cotton, are

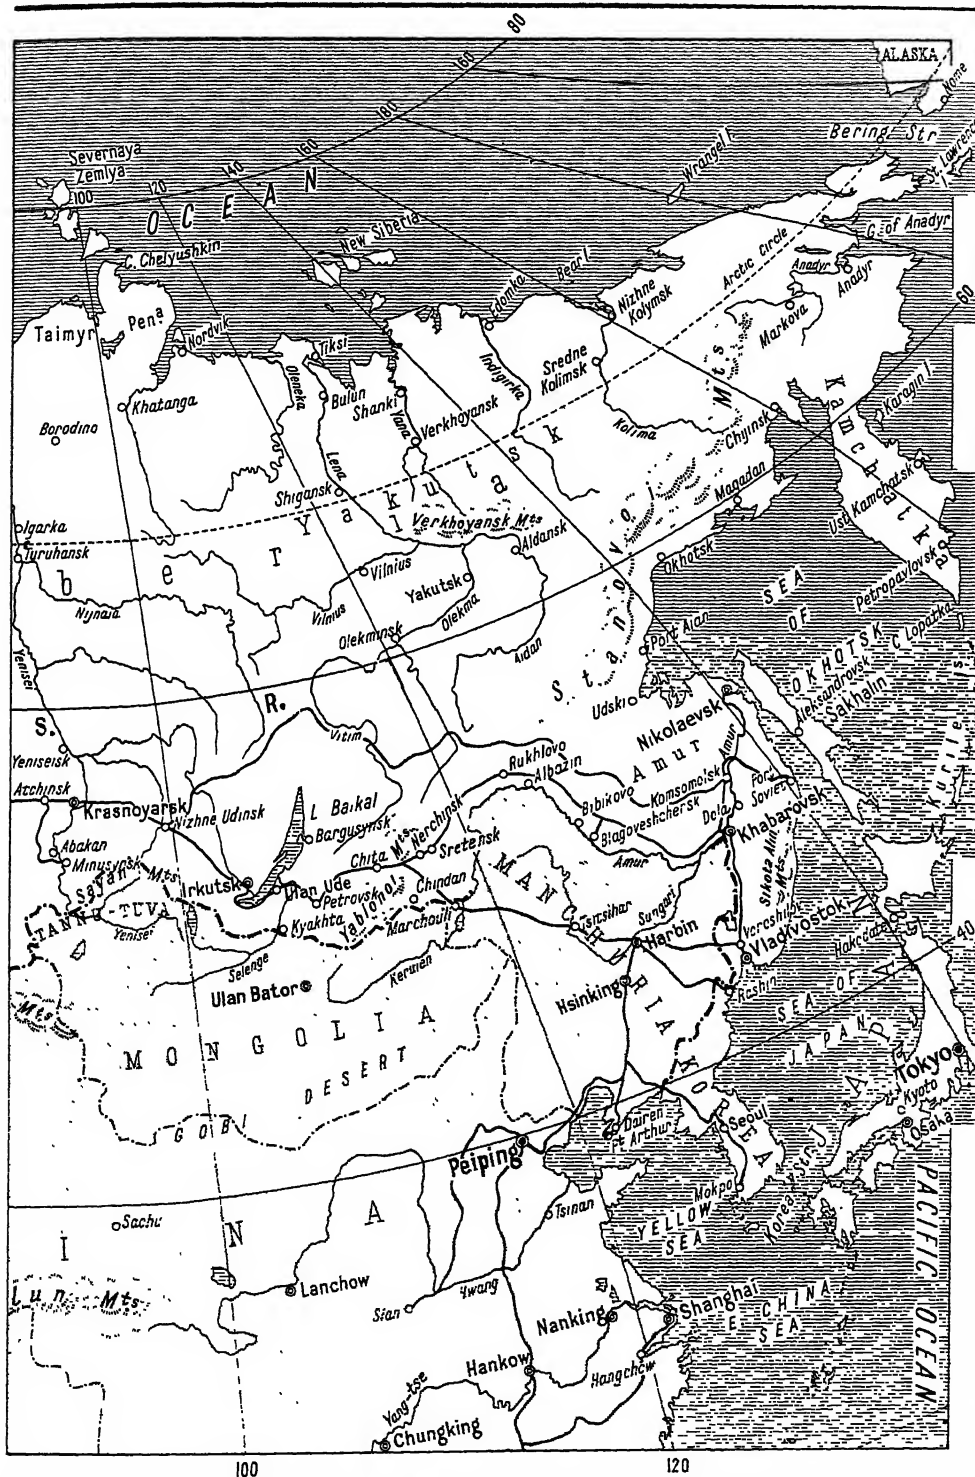

grown. Cattle breeding has now revived after a prolonged slump which was an effect of the collectivisation period.

The U.S.S.R. is enormously rich in minerals. At the turn of the century she was the world's greatest producer of petroleum. Since then she has been left far behind by the U.S.A., but in 1945 still ranked third in the world (*see table in p. 6455*).

The oil wells are concentrated as to 85 p.c. in the Caucasus;

Russia. Map showing the immense territory (more than one-sixth of the earth's land area) covered by the Union—

—of Soviet Socialist Republics, largest unit of which is the R.S.F.S.R. (Russian Soviet Federal Socialist Republic)

other rich fields have been developed between the Volga and the Urals, in central Asia, and in Sakhalin. The Donetz basin is particularly rich in coal and iron ore, and a large mining industry has been developed at Kuznetsk in W. Siberia. There is also a very old and important mining industry in the Urals area which includes coal, iron, bauxite, copper, gold, and other metals; the Caucasus and S.E. Siberia are particularly rich in manganese, while N.E. Siberia has Russia's principal gold mines. Though much scientific prospecting was done even before the revolution, under the three Five-Year Plans tremendous strides were made in ascertaining the natural treasures of the country and in establishing a number of entirely new industries to exploit them.

At the time of the German invasion of Russia in 1941 the bulk of the country's industrial production was concentrated in the Donetz basin, the Moscow and Leningrad areas, and the Caucasus; but impressive foundations for new industries beyond the invaders' reach had already been established, and these new industries played a vital part in Russia's defence after German occupation of the older industrial regions robbed her of their supply of war potential.

Forests occupy 2,360,000 sq. m., or almost a third of the whole territory. Like large parts of the plains they have a rich and varied animal life. The Siberian fur reserves are almost inexhaustible and enjoy the highest international reputation. Animal life ranges from polar bears and reindeer in the N. to tigers in the S.E. Russians are passionate hunters, and hunting has a great deal to do with the colonisation of outlying parts of the old empire.

By far the greatest part of Russia's rly. net was built before the revolution, but highly important strategic and economic rlys. were created after it in the U.S.S.R. Most of these newer lines are links between the Moscow-Leningrad region and the Urals; the Turksib rly. connects central Asia with Siberia; and in Siberia itself a network of shorter lines has been created. Though large as an absolute figure, the 58,000 m. of rlys. in the U.S.S.R. is a low total for this immense country.

Air transport is an important factor in Russian communications.

The air system, which radiates from Moscow, carries not only passengers, but also freight and mail between the capital and the outlying districts of the far N. and the far E.

The U.S.S.R. consisted in 1948 of 16 republics (see table), each divided into autonomous republics and regions. In 1939 Moscow had more than four million inhabitants, Leningrad more than three millions. Other towns with more than 100,000 inhabitants included Gorki, Rostov-on-Don, Stalingrad, Kuibishev, Novosibirsk, Voronezh, Omsk, Archangel, Irkutsk, Perm, Magnitogorsk, Krasnodar,

W. and S. Less than 100,000 live in the dist. of Birobidjan, the Jewish autonomous region of 14,000 sq. m. set aside in the Far East by the Soviet govt. in 1928. Some hundreds of thousands of Greeks live along the N. coast of the Black Sea. The Caucasus, besides some six million Georgians, Armenians, Persians, and Tartars (the latter also constitute important enclaves on the Volga and in the Crimea) has a medley of smaller mountain tribes and races which include: Ossetians, Ingushes, Kabardians, Circassians, Abkhassians, Chechenians, and Lesgians. A great variety of peoples—some of

them still nomadic—inhabit N.E. Russia, central Asia, and Siberia. Finns and Balts are concentrated in the N.W., and also form important small enclaves in the S., even in the Caucasus. The multinational U.S.S.R., however, is not a "melting pot" since the union's various peoples are for the most part localised in distribution. On the other hand, even in predominantly non-Slav parts, there are important Russian minorities.

The density of the population varies greatly. Over the whole U.S.S.R. the average is about 20 inhabitants per sq. m. But if the huge uninhabitable areas in the N. and the S.E. are deducted, the figure is about 90 per sq. m.

W. of the Urals the density is about 50 to the sq. m., E. of them about five to the sq. m. In the Moscow region, with its developed industry, there are about 260 inhabitants per sq. m. In the fecund black earth region and the Ukraine the average is about 160. The Volga area has something like 130, S.W. Siberia about 30 inhabitants per sq. m., and large areas have fewer than three inhabitants per sq. m. In the oases of Turkestan and in Transcaucasia, density varies from 65 to 155; the Caspian deserts are as empty of human beings as are the Siberian forests or the tundra of the extreme north. This inequality is to some extent inevitable in an area showing so much variety.

The colonisation of Siberia, which began with the turn of the century, the prospecting for raw materials, and the creation of new industries and industrial areas in the E. by the Soviet govt., and the development of communications have all tended towards internal migration and a redistribution of population from

SOCIAL STRUCTURE OF THE POPULATION

	Percentage of the total

Chelyabinsk, Grozny, Nijni Tagil, Kalinin, Tomsk, Smolensk, Murmansk, Orjonikidze, Kirov, Kerch, and Novorossiisk.

Russia's population includes nearly 200 different nationalities, races, and tribes, who, between them, speak some 150 languages and vernaculars. More than 150 million, however, are Slavs. The Great Russians predominate, constituting about 65 p.c. of the Slav total, and are spread all over the territory of the U.S.S.R. The Ukrainians, about 25 p.c., and the White Russians, less than 10 p.c., are more localised in the S. and W., the other principal Slavic groups being Poles and Ruthenians. From the time of Catherine the Great until the Second Great War, there was a compact colony of Germans on the Volga numbering in 1939 more than a million. When Germany invaded Russia in 1940, these Volga Germans were transported, it is believed, to a destination in Asiatic Russia.

There are more than two and a half million Jews in the U.S.S.R., of whom the majority live in the

the W. The nucleus of the Russian state was the principality of Muscovy. At the close of the 13th century this was still under Mongol domination, but even while the Mongols were nominally in possession, the realm of the great prince of Muscovy was growing rapidly. About 1330 Ivan Kalita controlled nearly all eastern Russia. Ivan III, Vassili III, and Ivan the Terrible successively made great advances towards the unification and expansion of their territory. The conquest of Novgorod (1478), Tver (1482), Vyatka (1484), Pskov (1511), Smolensk (1514), and Ryazan (1517), and the incorporation of a large part of Lithuania were among the principal achievements in extension. Spectacular subjugation of the former Mongol strongholds of Kazan and Astrakhan followed. Muscovy now stretched from the White Sea to the Caspian, and from the Baltic to the Urals.

Conquest of Siberia

Colonisation and conquest soon added Siberia to the tsar of Muscovy's domain, which at the close of the 17th century reached eastward to the Okhotsk Sea and Kamchatka. Peter the Great added Livonia and a part of Finland to his empire. He moved his capital from Moscow to his newly built city of St. Petersburg (founded in May, 1703), thereby "opening a window on to Europe" and initiating a new period in Russian history. Under Catherine the Great Russia gained the whole S. shore of the Black Sea, the Crimean peninsula, and, through the partition of Poland, a huge territory in the W. Alexander I annexed the whole of Finland with the Aaland Is., granting to it the status of a grand duchy with a measure of self-government. He also began to develop Alaska, where Russian settlements had been established some 50 years before, and in 1812 a Russian colony was organized in California. Under Alexander I the gradual conquest of the Caucasus was inaugurated with the incorporation of Georgia (1801), Mingrelia (1802), and Daghestan (1813). The last Caucasian tribes, however, were not subdued until 1864.

During the second half of the 19th century the Amur and Ussurisky regions in E. Asia, as well as Turkestan, Bokhara, Khiva, and Kokand were added to the empire. In 1867 Alaska was sold to the U.S.A. for 7.2 million dollars. Fort Ross, in California, had been sold to the Americans 23 years earlier. In 1875 Russia

exchanged the Kurile Is. with Japan for the S. part of Sakhalin; she had held the N. part of that island since 1860. But after her defeat in the Russo-Japanese war of 1904-05 she was compelled to cede the S. part to Japan again, regaining both it and the Kuriles, under the Yalta agreement, after the Allied victory of 1945.

Losses after First Great War

At the close of the First Great War Russia lost Finland, the Baltic provinces, and Bessarabia. The provisional government in 1917 appointed a special commission "for the liquidation of the kingdom of Poland," with the intention of carrying out a peaceful separation of Polish territory from Russia. When Germany and Austria collapsed the western Polish territories seceded from their former masters; a re-united Poland was established as a sovereign state, and proceeded to conquer parts of the Ukraine and White Russia (Belorussia) from weakened Soviet Russia.

The U.S.S.R. was established in Dec., 1922, and consisted at first of (1) the Russian Soviet Socialist Federative Republic (R.S.F.S.R.), or Russia proper; (2) the Ukrainian Soviet Socialist Republic; (3) the White Russian Socialist Soviet Republic; (4) the Trans-Caucasian Socialist Federative Soviet Republic, which comprised Georgia, Armenia, and Azerbaijan. Two years later, in central Asia, the Uzbek and the Turkmen soviet republics were formed and accepted into the U.S.S.R. In the years that followed Russia's former central Asiatic possessions were formed into the Tadzik, the Kazakh, and the Kirghiz soviet republics and joined the union and the Trans-Caucasian federation was dissolved, each of its three constituent parts becoming a republic on its own. Five more republics were added soon after the outbreak of the Second Great War—Finno-Karelia, Moldavia, Lithuania, Latvia, and Estonia.

After the end of hostilities, the area ceded to Poland by the treaty of Riga, 1921, the northern half of East Prussia, and Ruthenia, or Carpatho Russia, from Czechoslovakia, were added to Russia in Europe. In the Far East, besides S. Sakhalin and the Kurile Is., Russia acquired the formerly independent state of Tannu-Tuva on the N.W. border of Mongolia; the position of the Mongolian people's republic appeared to be uncertain. According to the constitution of the U.S.S.R., it is

a voluntary union which any state desirous of doing so can join or secede from, so that its boundaries remain, theoretically, at any rate, flexible, according to the will of the inhabitants inside and outside the union.

CONSTITUTION. The fundamental law of the U.S.S.R., adopted in 1936, which was the outcome of earlier constitutions of 1918 and 1923, was again amended in 1947. Under this constitution the highest legislative organ in the U.S.S.R. was the supreme soviet, which exercised all rights vested in the Union of Soviet Socialist Republics in accordance with article 14 of the constitution, in so far as they did not, by virtue of the constitution, come within the jurisdiction of organs of the U.S.S.R. accountable to the supreme soviet, that is, the presidium of the supreme soviet of the U.S.S.R., the council of ministers of the U.S.S.R., and the ministries of the U.S.S.R.

Form of Supreme Soviet

The supreme soviet consists of two chambers, the soviet of the union and the soviet of nationalities, and is elected for four years, the first by the citizens of the U.S.S.R. voting by election districts on the basis of one deputy for every 300,000 of the population; the second by the citizens of the U.S.S.R. voting by union republics, autonomous republics, autonomous regions, and national areas on the basis of twenty-five deputies from each union republic, eleven from each autonomous republic, five from each autonomous region, and one from each national area. Each chamber has equal rights.

Laws passed by a simple majority vote in each house of the supreme soviet are published in the languages of the union republics over the signatures of the president and secretary of the presidium of the supreme soviet. Sessions of the supreme soviet are convened by the presidium of the supreme soviet twice a year. Extraordinary sessions are convened by the presidium at its discretion or on the demand of one of the union republics. The supreme soviet of the U.S.S.R. at a joint sitting of the two chambers elects the presidium, consisting of a president, 16 vice-presidents, a secretary, and 15 members.

The highest executive and administrative organ of the state power of the U.S.S.R. is the council of ministers, which is responsible and accountable to the supreme soviet or, in the intervals

between sessions of that body, to the presidium. The council of ministers is appointed by the supreme soviet and consists of a chairman and vice-chairmen of the council of ministers, the chairman of the state planning commission of the U.S.S.R., the ministers of the U.S.S.R., and the chairman of the arts committee.

Military service is compulsory for all male citizens.

Elementary education is universal, free, and compulsory. There are state allowances for students at higher educational establishments who excel in their studies.

In 1918 the Soviet government changed from the Julian (old style) to the Gregorian (new style) calendar and replaced the old Russian weights and measures by the metric system.

HISTORY. By the middle of the 9th century the various Slav and other tribes living in the Great Russian plain had settled along its three principal highway rivers, the Volga, the Dnieper, and the W. Dvina. About the time when Alfred was fighting against the Norsemen, and 200 years before William the Conqueror invaded England, the Russians of the trading community of Novgorod invited a Varangian chieftain called Rurik to become their ruler, saying, according to legend, "Our land is great and bountiful, but there is no order in it; come and rule over us." Some historians believe Rurik was the Róric of S. Jutland who in 851 entered the Thames with 350 ships and pillaged Canterbury and London before he was defeated by Ethelwulf at Ockley in Surrey. The same Róric had the previous year successfully invaded France, and if he is the Rurik who came to Novgorod, it is likely that he did so as a conqueror, rather than in response to a peaceful invitation. But whoever he was, he and his immediate descendants established a dynasty which lasted through centuries of internecine warfare until 1598, and, unifying innumerable small principalities into one solid Muscovite monarchy, built the foundations of a highly centralised and powerful Russian empire.

About 880 the Slav town of Kiev was captured by a group of Varangians whose prince, Oleg, a kinsman of Rurik's, made Kiev the centre of his growing state. About this time also regular relations were established with Byzantium in the S. and the Scandinavian world in the N. The Kiev state

early became a military and sea power. Oleg and his immediate successors repeatedly organized expeditions against Constantinople—advancing against it on one occasion by land after first conquering Bulgaria. In 911 Oleg made an advantageous treaty with Byzantium; and in 988 Christianity was introduced into Russia from Greece, Russia becoming thenceforth subject to the continuing influence of Byzantine art and literature.

Yaroslav the Wise (1019–54) brought his realm of Kiev, through marriage, into contact with Sweden and Poland, while his three daughters were respectively wife of Henry I of France, of Andrew of Hungary, and of the Norwegian prince, Harold the Brave. After Yaroslav there were constant civil wars, the cities became the political units, and the great trading republic of Novgorod dominated the N., Suzdal, Ryazan, Vladimir, and Moscow taking the place of Kiev.

Invasion by the Mongols. In 1238 the Mongols, or Tartars, of the Golden Horde, under Batu Khan, invaded and devastated central Russia, and in a few years subjugated the whole country except the N. Their long dominion gave a distinctly oriental tinge to Russian life and the Russian people. The Mongols soon abandoned their ancestral Shamanism for Mahomedanism, but, apart from occasional outbursts of savagery, interfered little with the internal affairs of the Russian principalities. Their aim was to extort as much tribute as possible from the separate states into which the realm of Rurik was now broken up rather than to consolidate these into one powerful state. As the Mongol khanate decayed, Moscow rose to power, and under Dmitri Donskoi led the struggle for independence in 1380. The princes of Moscow thenceforward gradually drew the whole country under one ruler. In 1492 Ivan III, the Great (1462–1505), having expelled the Mongols and conquered Novgorod, made Moscow centre of govt. for all Russia.

Ivan III assumed the title of gosudar and autocrator (Gr. for emperor). Half a century later his grandson, Ivan IV, the Terrible (1553–84), had himself crowned as tsar (Caesar), in order to mark the place of the Muscovite state in Europe, and the unlimited power of the tsar within his own country. Ivan, called the Terrible because of his ruthless-

ness and savagery, was nevertheless a ruler of outstanding ability, and Soviet historians have seen in him a successful warrior and a great social reformer who fought the privileged classes—the boyars, the rich merchants, and the Church, reorganizing the domestic administration of his constantly growing realm, and compiling a code of laws called the *Sudebnik*. His terrorist praetorian guard, the Opritchniki, which shocked the historians of tsarist Russia, appears not to shock unduly their Soviet successors. Ivan fought the Tartars, the Poles, the great Swedish king, Gustavus Vasa, and many others, greatly extending his realm both E. and W. Under him also regular commercial relations were established between Russia and England, when in 1553 a series of accidents brought Richard Chancellor's ship to Archangel.

The Romanov Dynasty

Boris Godunov (c. 1550–1605) bound the peasants to the land. From 1601, invasion by the Poles, and by the Cossacks of the Don and the Dnieper, plunged Russia into anarchy. The cities combined, and under the leadership of Kozma Minin, a merchant from Nijni-Novgorod, and Prince Pozharsky, a minor nobleman, expelled the Poles from Moscow in 1612. In 1613 a national assembly, the Zemsky Sobor, met and elected a young boyar, Michael Romanov, tsar of Russia. Though the "time of trouble" was thus brought to an end, and a dynasty established which ruled the Russian empire until 1917, the election of the new tsar did not bring complete peace to Russia. Social and religious conflict continued to rage almost to the end of the century. Thus, there was a violent ecclesiastical conflict owing to the changes introduced in 1652–66 by the patriarch Nikon which caused the secession of a large body from the Church. During the 1660s, also, there was a peasant rising led by a picturesque adventurer called Stenka Razin, a Don Cossack, who gradually established his bandit rule over a large area between the Volga and the Urals. His followers included not only masses of discontented or outlawed peasants and a number of Don Cossacks, but also some Kalmucks and other Asiatic tribes. Having collected a large booty and set up his headquarters on a Caspian island near the shores of Persia, Razin returned to the Don in 1669. His success prompted him to attack Moscow; and during

1670 he seized the principal towns of the lower and middle Volga.

He advanced as far as Simbirsk, was defeated by government troops, fled back to the Don, where he was seized by the horse-owning Cossacks, who handed him over to Moscow. In 1671 he was executed, but he has remained a legendary figure in the Russian national epos.

Meanwhile, having secured Smolensk and part of the Ukraine from Poland, Russia, in 1686, concluded a perpetual peace with the Poles and an alliance with them against the Turks and the Tartars, by this act joining the coalition of Christian states directed against infidels.

Work of Peter the Great

Peter the Great (1672-1725) determined to make Russia a sea power. He created the new capital of St. Petersburg, near the mouth of the Neva on the Gulf of Finland; he secured command of the Baltic, built a fleet, and thus tried to attach Russia more firmly to the European system. In Peter's reign began the close association between the Russian and the Prussian courts and the participation of Russia in the quarrels of western Europe. Peter copied Prussian officialdom, and from the Baltic provs., which he added to his empire, came German barons to serve him. Up to the time of the revolution in 1917 many of the officials of the Russian ministry of foreign affairs were Baltic Germans, alien by temperament and upbringing from their Russian fellow-subjects. From the early part of the 18th century, Russia was a great power whose support and alliance were sought by leading European countries. During the Seven Years War Russian troops entered and occupied Berlin.

The long reign of Catherine the Great (1762-1796), who was sometimes called an enlightened despot, is often described as Russia's golden age, and Catherine was certainly anxious that both her contemporaries and posterity should so regard her reign. Setting out to make her reign brilliant and herself the initiator of a liberal era in Russia, she sought inspiration for her reforms in Montesquieu and Beccaria; but encountering the opposition of the gentry when she attempted to curtail their power over the serfs, she turned without struggle into a friend and protector of the privileged class. After the French Revolution she became a frank reactionary, per-

secuting the liberalism and advanced opinion that had developed in the early days of her "enlightened reign." But some of her purely administrative legislation was extremely good, and stood until the reforms of Alexander II, nearly a century later, put Russia on an altogether different basis, which in its turn lasted until the revolution of 1917.

Catherine the Great's Reign

Among Catherine's generals, under whose command the Russian army covered itself with glory and triumphed over Prussians, Swedes, and Turks, Suvarov ("the general who never lost a battle") deserves first place; but the outstanding figure of Catherine's reign was Prince Gregorei Alexandrovitch Potemkin—at first her lover and then her secret husband. As lover, statesman, pro-consul, administrator, diplomat, empire-builder, and coloniser he had no equal, and no one ever enjoyed Catherine's confidence in the same degree. He built, not cardboard villages as a popular legend asserts, but real cities; Sevastopol, Kherson, Nikolaev, Ekaterinoslav are of his creation. Among his diplomatic negotiations were abortive exchanges with England concerning an Anglo-Russian alliance.

Catherine's son, Paul, was murdered after a short reign; he was half mad, but the assassination shocked Europe, and the complicity in the plot of his son and successor, Alexander I, made the world think of Russians as "savages" for many years. Alexander was, however, the first of the really European tsars. He had been educated much as other princes were at that time, and he was at first inclined to liberal ideas. He played with thoughts of giving Russia a constitution, and emancipating the serfs who belonged to the owners of the estates on which they were born and lived in the same sense as did the cattle and the horses. But as he grew old the taint of madness in his family turned him into a melancholy mystic, who relied for advice upon a bitter reactionary and a crazy priest. Nicholas I, who became tsar in 1825, was scared off any movement towards modernising the government by a plot against him discovered just after he came to the throne. His blind refusal to move with the times led to the organizing of the revolutionary movement which grew later into Nihilism and terrorism. Nevertheless, even he sensed the gather-

ing storm and toyed with ideas of bringing Russian political and social conditions into line with "European standards." His son, Alexander II, after the fiasco of the Crimean War, introduced a series of liberal reforms ranging from a complete reorganization of the administration and the establishment of a wholly independent judiciary to the liberation of the peasant serfs in 1861.

Ten million workers on the land were liberated and assisted to buy land, which they held, not as individual owners, but as communes. Each village had its land, and all the villagers were entitled to their share of it. But there was in very few places enough land to satisfy the peasants, and the periodical redistribution of the strips of arable land, pasture, and wood discouraged careful farming.

This act of justice did not, therefore, bring into existence a contented peasantry, nor did the other reforms of Alexander II induce tranquillity. They were regarded merely as instalments, and this angered the tsar; he had no intention of giving the country a constitution, and he saw that nothing short of this would satisfy the agitators. Thus he went back on his liberal ideas, and after an attempt had been made to kill him, became a resolute opponent of change. This strengthened the revolutionaries and threw many who had been hitherto moderates on to the side of the extremists.

Constitutional Reform Postponed

The assassination of Alexander II in 1881 delayed the introduction of any constitutional measures for many years: the new tsar, Alexander III, was not unnaturally disinclined to listen to those who had killed his predecessor, and under the advice of Pobiedonostzév strove, on the contrary, to repress all self-governing aspirations and to impose on the whole empire with its varying peoples a rigid uniformity of discipline. He believed that God had appointed him autocrat, and that both his right and his duty were to force his will upon 120 million people. The hope that his son, Nicholas II, might relax the cast-iron system of bureaucracy and move in the direction of constitutional government was quickly dispelled by Nicholas's announcement that he would preserve the principles of autocracy as unswervingly as had his father.

From that moment disaffection spread through all classes. The

defeat of Russia by Japan in 1904 struck across the path of repression. There was an attempt at revolution in 1905, and to quiet popular discontent Nicholas was, after much difficulty, persuaded to announce the calling together of a national assembly, or *duma*, which met in May, 1906. Most of its members had been elected, on a platform of opposition to the council of ministers; they found, however, that they could exercise next to no influence. The bureaucrats had no idea of taking orders from the *duma*, and the feeble tsar, urged continually by his wife not to let his authority be weakened, took the bureaucrats' part. After less than three months' stormy sittings the *duma* was dissolved and repression was revived. Three more *dumas* were elected; the second was dismissed as the first had been; the third made no attempt to do anything, and lived out its time. The fourth *duma* was in existence when the First Great War began in 1914.

The First Great War

As soon as the army took the field it was discovered that the troops were shamefully ill-equipped. At the same time, stories circulated everywhere about the influence of a peasant-prophet named Rasputin upon the tsaritsa, and through her upon the tsar. Forced to summon the *duma* and to impeach the war minister Sukhomlinov, the tsar and the chief officials still refused for a time to put the nation's business into the hands of men whom it could trust. One prime minister after another, men of no account, mere bureaucrats, tried to keep the old system going. At last the army chiefs decided to join the constitutional reformers in laying a list of demands before the tsar, but before this could be done disorders provoked by hunger, by longing for peace, and perhaps by police provocation in a few days in March, 1917, swept away the tsardom with all its supports.

A provisional govt. was appointed by the *duma* with Prince George E. Lvov as chairman, Alexander Guchkov as head of the war office, and Paul Miliukov, leader of the Liberal party and an historian of international repute, as foreign minister. Alexander Kerensky, a Socialist lawyer, became minister of justice. From the moment of its inception, however, the provisional govt. found itself threatened and sabotaged by the soviet of workers' and sol-

diers' deputies which had arisen in Petrograd, as St. Petersburg was renamed in 1915, virtually overnight after the collapse of the monarchy. Moreover, there were paralyzing cleavages within the govt. itself between moderates and left wing members, and again between the bourgeoisie, who wanted "to continue the war to a victorious end," and the masses who were sick and tired of war and wanted to go home at once. On May 3 the Bolsheviks, who dominated the soviet, demanded the resignation of Miliukov whom they considered the chief protagonist of a "war to the end." After several re-shuffles Kerensky became premier, war and marine minister, and a very ineffective "persuader-in-chief," as he was nicknamed. Authority in Russia was rapidly disintegrating, industrial production was falling, the countryside was in a state of anarchy, and the armed forces were dissolving in chaos. Both a Bolshevik rising in July and an attempted *coup d'état* led by General Kornilov, the c.-in.-c., in Sept. failed; but Lenin, returned from exile, overthrew Kerensky's shaky govt. on Oct. 25 (Nov. 7 new style), and the soviets under his leadership established themselves in supreme, dictatorial authority. Trotsky was second in command and leading Bolsheviks occupied key posts under the new regime which, calling itself a dictatorship of the proletariat, was in fact the dictatorship of a very small group of men over the rest of the nation. In accordance with Lenin's special instruction, the extraordinary commission for the suppression of counter-revolution (the Cheka) was established on Dec. 20; and though its name was changed (e.g. to O.G.P.U.), this instrument of terrorism survived under the soviet regime, forming with the Communist party a main pillar of the system.

Soviet Expropriation Measures

Among the earliest measures taken by the Soviet govt. were the expropriation of land, factories, and real estate; the disestablishment of the Church and the creation of a strong "Godlessness" movement; the introduction of co-education; and the official suspension of ranks, titles, and discipline in the army and navy, which was described as "the pride and beauty of the Russian revolution."

After a period of wavering, Lenin concluded a separate peace with Germany at Brest-Litovsk (March 3, 1918) which accepted a serious

loss of territory and contributed to the acute economic crisis. The constituent assembly, preparatory work for which had been done under the provisional govt., met in Jan., 1918, in Petrograd and was dissolved by force since it had a non-Bolshevik majority. The old political parties—including the Socialist Revolutionaries and the Marxist Menshevik Social Democrats—were destroyed and their members persecuted. Internecine struggle grew into a violent civil war between the "reds" and the "whites." The principal "white" leaders were Admiral Kolchak in Siberia, Gen. Denikin (succeeded by Gen. Wrangel) in the S., Gen. Yudenitch in the Baltic, and the veteran Socialist politician Tchaikovsky in the north. With the inadequate and half-hearted help of the U.K., France, the U.S.A., Poland, and Japan, the "whites" for a time succeeded in freeing large parts of Russia from the Bolsheviks, but in the long run they were everywhere defeated by the red army—organized and led by Trotsky. The assassination of Tsar Nicholas II and all his family at Ekaterinburg, in the Urals, on July 19, 1918, was represented by the soviets as a "precautionary measure."

Introduction of N.E.P.

Meanwhile the economic exhaustion of Russia had reached its peak, and Lenin's hope of world revolution showed no promise of realization. He abandoned militant Communism and introduced the new economic policy (N.E.P.), which restored a certain measure of private enterprise and assisted economic recovery. The treaty of Rapallo signed with Germany in 1922 broke the boycott of Soviet Russia by the capitalist world, while the Third International (see Comintern) with its h.q. in Moscow directed and supported Communist activities throughout the globe. In 1924 Lenin died, and there ensued a struggle between his principal lieutenants, of whom Trotsky and Stalin were the leaders. Their personal rivalry turned to a great extent on the future political course to be pursued. Trotsky's contention was that world revolution was a prerequisite of Soviet Russia's continued existence since "Socialism in one country alone" was impossible.

Kamenev and Zinoviev held that the continuation of the N.E.P. would bring about a restoration of capitalism, while Bukharin and Rykov wanted more freedom for

the peasants and further limited encouragement for private enterprise. Stalin, disagreeing with all these groups, but not committing himself to any specific programme, drove them one by one from power. In 1927 Trotsky and his associates were expelled from the Communist party, and then banished. It was another ten years, however, before Stalin physically exterminated all those of the Lenin circle through the "purges" of 1936-1938.

Four Five-Year Plans

The first five-year plan was introduced in 1928, its official purpose being "the creation of socialism in Russia." One of its most striking features was the development of new industries in areas so far removed from the border as to be inaccessible to any potential foreign invader. The five-year plan was both a powerful instrument of political terrorism at home and of economic blackmail abroad. It meant the end of the N.E.P. and the collectivisation of agriculture. For a long time the peasants refused to be driven into collective farms (Kolkhoz) or state farms (Sovkhoz) and preferred to destroy their grain and cattle and to face extermination themselves, but in the end the kulaks were "liquidated" and collectivised agriculture was established.

On the completion of the first five-year plan before its time, a second, and later third and fourth, five-year plans were launched.

In 1936 a new constitution was introduced which, theoretically a most democratic document, embodied a proviso that gave the Communist party a dictatorial position; and in practice none of the freedoms it established were put into effect.

The growing threat of German militarism under Hitler affected Russian foreign policy and in 1934 the Soviet Union joined the League of Nations. Litvinov, a great protagonist of collective security, signed non-aggression pacts with one country after another.

Munich dealt this "western" policy a severe blow, and despite their mutual hatred and suspicions, Stalin and Hitler came to an understanding that was mutually advantageous at the time, concluding Aug. 23, 1939, a non-aggression pact. Within a few days the Second Great War began. For nearly two years Stalin was able to squeeze concession after concession out of Hitler, but on June 22, 1941, the Germans, without warning, attacked Russia. The course of the bitter struggle that followed

is described under Russo-German Campaigns. Space, climate, inexhaustible human resources, almost unlimited capacity of sacrifice, an impressive degree of military preparedness, and important supplies from the western allies were the determining factors of Russia's victories. But her brilliant generals also repeatedly outgeneralled the Germans, outstanding Soviet military leaders being Timoshenko, Zhukov, Koniev, Tolbukhin, Rokossovsky, Cherniakovsky, and the original chief of staff, Shaposhnikov, last of a group of brilliant young tsarist staff officers of the First Great War.

On August 8, six days before the Japanese surrender, Stalin declared war on Japan.

After the termination of hostilities, the Soviet govt. was busily engaged on reconstruction at home, with a new five-year plan, and on political activity abroad, extending her influence to the Elbe, and the Adriatic.

Post-war Relations

The friendly wartime collaboration with the western democracies, which had raised so many hopes throughout the world, soon changed into mutual suspicion and irritation. After 1946, there was no single international issue, vital or trivial, on which there was not complete disagreement between the Russians and the western democracies. The United Nations, the conferences of Foreign Ministers, and innumerable lesser meetings and consultations provided both sides with fresh occasions for stating their respective grievances (real or imaginary) and indulging in abuse of one another. The summer of 1948 brought the greatest tension over the joint four-power administration of Berlin and over the general German problem.

ECONOMIC LIFE. The turning point in Russia's economic history up to the revolution occurred during the 1860s. Then the transition from haphazard individual exploitation of the country's resources to organized capitalism took place. The first impulse towards this change came from the construction of railways, the necessity for which became so evident during the Crimean War that even the profound distaste of Nicholas I for this "destroyer of the tranquillity and the stability of the nation" was overborne by the sheer weight of events.

The principal result of this extension of communications was the opening up of larger markets for agricultural produce. For the first

time, instead of storing grain, the peasant was able to save up money and could pay the aristocracy in cash instead of in kind or in labour. The ground was thus well prepared for the liberation accomplished by Alexander II's great reforms, which became the starting point of Russia's economic and industrial development. So long as the Russian peasants—that is, the vast majority of the population—remained serfs, and so long as no real system of law existed in the country, the development of capitalism was impossible. Once the principal difficulties disappeared the exploitation of Russia's natural resources offered vast possibilities to foreign capitalists and enterprising Russians alike. Realizing that they were incapable of opening up and developing Russia's natural resources solely with their own funds (for a long time the state was the principal promoter of industry in Russia), successive Russian governments used every endeavour to attract foreign money, not only in the shape of state and municipal loans floated abroad, but by granting concessions to foreign companies or stimulating foreign interest in Russian joint-stock companies. Thus much of the history of Russian capitalism is the history of foreign capital investment in Russia. But the tsarist government, while anxious to attract foreign capital and granting it various facilities, also placed endless obstacles in its way. The laws concerning joint-stock companies in Russia, and certain restrictions imposed on Jews and foreigners, proved such a handicap to a free influx of foreign capital and unrestricted industrial development that time and again the government was forced to make exceptions or to suspend its own absurd decisions.

Rapid Industrial Development

From 300 million roubles in 1861 the state budget had risen to 2,630 millions by 1914; during the same period the annual foreign trade turnover had gone up from 248 million roubles to 2,960 millions; the value of industrial production from 160 millions to 2,792 millions; the number of factories and workshops from 9,944 to 33,519; rlys. from 663 m. to 38,560 m. In 50 odd years, therefore, Russia underwent a spectacular economic development. While this achievement was by no means proportionate to her possibilities, it was nevertheless colossal, and the Bolsheviks admitted that the solid foundations for their own plans of economic

expansion were established long before they came into power.

After the Second Great War, the economic system of Soviet Russia was based on strict state planning with a highly centralised govt. direction of industry, trade, and agriculture. The state owned all the means of production; labour was not only compulsory but workers were tied to their factories. Occasional deviations from direct state ownership were found in collective ownership under state control. According to Soviet statistics the share of industry in the total national output rose from 42 p.c. in 1913 to 78 p.c. in 1942, the share of agriculture in compensation. Production in all the old staple Russian industries increased anything from twice to ten times their pre-revolutionary figures, and many wholly new industries and industrial areas were created. Agriculture underwent not merely a complete structural change, but was also forced in the course of a few years from traditional, primitive forms of cultivation to mechanisation. Nevertheless, agricultural output rose much more slowly than industrial.

The Soviet Union used every means to develop self-sufficiency. Despite tremendous strides in industrialisation, however, and the constant discovery of more minerals and raw materials throughout the huge territory of the U.S.S.R., autarky still remained far from attainment. Through state monopoly of foreign trade Russia became an important factor in world commerce, since the concentration of all sales or purchases in the hands of the government frequently made her the largest buyer or seller of a given commodity.

Soviet Russia's principal exports are wheat and other grains, timber, oil, furs, cotton, and a variety of metals. Her chief imports are machines and equipment, scientific instruments and installations, wool, copper, tin, rubber, and other raw materials.

LANGUAGE AND LITERATURE. Modern Russian assumed its current form at the turn of the 18th and 19th centuries. It is the principal member of the Slavonic group of languages and has many roots in common with Polish, Czech, Bulgarian, Serbian, Rumanian, and other tongues of S.E. Europe. There are three Russian dialects. Two, Ukrainian or "Little Russian" and Bilorussian, or White Russian are regional; the third, "Great Russian," or Rus-

sian proper, is the official and literary language of the overwhelming majority of citizens of the former empire and of the U.S.S.R. alike.

The Russian alphabet, which is identical for all three dialects, was originally an adaptation of Greek characters, introduced by two 10th century monks, S. Cyril and S. Methodius, who translated the holy scriptures into Slavonic soon after Russia's conversion to Christianity. In 1708, however, Peter the Great modernised the alphabet, some unnecessary letters being dropped altogether while others were shaped to resemble a little more closely Latin characters. Peter's alphabet is still in force, but in 1918 the Soviet govt. introduced a much overdue spelling reform which dispensed with five unnecessary letters, thereby reducing the total from 36 to 31.

Beginnings of Literature

The origins of Russian literature date from the 10th century and the introduction of Christianity, and all the earliest writings are of a religious nature or are legends and chronicles. History begins with the chronicle of Nestor written about 1100. Great poetical qualities are revealed in the epic *Story of the Campaign of Igor* (second half of the 12th century; the story inspired Borodin's opera and ballet *Prince Igor*). During the next three centuries, chiefly because of Tartar domination, literature stagnated; but at the close of the 15th century it began to revive, the recording of pilgrimages and legal codification developing side by side with religious tracts and some very striking sermons. Moscow and Kiev were the centres of these literary activities which in the 17th century came under strong western influences.

Lomonosov, in his poems, dramas, and scientific works, gave Russian literature a European turn; other notable 18th century pioneers were Gabriel Derzhavin, poet and ode writer (1743-1816); Denis Fonvizin, satirical playwright (1744-92); Nicolas Novikov, humanitarian and freemason (1744-1818); Alexander Radishchev, humanitarian and political thinker (1749-1802). The historian and novelist Nicolas Karamzin (1766-1826) introduced "sentimentalism" and the "elegant style" of Russian prose which he modernised almost beyond recognition. Basil Shukovsky (1783-1852), poet, translator, and pedagogue, created the modern poetical language, while Ivan Krylov (1768-

1844) ranks as Russia's La Fontaine. His beast fables, rendered into perfect English verse by Sir Bernard Pares, retained their popularity into Soviet times and are the source of many quotations. The brilliant satirical play in verse by Alexander Griboyedov (1795-1829), *The Misfortune of Being Clever* (also translated by Pares), is another all-time classic and permanent source of quotations.

But the greatest Russian poet, as well as a prose writer of unique merit, is Alexander Pushkin (1799-1837). Unfortunately his lyrical poems or long dramas and humorous novels in verse have not so far found an adequate English translator (there are some very good German versions), and it is therefore difficult for an English reader to appreciate his romantic genius, the exquisite perfection of his style, or his amazing versatility.

Very close to Pushkin, and likewise both a poet and a novelist, is Michael Lermontov (1814-42). Byron exercised a strong influence on both Pushkin and Lermontov. Of a very different kind was the talent of Nicolas Gogol (1809-52) whose prose works and plays (especially *The Dead Souls* and *The Government Inspector*) have achieved world renown. His inexhaustible imagination, wit, sarcasm, and powers of observation, combined with lucidity of style, are easier to appreciate in translation than are the qualities of his two great poet contemporaries.

Three Great Novelists

The middle and the second half of the 19th century were exceptionally rich in novelists, political thinkers, essayists, poets, and dramatists who represent every variety of school: westerners, Slavophiles, humanists, populists, believers in art for art's sake, classicists, romantics, peasant poets, etc. Most of their works form a definite part of every educated Russian's literary inheritance, but are too local in their character to lend themselves to easy translation or to command much interest outside their own country.

Only three great novelists of that period have achieved world fame and enjoyed a lasting popularity in and out of Russia: Ivan Turgenev (1818-83), Theodore Dostoevsky (1821-81), and Leo Tolstoy (1828-1910). Belonging to a different generation, but not less famous at home and abroad, is Anton Chekhov (1860-1904), whose plays and short stories are remarkably popular. Maxim Gorky (1868-1936) first attracted

attention as a proletarian writer, then achieved striking literary success and ended as a political figure in the Soviet Union rather than a creative artist. Among the many prose-writers of the same or a slightly younger generation, Leonid Andreyev (1870-1919), the Nobel prize winner Ivan Bunin (b. 1870), Michael Artsibashev (1878-1927), Alexander Kuprin (1870-1938), Dmitri Merezhkovski (1865-1941) achieved a somewhat temporary fame at home and abroad, while a galaxy of brilliant poets (symbolists, acmeists, and other groups), hardly known outside Russia, included Valery Briusov (1873-1924), Constantine Balmont (1867-1943), Vyacheslav Ivanov (b. 1866), Alexander Blok (1880-1921), Andrew Bely (1880-1934), Nicolas Gumilev (1886-1921), and Anna Akhmatova (b. 1888). In the cultural and artistic panorama of Russia these poets occupy a place all their own: they have meant a great deal to the Russian intelligentsia both before and after the revolution.

Writers Driven into Exile

During the early years of Soviet govt. almost all literary activities came to a stop in Russia and some of the leading writers were driven into exile. Gradually, however, there developed a new literature which expanded considerably with the return to national rather than ideological tendencies just before and specially during the Second Great War. Most of the new writers of this period were born just before the turn of the century and received a liberal education, while a few particularly well-known ones belonged to an earlier generation. Thus Alexis Tolstoy was born in 1883, Ilya Ehrenburg in 1891, Eugene Zamyatine in 1884, and Michael Bulgakov in 1891. But Isaac Babel (1894), Valentine Katayev (1898), Leonid Leonov (1899), Nicolas Tikhonov (1898), Boris Pilnyak (1894), Michael Zoshchenko (1895) were typical representatives of the new intelligentsia. A still younger generation included men like Michael Sholokhov (1905), Benjamin Kaverine (1902), and the great literary discovery of the Second Great War Constantine Simonov, born in 1918. These authors, and many others of varying talents and tastes, wrote mostly in a strong realistic fashion, or else—like Ehrenburg—in a polemical and sarcastic style.

The post-revolution era produced no poets of great merit, the early proletarian or revolutionary writers of verse such as Kluyev,

Essenin, Mayakovsky, and Bedny fading into insignificance.

ART. The origins of "old" Russian art go back to the 11th century, when Byzantine influence firmly established itself soon after the introduction of Christianity. In the building of churches it gradually acquired specific forms of its own where oriental influences blended harmoniously with those from Byzantium. "Onion"-shaped golden cupolas (usually a large central one and several smaller ones) became one of its main characteristics. Under Ivan III, the Italian masters, who built churches and palaces in Moscow, introduced Renaissance elements into Russian architecture.

Old Churches and Icons

Simultaneously with building, painting was likewise stimulated by the introduction of Christianity and was exclusively devoted to holy icons or church mosaics and frescoes. Moscow, Kiev, Novgorod, Rostov, and many other ancient cities possess some unique examples of churches built in the 11th-17th centuries (some in stone and some in wood) with the rarest icons or murals.

"Modern" Russian art began to develop at the close of the 17th century under the influence of Polish baroque. Throughout the 18th century, following the creation of St. Petersburg, this art rapidly expanded into a variety of forms—mostly through the works of the great Italian and French architects who built the principal imperial or private palaces and churches of the new empire. B. Rastrelli (1700-71) was the creator of Russian rococo style (the great palace at Tsarskoe Selo (now called Pushkin) is the best known of his works). Classicism was brought to St. Petersburg by Vallin de la Mothe (1729-1800), Thomas de Thomon (1754-1813), G. Quarenghi (1744-1817), C. Rossi (1775-1849), and the Scotsman Ch. Cameron (up to 1811). Russian architects, some of whom followed these foreign masters and most of whom created a synthesis between rococo or classicism with the ancient native style, included V. Bashenov (1737-99), M. Kazakov (1733-1812), the builder of the Kazan cathedral in St. Petersburg, A. Voronikhin (1760-1814), the builder of the admiralty in St. Petersburg, A. Zakharov (1761-1811), and other men of talent.

Throughout the 19th century Russian Empire style was prevalent; between 1900 and the revolution contemporary architects

sought their inspiration either once more in ancient native forms or in Italy (Palladio, etc.).

A great deal of building was done in the Soviet Union during the 10 years preceding the Second Great War. Government and office blocks, hospitals, schools, theatres, factories, and large housing schemes gave Soviet architects the opportunity of trying every conceivable style—from the ancient and classical to the functional and constructivist.

Best known amongst these new builders are Iofan (in charge of the construction of the palace of Soviets in Moscow) and Shchusev, whose principal works include the Lenin mausoleum in Moscow's Red Square and the Marx-Engels-Lenin institute in Tbilisi. The revolutionary dynamo-monumental designs for the palace of labour to be built in Moscow by Tallin created a sensation, as did his project for the Third Internationale monument in Leningrad. Both plans, however, were abandoned and their author, who started with the plaudits of the Soviet officials, ended by incurring severe criticism.

Religious and Secular Painting

Painting, up to the 18th century almost exclusively religious, attained remarkable artistic forms. The outstanding icon painter of the earlier period was a monk called Andrew Rublev (1360-1427). With the arrival of the St. Petersburg period of architecture, new objects were chosen by artists: portraits, historical subjects, genre, landscapes became popular subjects of painting, while religious themes still exercised a great fascination on the rapidly growing school of classical Russian masters, among them D. Levitzky (1735-1822), V. Borovikovsky (1757-1825), O. Kiprensky (1773-1836), A. Venetsianov (1779-1847), and A. Ivanov (1806-58). Landscapes by Ivan Shishkin (1831-1898), the striking military canvases of V. Vereshchagin (1842-1904), the portraits and historical pictures of Ilya Repin (1844-1900) constituted the pride of the Russian school of painting recognized by the Soviets just as they were in tsarist times. A group of talented romantic painters who followed these great masters includes V. Vasnetsov (1848-1927), T. Levitan (1861-1900), M. Vrubel (1856-1910), and M. Nesterov (1862-1942). An early impressionist portrait painter of genius was V. Serov (1865-1911). The expressionist K. Petrov-Vodkin (1878-1939), the abstractionist V. Kandinsky

(1866-1944), and the surrealist M. Chagall (b. 1887) achieved more than national fame.

Sculpture developed rather late in Russia, since the Church did not approve of effigies even of a religious character. However, under the emancipating western artistic influences of the 18th century, and the new urge to put up monuments to tsars and national heroes, sculpture, too, began to attract native talent. The earliest Russian sculptors included T. Shubin (1740-1805), M. Gordeyev (1749-1819), M. Kozlovsky (1753-1802), and A. Loganovsky (1812-1855). A great Russian sculptor was Mark Antokolsky (1843-1902).

MUSIC. Up to the 17th century there was no music in Russia beyond church music and folk songs. These existed side by side for centuries without coming into any contact. Indeed the Church was opposed to folk music and in the year 1636 the Patriarch Jehosaphat had all musical instruments solemnly burnt in Moscow. Towards the close of the 17th century, however, a notable importation into the Moscow liturgy was a medley of new melodies from the S.—mostly from the Ukraine (where the people seemed to be endowed with great musical sense and wonderful voices) and from Greece. In 1735 the Empress Anne invited the Italian opera to the theatre at her palace in St. Petersburg, and the Italian singers made a profound impression. Many other Italian masters (singers, composers, and musicians, including Cimarosa and Sarti) visited Russia in the second half of the 18th century, and before long Russia also had a talented composer of her own. This was Dmitri Bortnyansky (1751-1825) who was trained by Italian masters, first in St. Petersburg and then in Italy. He was appointed director of the court choir in 1796 and greatly improved its quality by recruiting Ukrainian singers as well as widening its repertoire. Under Catherine the Great, secular western music—mostly French, Italian, and German—gained immense popularity.

In 1802 the Russian Philharmonic society was established; for more than a century it remained a great centre of musical culture. The Napoleonic invasion stimulated much latent national talent, and several patriotic operas as well as many songs were written.

Michael Ivanovitch Glinka (1803-1857), however, was the first Russian composer of note. His best known opera, *A Life for the Tsar*

(1836), though it has never become popular outside Russia, inside the country continues to be a popular classic. After the revolution it was renamed *Ivan Susanin*, thus transferring the emphasis from the tsar to the peasant who, according to the legend, sacrificed his life for his master. Another popular Glinka opera is *Ruslan and Ludmila* (1842), the libretto of which is based on a poem by Pushkin. The more realistic A. S. Dargomishsky (1813-1869), also took some well known works by Pushkin as libretti, e.g. *Rusalka* and *The Stone Guest*.

During the second half of the 19th century Russian music entered upon a period of exceptional brilliance that lasted until the revolution. Anton Rubinstein (1829-1894), himself a prolific composer of operas, oratorios, and songs, was best known throughout the western world as a dazzling pianist virtuoso. But his greatest contribution to Russian music was as a teacher and organizer, and as conductor and director of the Imperial Russian Musical society, which he founded in 1859, and the St. Petersburg conservatoire. His brother Nicolas (1835-1881) founded the Moscow conservatoire in 1864, and was likewise an outstanding teacher as well as a brilliant performer.

Tchaikovsky's Popularity

Perhaps the greatest pupil of the St. Petersburg conservatoire was Tchaikovsky (1840-1893). The western world knows him best for his symphonies, his many lyrical songs, and his ballets, but in Russia his operas *Eugene Onegin* and *The Queen of Spades*—based on works of Pushkin bearing similar names—remain popular.

A group of composers called in musical history the "mighty band" (*moguchaya kuchka*) enjoy equal fame at home and abroad. They were Caesar Cui (1835-1918), Modest P. Mussorgsky (1839-1881)—young officers both of them, Mily Balakirev (1837-1910), a university graduate, Nicolas A. Rimsky-Korsakov (1844-1908), a naval cadet and subsequently a naval officer, and a young professor of chemistry called Alexander P. Borodin (1834-1887). Under the brilliant leadership of the last named, the members of this circle mastered musical technique, evolved a style of their own in which Russian folk songs and eastern melodies were often the basis of their compositions, and created a number of operas amongst which Boris Godunov by Mussorgsky, Prince Igor by Borodin, Sadko and

The Invisible City of Kitezh by Rimsky-Korsakov, have taken a permanent place in the international repertoire—the interpreting genius of Chaliapin having undoubtedly contributed to this popularity. All the members of the "mighty band" also wrote songs, symphonies, and ballet music. Slightly younger, but still closely associated with them, was Alexander K. Glazounov (1865-1936). Though a prolific composer and a gifted conductor, his greatest contribution to Russian music, like that of Anton Rubinstein, was his work as director of the St. Petersburg conservatoire. Under Glazounov's management it trained some very great performing musicians.

The principal composers of the generation that followed the mighty band were Alexander N. Scriabin (1871-1915) and Serge V. Rachmaninov (1873-1942). Scriabin's best known works are the two symphonic compositions *Poem of Ecstasy* and *Prometheus*. Rachmaninov was equally famous as composer and as pianist. He, too, wrote an opera *Aleko* (1892), based on a poem by Pushkin. Rachmaninov was a pupil of S. Taneyev (1856-1915), himself a composer of distinction, who has sometimes been described as the Russian Brahms. Igor F. Stravinsky, born in 1882, was a pupil of Rimsky-Korsakov, but not in any way his follower. His ballets *Petrushka* and *Fire Bird* achieved world renown, and another of his ballets, *Le Sacre du Printemps*, caused something like a riot when it was first produced in 1913. Stravinsky went to live in France before the First Great War, and then to the U.S.A.

Soon after the Soviet revolution, some of Russia's leading musicians preferred to emigrate, most of them settling either in Paris or in New York. Stravinsky was already outside his country, but Rachmaninov, Grechaninov, Medtner, later on Glazounov, Prokofiev, and others, became political refugees; only Prokofiev returned after a few unproductive years in exile.

Ten years younger than Stravinsky, Serge Prokofiev was a classicist, a purist, and a proletarian in turn. He enjoyed great popularity and respect in the U.S.S.R. until the close of 1947, when a public rebuke was administered to him by the Communist authorities for being too "bourgeois" and fanciful. A similar rebuke was addressed to two other musicians who had achieved great renown in the U.S.S.R.: Dimitry Shostakovich

(b. 1909) and A. Khachaturian (b. 1904). Shostakovich's early opera, *Lady Macbeth of Mtsensk*, first produced in 1934, enjoyed considerable success, but was later condemned for its "vulgar naturalism." His 5th symphony, however, first performed in 1938, was proclaimed a work of genius, and his 7th, or Leningrad, symphony, composed during the siege, made him a national hero. Khachaturian based much of his music on his native Armenian folk lore.

Other composers of the Soviet era include I. Dzerzhinsky, who wrote the operas *Kind Flows the Don* and *The Uprturned Soil*, based on Sholokhov's novels; A. Mossolov (b. 1900), whose second symphony was widely acclaimed, while an earlier work called *Iron Foundry* was severely criticised by the Soviet press. Older musicians who, though not in the top rank, occupy a prominent position in Soviet music include Myaskovsky (b. 1881), Feinberg (b. 1889), Aleksandrov (b. 1889), Roslavets (b. 1880), Gnesin (b. 1883), Gliere (b. 1875). The Soviet authorities have given much attention to the stimulation of regional music, especially among the eastern tribes and nationalities of the U.S.S.R. Not only Armenian and Georgian, but even Bashkir and Turkoman music has materialised, while Uzbek S.S.R. has produced an opera of its own.

Russian Ballet. Originally, ballet as taught at the Imperial ballet school, St. Petersburg. (See Russia: Music), from the middle

of the 18th century, and from the middle of the 19th was a principal element in Russian artistic life. Until the beginning of the 20th century most of the ballet masters were of French or Italian origin, though all the dancers were Russian. About 1907 Serge Diaghilev (*q.v.*) brought together his own ballet company, and it is this company which gave to the W. its idea of Russian ballet. In Russia the ballet continued on traditional lines. After the Revolution academic standards were, if possible, even more rigidly maintained, and the most successful ballets at Moscow or Leningrad were full-length works by Tchaikovsky performed in the full splendour of their imperial setting. See Ballet.

Russian Soviet Federal Socialist Republic. This largest portion of Soviet Russia is mentioned under R.S.F.S.R., but for its topography, etc., see Russia.

Russky, NICHOLAS VLADIMIROVITCH (1854?-1918). Russian soldier. Born March 6, 1854, at Kiev, he was educated at the staff college, St. Petersburg, and entered

the army as a lieutenant of infantry in 1874. In the Russo-Japanese War, 1904-05, he held the rank of general and was chief of staff to the 2nd army under Kaulbars. On his return to St. Petersburg he acted as assistant minister of war. On the outbreak of the First Great War he led the 2nd army on the S.W. front, and greatly distinguished himself by taking Lemberg (Lwow). In command of the army of the Niemen, he forced the Germans to retreat into East Prussia. At the beginning of 1917 he was again in command of the northern armies. On the formation of the provisional government under Prince Lvoff, Russky assisted in securing the abdication of Nicholas II. But incurring the displeasure of the councils of workmen and soldiers' deputies, he was dismissed, and was said to have been murdered by the Bolsheviks.

Russo-Finnish Wars. The fighting between Russia and Finland, 1939-1944, is described under Finland: Russo-Finnish Wars (*q.v.*).

RUSSO-GERMAN CAMPAIGNS, 1941-45

Maj.-Gen. Sir Charles Gwynn, K.C.B., D.S.O.

This account describes the invasion of Russia by Germany in 1941, the long retreat of the Russians to Stalingrad, and their amazing recovery and invasion in their turn of Germany. See also Second Great War, 1939-45

At dawn on June 22, 1941, Germany attacked Russia without warning. It seemed at the time that she had chosen her moment well, and military opinion all over the world was almost unanimous in believing that she was assured of another swift and crushing victory. Her armies after nearly two years of war experience had reached the highest standard of training and were convinced of their invincibility, their armament had been perfected, and they had no other serious commitments. The British Empire alone stood in arms against her; but since the defeat of France in June, 1940, the danger of further Allied action in W. Europe appeared to be negligible. Moreover, Great Britain had recently suffered heavy reverses in Libya and in Greece, and her naval position in the Mediterranean had been immensely weakened by the loss of Crete. Germany was in no danger, therefore, of a diversionary attack on the flank through the Balkan peninsula all the states in which she had either conquered or forced into the rôle of satellite allies. Even though Turkey

adhered to her alliance with the U.K. she remained neutral, and Germany had extracted a treaty of friendship from her. The fact that Germany had to maintain considerable forces in occupied countries and to guard the western seaboard was not a serious commitment, for the troops so employed constituted a potential reserve available to change places with troops that might have suffered or become exhausted in active operations. The sole unfavourable condition was that, because the fighting in Greece had been more prolonged than anticipated, the attack on Russia had been postponed for a month beyond the intended date, and a month of the favourable campaigning season had thus been lost. Furthermore, the operations of the R.A.F., based on England, although they had not as yet seriously affected Germany's war industries, had begun to immobilise a proportion of her man power in A.A. defences, and to divert part of her war industries to the same purpose. But these unfavourable circumstances were not of such gravity that they were

expected to prevent a rapid victory over Russia.

Some of the German generals believed that though Russia might be rendered impotent, she could not be completely crushed if her people retained the will to fight. But Hitler relied on the opinion of those who considered this belief outdated, and that Russia's inexperienced army and undeveloped war industries could not withstand the shock of a *blitzkrieg* attack. Moreover, Germany could call on the resources of manpower and industries of the satellite and occupied countries to compensate for whatever advantages immense size gave to Russia. Russia on the other hand not only stood alone, but had to retain some of her best troops in the Far East in face of possible attack by Japan.

When Germany attacked, she secured at once the advantages of the initiative and a considerable measure of surprise. The attack was not, of course, altogether unexpected; but Russia had on a war footing only the covering force which had invaded Poland in 1939. Her main armies had still to be completely mobilised and deployed in their war stations. These were apparently behind the pre-1939 frontier on what was called the Stalin line, stretching from the Gulf of Finland to the mouth of the Dniester. This line was not a completely fortified zone, though it contained fortified pivots, but rather the position selected for deployment of the main army, behind the covering army of considerable strength deployed in Poland and in the Baltic states, whose mission was to fight for time in case of attack.

Opening of German Onslaught

The German onslaught on Russia, as on other countries, opened with a surprise air attack on airfields and the bombing of cities which formed centres of communication and control. Concentrated artillery bombardment, followed immediately by infantry attacks supported by tanks, breached the defences of the boundary into Russian-held Poland, and opened the way for panzer columns of tanks and motorised infantry. The tactical aim was apparently to effect breaches at intervals of about 25 m. and to strike with the panzer columns at the lines of retreat of the Russian troops, which could then be destroyed by the slower moving main bodies. The Russian plan to meet these tactics was in

general for the infantry to stand their ground and to prevent the German main bodies from closing up behind the panzer forces; it was at times effective, but was desperately costly when it failed. One result was that fighting often extended 30 m. or more W. of points the Germans claimed to have reached, a development that greatly increased the difficulty of maintaining supplies to German spearheads, and contributed to eventual loss of momentum.

Brauchitsch in Command

German strategical aims were soon disclosed. The offensive took the form of three divergent thrusts. Von Brauchitsch was in supreme control, as he had been in the W. His three groups of armies had each its separate aim. The northern group under von Leeb struck from E. Prussia towards Leningrad; the central and strongest group under von Bock advanced from German-occupied Poland on each side of the Pripiet marshes with its weight in the corridor between the Dvina and the Dnieper directed on Smolensk, and with Moscow as the ultimate goal. On the right von Rundstedt's group, with a strong Rumanian contingent, had to force the passage of the great rivers flowing into the Black Sea, clearing Bessarabia and the Ukraine, with the industrial region of the Donetz basin, the Black Sea ports, and the Crimea as its more distant aims.

All objectives selected were of vital importance to Russia, not only on sentimental and political grounds, but also because they were centres of war industries, and the Red army was therefore likely to fight for their protection with most of its available strength, leaving little in reserve for counter-offensive action. Had the Germans concentrated on the attack towards Moscow, they would have been liable to attack in flank, and would have been forced to employ large forces in a defensive rôle. The strategy adopted was an indication of the confidence of the Germans in their ability to conduct successful offensive operations in all three directions regardless of disparity in numerical strength.

That confidence seemed at first fully justified, for though the Russians fought gallantly their covering armies were unable seriously to delay the German advance or to carry out a well coordinated withdrawal, and they suffered a number of disasters, perhaps exaggerated in German communiqués. The invasion flood

progressed at an average rate of more than 20 m. a day until the Stalin line was reached. There, however, the main Russian army was organized in three groups under Voroshilov in the N., Timoshenko in the centre, and Budenny in the S., and the attack lost momentum in the face of determined resistance. Von Leeb, after being slightly checked on the Dvina, met stiff resistance about Pskov and on the line between L. Ilmen and the S. end of L. Peipus. His left wing, however, swung W. of L. Peipus into Estonia on Aug. 2, and by the end of the month had cleared the whole of that state, forcing the Baltic fleet to withdraw to its base at Kronstadt. After heavy fighting he turned the N. end of the lake. Von Leeb's right had during this period worked round L. Ilmen, capturing Novgorod and thus interrupting directly communication between Leningrad and Moscow. By the early part of Sept. Leningrad was almost encircled, and the Germans made desperate efforts to take it by storm. But the Russian regular troops, exhausted and disorganized, were valiantly supported by the citizens. The Germans closed in to within easy artillery range, until, with winter approaching, von Leeb abandoned the attempt to storm the city, and settled down to reduce it by bombardment and starvation. (See Leningrad, Siege of, 1941-44.)

Supply Difficulties

Von Brauchitsch's northern group, therefore, had not reached its objective or achieved the rapid decisive victory hoped for. His centre group, on reaching the Stalin line, encountered fierce opposition. It had to make frequent pauses before it could launch each fresh attack, and Berlin spokesmen complained of the difficulty of maintaining supplies over the indifferent roads. As early as July 11 the Germans claimed to have captured Smolensk, but not till Aug. 13 did the Russians admit having evacuated it some days earlier. The German claim on July 21 that the whole Russian army had been split into uncoordinated groups had evidently resulted from wishful thinking. Still von Bock was making progress, especially on his left where, after being checked at Polotsk, he took Vitebsk on July 12 and Nevel ten days later, thus severing a vital line of Russian lateral communications. The capture of Veliki Luki, on the Moscow-Riga rly., Aug. 26, opened

an additional line for advance on Moscow. Von Bock's right had a hard struggle to cross the Beresina and the upper Dnieper, but the capture of the great railway centre of Gomel, E. of the Dnieper, Aug. 21, was an important success. On Sept. 8, however, von Bock suffered a serious setback when Timoshenko launched a determined counter-attack which forced the Germans on to the defensive.

Rundstedt's Advance

Meanwhile, however, Rundstedt, although his initial onslaught had difficulty in crossing the Prut and had hard fighting in Bessarabia, had made great progress owing to the success achieved by his left wing. This, strengthened by Hungary's entry into the war on June 27, had crossed the upper Dniester, turning Budenny's main defensive line on that river, and had gained an important victory at Uman E. of the Bug. Budenny was forced to retreat rapidly to the Dnieper, leaving Odessa to stand a siege. Budenny had a difficult retreat, since his army, most of it cavalry, had little power of delaying German armour in a country that favoured mechanised vehicles. Even on the Bug he could make no prolonged stand, for this line also had been turned, and it was not till he reached the Dnieper that Rundstedt was forced to halt. Although by Aug. 18 he had cleared all territory W. of the river except round Kiev and Odessa, and on Aug. 27 the Russians had withdrawn from Dnepropetrovsk after breaching the dam, it was more than a fortnight before Rundstedt established a footing on the E. bank of the Dnieper at Kremenchug, evacuation of which the Russians announced on Sept. 14. Odessa he had by-passed, leaving a Rumanian army to invest the city, which the Russians ultimately evacuated on Oct. 16.

In front of Kiev the Russians fought with great determination, and it was only after von Bock's right wing struck S.E. from Gomel and Rundstedt drove N.E. from Kremenchug that a pincer movement developed which threatened to envelop Kiev. Budenny had delayed withdrawal too long, and when at last forced to retreat he suffered disastrous defeat, caught in the jaws of the pincers E. of the city, which was captured on Sept. 21. The Dnieper line was thus hopelessly broken and Rundstedt swept on till he captured Poltava. There his centre appears to have halted, for Khar-

kov was not taken till Oct. 24. His right, however, got a footing on the Perekop isthmus and drove along the N. coast of the Sea of Azov, von Kleist's panzer corps taking Rostov Nov. 22, from which city, however, he was thrown out again Nov. 28.

On Oct. 28 Rundstedt forced his way into the Crimea and soon overran the whole peninsula, except the defences of Sevastopol. His left, diverted N.E. towards Kursk and Orel, took Orel Oct. 7, thus affording substantial protection to the right of von Bock's central operations towards Moscow.

Timoshenko's pressure on von Bock (already referred to) continued. With autumn setting in this was a serious reverse for the Germans. Hitler, however, was not to be baulked; preparations for a decisive effort were made, and on Oct. 3 he announced that the offensive would be reopened. It began on the 6th and took the form of central and enveloping attacks. Vyazma in the centre, Briansk on the right, and Kalinin in the N. were captured by the middle of the month. The Russians were hard pressed, but fighting in great depth took place behind the points reached by German armour. Weather, moreover, had already become wintry, and mud was making supply difficult. By the end of Oct. the German centre had reached Mozhaisk, 60 m. from Moscow; and the right had developed a dangerous thrust to Tula, due S. of the capital. But Tula held out, and the Germans were forced to by-pass the place in order to continue their enveloping movement. By the end of the first week of Nov., though bitter fighting continued, little further progress could be made in the mud. On Nov. 10 real winter cold set in, and by the 22nd had hardened the ground and restored the possibility of mobile action.

Offensive Against Moscow

In spite of the sufferings of his troops from the bitter cold, Hitler insisted on using the opportunity. The offensive was again in full blast, not only on the direct line to Moscow, but in wide outflanking movements, especially from the north. Desperate fighting took place in the Kalinin sector, and it was here that the Russians were in greatest danger. But the cold was having its effect on the German troops, who were unprovided with winter clothing, and on their transport. Commanders were compelled to report that

the men had reached the limit of endurance, and on Dec. 7, 1941, the day of Pearl Harbour, Hitler was forced to announce that the offensive had been abandoned. That entailed the immediate retreat of the long pincer arms and a general withdrawal in search of shelter—for exhausted troops a desperate undertaking.

Temporary German Retreat

At the beginning of Nov. Zhukov had taken over command of the whole of the central and N. front, Timoshenko being transferred to the S. front, and Voroshilov and Budenny being given the task of supervising the training of new armies. Hitler's announcement found Zhukov ready; he immediately launched a general counter-offensive, for which he had held in reserve specially trained and equipped Siberian troops. The great German offensive had failed, and the German armies now faced catastrophic disaster.

In the S. von Kleist was forced to retreat with heavy losses to Taganrog. Attempts to capture Sevastopol were brought to a standstill, and on Dec. 30, by an amazing amphibious operation carried out in the midst of a storm, the Russians recaptured Kerch. In the N. the Germans isolated Leningrad on Nov. 11 by the capture of Tikhvin; but on Dec. 8 the Russians recaptured that town, and von Leeb was forced to withdraw to the Volkov river. The precarious supply route across L. Ladoga was reopened and Leningrad was saved from being starved into submission.

On the central front the Germans were in no condition to hold the vigorous Russian attack. Men collapsed from frostbite and much German equipment had to be abandoned. The Russians recaptured one town after another, and only on the direct approach to Moscow was withdrawal carried out in good order and with stiff resistance. By the end of the first week in Jan., 1942, the Germans to the N. of Moscow had been driven back to the approaches to Rzhev after losing Kalinin, Klin, and Volokolamsk. The centre was fighting desperately at Mozhaisk; and the forces in the S. arm of the pincer movement on Moscow (which had by-passed Tula) had retreated more than 150 m., abandoning its grip on Tula and losing Kaluga 50 m. farther W. Farther S. the whole front had been forced back to the approaches

to Orel and Kursk. By that time the impetus of the Russian pursuit had been reduced, partly owing to the efficiency of the German staff in rallying disorganized troops, partly also because the Germans were falling back on their reserve depots and had shortened their lines of supply, while the supply difficulties of the Russians were steadily increasing. An exceptionally cold winter also affected even the suitably clothed Russians, who found little shelter in the country which had been devastated by the retreating Germans. Nevertheless, during Feb. the Russians continued to gain ground, especially between L. Ilmen and the Moscow-Riga rly., where they drove a deep salient into an area weakly held by the Germans owing to lack of rlys. and the sparsely inhabited and marshy nature of the country. This drive actually gained possession of the Moscow-Riga rly. W. of Rzhev, though Rzhev itself remained in German possession, blocking direct rly. communication with Moscow. The salient at its head, however, was a serious menace to German lateral communication between the Leningrad front and Smolensk.

German Methods of Defence

During the spring months the Russians made some further progress, chiefly in this N. salient, where on its right flank the German 16th army was encircled at Staraya Russa, Feb. 24, immediately S. of L. Ilmen, and might have been captured, if a thaw had not given a German force an opportunity to relieve their isolated comrades. At the head of their salient the Russians recaptured Veliki Luki near the crossing of the Riga and Leningrad rlys., although desperate German resistance saved the latter line from interruption. The Russians extended the left flank of their salient more than 60 m. S. of the Riga rly., causing the German front opposite Moscow to become a pronounced salient based on Vyazma, still further restricted by a deep Russian penetration south of Vyazma.

By the end of May, exhaustion and spring mud brought the Russian main counter-offensive to a standstill. Long before then it had been checked on the greater part of the front by the system of defences the Germans had organized. Distances were too great and troops too few to permit of the construction of continuous trench lines like those of the First Great War; the Germans

therefore relied on holding a series of strong points in large towns with good rly. communications to the rear. These towns provided shelter and supply centres and were protected by a zone of defences in considerable depth, consisting chiefly of fortified villages, the whole forming a "hedgehog" for all-round defence. Fortified rly. lines by which reserves could be quickly moved served to check enveloping attacks. Snow and mud prohibited the use of heavy weapons, and lightly armed Russian troops could make no serious impression. Staraya Russa in the N., Rzhev and Gshatsk in the centre, and Briansk, Orel, and Kursk farther S. were main strongholds. Taganrog in the extreme S. formed a pivot to the whole line, while N. of it the built-up area of the Donetz basin lent itself to defence against the counter-attacks of Timoshenko launched after the Russian recapture of Rostov. By the end of Feb. Timoshenko had, however, driven the Germans back across the Donetz on the N. side of the basin.

In S. Russia spring naturally comes earlier and the ground dries more quickly than in the centre and N. As conditions improved there were signs that the Germans were preparing to renew the offensive. To forestall German plans and dislocate their preparations Timoshenko early in May, 1942, launched an offensive on the Kharkov front with considerable initial success, forming a salient S. of the city which threatened important German communications. The Germans reacted quickly, and attacked Timoshenko's S. flank. Very heavy fighting occurred in the Izyum area, and at the end of May Timoshenko was compelled to retreat behind the upper Donetz. The Germans claimed 240,000 prisoners; but they, too, had had heavy losses and, perhaps more important, had been forced to divert troops intended for a projected offensive into Caucasia, which was thereby delayed and weakened.

German Summer Offensive

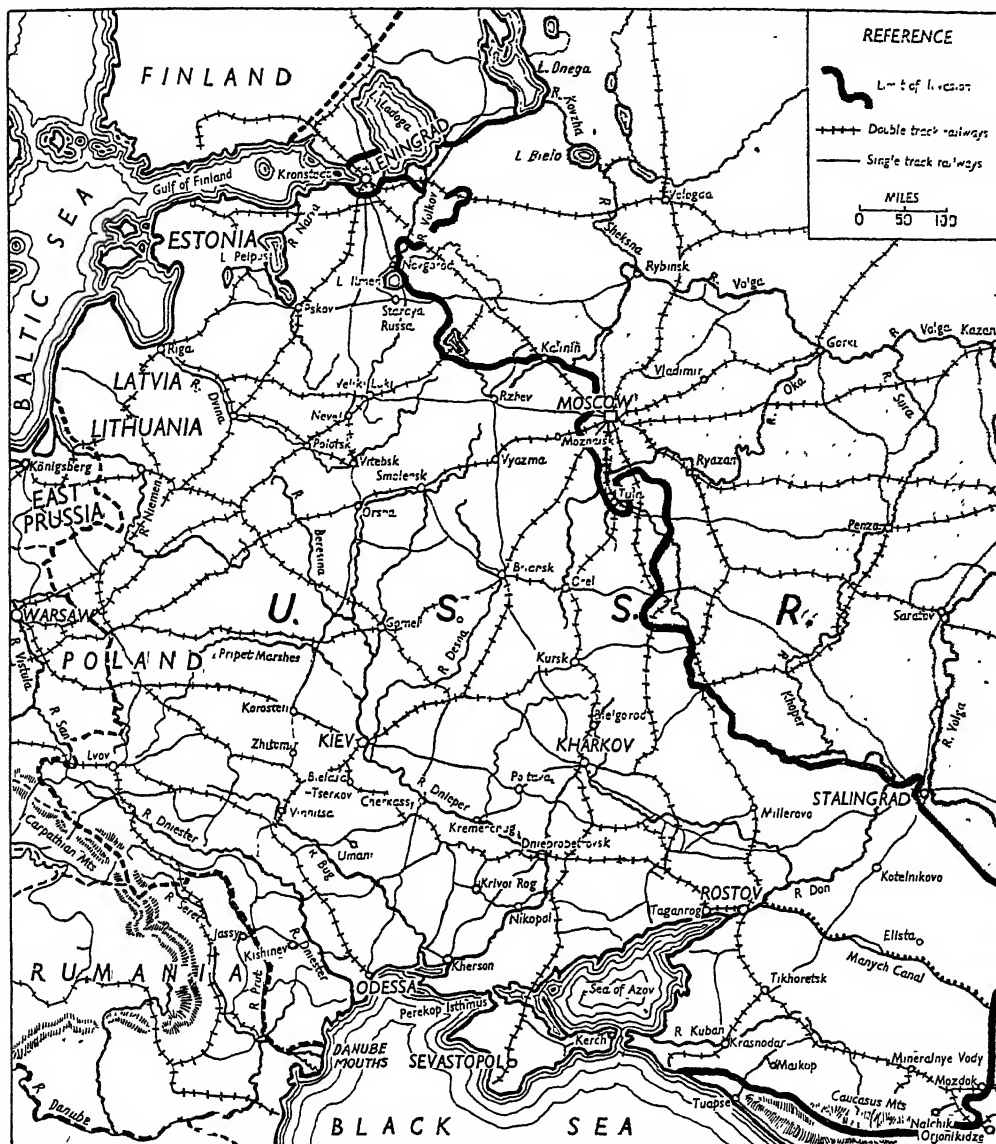

The German summer offensive opened on May 8 with a preliminary operation to regain the Kerch pen. in the Crimea; the Russians admitted they had evacuated it on the 23rd. On June 5 the Germans opened an intensive attack on Sevastopol, with artillery, tanks, and air bombardment. The garrison, besieged already for seven months, resisted until July 3,

when the remains of the garrison were evacuated by the Black Sea fleet. On June 11 the main German offensive opened in the Kharkov region, where the Russians were driven back from the upper Donetz to the line of its tributary, the Oskol. On the Kursk front, a blow aimed against Voronezh on the Don on June 28, gained a foothold in that city, July 6. The Germans extended the breach for 200 m., interrupting all the main lateral communications between Moscow and Rostov, and turning the N. flank of Timoshenko's armies. But desperate attempts by the Germans at Voronezh to enlarge their footing across the Don failed. A drive southward between the Donetz and the Don developed, threatening envelopment of the Russian forces in the S. which, by July 17, had also to meet a major offensive in the Donetz basin, where the Germans had been reinforced by troops released by the fall of Sevastopol.

Russian Rally at the Don

Timoshenko's armies were now in retreat to the lower Don though still successfully resisting continued attacks at Voronezh. The retreat was so rapid that decisive action was evaded, and German pursuit was checked by bridgeheads over the Don in the Tsimlyansk region, which enabled the Russians to rally on the left bank of the river. Retreat from the Donetz basin was not, however, so successfully carried out and there was disorganization which enabled the Germans to capture Rostov, July 27, and deploy on the left bank of the Don. By the end of July they were across the river all the way from Tsimlyansk to its mouth, rly. communication between Stalingrad and N.W. Caucasia being cut near Tsimlyansk. Further retreat to the Caucasus was inevitable; but while the German right and centre had been directed towards the lower Don the left was heavily engaged in the great elbow of the river between Kletskaya and Kalach, where a crossing would uncover Stalingrad. The Russians fought desperately to prevent this and their bridgehead at Kletskaya resisted all attacks; but they lost Kalach Aug. 11.

From the beginning of Aug. the German offensive began increasingly to develop in two divergent directions; on the left towards the Volga at Stalingrad, on the right towards Caucasia. For simplicity the two operations

Russo-German Campaigns. Map showing limits of occupation by Axis armies. State boundaries are those of 1939

will be described separately up to their ultimate failure.

In Caucasia German efforts were at first directed towards the Maikop oilfields, which were quickly reached by a strong armoured column: the Russians evacuated Maikop itself Aug. 16, but not before they had fired the wells. Simultaneously the Germans drove S. from the Rostov bridgeheads to clear the Azov coast; they took the great oil refinery at Krasnodar, Aug. 19, and secured a footing in the foothills on the S. side of the Kuban. The Germans captured

Novorossiisk on Sept. 10, but the Russians clung to the outskirts of the town making the port unusable. An attempt to reach Tuapse by the pass S. of Maikop failed, though in Nov. the Germans captured the pass.

These unsuccessful operations in W. Caucasus possibly diverted strength from the main attack E. towards Grozny and Baku. This began with a rapid drive which met little resistance before Mineralnye-Vody, a spa in the Kuma river area, was captured on Aug. 13, 1942. Then, in spite of

heavy reinforcements, the Germans failed to get beyond Mozdok. As winter approached the Germans tried to get possession of the upper Terek valley and of Orjoni-kidze not only for winter quarters, but because it was the base of a strong Russian force. Early in Nov. by a surprise offensive from the Nalchik area the Germans almost achieved their object, but the Russian defence held and a counter-attack on Nov. 19 drove the Germans back to Nalchik. The lack of decisive success in the Caucasus operations was no doubt

in part due to the demands made by the Stalingrad front. By Aug. 11 that city was threatened from across the Don, at the elbow between Kletskaya and Kalach, and, on the left bank of the river, by a drive from the Tsimlyansk bridgehead which had captured Kotelnikovo. But it was Aug. 24 before the Germans gained a footing across the Don S.E. of Kletskaya. Their capture of Elista, capital of the Kalmuck region, on Aug. 12, seemed to threaten an advance to the lower Volga and Astrakhan. This danger, however, never developed. On Sept. 11 the Germans claimed to have reached the Volga S. of Stalingrad, but by the middle of the month it became apparent that their main effort was being made N.W. of the city. There was fighting in the outskirts of the city by Sept. 16, and by the end of the month in the city itself. Through Oct. and the first half of Nov. the struggle went on, the Germans making steady but slow progress in desperate fighting. In spite of artillery fire and air attacks reinforcements from across the Volga reached the defenders, who, by burrowing in the steep banks of the river, secured bomb-proof cover. Less than one-third of the city, however, remained in Russian hands in a narrow strip along the river, and the final crisis threatened to occur when icefloes made the passage of reinforcements almost impracticable.

Second Winter Campaign

But the situation of the Germans was by no means happy. They had had disastrous losses and become involved in a second winter campaign. Although temps. were not so low as on the Moscow front in the previous winter and the men were more suitably clothed, the wind from the steppes was bitter. Landing grounds available in the summer had for the most part gone out of action; their northern flank was constantly under attack. So great were the demands on troops of the Stalingrad operation and the Caucasus campaign that the holding of the long defensive front on the Don southwards from Voronezh had to be left to troops of doubtful reliability from satellite states. On the Vyazma and other parts of the front the Russians had made dangerous attacks throughout the autumn, and Rzhev was closely threatened.

Then on Nov. 22 a major Russian offensive began on the front between the Volga and the Don

N.W. of the city; and the front was broken simultaneously N. of Kletskaya where Russian armour crossed the Don in a surprise attack and made rapid progress towards Kalach. S. of Stalingrad another surprise attack developed, the Russians there also advancing rapidly towards Kalach. Both the main supply lines of von Paulus's 6th German army were cut. The Russians from outside the city made contact with the garrison within it and von Paulus became engaged in a desperate struggle against the encircling forces. Stalingrad was saved, and the besieging army was threatened with destruction. Attempts were made to supply it by air, and a relieving force was quickly organized at Kotelnikovo. But the German situation rapidly worsened. As the encircling ring closed in supply by air became more difficult and the relieving force, after some initial success, was heavily counter-attacked and driven back to Kotelnikovo which the Russians recaptured Dec. 29. Before that, on Dec. 16, the Russians crossed the middle Don and broke through in a drive that threatened to reach the Donetz and encircle all German troops in the Don bend.

German Withdrawal in Caucasus

By the end of the year the Germans were in retreat to positions where they may have hoped to organize a force to relieve Paulus in the spring. The Russians were checked at Millerovo, E. of the Donetz, and the Germans retreating from Kotelnikovo rallied on the Manych canal. But in the Caucasus they had to withdraw from the Terek valley, hard pressed by a new Russian offensive which started on Dec. 24. During the first week of Jan., 1943, the Russians recaptured Mozdok and Nalchik, and after some hard fighting in the Mineralnye-Vody area the Germans retreated more rapidly as Russian progress on the Manych front threatened to cut them off. Had it not been that Paulus's army continued to engage large Russian forces and to block rly. communication through Stalingrad, this threat might have become more imminently dangerous.

On Jan. 16 a new Russian break through on the Don front S. of Voronezh was announced. This attack fell on a sector held mainly by Italians, and German reinforcements on their way to this part of the front were overwhelmed in the rout. New im-

petus was given to the offensive farther S., and the Germans were forced back across the Donetz. The situation in Caucasia rapidly became critical; the front on the Manych canal gave way, but aided by favourable weather and undamaged communications the Germans just escaped interception on the Baku rly. at Tikhoretsk. They abandoned Maikop Jan. 30 and withdrew the forces threatening Tuapse, the whole Caucasus army, except for a group left in the Kuban to cover the Kerch strait and retain Novorossiisk, retreating through a bridgehead at Rostov. By that time the Russians had recaptured Voronezh on the middle Don (Jan. 25) and overwhelmed the defence on the W. bank, consisting here mainly of Hungarian troops.

During Jan. pressure on Paulus's army had been intensified. On Jan. 22 he refused a demand that he should surrender, but driven into a diminishing area and subjected to intense bombardment, Jan. 31, he capitulated, though part of his army continued to fight until Feb. 2. This disaster marked the turn of the tide in Russia.

No greater stimulant could have been given to the ardour of the Red army. On the Voronezh front they captured Kursk, one of the chief German "hedgehogs," on Feb. 8; farther S., in the upper Donetz basin, they took Bielgorod on Feb. 9. The Russians recaptured Rostov, this time for good, on Feb. 14, and made a deep penetration into the Donetz basin S. of Kharkov which not only threatened that city but endangered communications between the Donbas and the Dnieper.

Recapture and Loss of Kharkov

The Germans had been driven back virtually to the starting line of their previous summer's offensive—and to the W. of Kursk even well beyond it. On Feb. 16 the Russians recaptured the great wrecked city of Kharkov, and, S.W. of it, were thrusting to the Dnieper, having cut all but one of the rlys. leading to the river from the Donbas, where, however, in built-up areas the Germans were fighting fiercely and showed no signs of withdrawing in spite of their perilous situation; for Hitler had not only proclaimed a complete mobilisation of all German resources but had dispatched all available reserves to Russia. These had assembled on the Dnieper, and as the Russian spearhead approached the river it met stiffening

resistance and counter-attacks against its head and its flanks. In the last week of Feb. German counter-attacks developed into a full-scale offensive by some 12 armoured divs. The Russians lost Kharkov on March 15, and Bielgorod on the 21st; but on the middle and upper Donetz they rallied. The Germans made fierce attempts to cross the Donetz, but the Russian defence held, even retaining bridgeheads across the river, while in the eastern Donbas and west of Kursk they lost no ground.

Such was the situation when spring mud brought operations to a standstill. The Russian offensive, in spite of a final reverse, had been an amazing achievement, the result of a daring and successful gamble which counted on living on captured enemy supplies.

The southern counter-offensive had been the main Russian operation of the winter; but other important successes had been achieved. On Jan. 1 Veliki Luki was recaptured and the offensive on the central front continued till the whole of the Vyazma salient was reduced, Rzhev being taken on March 3 and Vyazma on March 12, bringing Smolensk under close pressure. On the N. front Schlusselfurg was recaptured between Jan. 12 and 18, and a substantial corridor was thereby opened to Leningrad, breaking the German line of investment. S. of L. Ilmen, the important hedgehog of Demiansk was recaptured on March 1.

German Counter-Offensives

March 31 marked the end of the winter offensive and the beginning of a long pause, during which both sides reorganized. In the Kursk salient, where it was evident that the clash would occur, the Russians deliberately awaited attack in strongly entrenched positions of great depth, trusting that the enemy would expend his armour in an attempt to break through and thus expose himself to a counter-stroke for which the Russians were husbanding reserves. This plan fully justified itself. On July 5 the Germans opened a double attack from the Orel and Bielgorod fronts on the flanks of the Russian salient, evidently with the intention of pinching it out and recapturing Kursk. The attacks had all the character of a *blitzkrieg*. On the Orel front they employed 7 panzer, 2 motorised, and 11 infantry divs., on the Bielgorod front 10 panzer, 1 motorised, and 7 infantry divs.

The Orel offensive made no material headway, but the Bielgorod offensive penetrated the Russian defences to a depth of 30 m. before it was checked. The issue was critical and the battle raged furiously for more than a week before, on July 12, the Russians opened an offensive against the Orel salient from N. to E. By abandoning their Orel offensive the Germans were able to stave off disaster. It was only by a slow process of attrition that the Russians captured Orel and Bielgorod on Aug. 5, and the Russians' great defensive battle was won when the Germans began to withdraw to their original position. The opportunity had come, and everywhere the Russians turned to the offensive.

Russian Recovery of Donbas

Their forestalling offensive having failed, the Germans had no alternative but to withdraw to the Dnieper. Withdrawal from the Donbas was a critical operation, for the Russians were attacking it from the E., and by Aug. 16 were closing in on Kharkov, from which a threat to the railways leading to the Dnieper might develop. To meet this threat the Germans launched a powerful counter-attack W. of Kharkov which had initial success, but was repulsed on Aug. 23, when Kharkov again passed into Russian hands. About the same time the Russians attacked on the Mius river, which guarded the Azov coast, and on Aug. 30 broke through to capture Taganrog. The situation had therefore become highly critical for the Germans; but by assembling a strong group in the Poltava area they succeeded in protecting the retreat from the Donbas to the strongly fortified Melitopol line which ran from Zaporozhe at the bend of the Dnieper to the Sea of Azov. Farther N. their retreat was also skilfully conducted, though they suffered heavy losses in rearguard actions. They failed, however, to hold the line of the Desna, which the Russians forced by a surprise attack, over marshy ground deemed impassable. The Russians took Briansk on Sept. 17, and developed a new thrust still farther N. against Smolensk, from which they forced the Germans on Sept. 25 after their first re-crossing of the upper Dnieper. By the end of the month the Germans were back on the Dnieper all the way from Vitebsk to Zaporozhe, and the only considerable footholds they held E. of the river were the rly. centre of Gomel

and the area covered by the Melitopol line. They had suffered heavy losses in men and material but had escaped catastrophic disaster. The Russians maintained their pressure and were everywhere in close contact, but autumn rains were setting in and the Russians were now operating in country devastated by the Germans, who seem to have expected a respite for reorganization. They showed no signs of abandoning the Crimea, and even though they had lost Novorossiisk on Sept. 16 they still retained a bridgehead in the Taman pen. opposite Kerch.

But no respite was given them. By Oct. 7 the Russians had established small bridgeheads across the Dnieper N. and S. of Kiev and near Kremenchug. In the same week, on the Veliki Luki front, they captured Nevel, thus securing the main rly. from Leningrad to Vitebsk. By crossing the Sozh river they almost encircled Gomel; and they at last forced the Germans to evacuate the Taman pen. They were also developing heavy attacks on the Melitopol line, and these seemed to promise greater success than attempts to exploit the small bridgeheads across the great Dnieper obstacle. On Oct. 13, although the Germans had used three divs. from the Crimea as reinforcements, the Russians entered Melitopol, took Zaporozhe next day, and cut the railway to the Crimea.

Isolation of the Crimea

Then, on Oct. 17, came the totally unexpected news that the Russians had broken out of their Kremenchug bridgeheads and were driving towards the great iron mining and rly. centre of Krivoi Rog. During the week following this thrust made rapid progress, endangering the whole German position in the Dnieper bend. Reacting strongly, the Germans, by stubborn defence and counter-attacks, held up the thrust towards Krivoi Rog, but could not prevent the breach it had made widening to include Dnepropetrovsk, which, after another surprise crossing of the river, the Russians captured Oct. 25. Meanwhile, pressure on the Melitopol line increased, and on Oct. 23 the Russian capture of Melitopol involved the collapse of the whole German position there. Pursuing vigorously, the Russians reached and penetrated some distance into the Perekop isthmus, isolating the Crimea, while the remnants of the German army which had held the Melitopol line took refuge in bridgeheads

opposite Nikopol and Kherson. This was a disaster of the first order, though the Russians wisely left the Crimea until later.

While these events were happening heavy fighting was in progress near Kiev; Kiev itself was captured by a brilliant outflanking movement on Nov. 6, by which time the whole German line on the Dnieper was crumbling.

New Russian Commanders

At this stage it is well to describe the changes that had occurred in the Russian system of command, for whereas, since the summer of 1942 Russian battles had been won or lost anonymously, from now onwards events were increasingly linked to the names of the Russian generals concerned. The system of dividing the whole front into three, and later into two, main sections had been abandoned before the relief of Stalingrad, and h.q. at Moscow, where Vassilievsky was chief of the staff, directly controlled a number of fronts, constituted according to the circumstances. Now, however, the assignment of commands became systematised, and the 1st (Vatutin), 2nd (Koniev), 3rd (Malinovsky) and 4th (Tolbukhin) Ukrainian fronts (or armies) were constantly referred to in communiqués. Later the 1st, 2nd, and 3rd White Russian and the 1st, 2nd, and 3rd Baltic fronts (or armies) came into the picture. It was Vatutin who captured Kiev, and now the eyes of the world were on him. Thrusting W., with his right protected by the Pripet marshes, and repelling counter-attacks on his left, by Nov. 18 he had captured Zhitomir (Nov. 13) and Korosten, on the rly. which had formed the main German lateral line of communication across the marshes. Rokossovsky had meanwhile crossed the Dnieper N. of the marshes, and had had successes in the Gomel region. The great salient Vatutin had formed entailed a threat to the main line of communication through Poland between Germany and the Ukraine. This daring move invited counter-attack, and in a region where the Germans could most rapidly assemble reserves. Von Manstein, now commanding on the S. front, seized the opportunity, and during the second half of Nov. and first half of Dec. launched a series of violent attacks, being constantly reinforced by reserves from Germany and the W. But Vatutin, turning to the defensive and making great use of his artillery, ceded only some 30 m. of ground,

in depth, though he lost Zhitomir and Korosten. This, the most formidable counter-stroke the Germans delivered during their retreat, had exhausted itself by the middle of December. Meanwhile Rokossovsky continued his attacks, taking Gomel on Nov. 26 and establishing a firm footing across the upper Dnieper. Koniev in the Dnieper bend had also maintained pressure with success, though the Germans clung obstinately to a frontage on the middle Dnieper about Kanyevo between Kiev and Cherkassy.

The main Russian winter offensive started on Dec. 14 when the 1st Baltic army (Bagramyan) opened a new offensive on the Nevel front, outflanking Vitebsk. In the western Ukraine, Vatutin on Dec. 24 turned on Manstein's exhausted force, striking in the direction of the Lvov-Odessa railway S. of Vinnitsa. At Vinnitsa, however, Manstein rallied and, counter-attacking strongly, brought Vatutin to a standstill. But with his right and left wings Vatutin struck fresh blows. His right by the middle of Jan., 1944, was threatening to turn the Vinnitsa position to the W., and his left struck S. from Bielaya Tserkov towards Uman, narrowing the German salient at Kanyevo. During the first half of Jan. there was a pause on the Ukraine front, but N. of the Pripet marshes Rokossovsky gained ground, capturing Novo Sokolniki on Jan. 29.

Relief of Leningrad

Much more important, however, was the offensive launched on Jan. 15 by Govorov and Meretskov on the Leningrad front. In a few days they removed the city from danger and restored its communication with Moscow, involving the Germans in a costly retreat to the Estonian and Latvian frontiers N. and S. of Lake Peipus. The Russian pursuit did not exhaust itself till the middle of March, by which time N. of Lake Peipus the Germans were behind the River Narva, and although S. of the lake they held Pskov and a strong position running S. from it to Vitebsk, they had lost virtually the whole Leningrad-Vitebsk rly. and all territory to the east of it, giving the Russians a favourable starting line for operations in the summer.

Meanwhile in the Ukraine it was announced on Feb. 3 that rapid thrusts by Koniev's right and Vatutin's left had encircled ten German divs. near Korsun which had been attempting to withdraw from the Kanyevo salient. Fierce

fighting ensued, during which the Germans made desperate efforts to bring up relief. But the attempt at rescue failed; Korsun was taken Feb. 14, and when the encircled force surrendered on Feb. 18 the relieving force, having suffered heavily, withdrew towards Uman.

While this was happening, the Germans suffered another disaster in the S. On Feb. 6 Malinovsky broke the German Krivoi Rog-Nikopol defence line. Two days later Tolbukhin annihilated the bridgehead garrison E. of the Dnieper at Nikopol, and in co-operation with Malinovsky captured the city itself (which Hitler had ordered to be held at all costs), destroying seven German divs. On Feb. 22 Krivoi Rog was taken; and on the 24th, N. of the Pripet, Rokossovsky stormed Rogachev, one of the German strongholds on the upper Dnieper.

Recapture of Odessa

On March 5 it was announced that Zhukov (relieving Vatutin, who was suffering from an illness that proved fatal) had broken through on a wide front directed towards Tarnopol and cut the Lvov-Odessa rly., thus interrupting the main communications of the Ukraine with Germany and in particular those of the Vinnitsa group. Malinovsky at the same time was driving S. from the Krivoi Rog front, outflanking all German troops holding the lower Dnieper and its tributary the Inguletz. In the centre, on March 10, Koniev, who had extended his front to take over that of Zhukov's left wing, gained a decisive victory at Uman, the Germans for the first time cracking badly when their armour stuck in the mud. Exploiting his victory, Koniev swept on W. and S.W. across the middle Bug (March 15) and upper Dniester, thus separating the Germans opposing Malinovsky on the lower Bug from Manstein's group still fighting hard about Vinnitsa. The former group, their N. flank threatened, fell back rapidly, to a large extent out of control, pursued by Malinovsky who was thus enabled to capture Nikolaev and to close on Odessa. The Germans and Rumanians attempted to take up a position covering that great port, but by a brilliant manoeuvre Malinovsky outflanked it. Giving up the attempt, and evacuating the city in disorder on April 10, the Germans were driven across the lower Dniester.

Koniev meantime crossed the Prut and the Seret, but, hampered by mud and swollen rivers, was

unable to capture Kishinev and Jassy, on which line Kleist, now independently commanding on what had become the Rumanian front, took up a strong position. Malinovsky was also unable to cross the Dniester in strength, though he secured small bridgeheads over it. Meanwhile Zhukov's offensive had continued, and in co-operation with Koniev's right had outflanked the Vinnitsa-Proskurov area, forcing Manstein to withdraw S., though 45,000 of his troops were cut off and completely surrounded in the Skala area. Manstein, however, received reinforcements and began a series of counter-attacks, which not only helped part of the Skala group to escape but by the middle of April had slowed Zhukov down almost to a standstill short of Lvov. The great offensive, which had started in the Kursk salient in the summer of 1943 and continued thereafter with scarcely a pause, had, by the spring of 1944, achieved immense gains but, with ever increasing difficulties of communication, had at last exhausted itself. A long pause for regrouping and reorganization was clearly necessary before the offensive could be resumed. But there remained a postscript. The isolated German force in the Crimea called for liquidation, and Tolbukhin's 4th Ukrainian army had long been preparing for the task. On April 11 it was announced that by a brilliant manoeuvre he had crossed the Sivash swamp and turned the German defences of the Perekop isthmus. From the Kuban, Yeremenko had also gained possession of Kerch.

Storming of Sevastopol

The Germans, after a disorganized flight, rallied to defend Sevastopol, but, after a short pause to bring up heavy weapons, Tolbukhin carried Sevastopol by storm, May 7-9, in a three days' assault and virtually the whole garrison of more than 100,000 was killed or taken prisoner. The rapid fall of the great fortress that had withstood the German siege for eight months, was a disastrous blow to Germany and, as many Rumanian troops were involved, it was a fresh incentive to that country to get out of the war.

As the summer approached it became a matter for speculation where the Russians would resume the main offensive. The Germans appear to have expected it on the Lvov front, and were apparently confident that in the passage way between the upper Dnieper and the Dvina, which was the most prob-

able alternative, their defences were too strong to invite attack. But it was there on June 23 that the blow fell. On the right the 1st Baltic army (Bagramyan) and 3rd White Russian army (Chernyakhovsky) opened the attack and rapidly encircled and captured Vitebsk (June 26) and Orsha (June 27), the main German strongholds. On the left the 1st White Russian army (Rokossovsky), starting a day later, with equal speed took Zhlobin (June 26) on the Dnieper and Bobruisk (June 29) on the Beresina. In the centre the 2nd White Russian army (Zakharov), starting from farther back, also crossed the Dnieper and took Mogilev (June 28). In five days the whole of von Busch's boasted impregnable front had been broken, and the disaster was to become complete. Chernyakhovsky and Rokossovsky had both sent their armour forward to exploit success, and on July 3 Minsk was captured. Von Busch's line of retreat had thus been cut and his whole disorganized army group encircled. Zakharov was given the task of completing its liquidation while Chernyakhovsky continued his advance towards the E. Prussian frontier, and Rokossovsky, on both sides of the Pripiet marshes, made for the Vistula. With the western front now developing in Normandy the Germans were more than ever short of reserves, and it was not till Rokossovsky had reached the Vistula that he encountered opposition he could not overcome. But the Germans were determined to hold E. Prussia at all costs, and when he reached the Niemen Chernyakhovsky met stiffening resistance which, by the middle of July, held him near the frontier. Zakharov also was halted near the S. frontier of E. Prussia. Meanwhile, however, the offensive was extending. Immediately after the capture of Vitebsk Bagramyan turned W. and N.W. to capture Polotsk (July 4) and to cover Chernyakhovsky's right. By the end of July Bagramyan had driven far into Lithuania, cutting the main communications of the Germans in Latvia and Estonia. Farther N. Yeremenko's 2nd and Maslennikov's 3rd Baltic armies had also taken the offensive and had captured respectively Dvinsk (July 27) and Pskov (July 23). N. of L. Peipus Govorov had taken Narva (July 26). With their line of retreat to E. Prussia threatened and their E. defence disrupted, the position of the Germans in the Baltic states had become desper-

ately precarious; but Hitler insisted on their holding on, possibly in hopes of keeping Finland in the war, although the Finns had been driven out of the Karelian isthmus during June and July and were seeking terms of surrender.

In the S. there was an even more important extension of the offensive, for on July 18 Koniev, who had replaced Zhukov, took the offensive on the Lvov front in co-operation with Rokossovsky in his drive to the Vistula. By-passing Lvov, Koniev took Przemyśl (July 28), and by the end of the month had crossed the San and established a bridgehead over the Vistula near to the mouth of that tributary. About the same time Rokossovsky reached the Vistula at Demblin and was closing in on Warsaw at the beginning of Aug. On Koniev's left the 4th Ukrainian army, last heard of in the Crimea and now under Petrov's command, took the offensive in the Carpathian foothills and made gains.

Remarkable German Recovery

But German powers of recovery were still remarkable, and resistance solidified on the Vistula. Koniev's bridgehead over the river came under heavy counter-attacks, and Rokossovsky, though he took Praga, the suburb of Warsaw on the E. bank, failed in attempts to cross the river to Warsaw itself where the Germans crushed the Polish rising in the city by Oct. 3. Thereafter Rokossovsky devoted himself to operations northwards towards the W. Bug; while Chernyakhovsky, towards the end of Oct. resumed, without any major success, his attempt to break into E. Prussia. Thus during the late autumn of 1944 the main Russian offensive by degrees died down. But after the surrender of Finland in Sept. the offensive in the Baltic states developed successfully. Bagramyan reached the Baltic coast, closing all avenues of escape, while Yeremenko, Maslennikov, and Govorov hunted the Germans back to Riga; and, after capturing that city on Oct. 13, bottled the remains of Lindemann's 30 divs. in the Courland promontory, where they had little further influence on the war.

During the summer of 1944 the Bessarabian front remained virtually stabilised with the 2nd and 3rd Ukrainian armies, now commanded by Malinovsky and Tolbukhin respectively, in contact with Kleist's Jassy-Kishinev position and on the lower Dniester. But on Aug. 23, about the time the drive through Poland had be-

gun to lose its momentum, Malinovsky and Tolbukhin took the offensive. In three days' hard fighting Kleist's positions were irreparably broken, and on Aug. 23 King Michael of Rumania, by a *coup d'état* in Bukarest, broke away from the axis. By Aug. 31 Malinovsky, taking the Ploesti oilfields in his stride (Aug. 30) reached Bukarest to support him. Meanwhile Tolbukhin had crossed the lower Danube, and on Sept. 8 forced Bulgaria to declare war on Germany immediately. Advancing W. in three groups, Malinovsky rapidly overran southern Rumania, and on Oct. 6 crossed the Hungarian frontier. Meanwhile Tolbukhin, cooperating with Bulgarian troops, had turned W. to clear the Morava valley, the main avenue of communication for the Germans in Greece and S. Yugoslavia. On Oct. 20 he captured Belgrade, already outflanked in the N. by Malinovsky, whose southern group, continuing its advance into Hungary, on about the same date reached the Danube opposite the mouth of the Drave. Making no attempt to cross the river Malinovsky swung his left northward in order to cut off the Germans in N. Transylvania from Budapest and Bratislava. About the same time Petrov's 4th Ukrainian army seized the passes over the Carpathians in the North. This pincer manoeuvre failed to surround the German group, which retired into Slovakia; but it cut its communication with Budapest, which Malinovsky then attacked from the E. The Germans were determined to hold that city, and reinforced it strongly. Unable to storm its defences, Malinovsky extended his front northward to the elbow of the Danube, cutting the rly. to Bratislava on the N. bank of the river. Then on Nov. 29 Tolbukhin suddenly appeared on the left bank of the Danube where Malinovsky had first reached the river. Taking the Germans by surprise, he forced a crossing brilliantly and immediately fanned out towards the N. and S. ends of L. Balaton. He met a strong German position between the N. end of the lake and Budapest, but in cooperation with Malinovsky forced his way through and, driving N., completed the encirclement of the city and its garrison of over 200,000 men on Dec. 26. Alarmed, not only at the prospect of another major disaster but because the loss of the Danube line opened a new avenue of approach to the southern strongholds which they had hoped to hold as an

inner citadel, the Germans initiated a series of violent attacks which forced Tolbukhin to give ground. These did not, however, save Budapest which after stubborn resistance fell on Feb. 13, 1945. Nevertheless German counter-attacks persisted with a reckless expenditure of reserves until the last week of March, when the progress of the Russian offensive N. of the Carpathians made a German retreat inevitable.

Invasion of E. Prussia

That offensive had been opened by Koniev from his bridgehead on the upper Vistula on Jan. 12, and was taken up two days later by Zhukov, now in command of the Warsaw front, by Rokossovsky striking into southern E. Prussia, and by Chernyakhovsky in the N.E. of that prov. All made sensational progress. By the end of the month Koniev had entered Silesia and crossed the upper Oder; Zhukov, having liberated Warsaw on Jan. 17 and by-passed Poznan, entered Pomerania; Rokossovsky had not only driven deep into E. Prussia but had reached the gulf of Danzig, isolating the whole prov.; and Chernyakhovsky, having broken through the Insterburg gap, was closing in on Koenigsberg (Kalinograd). During Feb. further progress was made, but chiefly it was a matter of consolidating gains and clearing lines of communication. Poznan, which was a serious block on Zhukov's lines of communication, fell on Feb. 23. During March Koniev extended his hold across the upper Oder and encircled Breslau (Wroclau), but Zhukov made no attempt to cross the river, being content to extend his hold on its E. bank and in cooperation with Rokossovsky to round up all German forces in Pomerania, securing possession of the Baltic coast. Rokossovsky captured Danzig on March 30, and, in cooperation with Chernyakhovsky, continued splitting up and annihilating the enemy's armies encircled in E. Prussia.

By the middle of April the time for a final decisive effort had arrived. In the S. Tolbukhin had cleared Hungary and was at the gates of Vienna, while Malinovsky threatened it from the N. and, with Petrov, had driven far into Czechoslovakia, Koniev's left wing cooperating on that country's N. frontier. Vienna fell on April 13, and Tolbukhin advanced up the Danube to meet the Americans. In the north Koenigsberg was taken on April 9, leaving only a

remnant of Germans to be accounted for in the strip of coastal sand dunes. Chernyakhovsky was killed in the Koenigsberg fighting, and Vassilievsky had taken over his command. Then on April 16 Koniev and Zhukov launched their final drive, the former across the Messe towards the Dresden area and Zhukov across the Oder towards Berlin. After three days' hard fighting German resistance broke down and by April 23 Zhukov had entered the outskirts of Berlin, Koniev's right wing cooperating to encircle the city. On the 25th the Russians linked with the Americans at Torgau on the Elbe, and by then a fierce battle of extermination was proceeding in Berlin. On May 2 resistance ceased in Berlin. Rokossovsky had crossed the lower Oder and was advancing along the Baltic coast to link with Montgomery's army. May 5 saw the surrender of all German forces in the N.W. to Montgomery, and two days later Admiral Doenitz signed an act of unconditional surrender to all the Allies.

Russia's share in achieving that result calls for the fullest acknowledgement and is the more amazing in view of estimates of her potentialities in 1941. She received great material assistance from her allies, and in the last year of the war the reopening of the western front was the decisive factor. But if Russia had not engaged and defeated the greater part of the *Wehrmacht* the landings in France might have been a military impossibility. The Battle of Britain in 1940 was temporarily decisive; but had Germany been free to concentrate her war industries on developing air power, as would have been the case if Russia had collapsed, could British industries, harbours, and airfields under persistent air attack have met allied requirements? Russia's refusal to be crushed by initial disasters, and her subsequent development of offensive power, indubitably were the foundations of final Allied victory.

Russo-Japanese War. Conflict which lasted from Feb. 6, 1904, to Aug. 9, 1905, when the Russians agreed to peace, which was signed at Portsmouth, N.H., on Sept. 5. The Japanese had proved their fighting capacity in their victory against China in 1894. China, besides paying an indemnity, surrendered Port Arthur to the Japanese. All the European powers desired this port, and no one dared to take it. Germany, France, and Russia decided that it should be

given back to China—a severe blow to the ambitious Japanese, especially when Russia immediately stepped in and, under the pretext of a 100 years' lease, took possession. Japan in 1903 began to press Russia to leave Manchuria; Russia pushed on the work on her railways, Japan was not deceived, and eventually demanded that Korea should be independent and Manchuria given back to China. No effect being produced, on Feb. 6, 1904, the Japanese ambassador was recalled from Russia, and Japan declared war.

Opening of Hostilities

The total Japanese trained army was about a million men, but the number she could employ in Manchuria and Korea was limited by the oversea communications. Her forces were organized into armies with Oyama as commander-in-chief; the first army, under Kuroki, was for Korea; the second, under Oku, for the Liao-yang peninsula; three other armies were formed later. No Japanese army could move or be supplied without first obtaining command of the sea; so Togo opened the war on Feb. 8 by a surprise torpedo attack on the ships at Port Arthur, severely damaging two Russian battleships and a cruiser. On Feb. 11 and 12 the Russians lost two moreships, by running on their own mines, and their fleet took refuge under the guns of the fortress. Two Russian cruisers at Chemulpo were sunk on Feb. 9, and the Japanese generals were free to develop their strategy.

Kuropatkin, the Russian commander-in-chief, with the 70,000 men then in Manchuria, had taken up a position on the Yalu river, whence he was soon driven by Kuroki's army, which had landed at Chemulpo on May 1. Oku's army, waiting for the result of the Yalu operations, and with its sea communications further assured by the destruction of Admiral Makarov and his flagship, landed on the Liao-tung peninsula, and on May 21 moved S. and defeated the Russians at Nanshan.

On May 6, the viceroy Alexeieff left Port Arthur, leaving Stössel with 47,000 men to defend the place. By early June Kuroki faced the Russians at Feng-huan-cheng; the 2nd army facing N. was ready to move in the direction of Liao-yang; and Nogi, with a 3rd army, was commencing the siege of Port Arthur. The Russians made a determined effort to relieve it, but were driven back by Oku at the battle of Telissu, June 14-15, and the Japanese captured Kai-

ping on July 9. On July 16 the Japanese formed a 4th army under Nodzu to act in the centre, leaving Kuroki to act on the right.

On Aug. 3 the left and centre captured Haicheng, while Kuroki drove the Russians from the Lan Ho. Here was a pause, owing partly to the weather, but mainly to Oyama's hope that Port Arthur, strenuously attacked, would surrender. The Russians, reinforced to 150,000, thus slightly superior in numbers, were about to take the offensive, when the three reorganized Japanese armies attacked them at Liao-yang in an indecisive battle, July 29 to Aug. 3. The Russians fell back to Mukden. Operations again came to a standstill until Kuropatkin resumed the offensive, but he was badly repulsed in the battle of the Sha Ho, Oct. 9-17. In the neighbourhood of Mukden the exhausted armies, awaiting reinforcements, rested until the surrender of Port Arthur on Jan. 2, 1905, after a desperate and continuous siege. Stössel handed over 39,000 prisoners, but the strenuous attacks of the Japanese had cost the Russians nearly 100,000 casualties.

Russian Naval Losses

At sea, Russia's fortunes were disastrous. After months of blockade, the Port Arthur fleet had put to sea on Aug. 10, 1904, and had finally been defeated by Togo. At nightfall the Russians scattered. Some ships returned to port where they were finally surrendered with the fortress, while the remainder were either sunk or forced into neutral ports, where they were interned. On Aug. 14, Kamimura's squadron had defeated the Vladivostok ships, and the Russian flag disappeared from the Pacific. The only Russian hope of obtaining any naval success then lay in Rozhdestvensky's ships, which were making a laborious voyage from the Baltic, but this fleet was destroyed in Tsushima Strait, May 27-28, 1905. Meanwhile Kuropatkin, still superior in numbers, attacked at Heikoutai, Jan. 26 and 27, before Oku's men from Port Arthur could reinforce Oyama. This was an indecisive battle, but enabled Oyama to collect five armies for the great attack on Mukden, now surrounded by 45 m. of Russian defences.

After Mukden and Tsushima, being threatened with internal disorders, the tsar in June accepted the mediation of the U.S.A., and pourparlers were set on foot, but the war drifted on through July, the Russians slowly falling back.

Peace negotiations were opened at Portsmouth, N.H., on Aug. 9, and by the end of the month the main points were agreed on. Russia was to cede the half of Sakhalin annexed in 1875, surrender her lease of the Kwantung peninsula and Port Arthur, evacuate Manchuria, and recognize Japan's sphere of influence in Korea. Peace was signed on Sept. 5. *Consult* The Russian Army and the Japanese War, A. N. Kuropatkin, 1909.

Russo-Turkish Wars. In the two centuries 1677-1878 the following ten wars were waged between Russia and Turkey. (1) The war of 1677-81 resulted in the recognition of Russia's sovereignty over the Cossacks. (2) In 1689 Russia joined Austria, Poland, and Venice in a coalition against Turkey. By the peace of Constantinople, 1700, Azov was ceded to Russia. (3) Turkey attacked Russia in 1710, surrounded a Russian army on the Prut, and regained Azov by the treaty of the Prut, 1711. (4) In alliance with Austria, Russia declared war on Turkey, 1736, but was obliged to make an unfavourable treaty at Belgrade, 1739.

(5) In 1768 Turkey attacked Russia owing to her interference with Poland. Russia gained victories on the Dniester and Prut and in the Crimea, and by the peace of Kuchuk-Kainarji, 1774, compelled Turkey to recognize the independence of the Tartars, to renounce her suzerainty over Caucasasia, and cede to Russia certain ports on the Black Sea and the right of free commercial navigation in Turkish waters. Turkey reformed the government of Moldavia and Wallachia, and granted Russia the right of intervention on behalf of Christians. (6) Turkey, in 1788, again unsuccessfully attacked Russia, with whom Austria was allied, and by the treaty of Jassy, 1782, Russia acquired the Crimea and the Dniester frontier.

(7) Another war began Jan. 7, 1807, mainly as a result of the dismissal by Turkey of the pro-Russian hospodars of Moldavia and Wallachia. Russia occupied these provinces, but the revolt of the janissaries and the consequent palace revolution in Constantinople prevented a settlement. The armistice arranged, Aug. 24, 1807, after the peace of Tilsit, was followed by a renewal of the war in April, 1809, when the Russians advanced into the Balkans, and on Feb. 10, 1811, took Belgrade. By the treaty of Bukarest, May 28, 1812, Turkey ceded parts of Bessarabia and Moldavia to Russia.

but recovered control of Serbia, while pledging herself to respect the rights of the inhabitants.

(8) The Greek War of Independence, and Russia's share in the battle of Navarino, Oct. 20, 1827, brought about another war, April 26, 1828, in which the Russians took Varna and Silistria, and advanced to the neighbourhood of Adrianople. The treaty of Adrianople, Sept. 14, 1829, secured the independence of Greece and the virtual independence of Moldavia and Wallachia, afterwards Rumania, while Russia gained some districts in the Caucasus, and free commercial navigation of the Black Sea. (9) The war of 1853-56 is described under Crimean War.

(10) The last and most important war was occasioned by the atrocities attending the Turkish suppression of a Bulgarian rebellion in 1876. Serbia having declared war against Turkey and being defeated, the tsar, Alexander II, came in on April 24, 1877, and the Russians immediately advanced on Bukarest, crossed the Danube and seized Timova, which gave command of a pass over the Balkans. To prevent their pushing on to Serbia, Osman Pasha, who commanded some 30,000 men at Widin, marched to Plevna (*q.v.*), where he could command the Russian bridge over the Danube. Here he repulsed the Russian attack of July 30, and was besieged for over four months, defeating the Russians in gallant sorties, and was prevented from gaining an overwhelming victory only by the timidity and incompetence of his government, which refused to permit him to take the offensive. Meanwhile Suleiman, with an army of 30,000 men, advanced from S. of the Balkans, attacked the Shipka Pass (*q.v.*), and, after a bloody battle, was repulsed, settling down to hold the S. end of the pass.

As winter approached, the Russians concentrated on taking Plevna, which fell on Dec. 10. Confusion and maladministration thwarted every attempt of the Turkish army, and the Russian troops released by the fall of Plevna were skilfully used by their generals. The Shipka Pass was crossed, Adrianople taken, and by Jan. 30, 1878, the Russian lines stretched from the Black Sea to the Sea of Marmara, thus isolating Constantinople. The next day an armistice was signed, peace being concluded by the treaty of San Stefano (*q.v.*), March 3. See Osman Pasha; Plevna, Siege of; Russia; Turkey.

Rust. In metallurgy, the red or brown product of corrosion of iron. Chemically, it is hydrated ferric oxide, or ferric hydroxide, sometimes with an admixture of ferric carbonate. Iron readily combines with oxygen, and as oxygen is abundant in air and water, iron exposed to it rapidly changes its composition. Dry iron in dry air does not rust. On the other hand, iron immersed in water does not rust so rapidly as when exposed to the air. Pure iron exposed to pure water or pure oxygen does not rust appreciably. Water which falls on the surface of iron takes on a greenish tinge, produced by the combination of the oxygen in the water with the iron; later it assumes the reddish-brown colour of rust. The rust does not stick to

the iron, but is suspended in the water, becoming a coating on the iron only when the water has evaporated. Although rust is iron oxide, rust is not a simple case of oxidation; it is an electrolytic action, the water having in solution an electrolyte; as some parts of the iron are more aerated than others

there is a differential aeration, which causes a differential potential for the passage and deposition of the ferric oxide or hydroxide. That the difference in potential is due to both water and air is proved by the fact that a piece of iron dipping below water always rusts at the surface of the water, where the oxygen and carbon dioxide in the air combine with the water. Iron remains free from rust in an atmosphere containing water vapour, provided the vapour does not condense on the iron. Rusting may be temporarily prevented by coating the iron with paint to exclude from its surface air or water, but the paint must be constantly renewed. Amalgamating chromium with the iron prevents rust, but the process is not applicable to large surfaces.

Rustchuk (Bulg. *Ruse*). Town of Bulgaria. Important as a rly. and road junction, it stands at the confluence of the Lom with the Danube, with Rumania lying opposite, and about 140 m. N.W. of Varna, with which it is connected by rly. Under Turkish rule it was a great fortress, and figured in the wars with Russia. It is the seat of a Bulgarian archbishop and an Armenian bishop, and has a court

of appeal. It was occupied by the Russians, Sept. 8, 1944, after their declaration of war on Bulgaria of Sept. 5. Pop. 49,447.

Rustenburg. Town of the Transvaal, S. Africa. It is 65 m. by rail from Pretoria, under the Magaliesberg Mts., which form an extensive half-circle round it. There are a court house and several churches. A statue of Kruger, by the French sculptor, Achaud, stands in the town hall gardens. The climate is hot, and Rustenburg is a centre for tobacco, orange, and cotton growing. Founded in 1850, it was occupied by the British in June, 1900. Diamonds were found in 1932 in the Zwartdruggens area, near the town. Pop. 9,000.

Rust Fungi (*Uredinales*). Family of plant parasites. A familiar

Rust Fungi. Hawthorn twig attacked by *Raestelia* stage of *Gymnosporangium*

example is the rust of wheat. The vegetative portion of the fungus exists as fine threads traversing the spaces between the host cells. From these, branches enter the cells and feed upon their contents. They produce several kinds of fructification, often on different hosts, which burst through the cuticle

and these forms of the same fungus were formerly considered distinct species. Thus, the pretty little cluster-cups on leaves of the barberry were formerly known to mycologists as *Aecidium berberidis*. They are now known to be a stage in the life-cycle of wheat rust (*Puccinia graminis*).

The spores (aecidiospores) produced on the barberry will not germinate on the barberry, but they will do so on wheat, barley, and rye, when they produce the rust known as *Puccinia graminis*. The spores of the latter, though they produce rust on other wheat plants, when transferred to barberry produce cluster-cups. Another species produces cluster-cups on hawthorn and allied plants, and was known as *Raestelia lacerata*. Its spores germinate on juniper and produce long tongues of jelly known as *Gymnosporangium clavariiforme*, whose spores produce the cluster-cups of hawthorn. Other species exhibit a similar dimorphism.

Rustington. Seaside resort 2 m. E. of Littlehampton, Sussex, England. Of the church the tower and some arches are Norman, while the chancel and other features go back to the 13th cent. Sir Hubert Parry lived and died here.

Rutaceae OR RUE FAMILY. Large family of trees and shrubs (a few herbs), natives of the warm and temperate regions. They have mostly opposite leaves, dotted with glands which often yield strong odours. The flower-parts are in fours or fives, and the fruits are capsules or berries, the latter sometimes very large and juicy, as in the orange, shaddock, and Bombay quince (*Agele*). Well-known genera are *Ruta* (rue), *Citrus* (orange, lemon, lime), *Choisya*, and *Correa*.

Ruth, BOOK OF. O.T. book so named after the chief character in the narrative. A famine compelled Elimelech, an Ephrathite of Bethlehem-Judah, to take his wife Naomi and their two sons to the country of Moab, where one of the sons married Ruth. When Naomi, after losing her husband and her two sons, returned to her own land, Ruth, her daughter-in-law, insisted on going with her. Here a Hebrew named Boaz, accepting the duty of the next-of-kin, married her, and she became the great-grandmother of David. The action is placed in the period of the Judges, and most of the narrative is written in a pure and early style of Hebrew, but the book would seem to have been edited later. The purpose of the story may have been either to emphasise the duty of the next-of-kin to marry a childless widow, or to justify the legitimacy of intermarriage with foreigners. But the character of Ruth has become especially memorable for her disinterested love.

Ruth, GEORGE HERMAN (d. 1948). American baseball player, known as Babe Ruth and considered the greatest exponent of the game. He played for Boston Red Sox, 1914-19, then for New York Yankees, retiring 1935. Known early as a pitcher, Ruth became a celebrated hitter, who made the record aggregate of 714 home runs. He was also a national figure, and a film about his career had just been shown before he died, aged 53, Aug. 16, 1948. See *Baseball* illus. p. 968.

Ruthenia. Name given to a region of Central Europe, formerly part of Austria-Hungary. Ruthenia was the name also of a prov. of Czecho-Slovakia from 1918, sometimes called Sub-Carpathian Russia and Transcarpathian Ukraine. The cession of territory to Russia in 1945 by Czecho-Slovakia and Poland, and by Rumania in 1947, united the area with the Ukraine S.S.R.

The people of the area, called variously Ruthenes, Russianians, Russniaks, and Red Russians, inhabited the former areas of E. and central Galicia, N. and W. Bukovina, and the E. valleys of the Carpathians. The total Ruthenian pop. was 3,800,000.

In a great part of Galicia the Ruthenes, who were a very poor and backward people, formed the mass of the labouring population, and were dominated by the Polish landed gentry of the old Austro-Hungarian empire. They were conquered by Casimir I of Poland about 1350, although many migrated into Hungary.

The Ruthenian Church, the largest of all Uniat Churches, submitted to Rome at the Synod of Brest-Litovsk in 1596, and was extended in 1700 and 1702. It had an archbishop at Lvov, and used the Old Slavonic liturgy. The church was suppressed in Russian Poland in 1873 and in all Ruthenia in 1948.

Ruthenium. One of the rare metallic elements of the platinum group. Its chemical symbol is Ru; atomic weight, 101.7; atomic number 44; electrical conductivity, 16 (silver being 100); crystal form, close-packed hexagonal, with lattice constants $a=2.6984$ and $c=4.2730$; melting point, $2,400^{\circ}\text{C}$. It is hard, brittle, and one of the least fusible of metals, but the most easily oxidised of the group. White in colour, with greyish tinge, it resists acids, but is attacked by fluorine and chlorine. The metal is a powerful catalyst, absorbing gases readily. It was first isolated by Claus in 1845, and occurs in platinum ores of the Urals, hence its name, after Ruthen, Russia, in association with osmium and iridium ores, and in laurite. The chief present-day source is the low-grade copper-nickel ores at Sudbury, Ontario.

Rutherford, DANIEL (1749-1819). Scottish scientist. Born in Edinburgh, Nov. 3, 1749, he graduated M.D. from the university in 1772 with a dissertation establishing the distinction between carbonic acid gas and nitrogen. He was the first to discover that nitrogen was present in the air, and his research provided the basis for later work on the constitution of natural gases. In 1786 he was appointed professor of botany at Edinburgh university and keeper of the city gardens. He died Nov. 15, 1819.

Rutherford, ERNEST RUTHERFORD, BARON (1871-1937). British physicist. He was born at Nelson,

Lord Rutherford,
British physicist

N.Z., August 30, 1871, and educated at state schools there, Canterbury College, Christchurch, and as a scholar at Trinity College, Cambridge (1894-98), where he worked with

J. J. Thomson. Before his arrival in England he had already proved himself an ingenious experimenter by constructing a novel detector of electric waves, which he described in a communication to the Royal Society in 1897. His earliest work on radio-activity, the subject with which his name will always be associated, was done at McGill University, Montreal, where he was professor of physics, 1898-1907. Returning to England to take the chair of physics at Manchester, which he occupied until 1919, he was awarded the Nobel prize for physics in 1908 in recognition of his discoveries in the field of atomic structure. Knighted in 1914, he was in 1919 appointed Cavendish professor of physics at Cambridge, a position he held until his death. In 1923 he was awarded the O.M., and in 1931 he became Baron Rutherford of Nelson. He was president of the Royal Society during 1925-30, and held many important positions in the world of applied science. He wrote several books on atomic structure. He died Oct. 19, 1937, leaving no successor to his title.

Rutherford must be considered one of the greatest physicists of all time; his work on atomic structure revolutionised the outlook of men of science all over the world. The fact that atoms could break down spontaneously was known before his time; but to him is due the suggestion and the demonstration of artificial atomic disintegration. He was an experimenter of the first rank, and he inspired his collaborators and his students with his own enthusiasm. The establishment of the reality of the atomic nucleus, and the consequent parallelism between the solar system and the atomic system, which proved one of the most fruitful ideas in science, was due almost entirely to his imaginative inspiration, and, although the actual discovery was not his, he was the first to suggest the probability of the existence of the neutron. See *Atom*; *Radio-Activity*. Consult Rutherford: Life and

Letters, A. S. Eve, 1939; Man of Power, I. B. N. Evans, 1939.

John Rowland

Rutherford, MARK. Pseudonym of the British novelist William Hale White (1831-1913). Born at Bedford, he was educated for the Congregational ministry, but abandoned that career to earn his living by his pen. Later he became assistant director of contracts under the Admiralty. His early novels, *The Autobiography*

Mark Rutherford,
British novelist

of Mark Rutherford, 1881; *Mark Rutherford's Deliverance* 1885; and *The Revolution in Tanner's Lane*, 1887, though neglected at first, gradually secured recognition for their powerful handling of moral and other problems and revelation of the author's perplexities. He wrote later *Miriam's Schooling*, 1890; *Catherine Furze*, 1894; *Clara Hopgood*, 1896; *Pages from a Journal*, 1900; *More Pages*, 1910. He died March 14, 1913.

Rutherford, SAMUEL (c. 1600-61). Scottish divine. He was born at Nisbet, Roxburghshire, and educated at Edinburgh university, where he became professor of humanity in 1623. A few years later he was deprived of this office, and became a minister at Anwoth, where his attacks on Arminianism caused the high commission at Edinburgh to silence him in 1636; but two years later he was appointed professor of divinity at St. Mary's College, St. Andrews, and in 1651 rector of the university. A prominent opponent of the government, he especially condemned the treaty with Charles II. For this he was deprived of office; and his book *Lex Rex* was publicly burnt by the common hangman. He died March 23, 1661. Rutherford is best known by his letters, first published in 1664. *Consult Lives*, A. Thompson, 1884; R. Gilmour, 1904.

Rutherglen. Royal and mun. burgh of Lanarkshire, Scotland. It stands on the left bank of the Clyde, 2 m. S. of Glasgow, with a station on the Glasgow-London line. The chief buildings are the parish church and the town hall, both modern. Industries in-

Rutherglen arms

clude the making of chemicals, cotton, paper, pottery, rope, and light engineering products; also dyeing and, formerly, shipbuilding. It was made a royal burgh in 1126, including until 1226 part of Glasgow. It gives its name to a co. constituency. Pop. est. 25,000.

Ruthin OR **RUTHYN.** Mun. borough and market town of Denbighshire, Wales. It stands on the Clwyd, 8 m. by rly. S.E. of Denbigh. S. Peter's church, of the 14th century, has cloisters, and was once collegiate. The grammar school was founded in 1595. A limestone block in the market place is traditionally associated with King Arthur. The town grew up around a castle built by the English in the 13th cent. and known as the Red Castle (Welsh *rhudd din*). Market day, Mon. Pop. 3,690.

Ruthven. Name of a noble Scottish family. Sir William Ruthven was made a peer in 1487. His great-grandson Patrick, the 3rd Lord Ruthven (c. 1520-66), was a leader of the party that slew Rizzio, and he fled to England to escape Mary's vengeance. His son William (c. 1541-84), the 4th lord, arranged the raid of Ruthven, and in 1581 was made earl of Gowrie, but with his attainder and execution in 1584 the titles of the elder branch of Ruthven became extinct. In 1651 Charles II, then in exile, granted the title of Lord Ruthven to Sir Thomas Ruthven, grandson of the 2nd Lord Ruthven, from whom the title has come to the present holder, the 9th baron (b. June 6, 1870), who belongs to the family of Hore-Ruthven. A noted member of the family was Patrick Ruthven (d. 1651), who served under Gustavus Adolphus, and was made earl of Brentford by Charles I. In 1944 the 2nd son of the 8th baron Ruthven was created Viscount Ruthven of Canberra and 1st earl of Gowrie (q.v.). *Pron.* Rivven.

Ruthven, RAID OF. Name given to a plot for the seizure of James VI of Scotland. It was carried out in 1583 by William Ruthven, earl of Gowrie, who, with some associates, induced the king to leave Perth and go to Ruthven Castle, where he remained a prisoner for some months, his captors managing the affairs of the kingdom.

Ruthwell. A village, former burgh, of Dumfriesshire, Scotland. It is 5 m. by rly. W. of Annan. It is famous because of its cross. Dating from the 7th century, this has carvings of the Crucifixion on the front and back and some verses of the extant poem. The Dream of

Ruthwell. The 7th century Celtic Cross

the Holy Rood, attributed to Caedmon, in runic letters on the sides. Regarded as a monument of idolatry, the cross was broken by order of the general assembly in 1642, but was restored in 1802.

Rutile (Lat. *rutilus*, reddish). In mineralogy, common crystalline form of titanium dioxide, TiO_2 ; anatase and brookite have the same composition. Rutile occurs as reddish-brown to black tetragonal crystals or grains and is found as an accessory mineral in igneous rocks of many kinds and their metamorphic derivatives. The economically important deposits (see Titanium) are: (a) segregations in igneous rocks, such as asyenite, gabbro, etc., in Virginia, Canada, Norway, and elsewhere; (b) in peculiar pegmatitic dykes with apatite and ilmenite; and (c) as an important constituent of beach sands derived from the weathering of rocks, as in Florida, India, and Australia.

Rutland. County of England, the smallest in the country. Wholly inland, it is bounded by Lincoln-

Rutland. Map of the smallest county of England, with an area of 152 sq. m.

shire, Leicestershire, and Northamptonshire, and has an area of 152 sq. m. It is divided into two parts by the Gwash or Wash, which crosses the county to join the Welland, which forms the S.E. boundary. The upper portion is an elevated plateau; the lower comprises a series of valleys relieved by hills. There are remains of the forest of

Lyfield. An agricultural area, much of the land is permanent pasture; many cattle and sheep are reared, wheat is grown, and cheese is made. Oakham, the birthplace of Titus Oates, is the county town and Uppingham, with its school, is in the county. It is in the diocese of Leicester, and is included in the county constituency of Lincolnshire called Rutland and Stamford. It is a hunting county, the Cottesmore country being in the shire. Pop. 17,401.

LITERARY ASSOCIATIONS. These are connected with distinguished residents rather than natives, though Vincent Wing (1619-68), a celebrated writer on astrology and astronomy, was born at N. Luffenham. Jeremy Taylor was for a few years rector of Uppingham. Abraham Wright (1611-90), a miscellaneous writer, was in his later years vicar of Oakham; his son, James Wright (1643-1713), was a noted antiquary, and wrote a History of Rutland, 1684. Another historian of the co., Thomas Blore (1764-1818), lived for a time at Manton, and published his History of Antiquities of Rutland in 1811. William Whiston (1667-1752), translator of the works of Josephus, died and is buried at Lyndon. Edward Bradley, better known by his pen-name of Cuthbert Bede, was rector of Stretton, 1871-83. The Victoria History of the co. appeared in 1908.

Rutland. City of Vermont, U.S.A., the co. seat of Rutland co. It stands on Otter Creek, 67 m. S.S.E. of Burlington, and is served by the Delaware and Hudson and other rlys. The leading industry is the working of the great marble quarries in the neighbourhood. Settled in 1770, from 1777 to 1791 Rutland was the capital of the independent nation of Vermont. Pop. 17,082.

Rutland, EARL AND DUKE OF. English title borne by the family of Manners since 1525. Before then several princes had been made earl of Rutland, the best known being Richard Plantagenet, who became duke of York, and was the father of Edward IV. His granddaughter married George Manners, Baron Ros, and Thomas Manners was their son.

A prominent courtier, Thomas Manners received from Henry VIII Belvoir Castle and lands in Leicestershire, and was made an earl in 1525. His descendants were important figures in Tudor and Stuart times, especially Henry, the 2nd earl, and Edward, the 3rd earl, both being among Elizabeth's

courtiers and servants. John, the first earl's second son, obtained Haddon Hall by his marriage with Dorothy Vernon, and when the elder line became extinct one of his descendants inherited the earldom, thus bringing Haddon and the Derbyshire estates to it.

John, the 9th earl (1638-1711), was made marquess of Granby and duke of Rutland in 1703, these honours being rewards for his loyalty to Queen Anne. The third duke was the father of the soldier marquess of Granby, whose name is frequently found on inn signs. Charles, the 4th duke (1754-87), was a politician. A close friend of Pitt, he was lord-lieutenant of Ireland. John Henry, the 5th duke, was a society figure, and his younger son was the Tory politician, Lord John Manners, who himself became duke in 1888. His son, who became the 8th duke in 1906, married Violet Lindsay, who, as duchess of Rutland, was a leading figure in London society. The 9th duke made Haddon Hall once more into a family residence. In 1940 Charles John Robert Manners (b. May 28, 1919) became 10th duke. The family estates are in Leics and Derbyshire. Belvoir Castle (*q.v.*) is the duke's chief residence, and the eldest son bears the courtesy title of marquess of Granby.

Rutland, JOHN JAMES ROBERT MANNERS, 7TH DUKE OF (1818-1906). British statesman. Born Dec. 13, 1818, he was educated at Eton and Cambridge. M.P. for Newark, 1841-47, Lord John Manners, who formed one of Lady Blessington's *entourage*, became a prominent member of Disraeli's Young England Party (*q.v.*), and a firm opponent of the Manchester school. Breaking with Disraeli in 1845, he was in Derby's cabinets of 1851, 1858, and 1866, was postmaster-general, 1874-80 and 1885-86, and chancellor of the duchy of Lancaster, 1886-92, succeeding to the dukedom in 1888. Disraeli made him the prototype of Lord Henry Sidney in *Coningsby*, and of Waldershare in *Endymion*. He died Aug. 4, 1906.

Rütli or GRÜTLI. Legendary birthplace of Swiss independence. It is a meadow on the W. shore of the Bay of Uri, Lake of Lucerne, in canton Uri, Switzerland, with a landing-place for steamers from Brunnen to Flüelen. Here, according to a tradition, well known through Schiller's Wilhelm Tell, on Nov. 7, 1307, Stauffacher, Walter Furst, Arnold, Melchtal, and 30 others from Uri, Unterwalden, and Schwyz, swore to drive the

Austrian oppressors from their country, thereby founding the Swiss League. The property of the school children of Switzerland, the spot is marked with commemorative monuments.

Rutting Season. The annual period in the life of many animals. The term is especially used of mature male deer, and applies usually to the autumn, during which they mate with the hinds. At this time a stag will obtain control of a number of females and actively prevent access of other males. Fights may ensue when use is made of the antlers, at this stage fully developed. Such changes in behaviour and form are considered to be controlled by sex hormones.

Ruvigny. Name of a famous French family which settled in England after the revocation of the edict of Nantes. Henri de Massue, marquis de Ruvigny (1605-89), was a soldier who showed marked abilities in Savoy and Lorraine, 1629-30, Italy, 1637, and at Lens, 1648, and was made lieut. in 1652. A Protestant, he was deputy-general of the Huguenots, 1653-78. In 1680 he became naturalised in England, where he had held diplomatic posts, and was a councillor of William III. He died at Greenwich in July, 1689.

His son Henry, born in Paris, April 9, 1648, served in the French army and was engaged in various diplomatic negotiations for Louis XIV. In 1685 he left France, entered the English cavalry, served in Ireland, and was made Viscount Galway in 1692. He fought in Flanders, 1693, Italy, 1694, and was lord justice of Ireland, 1697-1701, being created earl of Galway in 1697. He commanded troops in Portugal and Spain, 1704-07, was ambassador at Lisbon, 1708-10, and died in retirement, Sept. 3, 1720.

Melville Amadeus, 9th marquis de Ruvigny, born in London, April 26, 1868, made a considerable reputation as a genealogist. His many publications included *The Jacobite Peerage*, 1904; *The Blood Royal of Britain*, in several vols., 1903-08; *The Titled Nobility of Europe*, 1914. A legitimist in principle, he was created knight of the order of Charles III of Spain in 1898. He died Oct. 6, 1921.

Ruvo di Puglia (anc. *Rubi*). City of Italy, in the prov. of Bari, 21 m. W. of Bari. It has a curious 12th-13th century Norman cathedral, with gallery and 15th century frescoes. San Giovanni is an old circular baptistry. The Palazzo

Jalta holds a collection of the vases and coins taken from Apulian tombs. The principal occupation is the manufacture of pottery. Pop. est. 24,000.

Ruwenzori. Mountain range of Africa. The peaks lie between Lakes Albert and Edward in the Uganda Protectorate, and have been identified by some with the fabled mountains of the moon of the ancients. The length of the range is about 70 m., with a minimum breadth of about 30 m. The mountains fall steeply on the W. to the Central Rift Valley traversed by the Semliki river. The existence of Ruwenzori was first made known by Stanley during his expedition of 1887-89. The main peaks are Mts. Luigi di Savoia, Baker (15,988 ft.), Stanley (16,815 ft.), Speke (16,080 ft.), Emin (15,797 ft.), and Gessi (15,647 ft.). The Ruwenzori range feeds the four lakes, Edward, George, Albert, and Victoria, as well as the Semliki river which connects Lakes Edward and Albert. On the W. side of the range is the great Ituri forest, the greater part of which is within the Belgian Congo.

Ruysdael, JAKOB IZAAK VAN (c. 1623-82). Dutch painter. Born at Haarlem, he studied surgery as a youth, but took up painting on the advice of Nicolas Berchem. He became a citizen of Amsterdam in 1659, but the proceeds from his art were so poor that he was forced to apply to the Mennonite almshouse at Haarlem. He painted the environs of Haarlem, and romantic woods, streams, waterfalls, and ruins, becoming one of the greatest landscapists of his time. His works are well represented in the National Gallery. He died at Haarlem, March 14, 1682. See Dutch School illus., p. 2879.

Ruyter, MICHAEL ADRIANSZON DE (1607-76). Dutch sailor. He was born at Flushing, March 24, 1607. In 1640 he commanded the Dutch fleet against Spain, whom he defeated at the battle off Cape St. Vincent, Nov. 3, 1641.

M. A. de Ruyter,
Dutch sailor

From 1653 he was engaged in various adventures in the Mediterranean and elsewhere, but the climax of his career was his appointment to command the Dutch fleet which sailed against England in 1666. Defeating Monk off the North Foreland, June 1-4,

he chased the English up the mouth of the Thames. The following year he again entered the Thames, burnt Chatham dockyard, and for a while threatened London. His next engagement of importance was in 1672 in Southwold Bay, where he fought the French and English fleets, but, failing to win a decisive victory, withdrew before he was himself jeopardised. The remainder of his life was spent at sea, in constant battles against the French, in one of which he was mortally wounded off Messina, dying at Syracuse, April 29, 1676. *Consult* Lives, G. Grinnell-Milne, 1896, P. J. Blok, 1933.

Ruzicka, LEOPOLD (b. 1887). Swiss chemist. He was educated at the technical high school, Karlsruhe, and for some years occupied the chair of organic chemistry at the federal institute of chemistry at Zurich. He carried out valuable research work on polymethylenes and the higher terpene compounds, for which he was awarded, jointly with A. Butenandt (*q.v.*), the Nobel prize for chemistry in 1939. In 1942 he became a foreign member of the Royal Society.

Ryan. Loch or inlet on the N.W. coast of Wigtownshire, Scotland. It extends for 8 m. in a S.E. direction from the Firth of Clyde to Stranraer. In width it is from

Ryan. The Scottish loch from the tower of Sheuchan Church, near Stranraer

1½ to 3 m. Oyster culture has been carried on in the neighbourhood.

Ryazan. Town of R.S.F.S.R. and capital of the region of the same name. It stands on the Trubezh, near its junction with the Oka, 120 m. S.E. of Moscow, and is the seat of a Greek Catholic archbishop and an important rly. centre. In the Church of the Elevation of the Cross were buried 16th century princes and princesses of Ryazan. The town trades in grain, cattle, salt, and timber. Pop. 95,358.

Rybinsk. Town of R.S.F.S.R. It is in the region and 50 m. N.E. of Yaroslav, on the Volga and the Yaroslav-Rybinsk rly. There are iron foundries, rope works, and flour mills. Owing to its position at the head of three canal systems, Rybinsk is one of the most promi-

nent river ports in Russia, and is a centre for the caviar industry. Pop. 139,011.

Rydal Mount. Residence at Grasmere, once the home of Wordsworth. It overlooks Rydal Water, and here the poet lived from 1813 until his death, April 23, 1850. See Wordsworth.

Rydal Water. Lakelet of Westmorland, England. It is situated between Grasmere and Windermere, and is 1,000 yds. long and 500 yds. wide. Near the E. end is Rydal village. In the grounds of the nearby Rydal Hall are waterfalls. See Lake District.

Ryde. Mun. bor. and watering-place of the Isle of Wight, England. It stands on the N.E. coast 4 m. S.W. of Portsmouth and 8 m. W. of Newport, and is connected with Portsmouth and other ports by a regular steamboat service. The chief buildings are the modern church of All Saints and the town hall. There are a long pier, excellent sands, and public gardens. The Royal Victoria Yacht Club has a club house here. Until the 19th century Ryde was a fishing village, the name being a corrup-

Ryde arms

tion of La Rye. In 1868 it was made a corporate town. About 2 m. from the town are the ruins of Quarr Abbey, a Cistercian house founded in 1131. The modern abbey belongs to the Benedictines who settled here when expelled from France. Pop. 19,624.

Ryder, CHARLES HENRY DUDLEY (1868-1945). A British surveyor. Born June 28, 1868, he was educated at Cheltenham College and commissioned in the Royal Engineers in 1888. In 1895 he was assistant surveyor to the Mekong boundary commission, and in 1898 was in Yunnan, mapping and reporting on the province. Within a year Ryder covered 1,400 m. of new routes, his work becoming the basis of maps for the survey of India. In 1904 he headed the party sent to

Lhasa to fix the boundaries of Tibet, and later led the expedition that surveyed 40,000 sq. m. between Lhasa and British India, during which the height of Everest was established. Chief surveyor to the Turko-Persian boundary commission of 1913, he drew the frontier from the Persian Gulf to Mt. Ararat. He was surveyor-general in India, 1914, and in the First Great War worked in Mesopotamia (Iraq). Ryder retired in 1924, and died July 13, 1945.

Ryder Cup. Trophy competed for by golf professionals representing Great Britain and the U.S.A. It was presented by Samuel Ryder (d. 1936) of St. Albans. The first match was held in 1927, at Worcester, Mass., and others in each odd-numbered year up to 1937, in the two countries alternately. The series was resumed in 1947. Four foursomes and eight singles are played to decide possession of the cup, which came to Great Britain in 1929 and 1933.

Ryder Memorial Prize. Naval prize founded in memory of Admiral Sir Alfred Phillips Ryder, who died April 30, 1888. It consists of a sum of about £160, the dividend accruing from which is expended annually in purchasing a prize of a book, or books, awarded to the lieutenant in the British navy who takes first place in French at the annual examination in foreign languages.

Rye (*Secale cereale*). Cereal largely grown for grain in North Europe. The so-called "black" bread is made from the flour. In Great Britain it is nearly always cultivated as a forage crop for spring feed. Rye is more tolerant of poor soil than the other cereals. There are summer and winter varieties. The former is sown in spring and matures quickly, though it does not give a large yield. Winter rye, when cultivated as a grain crop, should be put in two or three weeks before wheat, and drilled at the rate of two bushels per acre. The tilling and manuring are as for wheat. It ripens at the end of July or early in Aug. The straw is particularly valuable for thatching, and also makes good litter, but its feeding value is low. Owing to the fact that the grain is liable to be infected with the ergot fungus which can cause abortion, there is some risk in feeding it to pregnant animals.

Rye. River in the N. Riding of Yorkshire, England. It rises in the Cleveland Hills, and takes a S.E. direction for 35 m. to its junction

with the Derwent at Wykeham, 3 m. N.E. of Malton. Rievaulx Abbey stands on the left bank.

Rye. Mun. borough of Sussex, England, one of the Ancient Towns. It is on the Rother, about 2 m. from the coast. By rly. it is 72 m. S.E. of London. The chief objects of interest are the large church of S. Mary, a fine cruciform building, the Ypres

Rye arms

tower built in the 12th century, the Land Gate, and other remains of the fortifications. There are a number of old houses, and the appearance of the town is picturesque. The Mermaid Inn and the old hospital are famous. Pockock's school dates from the 17th century, and there are remains of both a Carmelite and an Augustinian foundation, the former being a small chapel. Some trade is conducted from a harbour on the estuary, and sheep and cattle fairs are regularly held.

Rye was a flourishing port soon after the Norman Conquest. It was governed by a mayor and jurats, retaining its old constitution until 1834. The silting up of the harbour has caused the sea to recede, destroying the commerce of the place. From 1366 to 1885 it was separately represented in parliament. Market day, Wed. (alternate). Pop. 3,947.

Rye Grass (*Lolium perenne*). Perennial grass, earlier known as ray-grass, and useful not only in permanent pasture, but in mixed grass farming. It should be

sown fairly deeply, in April or May, at a rate of 6 lb. per acre. There are five other species, but apart from the native sorts, the Italian varieties are the only ones worthy of consideration. Mixed with clover in the proportion of 25 p.c., rye grass has long been used to make a good pasture for sheep.

Rye Grass. Leaves and flowers

Rye House Plot. Abortive plot to murder Charles II and his brother James, duke of York, in 1683. The name is derived from Rye House, a lonely residence near Hoddesdon, Herts, and the plan was to murder the royal brothers as they returned from Newmarket to London.

Its leader appears to have been an old soldier named Rumbold. Informers gave warning to the authorities, and a number of

Rye House, Herts, from a print of 1781

Rye, Sussex. Mermaid Street, showing the famous Mermaid Inn on left. Top, 14th. cent. Land Gate in the Town wall

arrests were made. Three men were promptly hanged, and four more important persons, Lord William Russell, Algernon Sidney, the earl of Essex, and John Hampden, were arrested and charged with forming a council of six for the purpose of organizing an insurrection, the others

being the duke of Monmouth and Lord Howard. Russell and Sidney were beheaded, Hampden was heavily fined, and Essex committed suicide. Rumbold escaped. Rye House still exists, though fallen into some decay, and spoilt by being exploited as a popular resort, with dance hall, tea gardens, etc., as well as serving as a museum. For many years the Great Bed of Ware, referred to by Shakespeare, was housed here.

Rykov, ALEXEI IVANOVICH (1881-1938). Russian politician. He was born at Saratov, educated at Kazan university, and imprisoned several times for sedition under the tsarist regime. Joining the Bolsheviks in 1905, he was a member of the Politbureau from soon after the 1917 Revolution until 1929. Opposition to J. V. Stalin's policy of full collectivisation then led to his expulsion, but he was quickly readmitted as commissar of posts and telegraphs. Rykov was imprisoned in 1936, suspected of Trotskyist sympathies. Tried next year by the central committee of the party and found guilty of betraying the Communist cause, Rykov was executed on March 15, 1938.

Rylands, JOHN (1801-88). British merchant. Born at St. Helens, Feb. 7, 1801, he was educated

John Rylands,
British merchant

at the grammar school there. In 1819 his father and elder brother founded a cotton manufacturing business at Wigan, in which John soon became a partner. In addition to owning factories where textiles of all kinds were manufactured and prepared, the firm entered business as merchants in Manchester and London. From 1847 John was head of the enterprise until it was made a limited co. in 1873. He helped to finance the Manchester ship canal. Rylands died at Stretford, Dec. 11, 1888.

Rylands Library, THE JOHN. Library in Manchester, erected, equipped, and endowed by Enriqueta Augustina Rylands in memory of her husband (v.s.). Situated in Deansgate, and built in the later Gothic style by Basil Champneys, it was dedicated to the public, Oct. 6, 1899. Of its 300,000 books and MSS., the nucleus was the Althorp Library, among notable additions to which were the 6,000 illuminated and other MSS.

of the Bibliotheca Lundesiana of the earl of Crawford. Upwards of 2,500 volumes in the library were printed before 1501, including 60 Caxtons, 800 Aldines, and many rare editions of the Bible and of Greek and Latin, Italian and English classics, exemplifying the evolution of the arts of printing and binding. See Library.

Rymer, THOMAS (1641-1713). English critic and historian. Born at Yafforth, Yorks, and educated at Sidney Sussex, Cambridge, he was called to the bar, but most of his time was devoted to literature. Criticism of the drama was his chief interest, his works in this connexion being *The Tragedies of the Last Age Considered*, 1678, and *A Short View of Tragedy*, 1693. Rymer's real contribution to posterity is his *Foedera*, a work he compiled after being appointed historiographer to the king in 1692. It is a collection of information regarding leagues and treaties to which England was a party; 15 vols. came out before Rymer died in London, Dec. 14, 1713.

Rymill, JOHN RIDDOK (b. 1905). Australian explorer. Born at Penola, S. Australia, March 13, 1905, he was educated at Melbourne grammar school and then joined his father in managing the family sheep station. Interested in Arctic and Antarctic exploration, he went with the Cambridge university expedition to Canada in 1929, the British Arctic air route expedition to Greenland in 1930-31, and with Watkins to the same country in 1932-33. Leader of the British Graham Land expedition to the Antarctic, 1934-37, he was awarded the founder's medal of the Royal Geographical Society, and in 1939 he received the David Livingstone centenary medal of the American Geographical Society for his contribution to the knowledge of the S. hemisphere. In 1938 he published *Southern Lights*, an account of his discoveries. See Antarctic Exploration, p. 483.

Ryot (Arab. *ra'yat* from *ra'a*, to pasture). Indian occupier of the soil. To Europeans a ryot is a peasant holder of land; the Indian meaning is a subject as distinguished from a noble.

Ryswick, TREATY OF. Treaty which in 1697 ended the European war that had raged since 1689.

Ryswick is a village 2 m. S. of The Hague, where meetings took place between the representatives of France, England, the Empire, and the Netherlands. The treaty was signed Sept. 20, 1697, by England, Spain, and the Netherlands. The emperor refused at first to agree, but on Oct. 30 came into the peace. The treaty was a humiliation for France, as Louis XIV surrendered all he had taken since 1679 except Strasbourg, but including the duchy of Lorraine and fortresses on the Rhine. He recognized William III as king of England, and promised to cease supporting James II. To him, on the other hand, Nova Scotia and Pondicherry were restored.

Ryti, RISTO (b. 1889). Finnish president. From Helsinki university he went in for the law. A deputy from 1919 and a leading member of the Progressive party; he was minister of finance 1921-24, and governor of the bank of Finland 1923-45. Prime minister in 1939, he was next year elected president, and approved of Finland's alliance with Germany against Russia. He resigned in 1944 when accused by the Social Democrats of giving a pledge to Hitler not to make a separate peace. On Feb. 21, 1946, he was sentenced to 10 years' hard labour for having brought Finland into the Second Great War as an ally of Germany, but he was pardoned, for health reasons, in 1949.

Ryton. Urban dist. of Durham, England. It stands on the river Tyne, 6 m. W. of Newcastle, and is served by rly. There are iron and steel works, collieries, and limestone quarries. Pop. 14,204.

Ryukyu. Alternative spelling of the name of the Japanese islands described under Riukiu.

Rzhev. Town of Kalinin region, R.S.F.S.R. Lying 75 m. S.W. of Kalinin, it is built on both banks of the Volga, here 350 ft. wide and navigable. An important junction, it is on the Moscow-Riga rly. Its industries include machinery, saw-milling, leather work, oil pressing, and distilling. Part of the principality of Smolensk in the 12th century, it was divided and ruled separately under independent princes in the 15th century. A centre of heavy fighting in the Second Great War, Rzhev was captured by the Germans in Oct., 1941, during their drive towards Moscow and turned by them into a "hedhog" position. It was retaken by the Russians March 3, 1943, thus removing the last threat to Moscow. Pop. 54,081.

Thomas Rymer,
English author

THE Egyptian hieroglyph (5000 B.C.) corresponding to our letter S was a representation of lotus plants growing from water: . The later hieratic cursive had  simplified this into , in which a shape resembling , the modern w is uppermost. The "w" part was taken over by the Phoenicians, whose letter *shin*, meaning teeth, was simply . The early Greek forms of the letter turned  this on its side, , and later, as so often happened (see B, K, P, R), they reversed it: . From this reversed form was evolved the classic Greek *sigma*, . But other early Greek forms  eliminated the final stroke, ; here is first seen the germ of the formal rounded  Roman S.

In cursive script it was found difficult to join this letter with other letters in rapid writing, and many forms of minuscule were evolved, not always immediately recognizable as s, before printing standardised the minuscule in the simple form of a smaller version of the capital letter. The "long s" found in English printed books of the 17th and 18th centuries, which resembled a letter f with the cross-bar protruding to the left only, was a typographical version of an elongated form of the minuscule, together with its ligature. But note that in the case of a double S it was customary to use the "long S" for the first only of the two letters, a practice still occasionally met with in the handwriting of elderly people.

S Nineteenth letter of the English and Latin alphabets. In reality, a voiceless (sometimes voiced) fricative, it is often called a sibilant from its hissing sound. It has two chief values, one voiceless or hard and sharp, as in *sit*, the other voiced, or soft and flat, as in *his*, *rose*. It also represents *zh*, the French *j*, in *leisure*, *pleasure*, *hosier*, etc., the corresponding hard sound to which is *sh*. This should really be regarded as a separate letter, as it appears in some other alphabets, e.g. Russian and Arabic. *S* always has a hard sound at the beginning of words, but in other positions its value is so irregular that no definite rules can be given. In the termination—*sion*, if a consonant precedes, *sh* is heard, as in *possession*, *mansion* (also in *sure*, *sugar*); if a vowel precedes, *zh* is heard, as in *decision*, *delusion*. *S* is mute in *isle*, *island*, *viscount*, *Carlisle*, *Grosvenor*, the preceding vowel being at the same time lengthened. See Alphabet; Phonetics; Pronunciation; Shibboleth; Sibilant.

Saadabad, PACT OF. Regional agreement concluded in 1934 at Saadabad in Persia between Afghanistan, Iraq, Persia, and Turkey. It provided for political collaboration and consultation and was considered to be the nucleus of a Pan-Islam bloc.

Saadia, BEN JOSEPH (892–941), Jewish rabbi and philosopher. Born in the Fayum, Egypt, he was head of the Talmudic school at Sura near Babylon, where he died. His great object was to reconcile the internal differences of Judaism and to bring it into line with philosophical developments. His works, written in Arabic, include the first attempt at a scientific Hebrew grammar.

Saadists. Egyptian political party formed in 1941. Small but vocal, it was intensely nationalist, with Egyptian neutrality and

control of the Sudan the main planks of its platform. The Saadists gained 124 of 264 seats at elections on Jan. 8, 1945.

Saale. River of Germany, a left bank tributary of the Elbe. It flows from the Fichtelgebirge in Bavaria, in a curving but generally northward course, 266 m. to the Elbe, 25 m. above Magdeburg. It is canalised for 103 m. and leads by canal to Leipzig. Halle is the chief town on its banks.

Saalfeld. Town of Thuringia, E. Germany. It stands on the Saale, 31 m. S.S.W. of Jena, and is a rly. junction. The buildings include a Rathaus in the late Gothic and Renaissance styles, erected 1526–37, and the Gothic church of S. John (1389–1456). The château of Kitzstein and the Hoher Schwarm are supposed to have been built by the pagan chief Samo in 632. The chief manufactures were engineering products, paper, and chocolate up to 1945, when the town came under Russian control. Pop. 27,000.

Saar. German name for the river of France and Germany called in France Sarre. It rises in the Vosges mts. on the W. slope of mt. Donon and flows 152 m. in a general N., then N.E., direction to join the Moselle a few miles above Trèves. It is navigable for 74 m. from Sarreguemines to the Moselle, and is connected by the Saar canal with the Rhine-Marne canal.

Saar Basin (Ger. Saarland). Area of W. Europe. Formerly partly in the Rhine prov. of Prussia, and partly in the Bavarian Palatinate, its German name was then Saargebiet (Saar district). It covers 965 sq. m. and, with 874,450 inhabitants (1946), is one of the most densely populated areas of Europe. Here are valuable coal mines upon the production of which depends the working of the neighbouring Lorraine iron. The dist. is hilly and is traversed by the middle course of the Saar river and three minor tribs.; the highest point, in the N., reaches 1,880 ft. The valleys are fertile and produce grain, vegetables, fruit, and wine. The chief towns of Saarland, engaged principally in the iron, steel, and engineering industries, are Dillingen, Homburg, Neunkirchen, Saarbrücken (v.i.), St. Ingbert, and Völklingen. St. Ingbert has also a glass industry, Mettlach, with the area's big power station, makes ceramics, and Saarlautern makes enamel ware, paper, furniture, etc. The centre of a dense rly. network, the Saar basin is connected by canal with the Rhine-Marne canal, and by the Saar and the Moselle rivers with the Rhine.

Under the treaty of Versailles, the Saar basin was placed under French administration for a period of 15 years to compensate France for losses due to the German occupation of her N.E. coalfield during the First Great War. A plebiscite held under the treaty in 1934 gave a ten to one majority in favour of reunion with Germany, which took place in Jan., 1935. Hitler gave the basin the name Saarland and made it a region of the Reich. In 1940 it became part of the Westmark (q.v.).

During the Second Great War the U.S. 3rd Army reached the Saar river near Merzig on Dec. 1, 1944, and by the 5th had three bridgeheads across it in the Saarlautern area. Beyond the river

Saar Basin. Coal-producing areas are indicated by heavy shading.

lay the strongest part of the Siegfried line defences, the 3rd army's attack upon which was set for Dec. 19. But this plan was upset by the Ardennes counter-offensive of Dec. 16, and it was not until March 13, 1945, that the U.S. 7th and 3rd armies attacked from the Saar bridgeheads, capturing Haguenau the same day, and occupying Saarbrücken and Zweibrücken on March 20. All German resistance ceased on March 25.

After the surrender of Germany, Saarland came into the French zone of occupation. Elections held in Oct. 1947, for a new *Landtag* resulted in an overwhelming victory (411,577 against 37,929) for the parties favouring economic union with France. A new constitution made the Saar an autonomous state, detached from Germany and united economically with France, from April 1, 1948.

A convention signed March 3, 1950, by France and the Saar laid down the extent of the Saar's authority; it also gave France control of the Saar coalmines until a peace treaty was signed with Germany, and for a total of 50 years if ownership of the mines was in that treaty given to the Saar govt. The Saar became an associate member of the Council of Europe, May 2, 1950.

Saarbrücken (Fr. Sarrebruck). Capital of the Saar Basin (v.s.). From 1381 to 1797 it was the capital of the sovereign county of Nassau-Saarbrücken, later Nassau-Usingen, and went in 1801 to France, in 1815 to Prussia. It stands on both banks of the navigable Saar, is an important rly. junction about halfway between Strasbourg and Trier, Paris and Munich, and the centre of the heavy industry of the Saar. Though for the most part a modern town, it has a church of S. Arnaut (13th century), a Gothic castle church (1476), a town hall and a number of churches of the 18th century, of which that of S. Louis (1762-75) is outstanding. Parts of a palace, likewise of 18th century origin, survived the numerous attacks Saarbrücken has suffered in war, e.g. in 1870, 1914, and 1945. In addition to huge iron and engineering works in the N.W. suburb of Burbach, the town has electrical, piano, paper, leather, cement, sugar, tobacco industries and important schools, museums, libraries, and a theatre; a river port, it had an annual turnover of about 600,000 tons. Pop. (1935) 129,085.

Saaremaa. This is an alternative name for the Baltic island

of Oesel (q.v.), belonging to Estonia S.S.R.

Saarlautern (Fr. Saarlouis or Sarrelouis). Town of Saarland. It was founded as a fortress by Louis XIV in 1681, after Vauban's plans; to it were transferred the inhabitants of the neighbouring Wallerfangen, destroyed to make room for it. It remained a fortress until 1880. On the left bank of the river Saar, it lies at a height of 600 ft. Its walls were well preserved; and so, until damaged in the Second Great War (see Saar Basin), was a town hall with historical tapestries, gifts of Louis XIV. The town was the birthplace of Marshal Ney. It has good schools, museums, a large library, and enamel ware, paper, wood, electrical, brewing, furniture, cement, and brick industries. Though Prussian from 1815, Saarlautern—

Sabadilla. Flower spike and leaf; inset, above, root base; below, single flower

Sarrelibre under the French Revolution—kept stronger sympathies with France than other towns of the Saar basin.

Saavedra Lamas, CARLO DE (b. 1878). Argentinian jurist and statesman. Born June 6, 1878, at Buenos Aires, a great-grandson of Argentina's first president, and grandson of a governor of Buenos Aires prov., he studied and graduated at Buenos Aires university, 1903. Appointed soon after secretary general of the capital's municipality, in 1903 he was elected to parliament, as a Liberal, becoming minister of justice, and of public instruction. Professor of constitutional law at the university of Buenos Aires from 1915, he was leader of the Argentine delegation to the international labour office in Geneva in 1926. As foreign minister, 1932-38, he was instrumental in settling the Chaco War (q.v.); presided, 1935, over the Colombia-Paraguay peace conference at Buenos Aires; and was, 1936, president of the 17th assem-

bly of the League of Nations and of the 1936 Buenos Aires conference of American states (see Pan-American Conference). In 1936 he was awarded the Nobel peace prize. During later political troubles in Argentina he was frequently attacked by fascists, especially in 1944. He wrote a number of books on sociology, international law, etc.

Saba. Island of the Netherlands West Indies. It lies 26 m. S.W. of St. Martin in the Leeward Islands, and is a volcanic peak rising to 2,817 ft. with a total area of 5 sq. m. Coffee and indigo are produced. Pop. 1,194.

Sabadell. Town of Spain, in the prov. of Barcelona. It stands on the Ripoll, a tributary of the Besòs, 14 m. by rly. N.N.W. of Barcelona. There are textile factories, paper mills, and iron foundries. Pop. est. 51,614.

Sabadilla OR CEVADILLA (*Schoenocaulon officinale*). Bulbous perennial of the family Liliaceae. A native of Mexico, it has exceedingly long (18 ins. to 4 ft.), narrow, grass-like leaves, and a long cylindrical spike of tiny yellow flowers. The fruit consists of three papery pouches filled with winged seeds, which yield the drug veratrin or cevadin, a powerful irritant poison. In powder, or as an ointment, sabadilla has been used as a parasiticide.

Sabaeans. Ancient people in S.W. Arabia. The Biblical references, including those of the land of Sheba, have been greatly expanded by modern research. Besides coins and bronzes, thousands of inscriptions in a Phoenician alphabet have been recovered. Speaking a S. Semitic dialect, the Sabaeans settlements in Yemen were engaged in agriculture, mining, and caravan transport. They controlled the gold and spice trade of that region, as described in Isaiah 60, and took toll of early commerce with India and E. Africa. The Biblical account of the queen of Sheba's visit to Solomon puts their activity earlier than the dynastic inscriptions, apparently dating from about 800 B.C. See Himyar.

Sabanalarga OR SABANA GRANDE. Town of Colombia, in the dept. of Atlantico, situated on the Magdalena river, 20 m. S.W. of Barranquilla on the Caribbean coast.

Sabaoth (Heb. *Tsebaoth*, hosts). Term translated in the O.T. (1 Sam. 1, v. 3) as hosts, part of a title of Jehovah. The word Sabaoth is used in Rom. 9, v. 29, and James 5, v. 4. While the phrase Lord of Hosts or Lord of

Sabaoth is taken by some to refer to God as the leader of the armies of Israel, it is more generally regarded as implying the omnipotence of God over all creation, including the angels and the heavenly bodies, *i.e.* the stars, and therefore a warning against star-worship and other forms of idolatry. See Jehovah.

Sabatier, PAUL (1854-1941). French chemist. He was born at Carcassonne, Nov. 5, 1854, and made a detailed study of the problems of catalysis as applied to organic compounds. Professor of chemistry at Toulouse university from 1884, he evolved a method for using finely-powdered nickel as a catalyst for the hydration of various organic substances. This was applied to technical processes, especially the conversion of oleic into stearic acid, in the manufacture of soap. For this work he was awarded, jointly with V. Grignard, the Nobel prize for chemistry in 1912. Sabatier's Catalyse en Chimie Organique became a standard work. He died Aug. 14, 1941.

Sabatini, RAFAEL (1875-1950). British author. Born of Italian and English parentage at Jesi, Italy, he was educated in Switzerland and Portugal, and became a British subject 1918. He was known as a writer of picturesque historical fiction. Among his novels and tales are *The Tavern Knight*, 1904; *Bardelys the Magnificent*, 1906; *Anthony Wilding*, 1910; *The Sea Hawk*, 1915; *Scaramouche*, 1921; *Captain Blood*, 1922; *The Black Swan*, 1932; *Turbulent Tales*, 1946. Several were made into plays and films. Sabatini also wrote a *Life of Cesare Borgia*, 1912; *Torquemada and the Spanish Inquisition*, 1913. He died at Adelboden, Feb. 13, 1950.

Rafael Sabatini,
British author

Sabbath (Heb. *shabbath*, from *shabath*, to desist). In the Jewish religion, the seventh day of the week, kept sacred by worship and cessation of work. In the oldest parts of the Mosaic law, *e.g.* Ex. 23, v. 12, rest on the seventh day is enjoined. The sabbath is repeatedly associated with the festival of the new moon, as in Hos. 2, v. 11; Isa. 66, v. 23; some have thought that it was originally a feast of the full moon, later extended to the four phases of the moon.

The Pharisees, although allowing works of necessity on the Sabbath, interpreted the law in a pedantic spirit which made observance an intolerable burden. Our Lord laid down the principle that the Sabbath was made for man, and not man for the Sabbath (Mark 2, v. 23-3, v. 5). S. Paul treats the keeping of the Sabbath as indifferent (Col. 2, v. 16, etc.). It was, however, observed by many Christians during the first three centuries, in addition to Sunday, which replaced it as a holy day. See Saturday; Sunday; Week.

Sabbatical Year. According to the Mosaic law, every seventh year (Ex. 23; Lev. 25; Deut. 15 and 21; Neh. 10). During this year the land was to lie fallow, spontaneous growth was to be shared with the poor, strangers, and animals; with certain exceptions, debts were to be remitted, and slaves desiring freedom were to be granted it. The harvest of the 6th, *i.e.* the preceding year, would, it was promised, suffice to carry the people over the 7th. The Sabbatical year began and ended on the first day of the 7th month, Tishri, and seven Sabbatical years closed with the year of Jubilee (*q.v.*). The name has been widely adopted in the U.S.A. to denote leave of absence granted every 7th year by many colleges to members of the teaching staff for travel and research.

Sabellianism. Heresy which arose in the latter part of the 3rd century as a result of the teaching of Sabellius. He was a native of Pentapolis, and became a priest at Rome, where he adopted a form of the Noetian heresy and endeavoured to win Pope Zephyrinus (*c.* 198-217) to his side. He taught a form of Unitarianism, maintaining that the Father and the Son are identical, and that the Holy Spirit is simply the energy of the uni-personal God. His teaching had much in common with Monarchianism (*q.v.*), and represented the Trinity as merely a threefold manifestation in action and office of one divine Person. Sabellius was condemned by an early council at Rome, probably about 252, and by several later assemblies of the Church; his heresy became practically extinct in the 5th century.

Sabi. A river of S. Africa. Rising in Mashonaland, it drains the country between Umtali and the Lundi river. From the borders of S. Rhodesia it flows E.N.E. to the Indian Ocean, which it enters 30 m. S. of Chiloane, Mozambique.

In the valley are the Matindela ruins of ancient forts.

Sabine. River of the U.S.A. Rising in the N.E. of Texas, it flows first S.E., and then S., forming the boundary between Texas and Louisiana, through Sabine Lake, 18 m. long and 9 m. broad, into the Gulf of Mexico. It is about 500 m. long, but is navigable for a short way only by small vessels. On Sabine Pass, an excellent harbour at its mouth, is the town and port of entry of Sabine, where a bronze statue of heroic size commemorates the Confederate officer who prevented the invasion of Texas by a Federal army Sept., 1863. Sabine Pass is at the head of the Sabine-Neches waterways, a system of canals making inland towns accessible to merchant craft, opened in 1935 after the removal of a sandbar.

Sabine, SIR EDWARD (1788-1883). British geophysicist and organizer. Born in Dublin in 1788, he was educated at the Royal Military Academy, Woolwich, and saw service with the Royal Engineers in N. America in 1814; promoted gen. in 1870. He acted as astronomer on the Arctic expeditions of Ross and Parry, 1818-20, and undertook magnetic surveys of the British Isles, 1834-36 and 1861. From 1840 he helped to establish the magnetic and meteorological observatories at Toronto, St. Helena, Cape of Good Hope, Hobart, Mauritius, Hong Kong, etc., and to lay the foundations of the Canadian and Indian meteorological services. He initiated pendulum observations of gravity in connexion with the trigonometrical survey of India, started in 1864. Elected a fellow of the Royal Society, 1818, he was president, 1861-71; he acted as gen. secretary of the British Association (president, 1852) 1839-59. He was awarded the K.C.B. in 1869 and died, aged 95, at Richmond, Surrey, June 26, 1883.

Sabines. Ancient Italian people, the ancestral stock of the so-called Sabellians, comprising the Samnites and other central and south Italian tribes. Their earliest home was Amiternum, at the foot of the Apennines, whence they advanced southwards. Early tradition connected them with Rome; the story of the rape of the Sabine women is well known, and Titus Tatius, Sabine king of Cures, is said to have reigned jointly with Romulus. Rome carried on intermittent warfare with the Sabines.

until they were finally subdued by Manius Curius Dentatus, in 290, and admitted to full Roman citizenship in 268.

The country of the Sabines was mountainous and well wooded, suitable for cattle rearing; the inhabitants were hardy, frugal, and pious, and Numa Pompilius, a legendary Roman king of Sabine stock, was the reputed founder of Roman religious institutions. Their language, akin to that of the Samnites, was absorbed in that of Rome, as the people were absorbed. The origin and spread of Sabine tribes, such as the Samnites, Hernicans, and others, is attributed to the ancient Italian custom of the *ver sacrum*, or sacred spring. In times of need the first fruits of spring, including children then born, were dedicated to the gods. When the children grew up, they were expelled from their country to prevent over-population, and bidden to seek a home elsewhere. See Rome; Romulus.

Sable. In heraldry, the technical name for black as one of the tinctures. It is represented in

Sable, in heraldry

drawing by thin vertical and horizontal lines crossing one another. See Heraldry, colour plate; Tincture. **Sable** (*Mus-tela zibellina*). Small carnivorous mammal. It belongs to the weasel tribe, and resembles a marten. It is about 18 ins. long in body; and its fur is of great value for commercial purposes. It was formerly common in N. Asia, but incessant trapping has now restricted its range to the E. districts of Siberia. The name is derived through old French from Slavonic.

Sable (Fr. *sable*, sand). Sandy island in the Atlantic Ocean, belonging to Canada. It lies 104 m. S.E. of Cape Canso, Nova Scotia. The island is crescent-shaped, 20 m. long by 1 m. wide, with an unstable coastline continuously fretted by the sea, and from either end sandbanks extend 20 m. or more. A shallow lagoon, 11 m. long, lies among sandhills, nowhere higher than 80 ft. Lying

in the track of ocean navigation, between Great Britain and America, the island constitutes a most dangerous obstruction, on which more than 200 ships are known to have been wrecked. The Canadian government has planted trees to consolidate the sand and make the island readily visible, and maintains a life-saving establishment.

Sable Antelope (*Hippotragus niger*). Species of antelope. Found in E. and S. Africa, it is notable for its fine horns, 40 to 50 ins. in length. The pelt is glossy black, with white underparts, and white markings on the face. These animals move in herds, and possess great speed and endurance. See Antelope.

Sables-d'Olonne, Les. Town and watering-place of France. In the dept. of Vendée, it lies by the

Les Sables-d'Olonne, France. The harbour, with Tour d'Arundel, used as a lighthouse

Atlantic Ocean on a peninsula, E. of the Point de l'Aiguille. The Gothic church of Notre-Dame-de-Bon-Port was built in the 17th and restored in the 19th century. Other buildings are the casino and a tower, now used as a lighthouse, while there are remains of a castle. Across the harbour lies the suburb of La Chaume, where fishermen live. Fishing, including the cul-

Sable seizing a squirrel among the branches of a tree

ture of oysters, is the main occupation. Salt is obtained from the marshes, but this industry is less profitable than formerly. The town was fortified in the 11th century, and its port built by Louis XI. Pop. 17,650.

Sabot (Fr., wooden shoe). Shoe worn by the poorer classes in France, the Netherlands, and

Belgium. Carved in one piece, the shape varies with the locality. Sabot making is an important trade in parts of N.E. and E. France. See Boots and Shoes, colour plate.

Sabot. Type of artillery projectile. The original sabot was a disk of wood fitted to the base of a cannon ball to prevent gases generated by the explosion of the charge escaping past the projectile. In the Second Great War a sabot shot was developed for anti-tank work. The shell was solid for half its length and had fitted in its head a ballistic cartridge, which exploded the shell after it had penetrated the armoured target.

Sabotage (Fr. *sabot*, wooden shoe). Term originally meaning the infliction of personal violence by kicking. It is now more generally used to describe organized

resistance to an unpopular authority. It has been resorted to by discontented workers to achieve their claims by hindering production without involving themselves in the financial penalties of a strike. Sabotage may consist in deliberate damage to machinery, the destruction of manufactured articles, or persistent absenteeism. A more subtle form is to delay production by strict observance of every regulation likely to waste time and labour. In 1887 the French general confederation of labour recognized sabotage as a weapon in industrial disputes, and from France the term passed to Great Britain and the U.S.A., where the Independent Workers of the World used it in their campaign of 1920-22.

During the Second Great War sabotage of factories, premises, stores, and communications was an effective means whereby the subject peoples in the occupied countries fought the Germans. As part of resistance movements, working in cooperation with Allied agents, the workers destroyed factories and machinery, derailed trains, blew up military supply dumps. Within Germany foreign slave labour carried out sabotage. Despite German reprisals, sabotage increased as the war progressed,

and in the Balkans and occupied Russia entire divisions of German troops were required to guard railways and bridges and to protect factories and installations. Outstanding acts of sabotage were the sinking of a ferry carrying the last supplies of heavy water from Norway to Germany, and the destruction of the chief German airfield in Oslo.

Sabrata. Westernmost of the three Roman towns, Sabrata, Oea (near Tripoli), and Leptis Magna, from which Tripolitania, "country of the three cities," gets its name. Sabrata was originally a Punic settlement and submitted to the Romans upon the fall of Carthage. Excavations were carried on by the Italians, who re-erected large parts of a theatre. A British expedition worked on the site from 1914.

Sabre (Magyar *szablya*). Heavy one-edged sword, generally curved towards the point, used by mounted troops. The sabre of the heavy cavalry has a weighty blade, which is almost straight, while that of light cavalry is a lighter and more curved weapon, and that of the horse artillery is still lighter, shorter, and more curved. The regulation British cavalry sabre is a straight blade, 32 ins.

Sabre. 1. Oriental weapon, 16th century. 2. Persian, with Damascus blade. 3. Light cavalry officer's sword, 1815. 4. Heavy cavalry sabre, 1815

long, and weighs 2 lb. The sabre is also used for fencing, especially among soldiers, and sometimes for duelling. See Cutlass; Fencing; Sword.

Sabretache (Ger. *Sabel*, sabre; *Tasche*, pocket). Leather pocket formerly worn by cavalry officers suspended from the sword belt to a distance of 18 ins. It was highly decorated and bore a large representation of the badge of the regiment. It ceased to be worn by British officers on active service in 1880.

Sabu (b. 1924). Indian film actor. Sabu Dastagir, son of Sheikh Ibrahim (employed in the service of the maharaja of Mysore), was born in the Karapur jungle, near Mysore, March 15,

1924. A Muslim, he was brought up as a mahout, and the film director Robert Flaherty, impressed by his

fearlessness, engaged him in 1937 to play the title rôle in *Elephant Boy* (based on Kipling's *Toomai of the Elephants*). Other films of Sabu were *The Drum*, 1938; *The Thief of Bagdad*, 1941; *Black Narcissus*, 1947. During the Second Great War he served in the U.S. army.

Saccharates (Gr. *saccharon*, sugar). Salts of saccharic acid (*v.i.*). There are both normal and acid saccharates, the normal being more soluble than the acid. The name is also applied to compounds more correctly called saccharosates, or sucrosates, which are compounds of cane sugar with various metallic hydroxides, especially those of calcium and strontium, but saccharates of iron, lead, magnesium, sodium, and other metals are known.

Saccharic Acid. Amorphous, deliquescent solid prepared by the acid on sugar, the oxalic acid which is formed at the same time being separated by crystallisation. It was first prepared by Scheele, and is a brittle mass which soon becomes sticky by the absorption of moisture from the air. It is one of the substances giving a

mirror effect when warmed with ammoniacal solution of silver nitrate.

Saccharimeter. Form of polariscope used for determining the amount of sugar in a liquid. The method depends upon the fact that solutions of sugar have the power of rotating the plane of polarisation of light by an amount directly proportional to the quantity of sugar present in a given volume of the liquid through which the light passes (see *Polarisation of Light*). The sugar solution must be clear clarification being effected by means of a solution of lead subacetate or phosphotungstic acid.

Saccharin (Gr. *saccharon*, sugar). Intensely sweet crystalline compound. Discovered by Remsen and Fahlberg at Baltimore

Sabu Dastagir, Indian film actor

in 1879, it is chemically orthobenzoysulphonimide. The various strengths of saccharin may be expressed according to the sweetening power relative to cane sugar, e.g. 300, 450, or 550 times. It is made from toluene by treatment with chlorosulphonic acid. Saccharin replaces sugar in some aerated beverages and for sweetening food for diabetic persons. It possesses antiseptic properties, and is in no sense a food like sugar. During the two Great Wars it came into general use as a substitute. In 1942 saccharin was brought under govt. control by the Saccharin (Control and Maximum Prices) Order. See Sugar.

Sacco-Vanzetti Case. Most notorious murder trial in American history. On April 15, 1920, F. A. Parmenter and A. Berardelli, paymaster and guard of a shoe factory at South Braintree, Mass., were murdered, presumably by thieves who made off with the cash. On May 5, two Italian immigrants, Nicola Sacco (1891-1927), shoemaker, and Bartolomeo Vanzetti (1888-1927), fish pedlar, were arrested. Their trial began on May 31, 1921, before Judge Webster Thayer of the Massachusetts superior court, and on July 14 the jury returned a verdict of guilty. This was strongly contested by many prominent Americans on the ground that the accused had been victimised for their radical opinions and that the procedure of police and court were irregular. Over six years several motions for a new trial were made, but all were refused—even when C. Madeiros, an Italian under sentence of death for another murder, confessed that he had had a hand in the Braintree crime but that neither Sacco nor Vanzetti had been present. An appeal to the U.S. supreme court likewise failed, and on April 9, 1927, Thayer sentenced Sacco and Vanzetti to the electric chair.

A storm of protest was aroused throughout the world, men like Masaryk, A. Einstein and R. Rolland believing that miscarriage of justice had occurred. Nearly a million people signed an appeal to Governor Fuller to exercise his power of clemency, and he appointed President Lowell of Harvard, President Stratton of the Massachusetts institute of technology, and Robert Grant, a former judge, to make an independent investigation. On Aug. 3 Fuller announced that a new trial was not warranted on the evidence; and in spite of more appeals for clemency

or delay to the supreme court, the attorney-general, and President Coolidge, the two Italians went to the electric chair at Charleston on Aug. 23, 1927, both protesting their innocence to the last. There are several books on the case, which is also the basis of Upton Sinclair's novel, *Boston*.

Sacerdos (Lat., priest). General term for any holder of a religious office in ancient Rome. Priests wore a distinctive head-dress, had a place of honour at the public games, were salaried, and exempt from military service and taxation. They only carried out the orders of the senate, and did not take the initiative in any religious act. They usually wore a garland on sacrificial occasions.

Sacerdotalism (Lat. *sacerdos*, priest). Term for the spirit or system of the priesthood. It is used by Protestants and members of the Free Churches to indicate any tendency to over-emphasise the priestly office, particularly in reference to the view that the Holy Eucharist is a sacrifice, and the priest is the minister of that sacrifice.

Sacer Mons (Lat., sacred mountain). Hill on the right bank of the river Anio, about three miles from Rome. It is noted in Roman history as the place to which the plebs made two secessions, 494 and 449 B.C., by way of protest in their struggle for political rights against the patricians. The result of the first was the institution of the tribunes, which the plebeians made a condition of their returning to Rome; by the second, the decemvirs were forced to abdicate. See *Rome*.

Sacharissa. Name bestowed by Edmund Waller upon Lady Dorothy Sidney, eldest daughter of Robert, 2nd earl of Leicester. Waller addressed some of his best poems to her under this name, but while she admired his verses and retained him among her friends, she married Lord Spencer, later 1st earl of Sunderland.

Sacheverell, HENRY (c. 1674-1724). English controversialist. Born probably

Henry Sacheverell,
English
controversialist

at Marlborough, Wilts., son of the rector of S. Peter's, and educated at Marlborough and Magdalen College, he became in 1705 chaplain at S. Saviour's, Southwark. He achieved notoriety with a series of violent pam-

phlets and sermons in support of the High Church and Tory causes. A sermon preached at S. Paul's on Nov. 5, 1709, before the lord mayor and aldermen, drew upon him the wrath of the Whig government. He was impeached, tried in Westminster Hall before the lords, and suspended from preaching for three years, his sermons being burnt by the hangman.

Extraordinary excitement was aroused throughout the country, riots and attacks on meeting houses taking place during the trial, and his light sentence was regarded as a triumph for the High Church and Tory party. Sacheverell was disliked and despised by many of his Tory friends as a man of insolence, mediocre scholarship, and consummate vanity. In 1713 he was given the living of S. Andrew's, Holborn, and he died at Highgate, June 5, 1724. Consult *Bibliography of Dr. Sacheverell*, F. Madan, 1887.

Sachs, FERDINAND GUSTAV JULIUS VON (1832-97). German botanist. Born at Breslau, Oct. 2, 1832, he was educated at Prague, and went, in 1861, to Chemnitz as head of the experimental station, whence he moved to Poppelsdorf. In 1867 he was made professor at Freiburg-im-Breisgau, and in 1868 at Würzburg, where he died, May 29, 1897. Sachs wrote several valuable works on plant physiology, on which his researches were of supreme value. His *Handbook of Botany*, 1868, is a standard work, and like his *History of Botany*, 1875, has been translated into English. *Pron.* Zahx.

Sachs, HANS (1494-1576). German poet and dramatist. He was born at Nuremberg, Nov. 5, 1494, and was early initiated into the art of the Meistersingers (q.v.), in due course becoming one himself, and probably the most prolific of them all. His first poems are said to have appeared when he was twenty. On completing his apprenticeship as shoemaker in his native town, he travelled through Germany, living by his trade of shoemaking but making a name as a singer. He returned to Nuremberg in 1516, and settled there. He died Jan. 19, 1576.

A large part of his poetry was inspired by the Reformation, and

how great his activity was is shown by his having left more than 6,000 separate productions, including 4,275 songs and upwards of 200 pieces in dramatic form, from simple dialogues and Shrovetide plays to comedies and tragedies. Though his poetic gift was not of a high order, his work is of value for its presentation of life in 16th century Germany.

Sack (Fr. *sec*, dry). Name given in the 16th and 17th centuries to a white wine similar to sherry or canary (q.v.). A rough, strong, dry wine, it was commonly sweetened, flavoured with spices, and mulled. The name was used of any white, strong wine from S. Europe.

Sackbut (Fr. *saqueboute*). Musical instrument. It owed its origin, probably early in the 14th century, to the application of the slide mechanism to the buzine or long trumpet. Canon Galpin derives

Sackbut. Musical instrument

the name from the Spanish *sacar*, to draw, and *bucha*, pipe. The sackbut became very popular, and English sovereigns maintained several players of the instrument in their household bands. It was also much used by the watchmen or waits, and at stage plays. Like many other medieval instruments, the sackbut was made in sets. The modern trombone (q.v.) has been developed from the sackbut. The sackbut mentioned in the Book of Daniel, 3, was not a wind instrument, the translators of the A. V. having been misled by the Aramaic word *sabbeka*, which signified a stringed instrument, the *sambuca* of the Romans.

Sackets Harbour. Naval station of the U.S.A. It stands at the E. end of Lake Ontario in Jefferson co., N.Y., and has a rly. station, harbour, and barracks. It sheltered American naval reserves which ultimately enabled the U.S.A. to command traffic in the Great Lakes, British assaults in July, 1812, and May, 1813, having been beaten off. The smallest navy yard in the world, less than four acres, has been maintained there since. For some years the commander was a woman. Pop. 1,962.

Sacking. Coarse cloth for sacks. It is almost invariably made from jute, woven chiefly in Dundee and, under the name of gunnies, in Calcutta. See *Jute*.

Hans Sachs,
German poet

Sack Tree (*Antiaris saccidora*). Tree of the family Moraceae. A native of the East Indies,

Sack Tree. Spray of leaves and flowers; inset, flower-head

it has a tough inner bark from which ropes and matting are made. It is also ingeniously made to yield seamless rice-bags. The trunk is cut in lengths corresponding to the depth of sack required, soaked, and beaten to separate the bark from the wood; then the bark is turned inside out, and the wood sawn off to leave a thin section for the bottom of the sack.

Sackville. Name of a famous English family. The founder of the family fortunes was Richard Sackville, a Kentish landowner, who held office under Henry VIII and was knighted. His son was Thomas Sackville, the poet, made earl of Dorset in 1604. This title, and also that of duke, conferred on Lionel in 1720, were held by members of the family until the death of Charles, 5th duke, in 1843.

The family estates, including Knole Park, passed to the Lady Elizabeth Sackville, later Baroness Buckhurst, a daughter of the 3rd duke, and the wife of earl De la Warr. Her son, Mortimer Sackville-West (1820-1888), was made Baron Sackville in 1876. Lionel Edward (1867-1928), was 3rd baron; his daughter was Victoria Sackville-West (*q.v.*). Charles John Sackville-West (b. 1870), who became the 4th baron in 1928, was a soldier in Burma and South Africa and in the First Great War commanded a brigade. In 1918 he succeeded Rawlinson as British military representative on the Versailles council, received the K.B.E., 1919, and was known, until he succeeded his brother in the title, as Sir Charles Sackville-West. His son and heir, Edward Charles Sackville-West (b. Nov. 13, 1901) was a literary critic who also wrote feature programmes for the B.B.C., *e.g.* The Rescue, 1945.

See Dorset, Earl of; Knole. Consult The Sackville Family, C. J. Phillips, 1930.

Sackville, GEORGE SACKVILLE, 1ST VISCOUNT (1716-85). British soldier and politician, usually known as Lord George Sackville. A younger son of the 1st duke of Dorset, he was born Jan. 26, 1716. Educated at Westminster and Trinity College, Dublin, he entered the army in 1737. He fought at Fontenoy, and in 1758 became commander-in-chief of the British force serving in Germany. He led this at Minden, where he refused to obey the order of his

superior, Ferdinand of Brunswick, who wished the British cavalry to advance. For his action Sackville was dismissed from the service and the privy council, and condemned by a sentence of a court-martial.

After a year or two in retirement he took up political life. Already in the house of commons, and having been under his father secretary of war in Ireland, he became in 1775 a secretary of state, in which capacity he had much to do with directing the war in America. He retired in 1782, and was made a viscount. Sackville, who took the name of Germain on inheriting estates from Lady Betty Germain (d. 1769), died Aug. 26, 1785.

Sackville, LADY MARGARET (b. 1881). English poet, the third daughter of the 7th Earl De la Warr. Her first collection of verse came out in 1901, and was followed by several books of lyrics and ballads, collected in 1939. In 1947 she published *Miniatures*. She

Lady Margaret Sackville, British poet
Elliott & Fry

was temperamentally a romantic, and Romance is the title of one of her best-known poems. She also wrote fairy plays and tales.

Sackville-West, VICTORIA (b. 1892). British writer and poet. Daughter of the 3rd Baron Sackville, she was born at Knole, Kent. Her literary career began with a novel, *Heritage*; then

followed two travel books, *The Road to Teheran*, and *Seducers in Ecuador*. Her novels, *The Edwardians*, 1930, and *All Passion Spent*, 1931, were widely read, and both dramatised. English Country Houses appeared in 1941; *The Eagle and the Dove*, 1943. This poet of great lyrical power won the Hawthornden prize in 1927 with *The Land*; her collected poems appeared in 1933, and *The Garden* in 1946. She married Harold Nicolson (*q.v.*) in 1913, and collaborated with him in an anthology, *Another World Than This*, 1945. She was made C.H., 1948.

Victoria Sackville-West. British writer

Saco. City of Maine, U.S.A., in York co. It stands on the Saco river, 16 m. S.W. of Portland, and is served by the Boston and Maine rly. Near here the river makes a descent of 42 ft., providing abundant water power for the city's industries, among which are the manufacture of cotton, machinery, pumps and sawmill products. Settled in 1630, Saco became a city in 1867. Pop. 8,631.

Sacrament (Gr. *mysterion*, mystery; Lat. *sacramentum*, a sacred thing or an oath). Term which came into ecclesiastical use at the close of the 2nd century for certain doctrines and ceremonies of a sacred character. In the Protestant Churches baptism and Holy Communion are regarded as sacraments; the Roman and Greek Churches include also confirmation, penance, ordination, matrimony, and extreme unction. The Anglican catechism defines the word as "an outward and visible sign of an inward and spiritual grace"; the Roman catechism as "a visible sign of invisible grace instituted for our justification." See Baptism; Communion; Eucharist; Extreme Unction; Ordination; Penance, etc.; consult The Christian Sacraments, O. C. Quick, 1927; Sacraments, A. L. Lilley, 1928.

Sacramentarians. Name applied by the Lutherans to the followers of Zwingli in the Reformation period. Zwingli denied the Real Presence of Christ in the Eucharist, and maintained that the consecrated elements were merely sacramental symbols, and not the immediate vehicle of grace. The term has occasionally been

applied by recent writers—with strange confusion of thought—in an exactly opposite sense. See Communion; Zwingli.

Sacramentary (Lat. *Liber Sacramentorum*). Book containing forms of service for use in the administration of the Sacraments, dedication of churches, etc. The most elaborate work of the kind is the Mozarabic, ed. Dom Férotin, 1912. Others are the Roman or Leonine, Gelasian, Gregorian, Gallican, Ambrosian, and Bobbiense. Sacramentaries, superseded by the Missal, Pontifical, and Ritual of the R.C. Church, and the Prayer Book of the Church of England, came into use in the 4th century, the oldest extant example being the Leonine or Veronese, included in Muratori's *Liturgia Romana Vetus*. See Liturgy.

Sacramento. Chief river of California, U.S.A. It rises in the N. part of the state on the W. side of Mt. Shasta, and flows S. and W. to Suisun Bay, about 50 m. above San Francisco, through the N. half of the Great Valley of California. It is about 400 m. long, or 600 m. if Pitt River, its main headstream, which drains Lake Goose in the N.E. part of the state, be included. Navigation is practicable to Red Bluff, 250 m. up the river. See California.

Sacramento. City of California, U.S.A. The state capital and the co. seat of Sacramento co., it stands on the Sacramento river, 88 m. by rly. N.E. of San Francisco, and is served by the Southern Pacific and other rlys. The state capitol is a handsome building erected at a cost of \$500,000. Other prominent buildings are the R.C. cathedral and Crocker Art Gallery. Sacramento contains the state library, with 114,000 volumes. The park system extends to more than 1,000 acres, and in addition there is a large fair ground and racecourse. Among the city's leading industries are flour and grist milling, canning, slaughtering, and meat-packing, iron-founding, and the manufacture of carriages, brooms, pumps, furniture, and soap. It has also extensive rly. repair shops. Large quantities of fruit and grain are grown in the neighbourhood. Settled in 1839, Sacramento was laid out in 1848, and incorporated the following year. It became the state capital in 1854, and was chartered as a city in 1863. Pop. 105,958.

Sacred Heart of Jesus. Festival of the R.C. Church. It is celebrated the 8th day after Corpus Christi (*q.v.*). Arising from revelations made to Marguerite Marie Alacoque (1647-90), a French nun,

Sacramento, California. The state capitol, built in 1869

the Sacred Heart became the object of special devotions throughout the Church. It received official recognition in 1856, when the feast was instituted by Pius IX. The devotion has achieved great popularity in the Roman Catholic Church, and various societies and confraternities have been instituted in connexion with it.

Sacrifice (Lat. *sacer*, sacred; *facere*, to make). In a religious sense, an offering to a divinity, especially at an altar or shrine. The custom is ancient and common to all or most religions. Among the Jews of O.T. times, a sacrifice had three characteristics—it was a means of communion with Jehovah: a gift or tribute; and a means of propitiation or atonement. With the rise of Christianity material offerings were replaced, or believers were enjoined to replace them, by prayer, praise, thanksgiving, a humble and contrite heart, and Christian service, *i.e.* selfless conduct of the individual life. The word is used of the Crucifixion, hence its symbolical application to the Holy Eucharist. In a general sense the word signifies an act of destruction for some particular end, as the sacrifice of a city to prevent its falling into the hands of an enemy; or, in the case of an individual, the giving up of something of value under the compulsion of necessity or the impulse of generosity.

Human sacrifice is a ritual offering of human victims, especially as a propitiation or a vicarious expiation. The term loosely embraces also other forms of immolation, voluntary or involuntary, particularly in association with burial customs. Viewed as ceremonial slaughter—murder or suicide—it is widespread at cultural levels far above primitive savagery, reaching a terrible height of systematisation in 14th and 15th century Mexico. A frequent motive of cannibalism, infanticide, and wife-immolation (*sati*), it finds expression also in foundation sacri-

fices (*q.v.*). Practised by the early Semitic and Aryan peoples, it survives in negro Africa and Polynesia. The Japanese *harakiri* is a voluntary self-immolation at the bidding of loyalty. It is preserved symbolically among many peoples in the form of animal or effigy

sacrifice, and ceremonial blood-letting. See Abel; Abraham; Altar; Atonement; Mosaic. Consult also Primitive Culture, E. B. Tylor, 4th ed. 1903; At the Back of the Black Man's Mind, R. E. Dennett, 1906; The Golden Bough, J. G. Frazer, 1907-15.

Sacrilege (Lat. *sacer*, sacred; *legere*, to collect, steal). In English law, larceny from a church; and, in ecclesiastical law, the alienation to lay purposes of property given to pious uses. The Larceny Act makes it a felony to break into and enter any church, chapel, meeting-house, or other place of divine worship and commit any felony there, or with the object of committing a felony. It is a like offence for anyone who, having committed a felony in such a place, breaks out. Sacrilege, in the sense of alienating Church property, stands, in law, in no different position from any other alienation of property. If it is a breach of trust it can be restrained, and restitution ordered by the courts.

Sacristan (late Lat. *sacristanus*). Form of the word sexton (*q.v.*).

Sacrum (Lat., sacred, from its use in sacrifice). Triangular-shaped bone formed by the union of five vertebrae. It forms the posterior part of the pelvis and articulates above with the last lumbar vertebra of the spine. The inner or ventral surface of the sacrum is concave, the curvature being greater in the male than in the female, and the width from side to side being greater in the female than in the male. The dorsal surface is convex and very uneven. A cavity in the upper part with a triangular aperture lodges the lower part of the spinal cord.

Sacsahuana. Ancient hill-fort overlooking Cuzco, Peru. Rising 650 ft. above the city, between two deep ravines, it is protected by three parallel walls of cyclopean stonework 600 yards long, with 20 salient and re-entrant angles, built of massive dressed blocks of greyish limestone exactly fitted, without mortar. The lowest wall is 27 ft.

high, with blocks up to 27 ft. by 14 ft. by 12 ft.; the middle wall, 18 ft. behind it on the slope, is 18 ft. high; the uppermost, 9 ft. behind, is 14 ft. high. The space behind each wall was filled in, forming

a terraced platform. Each wall had three gateways, surmounted by monolithic lintels. There are remains of ancient buildings on the summit. The work, apparently pre-Incan, is the greatest mass of megalithic architecture in pre-Columbian America. See Inca.

Sacy, ANTOINE ISAAC SILVESTRE DE (1758-1838). French scholar. Born in Paris, Sept. 21, 1758, he entered the public service in 1781. Devoting himself, however, to the study of Oriental languages, he retired in 1792 and in 1795 became professor of Arabic in the Institute of Oriental Studies. Sacy made himself, by his writings and lectures, one of the foremost authorities on Oriental languages and literature, which studies were greatly fostered by him. He was made a baron and a peer of France, and died in Paris, Feb. 21, 1838. His chief books are translations and editions of Arabic and Persian works, and an Arabic grammar.

His son, Samuel Ustazade Silvestre de Sacy (1801-79), was a noted journalist and critic. He was long connected with the *Journal des Débats*, of which he became editor in 1828. In 1854 he was chosen a member of the Academy.

Saddle. Seat for a rider on horseback. Saddles differ widely in form, but are usually covered with leather and have raised portions at the front and rear. They are padded to span comfortably a horse's back, secured by a girth, and provided with stirrups for the feet of the rider. It is also a pneumatic or leather seat of any of a variety of forms for a rider of a bicycle. As applied to machinery, etc., a saddle is a bridge-piece or carriage made to travel on a guide-

way or bed. Examples are the member carrying the slide or tool-rest of a lathe, a seating for a cylindrical steam boiler, a block over which the cables of a suspension bridge pass, or to which they are anchored, and the bearing of an axle box. See Riding; Saddlery.

Saddleback OR **BLENCATHARA**. Mountain of Cumberland. It is 4 m. N.E. of Keswick, and its altitude is 2,847 ft.

Saddlers' Company, THE. London city livery company. Existing in Anglo-Saxon

ciated with the leather industry. An old one, its prosperity was checked by the great increase in motor traction. Dealers in saddlery are known as saddlers. See Leather.

Saddleworth. Urban district and market town of the W. Riding of Yorks, England. It is on the Tame, 14 m. N.E. of Manchester, and 12 m. S.W. of Huddersfield. It has a rly. station and is on a canal. The chief industry is the manufacture of woollen goods. In the neighbourhood Druidical and other remains have been found. Market day, Wed. Pop. 16,500.

Sadducees. Jewish religious party. It took its name from Zadok, probably the high priest who crowned Solomon and founded a priestly family. The Sadducees arose about 200 B.C. as the party of the priestly aristocracy; but at a later date they came to hold distinct theological views, as may be seen in the allusions to them in the Gospels.

The sect denied the resurrection of the dead and the existence of angels and spirits; and the preaching of the Apostles on the resurrection of Christ aroused their bitter hostility. They also strongly opposed the teaching of the Pharisees respecting the interpretation of the O.T., and maintained that the letter of the law

was sufficient in itself and needed no explanation from tradition or the teaching of the rabbis. The sect disappeared after the final destruction of the Temple. In modern times the Karaites (*q.v.*) may be said to represent them.

Sade, DONATIEN ALPHONSE FRANÇOIS, MARQUIS DE (1740-1814). French writer. Born in Paris, he served in the Seven Years' War, was sentenced to death for immoral practices in 1772, was imprisoned at Vincennes and in the Bastille, and wrote several disreputable romances. He died insane at Charenton, and added the word Sadism (*q.v.*) to the literature of modern psychology. *Pron.* Sahd.

Sa'di, MUSHARRIF UD DIN IBN MUSLHI UD DIN ABDULLAH (c. 1184-1291). Persian poet. A native of Shiraz, he was educated at Bagdad. For 30 years he was a wanderer, travelling to India and Abyssinia, and residing at times in Damascus and

Saddle. 1. Colomal and campaigning pattern. 2. Plain flap hunting saddle. 3. Polo saddle. 4. Roman saddle. 5. German type, 16th century

1-3, by courtesy of Champion & Wilton, London

times as a guild associated with the monastery of S. Martin's-le-Grand, and in the 12th century as a trading colony in West Cheap, its first charter is dated 1272, but it was not incorporated until 1395. Its constitution is more conservative than that of

Saddlers' Co. arms

the city companies, and it still exercises an influence on the saddlery trade, directly and by means of financial support of technical education. The hall, 141, Cheapside, E.C., was built in 1822, the frontal buildings in 1863-64. It was destroyed by German bombs on Dec. 29, 1940.

Saddlery. Term used for saddles, harness, bridles, stirrups, and other accessories of horses and carriages. The trade, of which the English centre is Walsall, is asso-

Jerusalem. He adopted the heretical principles of Sufism (*q.v.*). Settling in Shiraz in 1256, he wrote the *Bustān* or Fruit Garden, a book of ethical and religious verse, which was followed by the *Gulistān* or Rose Garden, his most famous work, in verse and prose mixed, as well as many lyrics of great beauty. Sa'di died Dec. 11, 1291.

Musharrif Sa'di,
Persian poet
From an old print

Sadism. Term used in psychology. A sadist is one who receives sexual pleasure through inflicting physical pain on another. In extreme cases of this psychological maladjustment, it may be that sexual pleasure can be secured only through such infliction of pain. A masochist, on the other hand, derives sexual pleasure from having pain inflicted on himself. The word sadism is derived from the name of the Marquis de Sade (*q.v.*); masochism from that of L. von Sacher-Masoch.

Sadiyā. Village of Assam. It is a frontier station, the farthest Indian post upstream on the Brahmaputra, near the mouths of the Dibang and Lohit tributaries. The town is the head of navigation, and is the terminus of a rly. from Chittagong.

Sadler, Michael Thomas (b. 1883). British biographer. Son of Sir Michael Sadler (*v.i.*), he adopted an older form of the family name. Born Dec. 25, 1888, he was educated at Rugby and Balliol, Oxford. He entered in 1912 the publishing firm of Constable and Co., of which he became director, 1920. He was Sanders reader in bibliography at Cambridge, 1937. His first publication, *The Political Career of R. B. Sheridan*, appeared in 1912, and he wrote on Daumier, 1924; Trollope, 1927 (stimulating a vogue for that novelist); *Bulwer and His Wife*, 1931; *Blessington-D'Orsay*, 1933. Of his novel *Fanny* by Gaslight, 1940, a film version was made.

Sir Michael Sadler,
British educationist

Sadler, Sir Michael Ernest (1861-1943). British educationist. Born at Barnsley, July 3, 1861, he went from Rugby to Trinity Col-

lege, Oxford. Secretary to the university extension committee from 1885, he was appointed in 1895 director of special inquiries and reports to the board of education, a post he retained until 1903. Professor of education at Manchester university, 1903-11, and then vice-chancellor of Leeds, he went back to Oxford as master of University College, 1923-34. He was knighted in 1919, and died Oct. 14, 1943. All forms of education in many parts of the world commanded Sadler's interest. His collection of pictures was exhibited in London, 1944. *Consult* Life, M. Sadler, 1949.

Sadler, Michael Thomas (1780-1835). British social reformer. Born at Snelston, Derbyshire, he was a successful business man in Leeds. He wrote books on social reform, and was a leading member of the group who sought to better the condition of the working classes by Factory

Michael Sadler,
British social
reformer
After W. Robinson

Acts and other legislation. From 1829 to 1832 he was in parliament. He died July 29, 1835. *Consult* Memoirs, R. B. Seeley, 1842.

Sadler or Sadleir, Sir Ralph (1507-87). English diplomatist. Born at Hackney, he obtained the patronage of Thomas Cromwell, and about 1536 entered the service of Henry VIII, who employed him on delicate diplomatic missions to James V of Scotland, made him a principal secretary of state, and knighted him. During the

Sir Ralph Sadler,
English diplomatist

reign of Mary, Sadler as a Protestant retired from public life, but under Elizabeth he became Cecil's most trusted agent in Scottish matters. He was sent on various errands to Mary Queen of Scots, and subsequently served, somewhat unwillingly, as her gaoler in 1580. Sadler died May

30, 1587. His State Papers, edited in 1809 by A. Clifford with a Memoir by Scott, are valuable.

Sadler's Wells. A London theatre, in Rosebery Avenue, Finsbury. It derives its title from a highway surveyor named Sadler, some of whose workmen, digging for gravel here in 1683, discovered "a broad flat stone, supported by four oaken posts, and under it a large well." The water was found to have medicinal qualities, and the place, called New Tunbridge Wells, became both famous and fashionable. Sadler built a wooden music-house or music-hall on the site; this was replaced in 1765 by a regular theatre, which forms part of the building reconstructed from designs by C. J. Phipps, and reopened by Mrs. Bateman in 1879.

Sadler's Wells Theatre had a great vogue, 1844-62, under Phelps, as a home of Shakespearean drama. With it during 1819-28 was associated the name of Grimaldi, and here in 1832 T. P. Cooke achieved great success in Black-Eyed Susan. Later it became a music-hall and then a cinema.

Lilian Baylis, whose successful management of the Old Vic had created an enthusiastic public for serious drama, was the originator of a scheme by which on Jan. 6, 1931, the reconstructed theatre opened with a revival of Twelfth Night by the Old Vic company, and subsequently became the home of opera and ballet (on the latter see also Vic-Wells ballet). On Sept. 7, 1940, the night of the first heavy German air raid on London, the theatre closed and became a rest centre for hundreds of bombed-out families. The building was damaged by bombs but still used during the war as a base for touring companies. Sadler's Wells reopened June 7, 1945, with a performance of Benjamin Britten's opera *Peter Grimes*. See

Sado. Island of Japan. It lies off the W. coast of Honshu, in the Sea of Japan. Formerly constituting a kuni or old prov. of Japan, it was later included in the prefecture of Echigo. Gold and silver are mined, chiefly in the W. near Aikawa, the principal town. Its area is 331 sq. m., and its pop. about 100,000.

Sadoletto, Jacopo (1477-1547). Italian humanist and divine. Born at Modena and educated at Ferrara, where he proved a distinguished scholar in philosophy and the classics, he was ordained priest. Leo X gave him the see of Carpentras, 1517, making him

Jacopo Sadoletto,
Italian humanist

and Pietro Bembo (q.v.) his secretaries. In 1536 Paul III made him a cardinal, and his gentleness, piety, and profound learning proved a considerable asset to the Church, to which he endeavoured to reconcile the Protestant reformers. *Consult S.* on Education, E. T. Campagnac and K. Forbes, 1916.

Sadowa, BATTLE OF. Decisive Prussian victory over the Austrians in the Seven Weeks' War, July 3, 1866. It is sometimes called the battle of Königgrätz. The net result of the brief summer campaign had been the retirement of the Austrian army along the line of the Elbe. The concentrated 1st Prussian and Elbe armies attacked the Austrians at the bridge of Sadowa, near Königgrätz, early on July 3. Pushing forward, they engaged in a furious fight by the bank of the Bistritz and in Maslowed Wood. The Austrians began a slow and ordered retirement, but the arrival of the 2nd Prussian army in the afternoon completed their defeat. By nightfall they had lost 40,000 men, four times the casualties of the Prussians. The numbers engaged were Prussian, 221,000; Austrian, 205,000. *See Königgrätz; Seven Weeks' War.*

Saentis, Sántis, or Hoch-Sentis. Mountain of Switzerland. It is situated on the borders of the cantons of St. Gall and Appenzell, 7 m. S.W. of the town of Appenzell, and has an alt. of 8,215 ft. An observatory and an hotel stand on the summit, which commands

an extensive view. A cable rly. runs to the top.

Safari (Arab. *sefari*, journey). Hunting or shooting expedition by Europeans in Africa. The term is used for any expedition across roadless territory, and includes with the journey the equipment and native porters and bearers.

Safe. Structure, usually portable, for the secure storage of valuables against fire and burglary. Non-portable safes are known as strong rooms and safe deposit vaults, and are nothing more than a strongly constructed part of a building answering the same purposes as a safe on a larger scale.

Safes of various kinds date from pre-Roman times, but it was not until the 18th century that fire-resisting safes were first seriously studied and made. The general principle of the early safe consisted in the construction of two metal walls, the intermediate space being packed with some non-conductor of heat. Plaster of Paris, ground alum and gypsum and various concrete mixtures were used.

In modern safes the walls are built of sheet iron and steel. Alternate layers are soft and hard, hardness and toughness being the two chief qualities required, one to

made and the use of any disguise, e.g. paint, being avoided. Round doors are often employed for the purpose. The locks of modern safes usually incorporate an anti-explosive device, embodying an independent check that automatically obstructs the sliding bolts should the lock mechanism be displaced. Combination locks can also be fitted. The sliding bolts are operated by a lever handle on the outside face of the door. The great safe deposits and bank vaults are protected by massive doors, and electrical alarms to nearby police-stations. (*See Lock; Strong Room*).

BANK SAFES. Home safes, in which money can be placed until there is sufficient to be taken to a bank, are supplied by the Post Office and by certain banks to applicants. The safes can be opened only by the bank authorities.

In the 1920s and 1930s various British banks introduced automatic safes to enable traders and others who carry on business after banking hours to deposit their money in safety. The idea was borrowed from the U.S.A.

Such a safe is inside the bank building and is connected, by means of a chute, with a fitting built into the outside wall of the bank. Access is gained by a small revolving door in this fitting, the door being controlled by a special key provided by the bank. The customer is also furnished with a leather wallet in which he places cash, cheques, etc. The wallet bears a distinctive number and can be opened only by means of a second special key. After unlocking and opening the revolving door on the outside wall, the cus-

resist cutting tools, and the other the hammering tools or explosives of the burglar.

By another method of construction the outer wall is of cast steel, the inner wall laminated as already described, and the space between filled with insulating material in which are embedded drill-proof steel rods. This construction very effectively resists the action of the oxy-acetylene flame, thermite, etc.

Safe doors are constructed in the best safes so that no join is visible between the door and the safe, the most accurate fit being

Safe. A toughened steel safe so constructed as to withstand fire, damage by falling, and burglary. Left, an insulated safe specially designed for the storage of radium

by courtesy of Milner's Safe Co., Ltd.

tomor places the wallet on a small platform which rotates as the door closes, thus permitting it to travel into the safe. Here it remains until the customer calls during banking hours to pay in the money.

Safe-conduct. In international law, a written permit given by a belligerent to a person allowing him to proceed to a particular place. It is also used of a guarantee of safety given by a military authority to either a neutral or an enemy who is permitted to pass through or into the camp, lines, blockade, or fortress of the authority giving the permission. Such a safe-conduct is always given upon the terms, express or implied, that the person to whom it is accorded will not commit any hostile act (*e.g.* spying), and if he does, he is liable to be dealt with summarily as a military offender.

Safed. Town of Palestine. It lies about 12 m. N. of Tiberias, on the Sea of Galilee. A Jewish tradition survives that the Messiah will appear here. It was fortified by the Crusaders. Pop. 10,900.

Safed Koh. Mt. range of Afghanistan and Pakistan. It forms the watershed between the Kabul and Kurram valleys, and the frontier between Afghanistan and the N.W. Frontier Province. It is snow-capped, with fine coniferous forests on the slopes, and has a general alt. of 12,000 ft., culminating in Sikaram, 15,620 ft.

Safeguarding of Industries Act. Title of two British Acts of parliament, passed 1921 and 1926, designed to foster manufacture in the U.K. of certain goods by imposing a duty on such goods imported from abroad. *See* Protection.

Safety Explosive. General term to define such explosives as may be fired in an explosive mixture of air and gas or coal dust without readily causing ignition of the latter. Every known explosive, if fired in a sufficiently large quantity, will ignite such mixtures, but explosives have been found to differ over very wide limits in the quantity which can be employed without causing ignition, and it is thus possible, by specifying definite conditions under which the test shall be carried out, to define explosives as "safe" or otherwise. Explosives which have passed certain statutory tests for safe use in mines are called Permitted Explosives (*q.v.*).

Safety First. Term used by movement for the prevention of accidents on the road, in industry, and in the home. In 1933 a number of safety-first councils set up in the U.K. in 1916 amalgamated into the national safety first association, which in 1941 became the royal society for the prevention of accidents. Its offices are at 52, Grosvenor Gardens, London, S.W.1.

Safety Fuse. Name applied to a type of fuse employed for firing charges of explosive which can be relied upon to burn at a given rate. It was invented by W. Bickford, a Cornishman, in 1831 *See* Bickford Fuse.

Safety Glass. Glass that does not splinter when broken. Introduced in 1898, it originally consisted of a wire mesh embedded in the glass while the latter was molten. This increased tensile strength and reduced the splintering surface to the area of each mesh. In 1924 an improved safety glass, known as bonded or laminated glass, was introduced by sandwiching a sheet of gelatine or celluloid between two thin sheets of glass, then sealing the edges. Tempered or annealed safety glass was invented in France in the 1930s. A sheet of glass is almost molten, then rapidly cooled on both sides by blasts of air, so that the internal stresses equal the external. Breaking point of annealed glass is 300 p.c. higher than that of ordinary glass. When struck by a blow in excess of its breaking point, it does not splinter, but disintegrates into blunt granules free of cutting edges. Safety glass is chiefly used for the windscreens and windows of motor vehicles. *See* Glass; Laminated Materials.

Safety Lamp. Oil lamp used in coal mines where explosions of firedamp (*q.v.*) may occur. The earliest lamps were invented in 1815 by Davy (*see* Davy Lamp), and George Stephenson perfected a similar lamp, in which the air passed through very narrow metal tubes. The original Davy lamps gave very poor illumination, as the flame was entirely surrounded by iron-wire gauze with 784 apertures per sq. in. In the Clanny lamp the lower part of the gauze was replaced by a glass cylinder, the candle-power being thus much increased. All later designs, Belgian, French, and British, are modifications of the Clanny type. The oil safety lamp is now rarely used for illumination because of its low candle-power. It is, however, still used as a firedamp detector, the height of the cap or halo of burning firedamp above the oil flame giving a rough indication of the percentage of firedamp in the air.

Electric lamps are now in general use for lighting purposes in mines. *See* Coal Mining.

Safety Valve. Contrivance fitted to vessels in which vapour or gas is generated or stored under pressure, to give relief if the pressure exceeds a pre-determined limit. Such a valve generally consists of a cone-seated or flat-seated valve held by a weight or spring. Weight-loaded valves are suitable only for stationary vessels where the axis of the valve is vertical and vibration non-existent or negligible. The weight-and-lever type (Fig. 1) has the advantage of requiring a smaller load than the dead-weight type (Fig. 2), but is more easily tampered with. For

Fig. 1

Fig. 2

Fig. 3

Safety Valve.

Deadweight.
3. Section of
Ramsbottom
safety valve.
See text

locomotives and marine boilers the valve is restrained by an adjustable spring, acting directly or through a lever. The Ramsbottom type (Fig. 3) is frequently used for locomotive engines. A single spring serves for two valves, either of which can be relieved for testing purposes by raising or depressing a lever. This spring is in tension, but for marine and stationary boilers it is in compression. The load on the valve increases as the valve lifts, which means that the pressure will rise as the quantity of steam discharged increases. To obviate this the valve is provided with a flat seat or its equivalent, so that the area acted on is increased as soon as the valve lifts, giving rapid opening without appreciable increase of pressure. Safety valves should have sufficient area to ensure that excess vapour or gas can be discharged without appreciable increase of internal pressure. The wings of the valve, which act as guides, should have sufficient clearance, or the valve may stick. For maximum discharge, the valve is usually arranged to rise about one-fifth of its diameter.

Safflower, **SAFFRON THISTLE**, OR **BASTARD SAFFRON** (*Carthamus tinctorius*). Annual herb of the

Safflower. Flower heads and leaves

family Compositae. It is a native of Europe, Asia, and Africa. The leaves are oval with spiny teeth. The orange flowers are aggregated in terminal heads. They form a valuable dye stuff, yielding pink, rose, crimson, and scarlet, which is used chiefly for silks. It was known to the Egyptians, the flowers being found with their mummies. Mixed with talc and the whole finely ground, safflower becomes rouge.

Saffron (Arab. *za'faran*). Perennial herb (*Crocus sativus*) of the family Iridaceae. It is a native of Europe and Asia. The rootstock is a corm like that of the garden crocus, but larger. The grass-like narrow leaves are delicately fringed along the edges and keel; and the light purple flowers appear in autumn. Part of the female organs—the stigma and upper part of the style—are orange-coloured, and constitute the saffron of commerce, which has a strong aromatic odour and a bitter flavour, and is occasionally used in medicine and food, being especially common in Cornwall, where it is used for flavouring cake. It also yields an orange dye. As it requires some 750 fully developed stigmas to make 1 gramme of saffron, the substance has always been costly, and this has in the past often led to adulteration.

Saffron Walden. Mun. borough and market town of Essex, England. It is 44 m. N. by E. of London, with a rly. station. The chief building is the church of S. Mary the Virgin, a fine Perpendicular edifice. The town has a 16th century grammar school, a museum, and a hospital, while there are remains of a castle founded in Norman times. The chief occupation is horticulture. Earthworks and ditches show that

there was an early settlement here. The place was made a borough in 1514. Known at first as Walden, it derives its other name from the saffron crocus grown here until about 1750. Market days, Tues. and Sat. Pop. 7,000. See Audley End; Harvey, Gabriel.

Safi, **SAFFI**, OR **ASFI**. Port of French Morocco. It is on the W. coast, between Mazagan and Mogador, and exposed to the W. wind and difficult of access. Pop. est. 25,000.

Safid Rud. Name given to the lower part of the course of the Kizil Uzen, a river of N.W. Persia.

Safranines. Group of dye-stuffs prepared from coal-tar. The first safranin, known as aniline pink, was made by Perkin in 1863. The process now used commercially differs from Perkin's and consists in 'oxidising equimolecular proportions of paratolylene diamine, aniline, and ortho-toluidine.

Saga (Icel., from *segja*, to say). In Icelandic literature, a prose narrative. The term is applied to various classes of composition, biographical, historical, mythical, and romantic, but the typical saga is a prose epic, governed by fixed rules of style and structure. The oldest sagas, some of which were written before 1100, are biographies of leading men of the preceding age. Ari (1067–1148) was the first great saga writer, Snorri Sturlason (1179–1241), was a notable literary genius, and after Sturla Thorðsson (1215–84) the saga decayed.

The great sagas, many of which are anonymous, not only are admirably told heroic tales, but give a vivid picture of Icelandic society in the period of its greatest vigour. The finest is perhaps that of *Burnt Njal* (c. 1250). Others are the *Laxdolla* saga and those of *Egil*. Of sagas drawn from myths and legends the most famous is that of the *Volsungs*. Of historical

sagas those describing the Viking discoveries in America are among the most remarkable. In the 13th and 14th centuries Icelanders in Norway drew romantic sagas from the cycles of Alexander, Charlemagne, and Arthur. See *Iceland*; *Sturlason*, *Snorri*. Consult *The Saga Library*, W. Morris and E. Magnusson, 1891–1905.

In the 20th century the word saga acquired a new semi-colloquial use, being applied to long prose narratives, e.g. *Galsworthy's Forsyte Saga*.

Sagaing. Division, dist., and town of Burma. The div. comprises almost the whole of the valley of the Chindwin, with an extension S.E. towards Mandalay. The dist. which forms part of this extension has a relatively dense population. It is the driest dist. in Burma, having a rainfall of only 27 ins. Cereals and oilseeds are extensively cultivated. The town, which was the former capital, is a rly. junction on the right bank of the Irawadi opposite Ava. The rly. and road bridge, 5,894 ft. long, built 1934, was badly damaged in the Second Great War in the course of British operations for the recapture of Mandalay from the Japanese, Feb.–March, 1945. Division, area, 26,182 sq. m.; pop. 2,322,675. Dist., area, 1,825 sq. m.; pop. 387,270. Town, pop., 15,000.

Sagan. Town of Silesia. It stands on the Bober, 118 m. S.W. of Berlin, and is a rly. junction. The palace, built by Wallenstein, dates from 1630. There are R.C. churches dating from 1183 (rebuilt 1516) and from 1628. Industries, up to the time of the Second Great War, included textile, paper, and leather works. Sagan was known as a town from 1202, and from 1844 was a sovereign principality. After belonging to Saxony and to the Hapsburgs, it eventually came to Prussia. Here in 1759 the Russians defeated a Prussian army. It is in the part of Germany placed under Polish administration in 1945. Population (1935) 18,205.

Sagar. Island of W. Bengal, India, at the extreme W. of the Sunderbans, 99 m. S. of Calcutta in the Hooghly estuary where the Ganges is considered to reach the sea. In Jan. 50,000 Hindu pilgrims gather annually for the great bathing festival, lasting three days or more. Game is abundant, including tiger, deer, wild boar, and sea birds. In 1864 the island was struck by a cyclone which killed 4,000 out of the

Saffron. Corm, leaves, and flower. Inset, above, flower; below, pistil

5,600 inhabitants. On Middleton Point, in the S.W., is a 76-ft. lighthouse, the foundation of which was laid in 1808. The Hooghli is 15 m. wide at this point. Area, 225 sq. m.

Sage (Fr. *sage*, from Lat. *sapere*, to be wise). Name for a wise man. The term is applied to legendary heroes famous for their wisdom, and to persons whose wisdom gains for them the veneration of others. The Seven Sages of Greece, famous in medieval literature, were Thales, Solon, Periander, Cleobulus, Chilon, Bias, and Pittacus, each of whom was credited with a special maxim.

Sage (*Salvia officinalis*). Low shrub of the family Labiatae. A native of S. Europe, it is about a foot high, with a woolly stem and downy branches. The leaves are opposite, oblong, and wrinkled. The purple flowers are in whorls which form a spray. It has aromatic and bitter properties and is largely used in cooking.

Sage. Cutting of the aromatic herb

Sage may be grown in any dry, well-drained soil and a warm position. It is propagated from seeds or cuttings sown or planted in the spring. The branches should be cut, tied up in bunches, and hung, leaves downwards, in a well-ventilated shed or loft. When the leaves are quite dry they may be rolled between the palms of the hands, similarly to tobacco, and stored away in airtight covered bottles. See Pollen.

Sage, Russell (1816-1906). American capitalist. Born Aug. 4, 1816, he was brought up on a farm, and, after serving as errand-boy and assistant, became a retail grocer at Troy, N. Y., 1837. Entering the wholesale business two years later, he remained in Troy until 1863, when he moved to New York and went on the stock exchange, where he made a large fortune in rlys. He died July 22, 1906, leaving about £15,000,000 unconditionally to his widow, Mar-

Mrs. Russell Sage, American philanthropist

garet Olivia Slocum Sage (1828-1918). Her benefactions were correspondingly large, and included £2,000,000 to the Russell Sage foundation to improve the social and living conditions of the U.S.A., 1907; over £700,000 to educational purposes; and £60,000 for the Sage institute of pathology. She died Nov. 4, 1918, and by her will over £10,000,000 was distributed to charities, hospitals, and educational institutions.

Saginaw. Bay or arm of Lake Huron. It extends into the state of Michigan, U.S.A., for 60 m., and has a greatest breadth of 24 m. It receives the river Saginaw.

Saginaw. City of Michigan, U.S.A., the co. seat of Saginaw co. It stretches for 4 miles along the bank of the Saginaw river, 100 m. by rly. N.N.W. of Detroit, and is served by the Grand Trunk and other rlys. Timber mills have given way to coal depots and oil reservoirs. There are also food-processing plants. Settled in 1822, Saginaw became a city in 1857. Pop. 82,794.

Sagitta (Lat., arrow). Small constellation N. of Aquila. It is one of the most ancient of the constellations. None of its stars is above the fourth magnitude, though several are variable stars. See Constellation.

Sagittaria. Genus of about 12 species of perennial marsh and aquatic herbs. One of them, the arrowhead, is native to Great Britain, Europe, and Asia; the others are all American. The leaves, which are floating or erect, spring from a short, thick root-stock, and in about half the species are arrow-shaped; in others lance-shaped or oval. The white flowers are produced in three to five whorls, the upper ones males, the lower females. See Arrowhead.

Sagittarius (Lat., archer). Ancient constellation and ninth sign of the Zodiac. It follows the Scorpion on the line of the ecliptic, and lies very near the S. horizon of British skies. The constellation contains many famous star clusters and nebulae. Though it has no stars brighter than the third magnitude, it is crossed by the brightest part of the Milky Way.

Sago (*Metroxylon laeve* and *M. rumphii*). Trees of the family Palmae. They are natives of New Guinea and Malaya. Stout trunks terminate in a crown of long, feather-shaped leaves. The smooth sago-palm (*M. laeve*) is the larger species, and distinguished from the prickly sago-palm (*M. rumphii*) by the leaf-stalks of the latter being armed with long, sharp spines. The sago of commerce is prepared from the soft inner portion of the trunks by washing and pounding, by which process the starchy matter is separated. The name sago-palm is also applied to the fern palms (*Cycas*) from whose seeds a kind of sago is prepared. See Fern Palm.

Saguenay. River of Quebec, Canada, a tributary of the St. Lawrence. It issues from Lake St. John by two rapids, and during the earlier part of its course is unnavigable. From Chicoutimi, however, it can be used by small vessels, and from Ha Ha Bay, a pleasure resort on the river, by the largest ones. The lower course is in a fjord valley flanked by rock walls rising from 1,000 to 1,800 ft., with a depth in mid-channel of 800 ft. The length of the river is 120 m., and Tadoussac stands at its mouth. The Ashwappmuchuan, which flows into Lake St. John, is sometimes called the Upper Saguenay. With its headstream, the Peribonka, it is 405 m. long.

Sagunto, Spain. Ruins of the Roman theatre

Sagunto. City of Spain, in the prov. of Valencia. The ancient Saguntum, it stands near the mouth of the R. Palancia, 18 m. by rly. N.N.E. of Valencia. Perhaps founded by a Greek colony from Zacynthus, it became a useful commercial port, but now lies inland, the sea having receded about 3 m. Sagunto is famous for its heroic resistance in 219 B.C. to Hannibal, to whom it fell, through starvation, after a siege of eight months,

its fall being the prelude to the second Punic War. Afterwards Saguntum became a Roman municipality, and traces of its prosperity are seen in the theatre, one of the best preserved of Roman monuments, in remains of walls, temples, pillars, the foundations of the citadel, inscriptions, etc. Called by the Romans Murviter, it became Murviedro after its deliverance from the Moors in the 12th century. The name Sagunto was restored in 1868. Old Sagunto is on the N. slope of a hill crowned with a castle. Although regarded as an almost impregnable fortress, it surrendered to the French in 1811. Pop. 11,400.

Sahara. Desert of N. Africa. It stretches from the Atlantic to the borders of the Nile, and includes the S. portion of Morocco, Algeria, Tunisia, and Libya, with portions of Egypt. In the N.E. is the Libyan desert (*q.v.*), and in the S. the Sahara extends to the neighbourhood of the river Niger and Lake Chad. The surface is not uniform, nor is the whole region sterile country. It is broken by a succession of dunes, and in some places is depressed below the level of the sea, whilst in others it attains a high alt. and is marked by lofty plateaux crowned by isolated mountain ranges, *e.g.* Ahaggar, whose peaks exceed 8,000 ft. These ranges are cut by deep valleys.

Portions of the desert are dotted with fertile oases which mark the great caravan routes from the Mediterranean to the W. Sudan, from Tripoli, Benghazi, and other ports through Fezzan; and much of the country, hitherto regarded as useless, especially in the regions N. of the river Niger, is capable of sustaining herds of cattle. The deep valleys which cross the desert frequently mark the courses of dried-up rivers, and water may probably be reached in many places by boring. The surface is not entirely covered with sand, but huge tracts are strewn with blocks of granite and other rocks, or covered with stones. These tracts are frequently varied by the remains of what were once broad marshes, where the water has evaporated and left great deposits of salt. There is no doubt that within historical times large portions of the Sahara have been much more fertile than they are at present, and even as late as the time of the Romans there were military posts far to the south.

The climate of the Sahara is excessively hot and unbearable for

Europeans; but a few indigenous nomad tribes subsist in the oases or the deep valleys. At Insalah, Algeria, the monthly mean temp. reaches 98° F. in July; at Azizia, Libya, 137° F. has been attained. The difference between day and night is striking, so quickly is heat lost by radiation to the clear skies; summer nights may be chilly, and frosts occur in winter. What little rain there is falls chiefly in isolated storms. Hot surface winds, often sand-laden, blow from the desert to neighbouring areas, where they are distinguished by such names as Leste, Leveche, Sirocco (*qq.v.*).

The greater part of the Sahara is under the control of France and forms part of French West Africa. The French have also gradually extended their occupation S. from Algeria and Tunisia, and many districts formerly regarded as sterile are now being cultivated. Many plans have been proposed for railways across the desert and extensive surveys undertaken under government auspices. There are air routes across the desert, where emergency landing grounds have been laid out.

Chief travellers in the Sahara during the 19th century were Laing, Richardson, Barth, Rohlf, and Nachtigal. In 1920–21 Rosita Forbes journeyed through the Libyan desert to Kufra, the sacred city of the Senussi (*q.v.*). During the Second Great War, Gen. Leclerc, the Free French commander, led a mixed French and native force across 1,500 m. of the Sahara from Fort Lamy (Chad Territory) to conquer the Saharan prov. of Fezzan between Jan. 4 and 29, 1943, and assist the British 8th army in completing the clearance of the Germans from Tripolitania and Tunisia. *See* Africa.

Phillips, 1909; Through Timbuctoo and across the Great Sahara, A. H. W. Haywood, 1912; The Secret of the Sahara, Rosita Forbes, 1921; Sahara Unveiled, P. Turnbull, 1940; Wind in the Sahara, R. V. C. Bodley, 1947.

Saharanpur. Dist. and town division, Uttar

union, India. The district lies between the Jumna and Ganges in the N. of the division. Annual rainfall is 38 ins. Wheat and barley are the chief crops. Area, 2,134 sq. m. Pop. 1,179,643.

Saharanpur town is the headquarters of the Jumna canal administration and a rly. junction 60 m. N. of Meerut. Founded in the 14th century, it possesses the shrine of Shah Haran Chisti, and was a summer resort of the Moguls. Botanical gardens started in 1817 by the E. India Co. are famous. The trigonometrical survey of the Himalayas was opened in 1835 at Nojli close by. Pop. 108,263.

Sahet Mahet, or **SRAVASTI**. Ruins of Jain temples in the United Provinces, India. They are situated in Godna dist. in Oudh, 80 m. E.N.E. of Lucknow. The ruined city of Sravasti was in ancient days one of the principal seats of Buddhist learning. *See* India; Jain.

Sahib (Arab., friend). Title of respect in India. It is used by natives in addressing and speaking of Europeans, and is added to native names and to titles and offices, *e.g.* Tippoo Sahib, Khan Sahib, Collector Sahib. European ladies in India are called by courtesy mem-sahib.

Saiga (*Saiga tatarica*). Species of antelope. It is distinguished by the extraordinary shape of the head. The nose is convex and inflated, giving a bulbous appearance to the face, the ears are small, and the horns are short, widely placed, and lyrate. It now occurs only in S. Russia and S.W. Siberia; but its remains are found in Great Britain. Its pelt is tawny yellow to grey on the upper parts and white beneath.

Saigon. Seat of govt. of Vietnam since 1949. Situated in S. Vietnam (Cochin China, of which it was formerly the capital), it is on the Saigon river, 40 m. from the S. China Sea. It is a great commercial

Saigon, Vietnam. A typical street scene

centre of the country, and was long the principal French military and naval base in the Far East

Buildings include government offices, town hall, cathedral and theatre. In the botanical gardens wild beasts live in natural surroundings. A commodious harbour is accessible to the largest steamers, and is equipped with shipbuilding yards and repair shops. Adjoining Saigon to the south-west is the large commercial city of Cholon.

Saigon, an administrative capital in the Annamese empire, was captured by the French in 1859 and ceded to them in 1862. On July 28, 1940, the Vichy French govt. was compelled to permit Japanese occupation of airfields and naval installations at Saigon. The Japanese developed the port into a base for operations against Singapore and the East Indies. F.-M. Count Terauchi, commander of Japanese forces in the southern regions, surrendered here in person to Admiral Mountbatten, Nov. 30, 1945. Pop. 217,518.

Sailcloth. Fabric used for the sails of ships and windmills. Ships' sails are mostly made of stout canvas. The sails of windmills were formerly canvas, but are now usually boarded. Originally sailcloth was made only of hemp or flax, but now cotton, ramie, and mixtures of flax and cotton are also used. See Ship.

Sailing. Navigation of wind-driven boats. Up to the beginning of the 18th century the sailing of yachts was almost exclusively confined to royalty and the wealthy classes, but the building of small craft and the formation of yacht clubs has enabled many to enjoy the pastime. The Norfolk Broads are favourite resorts for sailing small craft. Larger boats use the Solent. See Ship; Shipbuilding; Yachting.

Sailors' Society, BRITISH. Organization founded in 1818. It provides residential clubs and canteens in ports all over the world; port chaplains and missionaries; a world-wide welfare service with resources to meet every need of seamen and their dependents; library service for ships and lighthouses; and a school at which sons of deceased or disabled seamen are trained and maintained free; it is the oldest and largest seamen's society. The headquarters of the society are at 680, Commercial Road, London, E.14.

Sainfoin (*Onobrychis sativa*). Deep-rooted leguminous plant, particularly suitable for haying or grazing purposes in calcareous soils in the warmer parts of Great Britain. Its long leaves have six to

ten pairs of leaflets, with one at the end, and the pink flowers are arranged in conspicuous racemes. The pod is wrinkled and contains one brown seed. Common or English sainfoin is perennial, and is left down for three to seven years,

Sainfoin. Leaves and flowers of the field herb

yielding one cut of hay in the year. Giant or French sainfoin is a rapidly growing plant, giving two cuts of hay per annum, but does not last more than two years. Sainfoin is usually drilled from April to the end of May. When unmilled, i.e. with the husk on, about 4 bushels per acre are necessary, but 56 lb. is the average amount for milled or shelled seeds. *Pron.* Sanfoyn.

Saint (Lat. *sanctus*, holy). One whose life has been consecrated to the service of God. The phrase "called to be saints," in Rom. 1, v. 7, implies that all Christians are saints; and to the description of Our Lord as King of Saints, Rev. 15, v. 3, A.V., has the marginal note "or nations or ages," the R.V. reading being "King of the ages," with the note "many ancient authorities read nations."

The prefix Saint (St. or S.) to the names of the Apostles and Evangelists in the N.T. dates from the end of the 3rd or the beginning of the 4th century, when the word was applied especially to martyrs, the manner of whose death was regarded as winning immediate admission to Heaven. Thousands of saints are commemorated in the *Acta Sanctorum* (q.v.) of the Bollandists; those having days

allotted to them in the English Prayer Book number 73. In the R.C. Church the worship accorded to saints is called *douleia*; the worship of the Virgin Mary, *hyperdouleia*; and the adoration paid to God alone, *latreia*. In accordance with ancient custom, churches, abbeys, monasteries, convents, hospitals, colleges, and many school churches are dedicated to or named after saints. The word enters largely into topography, and many countries have their patron saints, as England has S. George; France, S. Denis. See entries under the names of the principal saints; Beatification; Canonisation; Hagiology.

Bibliography. Lives of the Saints, S. Baring-Gould, new ed. 1897; The Book of Saints, compiled by the Benedictine monks by S. Augustine's Abbey, Ramsgate, 1921; Saints and Heroes of the Christian Church, C. P. S. Clarke, 1935; Saints You Ought to Know, MacGillivray, 1936; Saints Who Spoke English, J. Windham, new ed. 1946.

St. Abb's Head. Rocky promontory of Berwickshire, on the coast of Scotland, 4 m. N.W. of Eyemouth. S. Ebba, after whom it is named, founded a monastery here in the 7th century. The promontory is 310 ft. high, and surmounted by a lighthouse visible for 21 m. St. Abb's, formerly

St. Abb's Head, Berwickshire. The cape and lighthouse from Kirk Hill
Valentine

Coldinghamshire, a seaside resort and fishing village, lies 2½ m. S.E.

St. Agnes. Seaside resort of Cornwall, England. It is 8 m. by rly. N.W. of Truro. John Opie, the painter, was a native. Near the town is St. Agnes beacon, 597 ft. high, and St. Agnes Head is about a mile away. Pop. 4,000.

St. Agnes. One of the inhabited Scilly Islands. It lies about 2 m. S.W. of St. Mary's. Objects of interest include a holy well, a disused lighthouse dating from 1680, and rock formations. Pop. 59.

Top, the West Front, restored in 1894, showing the Norman tower, faced with Roman tiles, and the Gothic nave, the longest in existence (292 ft.). Below, the choir, looking towards the Wallingford screen and the High Altar, showing the Norman arches of the church built by Paul de Caen

ST. ALBANS CATHEDRAL: ONE OF THE EARLIEST NORMAN CHURCHES IN ENGLAND

St. Albans. Mun. bor., city, and market town of Herts, England. It stands above the river Ver, 21 m. N.W. of London, with which it is connected by rly. and Green Line. To the W., in Prae Wood, and in Gorhambury and Verulamium, are remnants of the British-Roman city of Verulamium, destroyed by Boadicea in A.D. 61 and by the Saxons in the 5th century. Here was the only Roman theatre yet uncovered in England. The city, built by the Saxons on the summit of Holywell Hill, and called Watlingceastre, became known as St. Albans after the foundation by Offa II, in 793, of a Benedictine abbey in memory of England's protomartyr Alban (q.v.). The abbey was rebuilt by Paul de Caen (1077-97) and his successors on a magnificent scale. Suppressed in 1539, its church was sold to the city for a parish church and grammar school in 1553.

St. Albans arms

The cruciform church, partly renovated by Sir Gilbert Scott in 1856, and thoroughly restored, amidst a storm of criticism, by Baron Grimthorpe, was constituted in 1875 the cathedral of a new diocese which took in the county of Herts. Standing 320 ft. above sea level, 550 ft. in length, and 175 ft. in breadth across the transepts, it has a central Norman tower faced with Roman tiles, 145 ft. high, and exemplifies all styles of architecture. It is notable also for its high altar screen, rood screen, choir ceiling, Saxon baluster columns and frescoes, and its monuments. The brasses include one to Robert Fayrfax (d. 1529), a notable organist of the abbey. Excavations in the deanery garden in 1920 disclosed the floor of the chapter-house.

England's third printing press was set up here by Abbot Wallingford in 1480. The 14th century abbey gatehouse, long the home of St. Albans grammar school, was for some time used as a gaol. The school records go back to the 11th century. Three churches, S. Peter's, S. Stephen's, and S. Michael's, all restored, were founded in Saxon times by Abbot Ulsinus, or Ulsig, who also started the market. S. Michael's contains a beautiful 17th century carved pulpit and a monument to Francis Bacon. Near by were excavated, in 1847 and 1934, remains of the Roman theatre, and, in 1898-1908, part of a town hall and forum. On the restored Clock

Tower, 1403-12, near the market place, a plaque records the neighbouring site of an Eleanor cross. The town hall dates from 1826. The Fighting Cocks inn is a 16th century octagonal building.

Printing, light engineering, orchid culture, and clothing and hosiery manufacture are carried on. Incorporated in 1554, St. Albans was a parl. bor. until 1852, and now gives its name to a county constituency. Millenary celebrations were held in 1948. Market days, Wed. and Sat. Pop. 42,000. *See* Bacon, Francis; Gorhambury; Inn illus.; Pulpit illus.; Roman Remains; Verulamium. *Consult* Historical Records of St. Albans, Gibbs, 1888; History of the Abbey of St. Albans, L. F. Rushbrook-Williams, 1917.

St. Albans, BATTLES OF. Fought between Yorkists and Lancastrians, May 22, 1455, and Feb. 17, 1461. When in 1455 Richard of York took up arms, Edmund Beaufort, duke of Somerset, the chief adviser of Henry VI, at once collected an army about 3,000 strong and left London for the north. Reaching St. Albans, they heard that the Yorkists were at hand and so prepared to fight in the town. The royal standard was pitched in the main street, and the ways into the city were barricaded. After a short but stubborn fight Somerset was killed, his followers put to flight, and the king was made prisoner by the Yorkists.

After their victory at Wakefield, Dec. 30, 1460, the Lancastrian queen and her followers marched towards London. Warwick, to oppose them, collected the remaining Yorkists and had a strong force, drawn mainly from the home counties, when he arranged his men in order of battle just outside St. Albans. For the first time in English military history he had cannon with him and also other firearms. But in spite of his preparations, the Yorkists were surprised, and the first fighting took place in the town itself, their left flank there being unexpectedly assailed. The archers beat back this attempt, but a second broke the Yorkists, who were routed. *See* Roses, Wars of the.

St. Albans, DUKE OF. British title borne by the family of Beaulieu since 1684. In 1628 Richard Bourke, earl of Clanricarde, was made earl of St. Albans, but the title died out with his son in 1657. From 1660 to 1684 Henry Jermyn, the favourite of Henrietta Maria, was earl of St. Albans. He was with the exiled royal family during

the Commonwealth, and was said to have been secretly married to the queen. In 1685, the year of Jermyn's death, Charles II made his son, Charles Beaulieu (1670-1726), duke of St. Albans, Nell Gwynn being the boy's mother. Charles was made hereditary falconer, a post held by his successors, though the emoluments were commuted by the state in the time of the 10th duke. Charles's descendants followed in the title, the 9th duke marrying the actress Harriet Mellon, widow of the banker Thomas Coutts. Osborne (b. Oct. 16, 1874) became 12th duke in 1934 in succession to a brother.

St. Aldegonde, PHILIP VAN MARNIX, LORD OF (1536-98). Ne herlands statesman. Born in Brussels, of noble family, he passed some of his early life in Geneva, where he was under Calvin's influence. In the Netherlands he became a leading spirit among the reformers, and was prominent in the rising against Spain, chiefly as a diplomatist. In 1583 he was made burgomaster of Antwerp, a post he held through the siege of that city by the Spaniards in 1584-85. He died at Leyden, Dec. 15, 1598. As a writer, St. Aldegonde is known by his metrical translation of the Psalms.

St. Aldhelm's Head. Promontory on the English Channel, 5 m. S.W. of Swanage, Dorset, and the S. extremity of the Isle of Purbeck. A common corruption of the name is St. Alban's Head. Here is a Norman chapel dedicated to S. Aldhelm (c. 640-709), bishop of Sherborne in 705. The cliffs attain 350 ft., and there are many fine walks hereabouts.

St. Aldwyn, MICHAEL EDWARD HICKS-BEACH, EARL (1837-1916). British statesman. Born Oct. 23, 1837, he belonged to a Gloucestershire family, and in 1854 succeeded his father as 9th baronet. He was educated at Eton and Christ Church, Oxford, and in 1864 entered the house of commons as M.P. for E. Gloucestershire, retaining that seat until 1885, after which he represented W. Bristol till 1906. Sir Michael joined the Conservative ministry as chief secretary for Ireland, 1874-78, and secretary for the colonies, 1878-80. He left office then, to return in 1885 as

Earl St. Aldwyn,
British statesman
Russell

chancellor of the exchequer and leader of the house. A short Liberal ministry followed. In 1886-87 he was again Irish secretary but not leader of the house. After a year's rest on account of his health, he was president of the board of trade, 1888-92. As chancellor of the exchequer 1895-1902, he disliked Chamberlain's plan of tariff reform. In 1906 he was made a viscount, and in 1915 an earl. He died April 30, 1916, being succeeded by his grandson Michael John (b. Oct. 9, 1912). *Consult* Life, V. Hicks-Beach, 1932.

St. Amand les Eaux. Town of France. In the dept. of Nord, it stands at the confluence of the Scarpe and the Elnon, 6 m. N.W. of Valenciennes. Pop. 14,218.

St. Andrews. City, burgh, and seaport of Fife, Scotland. Standing on cliffs rising above the sea, it is situated on St. Andrews Bay, an opening of the North Sea, 12 m. S.E. of Dundee. Here the Eden falls into the sea.

St. Andrews arms

Attractions in a city of remarkable beauty include the ruins of the castle and the cathedral. The former, at first the residence of the bishops, was the scene of many interesting episodes. Of great strength, it was nevertheless captured more than once, and its dungeons housed prisoners of eminence. The cathedral was a noble building of the 12th and 13th centuries; it originated in a priory which long flourished here. After the Reformation it decayed, and some walls and towers alone remain. The university has mainly modern buildings. There are also a parish church, town hall, public halls, and hospital. The Martyrs' Memorial is noteworthy. Madras College is a celebrated school, and another is the girls' school that occupies the buildings of S. Leonard's College. Of the city gates only the West Port remains. St. Andrews is the headquarters of golf, and providing for players and visitors is its main industry. The Royal and Ancient Club, founded in 1754, has its fine links here. The city is served by branch rly. from Leuchars and has a small harbour.

St. Andrews is said to owe its name and origin to the fact that S. Regulus, bearing the bones of the apostle, settled here in the 7th century. In the 9th century it was made a bishopric. Later its bishop became primate of Scotland and

St. Andrews, Scotland. Ruins of the cathedral, built in the 12th and 13th cents.

was an archbishop until 1688. There is still a R.C. archbishop of St. Andrews and Edinburgh. It was made a royal burgh in 1124. Pop. est. 8,750. *Consult* St. Andrews, A. Lang, 1893; Handbook to the City and University, J. M. Anderson, 1911.

St. Andrews, UNIVERSITY OF. Scottish university. It was founded in 1411 by Henry Wardlaw, bishop of St. Andrews, and was made a university by papal bull in 1413. In 1450, Bishop Kennedy founded the college of S. Salvador, and in 1512 that of S. Leonard was founded. The original university was made into the college of S. Mary in 1537, and is now confined to students of theology. In 1747, S. Salvador's and S. Leonard's were formed into the United College. The college buildings include S. Mary's College, which has part of the original edifice, the United College, a modern building occupying the site of S. Salvador, the university chapel, the library and medical buildings erected at the expense of the 3rd marquess of Bute. There are also lecture rooms, museums, and laboratories.

The university is managed by a chancellor and rector, the latter being president of the university court. Its acting head is the principal, and it unites with the

other Scottish universities to send three members to parliament.

University College, Dundee, dating from 1880, is part of the university. *See* Gowns colour plate.

St. Anne's-on-Sea. Watering-place of Lancashire, England, now joined with Lytham to form Lytham St. Annes (*q.v.*).

St. Anthony's College. College of Oxford university. Inaugurated in 1950 in Halifax House, Woodstock Rd., with accommodation for 20 students, it owed its foundation to Antonin Besse, a French shipowner who in 1948 put up £1,500,000 anonymously for the creation of a new college for post-graduate work in international and economic affairs; the only condition was that a proportion of the students should be French. The first warden, F. W. D. Deakin, historian and linguist, was in 1943 dropped into Yugoslavia where he earned the D.S.O. serving with Marshal Tito.

St. Anthony's Pigs. In medieval times friars of S. Anthony (1195-1231), members of the Franciscan order, enjoyed the right of allowing their swine to roam at liberty in search of food. Remedy for damage caused by these animals, which were distinguished by a T cross, had to be sought in the court of the ecclesias-

St. Andrews University. Buildings of the United College of S. Salvador and S. Leonard. *See* also frontispiece to this vol.

tical ordinary, and the custom became such a nuisance that many towns compounded for its extinction. Thus for several centuries Bruges paid an annual £2 sterling to the monastery of S. Anthony at Bailleur on condition that no T Anthony pig should be allowed to roam within the town.

St. Arnaud. Township of Victoria, Australia. It is 158 m. N.W. of Melbourne by rly. Gold mining and agriculture are its chief industries.

St. Arnaud, JACQUES LEROY DE (1796-1854). French soldier. Born in Paris, Aug. 10, 1796, he entered the army in 1817 and had an adventurous and chequered career before making his reputation as an officer in the foreign legion in Algeria. He defeated the Kabyles in 1851, and in the same year, being then

J. L. de St. Arnaud,
French soldier

minister for war, assisted Louis Napoleon in his *coup d'état*. On the outbreak of the Crimean War, being then a marshal, he was appointed to the command of the French forces, but he died a few days after the battle of the Alma, Sept. 29, 1854.

St. Asaph. City and market town of Flintshire, Wales. It is 5 m. N. of Denbigh, with a rly. station, and stands on elevated ground near the junction of the rivers Clwyd and Elwy. The chief building is the cathedral, a plain cruciform edifice dating mainly from the

St. Asaph arms

14th century, although the choir was restored in the 15th. Sir Gilbert Scott restored the cathedral in the 19th century. The library is small but valuable. St. Asaph has a parish church, a grammar school, and an old bridge across the Elwy. It is the centre of an agricultural district. The city, called in Welsh Llanelwy, grew up around a monastery founded about 560. The church became the cathedral and took the name of Asaph, the successor of Kentigern. Market day, Thurs. Pop. est. 2,000. See Edwards, A. G.

St. Augustine. City of Florida, U.S.A., said to be the oldest permanent European settlement in the country. It stands on a peninsula, fronting the Atlantic Ocean,

36 m. from Jacksonville. Its appearance is picturesque, with old streets and houses and many reminders of its Spanish past. It has a Spanish fort of the 17th century where, during the revolution, three prominent signees of the declaration of independence, who had been captured by the British in S. Carolina, were imprisoned. Notable are the R.C. cathedral, Trinity Church, and the post office, once the headquarters of the Spanish rule. The industries include the manufacture of rly. stock and cigars, also fishing. St. Augustine is a pleasure and health resort. The city was founded by the Spaniards on S. Augustine's Day, 1565. It was fortified, and was attacked and occasionally plundered by the English. Having been British from 1763-83, it was ceded by Spain to the U.S.A. in 1821. Pop. 12,090. Consult Old St. Augustine, C. B. Reynolds, 1835.

St. Austell. Market town and urban dist. of Cornwall, England. It stands above St. Austell Bay, on

the S. coast of the county, 14 m. N.E. of Truro, with a rly. station. The church of Holy Trinity, dating partly from the 13th century, has a splendid Perpendicular tower; it was restored in the 19th century. Other buildings include the town hall and market house. St. Austell was the centre of a tin and copper mining district, but the metal industry has since the 1920s been largely superseded by the production of china clay, used in the making of fine chinaware. Of this clay the St. Austell district is now the greatest producer in the world. A. L. Rowse (g.v.) was a native of St. Austell. Market day, Fri. Pop. (town) 10,000; (district) 23,000.

St. Asaph, Flintshire. Cathedral from the south-west

St. Bartholomew, MASSACRE OF. Name given to the murder of the Huguenots in France which began on St. Bartholomew's Day (Aug. 24), 1572. Its authorship is usually attributed to the king's mother, Catherine de' Medici, but its causes were probably more complex. It began with a plot to murder Coligny, whose influence with the king was dreaded by the queen-mother and others. This failed, but it aroused a good deal of suspicion, and both sides prepared for bloodshed. Taking advantage of the presence in Paris of many Huguenots who had come to attend the marriage of the king's sister Marguerite and Henry of Navarre, Catherine, backed by the Guises and others, persuaded Charles IX to strike at their foes. He consented, and the massacre began in Paris, spreading to the provinces, and lasting until Oct. 3. One authority states that 50,000 were killed, but 25,000 is probably nearer the mark. Gregory XIII issued a medal in commemoration.

St. Austell, Cornwall. Fore Street, showing the tower of the parish church of Holy Trinity

St. Bartholomew's Hospital. Hospital and medical school at Smithfield, London. The hospital and priory of St. Bartholomew were founded by Rahere in 1123, but a century later the hospital was a separate community.

A bequest of Whittington in 1423 was used for repairs to the hospital. Its constitution was remodelled in 1544, and in 1547 the king gave it to the City of London. New endowments were found by the city, and the government of the foundation was entrusted to twelve governors, of whom four were aldermen appointed by the lord mayor. The hospital was rebuilt by James Gibbs in 1760, and this building was added to in 1793. Part of

St. Bartholomew's Hospital, London. The main entrance to the building in Smithfield

the adjoining site of Christ's Hospital (*q.v.*) having been acquired, new blocks, containing 10 medical and 10 surgical wards, were erected on the S. side of the quadrangle, being completed in 1937.

The oldest part of the structure is the entrance gateway from Smithfield, 1702, which is scheduled as an ancient monument. The paintings on the main staircase are the work and gift of Hogarth, and by Reynolds, Lawrence, Kneller, Millais, and Luke Fildes in the Great Hall.

Within the original hospital there were three chapels, of which one only, that of the Holy Cross, survives under the name of S. Bartholomew-the-Less, rebuilt in wood by George Dance, in 1789, in stone by Thomas Hardwicke in 1823, and restored since.

The medical school of the hospital dates from 1662. "Barts" has 689 beds, 350 for surgical cases, and treats 8,000-9,000 in-patients and 270,000 out-patients annually. During the Second Great War part of the hospital was moved to buildings near St. Albans, and it was later planned to keep some of its activities in Herts, a site near Watford being selected for this purpose. *Consult* History of S. Bartholomew's Hospital, 2 vols., N. Moore, 1919.

St. Bartholomew the Great. Old London church. In W. Smithfield, E.C., and remarkable for its magnificent Norman pillars and arched recesses, it now consists of very little more than the choir and transepts of the church of the Augustinian priory

founded by Rahere (*q.v.*), 1123. Of the W. façade all that remains is a 13th century gateway. Restoration was carried out from 1864 to 1906, mainly under Sir Aston Webb. The lady chapel, restored in 1897, served at one time as a printing office, in which Benjamin Franklin worked, and as a fringe factory; while the N. transept, reopened in 1893, accommodated a blacksmith's forge. The 12th century Norman tower was replaced in 1628 by the existing brick struc-

St. Bees, Cumberland. View of the shore and the town, from St. Bees Head

ture, which contains five 16th century bells. Hogarth was baptized at the existing font. The tombs of Rahere and Sir Walter Mildmay, founder of Emmanuel College, Cambridge, are among the features of the interior of the church.

Milton, Benjamin Franklin, Hogarth, Dr. Caius, and Washington Irving are among those who have lived in Bartholomew Close. *See* Bartholomew Fair; London; Smithfield.

St. Bartholomew the Great, London. Interior of the Norman church, looking east

St. Bees OR ST. BEGHA. Town of Cumberland, England, 4 m. by rly. S. of Whitehaven. It derived its name from St. Begha, an Irish princess, who is said to have established a nunnery here about 650. Destroyed by the Danes, this was succeeded by a Benedictine priory, founded during the reign of Henry I, to which the present church belonged. A theological college, established by Bishop Law in 1816, was closed in 1896; the grammar school, founded in 1587, was enlarged in 1881. On St. Bees Head, 335 ft., is a lighthouse. Pop. 1,208.

St. Benoit. Town of Réunion, a French island in the Indian Ocean. It is on the N.E. of the island, 23 m. S.E. of St. Denis, and is connected by rly. with Pointe-des-Galets and St. Pierre. Pop. est. 13,000.

St. Bernard Dog. Large dog of the mastiff group. It derives its name from the hospice on the Great St. Bernard Pass, where

St. Bernard Dog. Champion specimen of the breed

these dogs were used for finding travellers lost in the snow. It is the largest of all the domesticated dogs known in Great Britain.

The original breed at the Great St. Bernard is of unknown descent, and was almost destroyed by the severe winter of 1812, or by an epidemic. The present breed has descended from the famous show dog, Barry, but is said to depart considerably from the old type. The St. Bernard has a high head, with deep-set eyes, pendulous lips,

and moderate-sized pendent ears. Its feet are very large. The dog has remarkable intelligence. See Dog colour plate.

St. Bernard Pass, GREAT. Mt. pass of the Pennine Alps, between Valais in Switzerland and Piedmont in Italy. It is on the road from Aosta to Martigny (50 m.), reaches an alt. of 8,110 ft., and was known to the Romans as Mons Poeninus. A pack-horse road existed by A.D. 69. By this pass Napoleon led his army into Italy in 1800. On the summit are a monastery and an inn. The hospice founded about 962 by S. Bernard de Menthon, has a church dating from 1680. There are bed-

St. Brelade, Jersey. The 12th century parish church

St. Boniface. City of Manitoba, Canada. It stands on the E. side of the Red river, just opposite Winnipeg, of which it is virtually a suburb, and is served by the

side of St. Brelade's Bay, and has a fine sandy beach. The parish includes the village and also St. Aubin town; its pop. is about 2,000.

St. Briac. Holiday resort and fishing village of N. France. In the dept. of Ille-

et-Vilaine, it is about 4 m. from St. Lunaire, at the mouth of the Frémur, and overlooking a picturesque bay. The modern church has a 16th century tower. The Sailors' Cross is a well-known landmark. There are excellent golf links. The place takes its name from an Irish saint, who died at Bourgbriac, Côtes-du-Nord, c. 570.

St. Briavels. Parish in Glos, England. Overlooking the Wye, 7 m. by rly. N.E. of Chepstow, it is noted for its church and the remains of its castle, and gives its name to the hundred in which the Forest of Dean is situated. Certain forest privileges still attach to those born in the hundred of St. Briavels. The castle was built in the 11th century as a defence against the Welsh. A ruined keep remains; other parts, having been restored, are now a private residence. St. Briavel's long had a custom of charging twopence each to the parishioners in order to buy bread and cheese for all paupers who attended church on Whit Sunday. Pop. 1,100.

St. Bride's or **S. BRIDGET'S.** Church off the S. side of Fleet Street (q.v.), London, E.C. Its

Great St. Bernard, Switzerland. The hospice, founded by S. Bernard for travellers crossing the Alps; in the background, Mt. Velan

rooms for 175 travellers; the oldest part dates from the 15th century. In a museum are kept relics of Roman times.

St. Bernard Pass, LITTLE. Mountain route over the Graian Alps between Italy and Savoy. It is on the road between Courmayeur and Bourg St. Maurice, and attains an alt. of 7,176 ft. It had a hospice with observatory. Hannibal is reputed to have crossed the Alps by this pass, which certainly was used by the Romans about 100 B.C., or perhaps a little earlier. After the Second Great War the whole pass became French territory, and in 1947 the monks left.

St. Blazey. Market town and parish of Cornwall, England, 4 m. by rly. E.N.E. of St. Austell. It takes part in the china clay industry of the neighbourhood. Market day, Sat. Pop. 3,100.

C.P.R., C.N.R., and elec. rly. to Winnipeg. The industries include the making of bricks, flour, and agricultural implements, and there are lumber yards, breweries, abattoirs, and sheet metal works. It is the seat of a R.C. archbishop. Its original name was La Fourche, referring to the fork here formed by the Red and Assiniboine rivers. St. Boniface suffered in the Red river floods of 1950. Pop. 18,157.

St. Brelade. Parish and village on the S.W. coast of Jersey. It is picturesquely situated on the W.

St. Bride's, London. The interior of the church after the German fire raid of Dec. 29, 1940. Right, the steeple

records go back to the 13th century. Burnt in 1666, it was rebuilt in 1680 by Wren, who, in 1701, added to it his tallest steeple, lowered 8 ft. in rebuilding after a storm in 1764, and restored in 1902; present height, 226 ft. On the night of Dec. 29-30, 1940, the church, except for the tower, was gutted during the great German fire-raid on the City of London. The font, 1615, was from the old church, in which Wynken de Worde and Lovelace were buried, and Pepys was baptized. Samuel Richardson was buried here in 1761. Near by are St. Bride's and Bridewell schools and the St. Bride Foundation Institute for printers, the last-named opened in 1894. Milton lived for a time in a house in St. Bride's churchyard.

St. Brieuc. Town of France. The capital of the dept. of Côtes-du-Nord, it stands on the left bank of the Gouet, about 2 m. from the Atlantic Ocean, 93 m. E. of Brest. The cathedral of S. Guillaume, belonging to the 13th century but rebuilt in 1864, contains two frescoes by Gouézou. There are iron and steel works and manufactures of shoes and agricultural implements, and a trade is carried on in grain, butter, honey, and cattle. The town grew round a monastery founded by a Welsh missionary, S. Briocus, in the 5th century. It was captured by the Chouans in the Vendéan War, 1799. Pop. 36,674.

St. Brieuc Bay. Indentation on the N. coast of France. It is a wide bay of the English Channel in the dept. of Côtes-du-Nord, Brittany; the mouth between Cape Fréhel and the Pointe de Plouzeuc exceeds 30 m. across. The river Gouet enters the head of the bay.

St. Budeaux. Suburb of Plymouth, Devon. About 4 m. N. of the city, it has a rly. station and is the terminus of the ferry to Saltash, in Cornwall, across the Tamar. Pop. 1,819.

St. Catharines. A city of Ontario, Canada, the capital of Lincoln co. It stands on the Welland Canal, near Lake Ontario, 13 m. N.W. of Niagara, and is a station on the C.N.R., while an electric rly. connects it with Port Dalhousie on the lake. It is the centre of a fruit growing district, and textiles and paper are manufactured. It has a plentiful supply of electric power, and natural gas is found. Pop. 34,599.

St. Catharine's. College of Cambridge university. It was founded in 1473 as Katharine Hall

by Robert Wodelarke, chancellor of the university and provost of King's. None of the original

St. Catharine's College arms

buildings remains, the college having been rebuilt and restored between 1674 and 1876, when the master's lodge was erected. The hall was restored in 1895. John Bradford, the Protestant martyr; Edwin Sandys, deprived of office for espousing the case of Lady Jane Grey; Lightfoot; Strype; Edward Capell, the Shakespearian editor; and Shirley, the dramatist, were members of the society, which consists of a master, 12 fellows, and 26 scholars, and a varying number of undergraduates—320 in 1948. The college is familiarly known to Cambridge men as "Cat's."

St. Catherine's Hill. Chalk hill, 255 ft. high, lying 1 m. S. of Winchester, England. A story connected with this hill concerns a 15th century Wykehamist who, left at school during the holidays, occupied himself first in writing verses which became the school song, Dulce Domum, and then in carving out of the turf on St. Catherine's Hill a large cross. Every new boy at Winchester must run up the hill round a certain deep trench, find his way blindfold through some trees, and climb up Chalk Pit, take out a piece of chalk, and carry it to the cross.

There is another hill of the same name at Guildford, Surrey, on which stand the ruins of S. Catherine's chapel, with walls dating from the 14th century.

St. Catherine's Point. Most southerly point of the Isle of Wight, in the English Channel. At this landmark is a lighthouse, 136 ft. above the sea, which has an intensity of 15,000,000 candlepower, being nominally visible from a distance of 18 m.

St. Catherine's Society. Institution of Oxford university. In 1868 the statutes which confined the university to members of a college or hall were relaxed, and there came into being a body of students who, except that they lodged in the city, were in every way members of the university. They are under supervision of a delegacy; their head is called the

censor, and they have a dean and a staff of lecturers. Scholarships and exhibitions are provided. In 1936 buildings by Hubert Worthington, including a dining hall and common room, were opened in St. Aldate's by Lord Halifax.

St. Chamond. Town of France. In the dept. of Loire, it stands on the Gier, at the foot of Mont Pilat, 7 m. N.E. of St. Étienne. It is a well-built town, with a medieval château and an aqueduct, now in ruins, which conducted the water of the Janon to Lyons. There are coal mines, iron foundries, oil wells, and silk ribbon, nail, and boot fac-

St. Catharine's, Cambridge. Quadrangle of the college, showing the hall on the right

ories. The public gardens contain a monument to Carnot, the work of Vermaire. Pop. 14,820.

St. Christopher. One of the Leeward Islands, W. Indies, more commonly called St. Kitts (q.v.).

St. Clair. Lake of the U.S.A. and Canada. It receives the overflow of Lake Huron by the St. Clair river and outflows by the Detroit river into Lake Erie; the state of Michigan, U.S.A., lies to the W., and Ontario prov., Canada, to the E. Its level is 6 ft. below that of Lake Huron, and 3 ft. above that of Lake Erie. The N. end is shallow, but a navigable channel is maintained among the mud flats of the St. Clair delta; the greatest depth is 21 ft.

St. Claude. Town of France. In the dept. of Jura, it lies in a deep gorge at the junction of the Bienne and Tacon rivers, 19 m. N.W. of Geneva. The 14th century Gothic cathedral of S. Peter is noted for its beautiful choir stalls, the work of Jean de Vitry. The industries include the manufacture of snuff-boxes, toys, and pipes. The town grew up around a monastery built in 430 by S. Romain. This was dissolved in 1742, when the town became a bishopric. Pop. 10,749.

St. Clement Danes. Former London church, at the E. end of Strand, W.C.2. It was built on a site reputed to have been the burial ground of Harold Harefoot and other Danes. The build-

St. Clement Danes, London. The church on an island site in the Strand, virtually destroyed in air raids of the Second Great War

ing, erected in 1681 from designs by Wren, was probably the third on the site. Its interior had an ornate ceiling, adorned with the royal arms, and much good carving, particularly on the pulpit (ascribed to Gibbons). The tower, 115 ft. high, was added by Gibbs in 1719. Samuel Johnson attended the church; in the N. gallery was his pew, marked by a tablet, and his statue (life size) by Percy Fitzgerald is outside the N.E. wall. With the exception of the tower and outer walls, the church was destroyed by German air raids during 1940-41. Reconstruction began in 1949. The saint's name occurs in the nursery rhyme Oranges and Lemons, whose tune the bells chimed, and an annual orange-and-lemon service for children was instituted in 1920.

St. Cloud. Town of France. It stands on the left bank of the Seine, just W. of Paris, in the dept. of Seine-et-Oise. Reached by railway and steamboat, it is chiefly notable for its park and as a pleasure resort. In the park was a palace, built about 1600 by a duke of Orléans. This became a favourite residence of Napoleon I and other rulers, and here several memorable incidents took place, including the emperor's marriage to Marie Louise and the ordinances of 1830. At St. Cloud is the porcelain factory where the famous Sèvres ware is made. The church is modern. The place owes its name to a monkish grandson of Clovis who

was buried here. An annual fair is held in the park. In 1871 the Prussians burned the palace and did considerable damage to the park and town. Pop. 17,614. *See* Fountain illus.; Sèvres.

St. Cloud. City of Minnesota, U.S.A., the co. seat of Stearns co. It stands on the Mississippi river, 64 m. N.W. of Minneapolis, and is served by rlys. The buildings include a Roman Catholic cathedral, a state normal school, and the Minnesota state reformatory. Granite is quarried and sent all over the U.S.A. Between 1858 and

de Blois, to provide accommodation for 13 poor men. The present buildings, erected by Cardinal Beaufort in the 15th century, consist of the apartments for the inmates and a magnificent church standing round a quadrangle. The church is cruciform, and contains some fine Perpendicular work. The master's house is modern. The inmates wear a peculiar costume, similar to that worn in Henry VI's reign, and there is a traditional dole of bread and beer for every wayfarer who applies for it. *See* Almshouses; Winchester.

St. Cross Hospital, Hampshire. A view from the park showing W. end of the church, the brothers' quarters, the hall, and Beaufort tower. *See* also p. 237

1906 St. Cloud was the seat of the U.S. land office, which allotted 160 acres free to each applicant who undertook to stay five years and make reasonable improvements. St. Cloud was settled in 1852, incorporated in 1868, and became a city in 1889. Pop. 24,173.

St. Cloud, ORDINANCES OF. Name given to some laws suddenly promulgated at St. Cloud by Charles X of France and his ministers, July 26, 1830. They placed the press under a strict censorship, suppressing the chief liberal papers; diminished the number of electors by raising the property qualification; and ordered elections to be indirect, not direct as heretofore. The chamber of deputies was dissolved. The ordinances caused the so-called July revolution in Paris, which led to the abdication of Charles X.

St. Cloud Ware. Semi-transparent paste of a yellowish tinge. Produced at the royal factory at St. Cloud, France, 1697-1773, it was decorated with painted flowering plants under glaze, and later with painting and gilding over glaze. The pieces were mostly in the Oriental style.

St. Croix. West Indian island belonging to the U.S.A., better known as Santa Cruz (*q.v.*).

St. Cross. Hospital or almshouse, 1 m. S. of Winchester, Hants. It was founded in 1131 by Bishop Henry

St. Cyr. Village of France, in the dept. of Seine-et-Oise, 14 m. N.W. of Paris. Louis XIV founded a seminary here for impoverished daughters of the nobility, at the instigation of Madame de Maintenon, who supervised it from 1686 to 1717, and to whom there is a memorial in the chapel. Napoleon I in 1806 transformed this into the famous military school for infantry and cavalry cadets. A gunnery branch was later instituted.

Saint-Cyr, LAURENT GOUVION, MARQUIS DE (1764-1830). French soldier. Born at Toul, April 16, 1764, he first came into prominence

St. Cloud Ware. Jug and cover decorated with conventional design Victoria & Albert Museum, Kensington

Marquis de Saint-Cyr, French soldier

in Moreau's (*q.v.*) retreat from Bavaria in 1796, and until 1806 served chiefly in Italy. Next he fought in the Polish campaign, and in the Russian campaign of 1812 distinguished himself by winning the battle of Polotsk, in recognition of which he was made a marshal. After the overthrow of Napoleon he made his peace with the new regime, was minister of war in 1815, and was created a marquis in 1817. Author of valuable memoirs, he died March 17, 1830.

St. Cyran, JEAN DU VERGIER DE HAURANNE, ABBÉ DE (1581-1643). French Jansenist. Born at Bayonne, he studied at Louvain, and formed a close friendship with Jansen (*q.v.*). In 1620 he became abbé of St. Cyran, and in 1633 director of Port-Royal (*q.v.*). His influence alarmed Richelieu, who caused his arrest in 1638, and he was a prisoner at Vincennes for four years. One of the chief figures in the history of Jansenism (*q.v.*), he published *Théologie Familiale*, 1642, and his *Lettres Chrésiennes et Spirituelles* appeared posthumously in 1649. He died in Paris, Oct. 11, 1643.

Abbé de St. Cyran, French Jansenist

St. Davids. City of Pembrokeshire, Wales, 1 m. from the N. side of St. Bride's Bay and 15 m. W.N.W. of Haverfordwest. It derives its name from the patron saint of Wales, who founded the see and died here in 601. Its earlier Roman name was Menevia. The Gothic cathedral

St. Davids arms

is the biggest church in Wales. Begun in 1180 and added to at various dates down to the 16th century, it was restored by Scott, 1862-78. Bishop Gower's palace (1342) and S. Mary's College (1377) are interesting ruins, and near the former are remains of an ancient camp. Formerly attracting many pilgrims, St. Davids is now a mere village, the smallest cathedral city in Great Britain, though it has be-

St. Davids, Pembrokeshire. The Gothic cathedral viewed from the south-east

come a summer holiday centre. St. David's Head (100 ft. high), 3 m. N.W., is the most westerly point of Wales. Pop. 1,600.

St. Denis. Capital of Réunion, a French island in the Indian Ocean. It is situated on the N.W. coast and has an exposed roadstead. The chief harbour is now Pointe des Galets, 11 m. to the W.S.W. Pop. est. 30,000.

St. Denis. Town of France, in the dept. of Seine. It stands on the right bank of the Seine, near the

wines, and brandy. The wharves form part of the river port of Paris. The town owes its origin to S. Denis, bishop of Paris and patron saint of France, to whom a tomb was erected on this spot about 240. Dagobert I replaced it by a church, round which grew the modern town. In 1871 it was bombarded by the Germans, but capitulated after the armistice in that year. Pop. 69,939.

St. Denys. Suburb of Southampton, Hants. On the N. side of the city, it has a rly. station. It owes its name to a priory (of which some remains exist) founded here in 1124 and dedicated to S. Denys. See Southampton.

St. Dié. Town of France. In the dept of Vosges, it lies in a wooded valley on the Meurthe, 50 m. S.E. of Nancy. The cathedral of S. Deodatus is of various dates from the 11th to 18th centuries. There is an obelisk erected to Stanislaus Leszcynski, duke of Lorraine, who rebuilt the town after the fire of 1757, and a monument to Jules Ferry, a native. Among the industries may be numbered tanneries, engineering, cotton, and paper works, and trade is carried on in timber, grain, and cattle. Named after S. Deodatus or Dieudonné, who founded a monastery here about 660, it became a town in the 12th cent.

St. Denis, France. The famous church of St. Denis, and burial place of the early French kings

Canal de St. Denis, 4 m. N. of Paris, of which it is a suburb. The famous early Gothic church of S. Denis is rich in historic and architectural interest. It was the burial-place of most of the kings of France from 638. During the Revolution many of these tombs were rifled. Between 1806 and 1847 its restoration cost £290,000. There are flour and cotton mills, chemical, textile, and dye works, and engineering industry. A trade is carried on in fruit, vegetables,

St. Dizier. Town of France. In the dept of Haute-Marne, it stands on the right bank of the Marne, here navigable, 39 m. S.E. of Châlons. It is a centre of the iron industry, and also carries on a trade in grain and timber. St. Dizier was known in the Middle Ages as St. Desirius, after a bishop of Langres, who was martyred towards the end of the 3rd century. When Charles V invaded France

St. Dié, France. West front of the cathedral of S. Deodatus

it was besieged for two months, the governor of the town capitulating owing to a forged letter. It was added to France by the peace of Crépy, 1544. It figured in the Marne battles of the First Great War. Pop. 19,532. See Marne, Battles of the.

St. Dunstan's. British institution for the training and care of men and women blinded through war service. Founded by Sir C. A. Pearson

St. Dunstan's badge

in the Inner Circle, Regent's Park, London. Here, eventually, every man blinded in the First Great War "learned to be blind," being trained to overcome his disability as far as was humanly possible in both work and play. By the 1930s over 2,000 had been settled in their own homes and were being assisted in the running of their own businesses. Occupations found to be particularly suitable were those of massage and telephone operating, in addition to the more usual joinery, boot-repairing, and other handicrafts. Many became poultry farmers. All received help and encouragement from the St. Dunstan's after-care department. A hostel

and training centre was opened at Brighton in 1918, though the administrative headquarters remained for many years in Regent's Park in one of the original training workshops.

Shortly before the Second Great War a new hostel at Ovingdean, Brighton, was opened; but this was evacuated during the war, a temporary training centre being opened at Church Stretton, Shropshire. By the end of 1945 over a thousand ex-service men and women blinded in the Second Great War had passed through this centre; but it was expected that this number would be more than doubled in the years to follow, as experience after the earlier war

had shown that blindness from war wounds was often delayed for many years.

Following the death of Sir C. A. Pearson in 1921, Capt. (later Sir) Ian Fraser, himself one of the earliest war-blinded men to be trained at St. Dunstan's, became chairman of the executive council. The present headquarters is at 9, Park Crescent, London, W.1. The institution is closely affiliated to similar institutions in the various British dominions, some of which (e.g. S. Africa, New Zealand) bear the name St. Dunstan's. Consult Victory over Blindness, Sir C. A. Pearson, 1919; Whereas I Was Blind, Sir I. Fraser, 1942; and St. Dunstan's annual reports.

Sainte-Beuve, CHARLES AUGUSTIN (1804-69). French critic. He was born at Boulogne-sur-Mer,

Dec. 23, 1804, three months after the death of his father. His maternal grandmother was English. Educated at Boulogne until he was 14, he then studied at the Lycée Charlemagne, Collège Bourbon, and the school of medicine, Paris. He became a contributor to a new paper, *Le Globe*, started in 1824. His friendship with Victor Hugo led to his conversion to the romantic school, evidenced by his collections of verse, *Vie, Poésies, et Pensées de Joseph Delorme*, 1829; *Les Consolations*, 1830; and *Pensées d'Août*, 1837; and by his *Tableau de la Poésie Française au XVIIe Siècle*, 1828.

Influenced by Roman Catholicism and Saint-Simonism in turn, he abandoned both, broke with the romantics, and gave up verse for the work of historian and critic. The semi-autobiographical novel, *Volupté*, appeared in 1834. His lectures at Lausanne, 1837, on Port-Royal, formed the nucleus of his first important work, *L'Histoire de Port-Royal*, 5 vols., 1840-48. Appointed librarian of the Mazarin Library, 1840, and an Academician, 1845, he was compelled by the revolution of 1848 to resign his office as librarian and go to Liège university, his lectures here being published in 1860 as *Chateaubriand et son Groupe Littéraire*. After the events of 1851, he was professor in the Collège de France, and spent 1857-61 at the École Normale. Made a senator in 1865, he died in Paris, Oct. 13, 1869.

Sainte-Beuve was the greatest literary critic of his time, and his criticisms and appreciations, collected in *Premiers Lundis*, *Causeries du Lundi*, *Nouveaux Lundis*, etc., are of permanent value. His *Critiques et Portraits Littéraires* were published in 1836-39; *Chroniques Parisiennes*, 1843-45; *Portraits de Femmes*, 1844; *Portraits Contemporains*, 1846; *M. de Talleyrand*, 1870; *Souvenirs et Indiscrétions*, 1872; *Lettres à*

C. A. Sainte-Beuve, French critic

St. Dunstan's. The hostel at Ovingdean, Brighton, opened in 1918

la Princesse, 1873; Les Cahiers de Sainte-Beuve, 1876; Étude sur Virgile, 1878; Lettres, 4 vols., 1877-80.

Bibliography. Sainte-Beuve, J. Levallois, 1872; S.-B., Sa Vie et Ses Oeuvres, O. d'Haussonville, 1875; Confession de Sainte-Beuve, L. Nicolardot, 1882; Lettres à De Musset et à Sainte-Beuve, G. Sand, 1897; Études sur Sainte-Beuve, G. Michaut, 1905; S.-B., Mott, 1925.

Sainte-Chapelle. Old palace-chapel in Paris. In the precincts of the palais de justice, it was built

Sainte-Chapelle, Paris. Interior of the upper chapel, showing the wooden canopy over the shrine. Right, the exterior with its Gothic spires

in 1245-48 by Pierre de Montreuil, as a shrine for the sacred relics (Crown of Thorns and piece of the true Cross) brought from the Holy Land by Louis IX in 1239. A beautiful example of Gothic architecture, the lower chapel or crypt was set apart for the domestics, the upper for the court. The gilded spire was added in the restoration begun in 1837. Notable features of the upper chapel are the 13th century stained glass, rose window, richly decorated choir stalls, Louis XI's private oratory, and the wooden canopy over the shrine in which the relics reposed before they were transferred to Notre Dame. Between the buttresses are 15 windows of exquisite stained glass, illustrating the legend of the Cross and other Biblical subjects. Against the pillars are statues of the twelve apostles, and a number of saints and martyrs are represented in medallions around the walls. The Mass of the Holy Ghost was formerly held annually in the Sainte-Chapelle on Oct. 16.

Sainte-Claire Deville, ÉTIENNE HENRI (1818-81). French chemist. He was born in the W. Indies, March 11, 1818, and successively occupied the chairs of chemistry

at Besançon, 1845-51; École Normale, 1851-59; Sorbonne, 1859-81. He investigated problems in inorganic chemistry, becoming famous through his work on reversible reactions, during which he discovered nitrogen pentoxide, and to help in which he invented a hot and cold tube later known by his name. He also carried out work which had valuable applications in the commercial preparation of platinum and aluminium. He died July 1, 1881.

St. Edmund Hall. The only surviving ancient hall of the university of Oxford. It was founded probably in 1226, and owes its name to S. Edmund Rich, archbishop of Canterbury, who taught in a house on the site. The buildings are in Queen's Lane, and the hall was closely connected from 1553 with Queen's College, which had the right of nominating the principal, until in 1937 the hall became an independent body with a quasi-collegiate constitution.

St. Elias. Volcanic mt. of N. America. Situated in Alaska, close to the Canadian frontier, it has a snowclad summit, reaching 18,024 ft. On its

south declivity, facing the sea, is the great Malaspina glacier, 1,200 sq. m. in extent. The first ascent was made in 1897 by the duke of the Abruzzi.

St. Elmo's Fire. Bluish glow or brush-like discharge of electricity which may be seen on the masts and yards of ships exposed to the intense electric fields of thunderclouds. Similar discharges are seen on projecting objects on mountain slopes during stormy weather. The phenomenon is due to a stream of ions of the same electrical sign as the charge, induced upon the point of the conductor. It may be imitated in the laboratory by bringing a sharp-pointed object, e.g. a darning needle, near a charged Leyden jar. The name, originally used by seamen, is a corruption of S. Ermo, the popular rendering of S. Erasmus, patron saint of sailors in the Mediterranean. When an aircraft flies into a strong electric field, it tends particularly to concentrate the electric force at the nose, propellers, wing tips, and aerial, and the first stage of electrical discharge which sets in is S. Elmo's Fire. A lightning discharge may develop between the aircraft and the air. Although brush discharges are almost harmless, they serve to indicate regions of abnormal field strength. Only weakly luminous in daylight, at night they may, though occurring on the outside, be sufficiently bright to light up the interior of an aircraft. See Lightning.

St. Eloi. Village in W. Flanders prov., Belgium. It is 2 m. S. of Ypres. Throughout the First Great War St. Eloi was the scene of incessant local fighting, some of which was linked up with larger battles, e.g., Neuve Chapelle, Ypres. Two minor battles there were those of March, 1915, and March-April, 1916. The first was the Germans' reply to Neuve Chapelle,

St. Edmund Hall arms

St. Edmund Hall, Oxford. Quadrangle and hall

Saintes, France. A general view showing the church of S. Eutrope, and the remains of the Roman amphitheatre in the foreground

and on this occasion the Canadians first met the Germans in actual battle. Severe casualties were incurred in an indecisive action. The second battle began on March 27, 1916, the British taking the offensive. Intermittent fighting continued until on March 30 the Germans counter-attacked in force, and for days a swaying fight went on between them and the Canadians, who were holding the positions attacked. On April 19 the Germans attacked at St. Eloi and elsewhere around Ypres, recapturing territory, though the village remained in the hands of the British. In this battle the Germans lost several thousand men.

St. Émilion. Town of France. In the dept. of Gironde, it stands on an eminence overlooking the Dordogne, 20 m. E. of Bordeaux. Important in medieval times, it has an interesting rock-hewn church and ruins of ecclesiastical edifices. St. Émilion is noted for its wine, stronger and fuller than Médoc, resembling Burgundy, and gives its name to a brand produced by a group of communes bordering the Dordogne.

Ste. Odile. Nunnery of Bas-Rhin dept., France. It was founded in the 7th century by S. Odilia, the patron saint of Alsace. According to tradition she was the daughter of the duke of Alsace, was born blind, and gained her sight at baptism. Her tomb is in the abbey church, which is a place of pilgrimage. The nunnery is centrally placed on the hill of Ste. Odile, which rises to about 2,800 ft. N.W. of Barr; the summit is wooded, and was surrounded by a prehistoric wall of sandstone blocks, 6½ ft. thick and from 6 to 10 ft. high; parts of it still stand. See Alsace.

Saintes. Town of France. In the dept. of Charente-Inférieure, it stands on the left bank of the

Charente, 28 m. S.E. of Rochefort. It contains many Roman antiquities, including a triumphal arch, erected in the reign of Nero to the memory of Germanicus, now in the Place Bassompierre, and the remains of an amphitheatre. The cathedral of S. Pierre has a beautiful 16th century portal. There are iron and copper foundries and a trade is carried on in grain, wine, and brandy. It was anciently the capital of Saintonge. In 850 it was destroyed by the Normans, and here in 1242 Louis IX. defeated Henry III. of England. Pop. 23,441.

St. Etienne. Town of France, capital of the dept. of Loire. Situated on the Furens, 36 m. S.W. of Lyons, it is a mining and manufacturing centre, owing its importance to the coal found in

the vicinity, and has developed almost entirely since 1850, though it had some industry as early as the 14th century.

It manufactures silk, ribbons, velvets, and other textiles, and other industries are the making of ironmongery, bicycles, etc. Before 1914 St. Étienne arms the government had a small-arms factory here, and during the First Great War this was enlarged, other establishments of like kind sprang up, and the town became important by its output of munitions. Since that time it has developed many manufactures, e.g. of machinery, bicycles, trucks.

The buildings of the town are modern, except the 14th century church of S. Étienne, from which the town is named. There is an important school of mines, an hôtel de ville, and many military institutions. Pop. 177,966.

St. Etienne-du-Mont. Old church in Paris. In the heart of the Quartier Latin, N.E. of the Panthéon, it occupies the site of a church built in 1220 as part of the abbey of Ste. Geneviève, founded by Clovis in 481-511. The existing Gothic-Renaissance structure dates from the period 1517-1626, and was dedicated Feb. 25, 1626. In one of the chapels is the tomb of Ste. Geneviève, whose remains were removed here when the abbey church was destroyed in 1801.

Other features are the delicately carved *jube*, or rood loft enclosing the choir; the wooden pulpit supported by a statue of Samson; stained glass, paintings, organ loft, rose window, and stone porch, the first stone of which was laid by Marguerite de Valois. Archbishop Sibour was assassinated here by Abbé Vorger, 1857.

St. Eustache. Noted church of Paris. Cruciform Renaissance, standing at the end of the rue de Montmartre, it was begun in 1532 and consecrated 1637. Restored after a fire in 1844,

St. Étienne-du-Mont, Paris. West front of the famous church in the heart of the Quartier Latin

the interior is remarkable for its loftiness and grace, and contains some beautiful stained glass, frescoes, statues, etc. Colbert and La Fontaine were buried here. It was also the scene of a funeral service over the body of Mirabeau. The Feast of Reason, 1791, took place in this church, which occupies the site of a 13th century chapel dedicated to Ste. Agnes.

St. Eustatius OR **ST. EUSTACHE**. Island of the Netherlands W. Indies. It is one of the smaller islands in the Leeward group, 12 m. N.W. of St. Kitts. A symmetrical volcanic cone rises to 1,905 ft. Tobacco and cane sugar are the chief products. Oranjestad (Orangetown), the chief town, is on the S.W. coast. Its area is 7 sq. m., and it forms part of Curaçao. Pop. 1,092.

Saint-Évremond, CHARLES MARGUETEL DE SAINT-DENIS, SEIGNEUR DE (1610-1703). French

author. Born in Normandy, April 1, 1610, he had an active and distinguished career in France both as soldier and courtier. He fell into disgrace in 1661 and fled to England, where he passed the rest of his life. His polished wit is shown to greatest advantage in his *Comédie des Académiciens*, while his criticism, e.g. *Sur les Poèmes des Anciens*, is remarkable for its singularly modern tone. He died Sept. 29, 1703, and was buried in Westminster Abbey. *Consult* Saint-É.: étude, G. Merlet, 1870; and *Sainte-Beuve's* *Causeries du Lundi IV*, and *Nouveaux Lundis*, XIII.

Seigneur de Saint-Évremond, French author

St. Florian. Augustinian monastery in Austria. Situated 3 m. from Emmis, it was founded by the Benedictines about 700, and passed before 1100 to the Augustinians. The present buildings, mainly erected about 1700, are on a very extensive scale. The library has contained many valuable MSS.

St. Francis. River of the U.S.A. It rises in the S.E. of Missouri and flows S. for 450 m. to join the Mississippi near Helena. It is navigable for 150 m. The lower course is through a swampy area, which acts as a regulator for the floods of the Mississippi.

St. Francis Xavier, UNIVERSITY OR. Canadian university at Antigonish, Nova Scotia. Originally a R.C. college founded in 1855, it became a university in 1866, and received a new charter in 1909. It

is controlled by the R.C. Church, but there are no religious tests. In addition to classics, literature, law, etc., there are courses in engineering, and the buildings include a library and laboratories.

St. Gall (Ger. *St. Gallen*). Canton of N.E. Switzerland. It is bounded E. by Austria and Liechtenstein, from which it is separated by the Rhine, S. by the canton of Grisons, and touches the lakes of Constance on the N. and Zürich on the W. It surrounds the canton of Appenzell, and contains Lake Wallen. Mountainous in the S., its culminating point is Ringelspitze, 10,665 ft. Mount Saentis (q.v.), in the middle of the canton, reaches 8,215 ft. The mountain slopes are well wooded, and there are large tracts of pasture land, orchards, and vineyards.

Muslin and embroideries are manufactured in the N. section and largely exported to the U.S.A. Sandstone and slate are quarried, and there are mineral springs at Ragatz and Pfäfers (q.v.). Formed in 1803, the canton's present constitution dates only from 1890. It was the scene of the labours of S. Gall in the 7th century, and the abbots of St. Gall held a petty sovereignty over the dist. till the 19th century. Area, 777 sq. m. Pop. 286,201.

St. Gall. City of Switzerland, capital of the canton of St. Gall. It stands on the left bank of the river Steinach, 9 m. by rly. S.W. of Rorschach (q.v.) and 52 m. by rly. E. of Zürich.

St. Gall arms

The abbey church of its famous monastery, restored 1756-68, was made a cathedral in 1846. The abbey library contains over 30,000 vols., and some of the oldest and most precious MSS. in the world. There are also a Protestant church, ethnological museum, picture gallery, a town library, and industrial museum. The old monastic buildings house the great library and the central office. One of the most important industrial cities of Switzerland, it manufactures linen, woollen, and cotton goods, laces, embroideries, fine muslins, etc. The city originated from a cluster of cottages built round a Benedictine abbey, which enclosed the cell of S. Gall, an Irish hermit, who lived here from 614 to 640. It was one of the chief centres of learning in Europe from the 8th to the 10th century. Pop. 62,530.

St. Gall, Switzerland. Town and cathedral, formerly the abbey church

Saint-Gaudens, AUGUSTUS (1848-1907). American sculptor. He was born in Dublin, March 1, 1848, of mixed French and Irish parentage, and was taken to New York when six months old. He began his career as a cameo cutter, then studied at the Cooper Institute, the National Academy, and the Beaux Arts, Paris (1867-70). He was president of the Society of American Artists, honorary member of the English Royal Academy, the friend of R. L. Stevenson, of whom he executed a memorable bust, and the sculptor of the Farragut statue in New York and the Lincoln statue at Chicago, a replica of which is in Parliament Square, Westminster. He died Aug. 3, 1907.

St. George, GULF OF. Wide semicircular opening of the Atlantic. It indents the S.E. shore of Argentina, between the territories of Chubut and Santa Cruz. It penetrates inland about 120 m., and is 150 m. wide.

St. George's. Capital and administrative centre of Grenada, Windward Islands. It is on the W. coast of the island. It contains the residence of the governor. There is a radio station to maintain communication with Barbados, and the port handles export trade in bananas, lime oil, and raw cotton.

St. George's Channel. Channel separating Ireland from Wales, and connecting the Irish Sea with the Atlantic Ocean. It extends for about 100 m. N. to S., and varies in breadth from 50 m. to 90 m.

St. George's Day. Feast day of St. George. Held on April 23, the

date of his martyrdom, it used to be kept in England as a day of great pageant and festivity, a council held at Oxford in 1222 commanding that it be made a public holiday. The Royal Society of S. George holds an annual dinner. Until the beginning of the 19th century people of fashion wore blue on S. George's Day, the origin of which is unknown. See George, S.

St. George's Fields. Formerly an open space in London, between Lambeth and Southwark. Named after the church of S. George the Martyr, which stood a little S. of Southwark Cathedral, it formed the centre of three Roman ways. The fields were a noted place of public assembly, associated with Wat Tyler, Jack Cade, and the Gordon rioters. Gerard here collected specimens for his Herbal, and here, on ground now covered by the Imperial War Museum (in the building formerly Bethlem Hospital), stood from 1642 until 1811 the building known as the Dog and Duck tavern, or St. George's Spaw (Spa).

St. George's Hall. Former London hall of entertainment in Langham Place, W.1. It adjoined the former Queen's Hall (q.v.) and was built in 1893. Concerts and recitals were given until in 1905 it became the h.q. of Maskelyne and Devant's conjuring entertainments. Taken over by the B.B.C. in 1934 for broadcast variety shows given before an audience, the hall was destroyed in the German air raid on May 10, 1941.

This is the name also of a public hall in Liverpool, a notable example of architecture in the Greco-Roman style, completed in 1854, and faced with a portico of 16 Corinthian pillars 60 ft. high.

St. George's Hospital. London hospital. Founded in 1734 and incorporated by Act of parliament 1834, it has 476 beds, of which 139 are at the branch hospital at Wimbledon. There is a good medical school attached to the hospital. John Hunter was appointed surgeon to the institution in 1768, and died within its walls, Oct. 16, 1793. The build-

ing is at Hyde Park Corner, London, S.W. In association with it are the Royal Dental Hospital, the Princess Beatrice Hospital (88 beds), and the Victoria Hospital for Children (114 beds).

St. Germain, COMTE DE (d. c. 1784). Adventurer of disputed origin. He was by some believed to be the natural son of the queen of Charles II of Spain, and came to the French court from Germany

543, originally dedicated to S Vincent, and a burial place of the Merovingians. The choir and apse date from the 12th century, the porch from the 17th. The church, restored early in the 19th cent. is notable for its well of St. Germain, and marble slabs in memory of Boileau, whose heart was buried here in 1819, and of Descartes.

St. Germain-en-Laye. Town of France. In the dept. of Seine-

St. Germain-en-Laye, France. The 16th century château from the north-east

in 1748. He claimed extraordinary powers of alchemy, and declared that he had lived 2,000 years, and had known Francis I. He lived in London, 1760-62, and was in St. Petersburg, 1762. A teacher of Cagliostro, he engaged in magical practices with the landgrave Karl of Hesse, and probably died in Schleswig-Holstein about 1784. Consult Historical Mysteries, A. Lang, 1904; The Comte de St. Germain, J. Cooper-Oakley, 1928.

St. Germain-des-Prés. A church in Paris. Situated at the corner of the Boulevard St. Germain and the rue Bonaparte, and dating from the 11th century, it belonged to the abbey of Saint-Germain, which was founded in

et-Oise, it is situated on the summit of a hill which overlooks the left bank of the Seine and the forest of St. Germain, 13 m. W. of Paris. The town dates from the 10th century, and grew round a convent in the forest, then known as Ledia. It became a royal residence in the time of Louis VI. In 1370 Charles V began the château where James II sought refuge after his expulsion from England. The forest of St. Germain, on the borders of the Seine, is one of the largest forests in France, over 10,000 acres, with a circuit of 21 m. Pop. 22,013.

St. Germain-en-Laye, TREATY OF. Treaty signed between the allied and associated powers and Austria, Sept. 10, 1919. It was the complement of the treaty of Versailles (q.v.), and settled the territorial and political status of Austria following the First Great War. Its complete text was handed to the Austrian delegates on July 20, and it was ratified by the Austrian assembly on Oct. 17.

It recognized Austria as a republic and fixed its boundaries. Austria recognized the independence of all territories which formed part of the former Russian empire, and accepted the annulment of the Brest-Litovsk treaty and of all treaties or agreements concluded since the Revolution of 1917 with all governments or political groups on territory of the former Russian empire. Austria further agreed to respect the rights of all peoples

St. George's Hospital, London. The main entrance, seen from Grosvenor Place

within her boundaries. The army was limited to 30,000 men; all warships had to be surrendered to the Allied powers, and no naval or air forces were allowed. Other clauses provided for the restoration of jewels and paintings carried off by the house of Hapsburg and other dynasties from Italy, Belgium, Poland, and Czechoslovakia.

St. Germain - L'Auxerrois. Church in Paris. Standing on the Place du Louvre, it was founded in the 7th and rebuilt in the 12th-16th centuries. It is Gothic in style, and its W. façade has a rose window, two turrets, and porch. From its bell-tower the signal was given for the massacre of S. Bartholomew's Day, 1572. On the right of the entrance is a chapel with a Tree of Jesse (*q.v.*). The gargoyles without and the stone carving within are notable; there are modern wall paintings and some beautiful coloured glass of the 15th century. In the nave is a *banc d'oeuvre* of carved oak by Mercier. The name comes from S. Germanus, bishop of Auxerre, in the 5th century.

St. Germans. Village of Cornwall, England. It stands on Lynher Creek, an arm of Plymouth Sound, being 9 m. by rly. W. of

St. Germans, Cornwall. Parish church and Port Eliot, the seat of the earl of St. Germans

Fifth

Plymouth. The chief building is the beautiful church of St. Germans; it has a Norman front, the remainder being mainly Perpendicular work. St. Germans was in the 10th and 11th centuries the see of the bishop of Cornwall. It had a priory, and markets and fairs were held in the Middle Ages. Lynher Creek is sometimes given the name of St. Germans river. Pop. est. 2,000.

Close to the church is Port Eliot, seat of the earls of St. Germans. John Eliot was created an earl in 1815, and in 1942 Montague Charles Eliot (b. May 13, 1870) became the 8th earl.

St. Gervais. Church in Paris. Standing E. of the hôtel de ville, on the site of a 6th century church rebuilt in 1212, the present structure is mainly of 13th-15th century work. In 1616, Louis XIII laid the first stone of the façade, which exhibits the Doric, Ionic, and Corinthian orders, with triangular pediment and arch. The church, which is cruciform, contains many fine frescoes, a copy of Rubens' Descent from the Cross, some magnificent candelabras, and a cross of gilt bronze. On Good Friday, March 29, 1918, the Germans shelled it, seriously damaging it and killing or injuring over 150 worshippers.

St. Giles's, CRIPPLEGATE. Old London church, in Red Cross Street, E.C. Late Perpendicular in style, it was founded in 1090 by Alfune, first hospitaller of S. Bartholomew's Hospital. It was repaired 1360, partly destroyed by fire in 1544, several times restored or added to but unroofed in the great German air raid of Dec. 29-30, 1940, standing almost in isolation among the destroyed buildings around. Its name is derived from its proximity to a

"crepel" or gate in the old London wall, a bastion of which is in the churchyard where was Crowden's Well, famous for its healing properties.

During the Great Plague the burials in the churchyard rose to 800 a week. Milton, Sir Martin Frobisher, John Foxe, and John Speed were also buried in S. Giles's. Oliver Cromwell and Nicholas Breton were both married here. Lancelot Andrewes was vicar, 1588-1605.

St. Giles's - in - the - Fields. London parish divided N. and S. by Holborn and New Oxford Street, W.C. Here, about 1101, Matilda,

queen of Henry I, founded a leper hospital, around which grew up a village, and the chapel of which, in Henry VIII's time, was made the parish church. Near the hospital was a place of public execution, where Sir John Oldcastle was hanged and burnt in 1416. Much of the squalor pic-

St. Giles's, Cripplegate, London. The damaged church, now isolated amid air-raid devastation of the Second Great War

tured by Hogarth has disappeared. New Oxford Street was built through the notorious Rookery in 1849 at a cost of £290,000, but the S. section has still poor districts. The church, on the S. of the High Street, by Henry Flitcroft, 1733, has above its gate a bas-relief, erected about 1687, and portraying the Day of Judgement. It is believed to be the work of a shipcarver. George Chapman, translator of Homer, was buried in the churchyard; and in the church Shirley, Roger L'Estrange, and Andrew Marvell.

St. Gotthard or **St. GOTHARD.** Group of mountains, pass, and rly. of Switzerland. The mountains form a division of the Lepontine Alps, spreading into the four cantons of Grisons, Uri, Ticino, and Valais, and hold the sources of the Rhine, Rhône, Reuss, and Ticino. Among the chief peaks are the Sasso or peak of St. Gotthard, 8,235 ft. high; Pizzo Rotondo, 10,489 ft.; Monte Prosa, 8,983 ft.; Piz Lukmanier, 9,115 ft.

The St. Gotthard is crossed by one of the oldest and most famous of the Alpine passes (6,935 ft.) from Switzerland to Italy. The route, which leads from Lake Lucerne to Lake Maggiore, was opened as a pass practicable for pack animals early in the 13th century. Soon it surpassed in importance all the other passes in

the central Alps. During 1820-32 it was widened and made available for carriages. The hospice on the summit is first mentioned in 1331. It was partially destroyed by an avalanche in 1775, and wholly destroyed by the French in 1799-1800. Rebuilt in 1834, it was burnt in 1905, and again rebuilt. The St. Gotthard rly., from Lucerne to Milan, tunnels the range near Goeschenen in Uri and emerges above Airolo in Ticino. The rly., built in 1872-82, reaches an alt. of 3,786 ft., and the maximum gradient is about one in four. In places the ascent is made by means of spiral tunnels, of which there are seven. The whole line has 80 tunnels, 324 bridges of more than 32 ft. span, and many smaller ones. The main tunnel, 28 ft. wide by 21 ft. high, is $9\frac{1}{4}$ m. long. The whole region is strongly fortified. Louis Favre, the engineer of the tunnel, died in it on July 19, 1879. The St. Gotthard rly., which is now electrified, was purchased by the Swiss government in 1909. Right through Switzerland, from

St. Gotthard. The Alpine pass, near Giornico, showing three lines of railway, one above the other

Basel in the N. to Chiasso (near Como) the line is double-tracked. Over it run the heaviest electric locomotives in the world. See Devil's Bridge.

St. Gregory the Great. Papal order. It was instituted by Pope Gregory XVI, 1831, as a reward for services to the Catholic Faith. The badge is a red Maltese cross with white edge and gold knobs; on the circular centre, within a golden band inscribed "S. Gregorius Magnus" (on reverse: "Pro Deo et Principe"), is a golden bust of the saint on a blue field. For civil merit the cross is surrounded by a green wreath of olive; for military service, by a golden trophy of arms. The ribbon is red with a yellow border.

St. Helena.

British island in the S. Atlantic, an Admiralty coaling station. It is 800 m. S.E. of Ascension Island, 1,200 m. from the nearest point of Africa, and 1,500 m. N.W. of Walvis Bay. Of volcanic origin, the island is rugged, and rises to 2,700 ft. in the high hills in the S.W.; the coast cliffs vary from 600 to 2,000 ft. sheer from the sea. The original forest has disappeared, but fruit trees, eucalyptus, Norfolk pines, and cedars do well. Flax (phormium) is grown, and hemp production was increased during the Second Great War. Cattle thrive, but in the comparative absence of shipping there is no outside market for the meat. Potatoes are grown, but flax, tow, rope, and twine are the main exports, and there are nine flax mills in operation.

Administration is by a governor, assisted by an advisory council of six. At the chief place, Jamestown, on the N.W., is an observatory, and a cable and wireless station, connected with Cape Town and St. Vincent. Area 47 sq. m. Pop. est. 4,710.

A Portuguese sailor, João da Nova, discovered the uninhabited island in 1502. He named it St. Helena, and some of his countrymen were its first inhabitants. Soon, however, it was again deserted, but from time to time travellers,

Thomas Cavenish among them, visited it. The Dutch occupied the island about 1645, but remained only a short time. Its next possessor was the British E. India Co., who built Jamestown, named after James, duke of York. The company cultivated

St. Helena. Map of the British island in the Atlantic, where Napoleon was imprisoned and died

the land by means of slaves, and the island was prosperous. In 1815 the British government took it over in order to make it the home of Napoleon, who died here in 1821. It was then returned to the E. India Co., but in 1834 it became the property of the crown. Meanwhile the slaves had been freed, but the island remained a port of call, until the mid century.

Boer prisoners were interned here during the S. African War; the garrison was withdrawn in 1906. In the Second Great War, while the Mediterranean route was closed, it was a port of call for shipping to and from India and the Far East. See Jamestown; Longwood; Napoleon. Consult St. Helena, 1502-1938, P. Goss, 1938.

St. Helena Bay. Bay of Cape Province, S. Africa. In the western coast and N. of Saldanha Bay, it receives the Great Berg river.

St. Helens. County borough and market town of Lancashire, England. It stands 11 m. E. of Liverpool, and is served by rlys. The public buildings include the town hall and the Gamble Institute,

St. Helens, Lancashire. Town hall, built in 1873
Valentine

a technical school. The public parks include Victoria, Taylor, Queen's, and Sutton. The town is the chief centre of the glass manufacture ;

St. Helens arms

other industries are pottery and making patent medicines. Iron is worked, and around are extensive collieries. St. Helens developed into a commercial centre in the 19th century, was made a bor. in 1868, and a co. bor. in 1888. It sends one member to parliament. The council owns several housing estates. Pop. est. 105,880.

St. Helens. Easternmost suburb of the borough of Ryde, Isle of Wight, England. Incorporated with that town in 1933, it stands on the coast and is an attractive village. It takes its name from that of a church which was pulled down about 1800 because of the encroachments of the sea. The tower of the church, however, still stands.

St. Helen's, GREAT. Ancient London church. Dedicated to the mother of the emperor Constantine,

Great St. Helen's, Bishopsgate. Tower and west entrance of the London church

it stands in a close on the E. side of Bishopsgate (q.v.), E.C., and has been several times restored. The oldest parts belonged to the church of a Benedictine nunnery founded about 1210. This nunnery occupied what was later St. Helen's Place. The church has two parallel naves, divided by an arcade with six lofty pointed arches, and two chapels, also with pointed arches. The N. nave, separated from the other in pre-Reformation times by a screen, is known as the nuns' choir; the other was for the parishioners. The

oldest part includes an arched doorway, which led to the nunnery, and a squint (q.v.). Among its many monuments are altar tombs in memory of Sir Thomas Crosby and his wife, Sir William Pickering, Sir Thomas Gresham, and Sir Julius Caesar. The Shakespeare memorial window was the gift in 1884 of an American. The refectory of the nunnery, destroyed in 1799, a fine hall with panelled ceiling, served for a long time as the hall of the Leathersellers' Company (q.v.).

St. Helier. Seaport, market town, and capital of Jersey. It stands on the S. side of the island and the E. side of St. Aubin Bay, and is the terminus of the bus services. It has regular steamboat communication with Southampton and ports in France, also air service to Southampton and Northolt. The town has a good harbour, protected by a breakwater, and its chief industries are agriculture and catering for tourists. The public buildings include the parish church, partly of the 14th century, the court house, the *salle des états*, where the Jersey legislature meets and Victoria College, a public school. There are a town hall, museum, public library, theatre, cinemas, and post office.

Quite near St. Helier is Elizabeth Castle, built during the reign of Elizabeth for the protection of the town. There Charles II and Clarendon lived during their exile. Fort Regent, another defence work, dates from 1806. In 1781 there was a fight in the market place between the French and the English, the French being beaten. The incident is described by Sir Gilbert Parker in *The Battle of the Strong*. St. Helier, which is named after the patron saint Helerius, attracts many visitors in summer. Pop. 30,000. See Jersey.

St. Helier. Municipal housing estate in Surrey, England. It is situated between Mitcham and Sutton, 9½ m. S. of London, and is served by bus and tube rly. to Morden. The L.C.C. developed the estate between 1930-36. Pop. approx. 40,000.

Lord St. Helier, British judge

Oxford, and was called to the bar at the Inner Temple, in 1868. His first important case was *Tichborne v. Lushington*, 1871-72, in which he was a counsel for Sir Roger Tichborne. Having won a high reputation, chiefly in ecclesiastical cases, Jeune was appointed judge of the probate, divorce, and admiralty division, 1891, and president the following year. He resigned in Jan., 1905, when he was created a peer, and died April 9. His only son had predeceased him.

St. Hilda's College. College for women at Oxford university. Founded as St. Hilda's Hall, by Dorothea Beale (principal of Cheltenham ladies' college) in 1893, it was incorporated in 1926 under the style at the head of this article. The first principal was Mrs. Burrows. The number of undergraduates is about 150. Open scholarships and exhibitions are awarded; other scholarships are confined to candidates from Cheltenham ladies' college.

St. Hugh's College. College for women at Oxford university. It was founded in 1886 as St. Hugh's Hall, and incorporated as St. Hugh's College in 1926. Its first principal was C. A. E. Moberly, 1886-1915. In the Second Great War it was a military hospital.

St. Hyacinthe. City of Quebec, Canada. It stands on the Yamaska river, 35 m. W. of Montreal, near the U.S. border, and has stations on the C.P.R. and C.N.R. It has an R.C. cathedral, and other churches, and its chief industries are the making of boots and shoes, agricultural implements, biscuits. Pop. 17,798.

Saintine, XAVIER BONIFACE (1798-1865). French story writer and dramatist, whose real name was Joseph Xavier Boniface. He was born in Paris, July 10, 1798, at 21 gained the Academy prize for a poem, *Le Bonheur de l'Étude*, and in 1823 published a volume of poems. In 1836 appeared

Xavier Saintine, French writer

the tale of Picciola on which his fame mainly rests. It gained for its author the Montyon prize, and at once became widely popular, the first of many English translations appearing in 1837. Besides stories and romances, Saintine also wrote plays, generally over the pen-name of Xavier, and frequently in collaboration with Scribe and others. He died Jan. 21, 1865.

St. Helier, FRANCIS HENRY JEUNE, BARON (1843-1905). British judge. Born March 17, 1843, at St. Helier, Jersey, he was educated at Harrow and Balliol College,

St. Ives. Mun. borough and market town of Hunts, England. It stands on the Ouse, 6 m. E. of

St. Ives, Huntingdonshire. The old bridge with its medieval chapel

Huntingdon, and is served by rly. The chief building is the 15th century church of All Saints. There is an agricultural trade and important cattle markets are held. St. Ives was named after a 6th century missionary. Slepe Hall, in which Cromwell lived 1631-36, has been pulled down. An old bridge crosses the river, and on it is a 15th century building, originally a chapel. For long St. Ives was under the authority of the abbot of Ramsey. It was made a corporate town in 1874. Pop. est. 3,000.

St. Ives. Mun. borough, holiday resort, and seaport of Cornwall, England. It stands on the W. side

St. Ives, Cornwall, borough arms

of St. Ives Bay, an opening of the N. coast of the county, 8 m. N. of Penzance, with a rly. station. The chief building in the town, which is picturesquely situated, is the 15th century church. There is a harbour with pier and breakwater. Industries are fishing, boat building, light engineering, and clothing manufacture. There are good sands and bathing. An ancient town, it is named after an Irish princess, Ia or Hia, who lived in the 5th century. It became a port under a portreeve, and from 1558 to 1885 was separately represented in par-

St. Ives, Cornwall. The harbour of this picturesque Cornish town

liament. It had a court of pie poudre. The existing form of government under a mayor and corporation dates from 1639. In 1934 the old borough was extended to include the parish of St. Uny Lelant, which contains the modern residential area of Carbis Bay. Pop. 8,760.

St. Ives. Title of a novel by R. L. Stevenson. Thirty chapters were left by Stevenson, and the remaining six were added to complete the work by Sir A. T. Quiller-Couch; it appeared in 1897. The tale recounts the adventures in England and Scotland of the Viscount Anne de St. Yves de Kéroual, a French prisoner of war in Edinburgh Castle, who escapes and travels to the south of England to see his lady love.

St. James's, PICCADILLY. London church on the S. side of Piccadilly. It was built 1680 by Wren, funds being provided by Henry Jermyn, earl of St. Albans. The parish of St. James's was formerly part of that of S. Martin-in-the-Fields. The interior contained a marble font by Gibbons, who also executed the carved reredos, and plaster work over the altar. In a German air raid, Oct. 14, 1940, the spire disappeared and the roof was almost entirely destroyed. The early 19th century rectory and gateway were likewise destroyed. The Gibbons carvings were stored at S. Kensington Museum, and the organ, the gift of Mary, wife of William III, was also preserved. In 1946 a garden of remembrance, to honour the courage of the people of London, was opened by Queen Mary, and in 1947 reconstruction of the roof and N. wall was started.

St. James's Palace. London building, in Pall Mall, S.W. It stands on the site of a 12th century leper hospital, dedicated to S. James the Less, which Henry VIII transformed into a manor

house, at the same time enclosing the park. After Whitehall (q.v.) was burnt, St. James's palace was a royal residence, 1698-1837. Royal levées are still held here, and representatives of foreign powers are accredited formally to the court of St. James's. Mary I, Prince Henry, son of James I, and Queen Caroline, wife of George II, died here; Charles I slept here the night before his execution; and the palace was the birthplace of Charles II, Mary, mother of William III, James II, his son the Old Pretender, Mary II, Queen Anne, and George IV. William III made it his first residence in Lon-

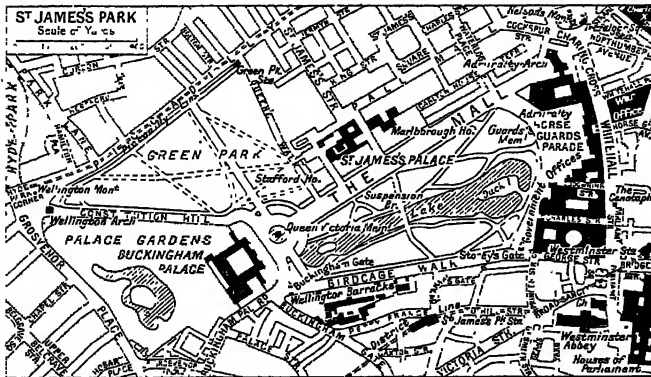

St. James's Palace, London. The Gate House, built by Henry VIII

don. In Charles II's time it was the chief residence of the duke of York, afterwards James II, and Edward VIII, while prince of Wales, made it for a time his residence.

Of Henry VIII's building, the only remains are the picturesque gateway facing St. James's Street, the chapel royal, in which Queen Victoria and Prince Albert, and the duke of York (later George V) and Princess Victoria Mary of Teck were married, and the presence chamber or tapestry room. The wing connecting the palace with Marlborough House chapel was burnt down, Jan. 21, 1809. The palace itself, and the chapel royal, were severely blasted by bombs during a German air raid Feb. 23-24, 1944.

St. James's Park. London park. It extends from Whitehall

St. James's Park, London. Plan of the park and its surroundings
Based upon the Ordnance Survey map with sanction of H.M. Stationery Office

to Buckingham Palace, includes the Horse Guards Parade, the Mall, and Birdcage Walk, and covers 93 acres. An ornamental lake of 5 acres, notable for its waterfowl, is crossed by a suspension bridge, constructed in 1857; Duck Island, at the E. end of the lake, is a breeding-place for the waterfowl. S. of Birdcage Walk, so named from the aviary kept here by Charles II, is Wellington Barracks, 1834. During the First Great War the lake was drained, as camouflage, and the site held temporary buildings used by the ministry of Shipping and the passport offices.

Charles II, in whose time the park became a fashionable promenade, greatly beautified it, calling in the aid of the French landscape gardener, Le Nôtre, for the purpose. Several of the ponds were made into a canal; later improvements were carried out during 1827-29 and in 1857. Rosamond's Pond, in the S.W. corner, filled up in 1770, was notorious as a place for duels; but in Stuart times the park was a sanctuary in which it was a serious offence to draw the sword. Palace and Park figure in Scott's *Fortunes of Nigel*, Ainsworth's *St. James's*, Thackeray's *Esmond*, and the pages of Evelyn and Pepys.

St. James's Square. London square which opens from Pall Mall and is entered N., E., and W. respectively by Duke of York, Charles II, and King Streets. Planned 1674-76 by Henry Jermyn, 1st earl of St. Albans, and the most fashionable as well as the best built square of its period, it came later to be occupied by govt. depts., clubs, and business offices. In the centre is an equestrian statue of William III. No. 1 was partly, No. 2 completely demolished by bombing during the Second Great War;

several other houses were less severely damaged. At No. 4 is the Arts Council. At No. 8 the younger Wedgwood had a show-room. Ormond House stood on the site of Nos. 9-11. No. 10, former residence of Lady Blessington, the earl of Chatham, the prime minister Derby, and Gladstone, became, as Chatham House, h.q. of the Royal Institute of International Affairs. At No. 14, rebuilt 1898, is the London Library; at No. 16, the East India and Sports Club. No. 31 is Norfolk House, built in 1939, where the staff preparing plans for the Allied invasion of France worked from Aug., 1943, and here Gen. Eisenhower (*q.v.*) had his h.q. Jan.-March, 1944; the previous Norfolk House was put up in 1748 on the site of St. Albans House, behind which was the house where George III was born. No. 32 was built in 1820 to replace the dwelling in which Lord Chesterfield was born, and became the town house of the bishop of London.

St. James's Street. London thoroughfare connecting Piccadilly with Pall Mall, S.W.1. In 1755 described as "well inhabited by gentry," its residents have included Byron, C. J. Fox, Gibbon, Gillray, Thackeray, Waller, and Wren. In this street the duke of Ormonde was attacked by Col. Blood in 1670; and here were celebrated coffee and chocolate houses, including White's Chocolate House, which attracted the patronage of highwaymen, and St. James's Coffee House, the resort of the Whigs of Queen Anne's time. Its clubs include Boodle's, Brooks's, Carlton, Conservative, Devonshire, and White's. See Crockford's.

St. James's Theatre. London playhouse in King Street, S.W.1. It was opened Dec 14, 1835, with

a production of Agnes Sorel, under the management of John Braham. Enlarged and remodelled by Sir George Alexander, who made it London's most fashionable theatre from 1891 until the First Great War, it became noted for "drawing room" comedies and romantic plays, *e.g.* *Lady Windermere's Fan*, 1892; *The Second Mrs. Tanqueray*, 1893; *The Prisoner of Zenda*, 1896; *If I Were King*, 1902; *His House in Order*, 1906; *The Passing of the Third Floor Back*, 1908. During the Second Great War the theatre suffered bomb damage on the night of Feb. 23-24, 1944, but put on *The Wind of Heaven* in 1945. In 1948 provincial repertory companies played here. There are 1,208 seats.

St. James's Wort. Alternative name for the plant ragwort (*q.v.*).

St. Jean or St. John's. Town of Quebec, Canada, formerly called Dorchester. It stands on the Richelieu river 23 m. S.E. of Montreal, and is a station on the C.N.R., C.P.R., Central Vermont, and Delaware and Hudson rlys. The first rly. in Canada was installed here in 1836. Industries include lumbering, the making of bricks, furniture, textiles, and paper, and there is a considerable agricultural trade. Pop. 15,000.

St. Jerome. Town of Quebec, Canada, on Rivière du Nord, 33 m. N.W. of Montreal, on the C.P.R. and C.N.R. The centre of a farming and lumbering district, it has butter factories, pulp and paper mills, and sawmills. Pop. 13,314.

Saint Joan. Chronicle play by Bernard Shaw. It covers the last two years of Joan of Arc's life, from the moment when she meets Robert de Baudricourt at Vaucouleurs in 1429 to her death at the stake, May 30, 1431. Five scenes take the story up to the coronation of Charles VII after Joan's victories in the field. The climax is reached in the trial scene with Joan's triumphant declaration of her responsibility to God and not to the Church. In an epilogue she becomes the object of adulation by former persecutors and false friends. Produced at the New Theatre, London, March 26, 1924, this play became accepted as Shaw's masterpiece. Sybil Thorndike gave a brilliant performance as Joan. Translated into the chief languages of the world, the play was performed throughout Europe and the U.S.A., and had several London revivals.

St. John. One of the smaller islands of the Virgin group of the Lesser Antilles, belonging to the

U.S.A. It is situated between the islands of St. Thomas and Tortola, has an area of 19 sq. m., and yields sugar, cotton, tobacco, and bay rum. The principal settlement is Cruz Bay. Formerly belonging to the Danish W. Indies, in 1916 it was sold with St. Thomas and St. Croix by Denmark to the U.S.A.

St. John. River of N. America, in the U.S.A. and Canada. It rises in Maine, U.S.A., in the midst of a lumbering dist., and flows by a great curve, N., S.E., and S., for 450 m. before it enters the Bay of Fundy. For 80 m. it forms part of the boundary between Maine and New Brunswick, and the last 300 m. are in the Canadian province. It drains an area of 21,500 sq. m.

At Grand Falls is a vertical drop of 58 ft.; above this point 65 m. are navigable; below, small steamers navigate the 126 m. to Fredericton in the flood season. Large river steamers reach Fredericton, 86 m. upstream and 6 m. below the limit of tidewater. The chief tributaries are Aroostook, Madawaska, St. Francis, Tobique, and Nashwaak. At the entrance to St. John Harbour is a curious reversible fall, where the river flows through a gorge, $\frac{1}{4}$ m. long and 400 ft. wide, flanked by rock walls 100 ft. high. At low tide the river is 11 to 15 ft. above the sea, at high tide the sea is 8 to 12 ft. above the river, for the gorge checks the flow of water in each direction; only four times daily for about 15 mins. each time can vessels pass in and out of the harbour. The chasm is crossed by a rly. cantilever and a road suspension bridge. Above it the estuary, which receives the Kennebecasis river, exceeds in parts a mile in width. See Grand Falls.

St. John. Lake of Quebec, Canada. It is about 150 m. N. of Quebec, and the Saguenay takes its waters to the St. Lawrence. It is a shallow basin, 26 m. by 20, with an area of 350 sq. m., and is fed by various streams coming from the highlands of Quebec. The lake is noted for its small salmon, called the ouinanche, and is frequented by sportsmen. The locality has an important dairy industry.

Saint John. City of New Brunswick, Canada. Situated on a peninsula at the mouth of the Saint John river, 483 m. from Montreal, it is the winter terminus of the C.P.R., and is also served by the C.N.R. A flourishing port, it has a commodious harbour with good docks, and a regular steamer service to S. Africa, the W. Indies, etc. The city has an old fort and a

martello tower. An important industrial centre, it also serves a good mixed farming, fruit-growing, dairying, and lumber district. The municipality includes the adjacent places of North End or Portland and West End or Carleton.

Saint John was founded by the French as Fort St. Jean in 1635. It became British in 1758, but its prosperity dates from the arrival of loyalists from the U.S.A. in 1783. These called it at first Parr Town, but soon restored the earlier name of Saint John. It was not, however,

Saint John, New Brunswick. A general view of the Canadian city, looking towards the St. John river

made the capital of the province, as it was thought too near the sea to be easily defensible. Its name is always spelt in full, to avoid confusion with others of the same name.

St. John or St. John's. Capital and seaport of Antigua, Leeward Islands. It is in the N.W. of the island, built on an eminence which overlooks one of the finest harbours in the W. Indies. It has air mail and passenger services to Miami and Trinidad. Pop. 10,000.

St. John Ambulance Association. Foundation of the Grand Priory of the Hospital of St. John of Jerusalem in England. With headquarters at St. John's Gate, Clerkenwell, it provides courses of instruction in the preliminary treatment of sick and injured persons, and in home nursing and sanitation, conducts examinations, and confers diplomas. It also supplies training in ambulance work and organizes transport corps for the removal of the sick and wounded at home and abroad. Offshoots of the St. John Ambulance Association are the military hospital home reserve, brigade bearer companies, and S. John's voluntary aid detachments. During both Great Wars its work was combined with that of the British Red Cross Society. See Ambulance; Nursing; Red Cross.

St. John Ambulance badge

St. John of Jerusalem. Order of chivalry. Its exact origins are obscure, but its title came from a hospital of S. John founded at Jerusalem about 1070 by certain merchants of Amalfi, who organized themselves as a religious order of Hospitalers. In addition to vows of poverty, chastity, etc., they were obliged to aid and defend pilgrims to the holy places. They spread branches of military-religious character in most countries of Europe, the provinces of administration being known as *langues*,

Driven from the Holy Land, 1290, the order went to Limasol, in Cyprus, and in 1310 to Rhodes.

Forced from Rhodes in 1522, the knights, numbering some 4,000, went to Candia and Sicily, and settled in Malta in 1530.

Charles V granted the island to the order, and Malta remained in their hands until 1798. The order then became religious in character, its headquarters being established at Rome in 1879. Admission is restricted to those who bear 16 quarterings and profess the R.C. faith.

The English order of S. John of Jerusalem is descended from the original order, and was revived in 1834. It received a charter of incorporation in 1888, and devotes itself to organizing hospital and Red Cross work, notably the St. John Ambulance Association, which during both Great Wars worked in amalgamation with the British Red Cross Society. Its chancery is at St. John's Gate, Clerkenwell, London, E.C. Its chapter consists of 350 knights of justice and knights of grace; there are also ladies of justice, ladies of grace, and esquires. The ribbon of the order is black. See Knight-hood; Knights Templars; Malta; Red Cross; Rhodes; St. John Ambulance Association.

St. John of Jerusalem. Arms of the order

St. Johns. A river of Florida, U.S.A. It issues from swamps in Osceola and Brevard cos., and follows a N. course to the Atlantic, 20 m. below Jacksonville. It is 400 m. long and is navigable for upwards of 230 m. At Jacksonville the largest vertical lift bridge in the U.S.A. spans the river.

St. John's. Capital of Newfoundland, Canada. On a fine harbour on the E. coast of the island, 560 m. N.E. of Halifax, Nova Scotia, it is the largest town in Newfoundland. It has a dry dock and other accommodation for shipping, and regular steamer services to Liverpool, New York, and Halifax. It is the terminus of the island rly. line and the headquarters of the fisheries, as well as the banking and general business centre. The chief buildings are the two cathedrals, Anglican and R.C., government house, and the court house. On Signal Hill, guarding the entrance to the harbour, is Cabot Tower. The city was founded by Sir Humphrey Gilbert in 1582, and was twice seized by the French. Its harbour was used by the British fleet in the wars against America, and it was then a fortified place. The city has several times been seriously damaged by fire, the last in 1892. Pop. 62,823.

St. John's. Another name for the town in Quebec usually called St. Jean (*q.v.*).

St. John's. One of the colleges of Cambridge university. Built on the site of an Augustinian hospital, 1135, and dedicated, as was the hospital, to the Evangelist, it owes much of its prosperity to John Fisher, bishop of Rochester and executor to the Lady Margaret, countess of Richmond and Derby (1441-1509), under whose will it was founded in 1511. The first court, entered by an imposing gateway, dates from 1520, but has been much rebuilt; the second, notable for its brickwork, from

1598-1602; the third, from 1624-69; and New Court is approached, across the Cam, by a covered bridge of one arch known as the Bridge of Sighs, 1827-31.

The hall has fine panel work. The beautiful library, gift of John Williams, bishop of London, contains among other treasures an edition on vellum of the Bible of 1539. The Gothic chapel, designed by G. G. Scott, and dedicated 1869, has a decorated wooden roof, beautiful stained glass, and statues of Bishop Fisher, Lady Margaret,

St. John's College, Oxford. First quadrangle, and the hall and chapel on the right

and other benefactors. The arms of the college are the same as those of Christ's.

Among famous names associated with the college are Ascham, William Cecil, Thomas Cartwright, Robert Greene, Nashe, Thomas Fairfax, Falkland, Strafford, John Cleveland, Stillingfleet, Prior, Herrick, Richard Bentley, William Wilberforce, Horne Tooke, Wordsworth, Castlereagh, Samuel Butler, Palmerston, Sir J. Herschel, J.

Couch Adams. The society has a master, some 60 fellows, and 600 undergraduates and graduates.

St. John's. One of the colleges of Oxford university. Founded in 1555 by Sir Thomas White, an alderman of London, and a member of the Merchant Taylors' Company, it has always had

a close connexion with the Merchant Taylors' school, and some of its best scholarships are confined to boys educated there. Its head is the president. The buildings, which front St. Giles, contain remains of a house founded by Archbishop Chicheley for Cistercian students. The older parts consist of two beautiful quadrangles, the back one overlooking the garden being especially notable, while the garden is perhaps the most beautiful in Oxford. Laud, former president, built part of

the college, to which considerable additions were made about 1900. The library is perhaps the most interesting room, and the college has relics of Charles I. It owns much valuable land in Oxford. Laud, president of this college 1611, is buried in the chapel, as is Juxon. Also up at St. John's were Edmund Campion and James Shirley.

St. John's Gate. Relic of old London, in Clerkenwell (*q.v.*). An example of Perpendicular architecture, much restored, it formed the S. gatehouse of the priory of the Knights Hospitallars of the Order of S. John of Jerusalem. The priory, founded about 1145, grew immensely wealthy; it was wrecked by the followers of Wat Tyler, 1381, and, rebuilt, was dissolved in 1540. Apart from the Norman crypt and ruined parts of the adjacent church of S. John (bombed by the Germans in 1941),

St. John's College, Cambridge. New Court, built 1826-30

St. John's College, Oxford, arms

St. John's, Newfoundland. A general view of the Newfoundland capital, looking towards the harbour

St. John's Gate, London. The interior of the council chamber. Right, the old gatehouse of the priory of S. John, Clerkenwell

the gatehouse, which was built by the grand prior, Sir Thomas Docwra, in 1504, is all that remains of the priory. In Elizabethan times a residence of the master of the revels, it was used in 1731-81 as the printing office of *The Gentleman's Magazine*. After serving as a watch-house, and then as an inn, the gatehouse became in 1874 the headquarters of the revived order of S. John of Jerusalem and of the S. John Ambulance Association. See *Hospitallers*; *consult* *The Order of the Hospital of S. John of Jerusalem*, H. W. Fincham and W. R. Edwards, 1915.

St. John's Wood. Residential district of London. In the bor. of Marylebone, and built over in the 19th century, it lies N.W. of Regent's Park. Near the station of the Bakerloo rly. are Lord's cricket ground and S. John's church, with the grave of Joanna Southcott. The district holds memories of many eminent writers and artists, including Charles and Mary Lamb, Thos. Hood, George Eliot, G. H. Lewes, Herbert Spencer, Landseer, Harold and Dame Laura Knight; but many notable houses were destroyed when the Great Central rly. was extended to Marylebone. It was once the property of S. John's Priory, Clerkenwell.

St. John's Wort (*Hypericum calycinum*)
Perennial

St. John's Wort.
H. calycinum

herb of the family Hypericaceae. A native of Europe, Asia, and N. Africa, it has slender, two-ridged, brown stems, branching above; and opposite oblong leaves whose veins are pellucid, as are the glands with which the leaf is freely dotted. On holding a leaf to the light these appear like perforations. The bright yellow flowers are an inch across, and appear in clusters at the end

of the branches. Several other species of *Hypericum* are also called St. John's Wort. See *Aaron's Beard*; *Leaf*.

St. Joseph. City of Missouri, U.S.A., the co. seat of Buchanan co. A port of entry, it stands on the Missouri river, 61 m. N. by W. of Kansas City, and is served by the Atchison, Topeka, and Santa Fé and other rlys. Among the principal features are the county court house and auditorium, the Carnegie and public libraries,

and it has one of the world's biggest meat-packing industries. Carriages, clothing, and furniture are made. Third city in the state, St. Joseph has a pop. of 75,711.

St. Just. Urban dist. of Cornwall, England. It stands near the coast, 7 m. N.W. of Penzance. The chief building is the church of S. Just, a Perp. edifice with some interesting features. In full St. Just in Penwith, the town is surrounded by ancient disused tin and copper mines. In a round, or amphitheatre, here, Cornish miracle plays were performed. About 1 m. away is Cape Cornwall. Pop. approx. 4,000.

St. Just, LOUIS ANTOINE LÉON DE (1767-94). French revolutionary. Born at Decize, Nièvre, Aug. 25, 1767, he was educated at Soissons, supported the revolutionary movement, and was elected to the assembly in 1792. Closely allied with Robespierre, he was a member of the committee of public safety, 1793, secured the confiscation of the property of refugees, and was dispatched to strengthen discipline in the Rhine armies. On his return he became president of the convention, where he urged the ideal of a Spartan republic. Fanatic and tyrant, he ordered wholesale execution of soldiers suspected of treason and secured the success of the northern armies by threatening the leaders with death if they failed. Arrested with Robespierre, he was guillotined, July 28, 1794.

St. Kilda, Scotland. The town and bay, viewed from the south

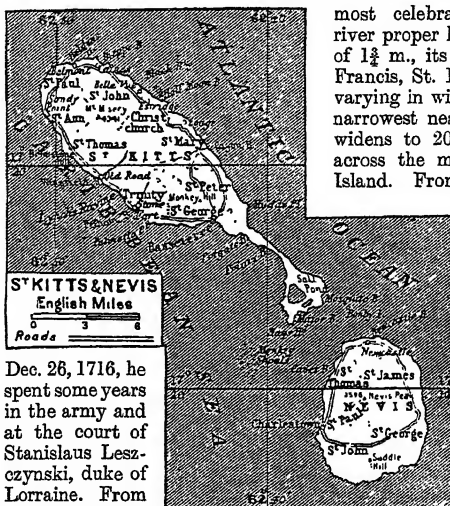

and the state hospital for the insane. St. Joseph was laid out in 1843 and chartered as a city in 1853. Its prosperity began with the opening of westward trade routes before the days of rlys.,

St. Kilda. (Gaelic *Hirta*, "the western land.") Island of the Outer Hebrides, Scotland. It belongs to Harris, Inverness-shire, and is 40 m. W. of North Uist. The chief of a group of about 17 rocky islets,

its circumference is about 7 m.; its highest point is 1,397 ft.; it has lofty, precipitous cliffs around the coast, except in the S.E., where is the landing-place. It is a sanctuary for the fulmar petrel and other sea birds, and has half-wild sheep. On May 15, 1918, a German submarine shelled the church. In 1930 the pop. of 35 with their possessions were taken off this isolated spot and mostly settled in Morven. The island belongs to the Macleod of Macleod.

St. Kilda. Watering-place of Victoria, Australia. It is 3 m. S.E. of Melbourne, of which it is practically a suburb.

St. Kitts OR **St. CHRISTOPHER.** Third largest of the Leeward Islands, in the British West Indies. It lies 46 m. W.N.W. of Antigua, and has an area of 68 sq. m. The central mountainous area, which is forested, culminates in Mt. Misery, 4,341 ft. The coastal lowlands yield sugar, molasses, cacao, limes, coffee, tobacco, coconuts, salt, and cotton. Basseterre is the chief town. With Nevis and Anguilla. St. Kitts forms an ad-

St. Kitts. Map of the West Indian island, including the adjacent island of Nevis

most celebrated waterfall. The river proper has an average width of $1\frac{1}{2}$ m., its lake expansions, St. Francis, St. Louis, and St. Peter, varying in width from 5 to 9 m.; narrowest near Quebec, it rapidly widens to 20 m., and is 100 m. across the mouth near Anticosti Island. From the Atlantic Ocean, at the Strait of Belle Isle to the head of Lake Superior, is a water stretch of 2,264 m., which is navigable with the aid of the "Soo" canals to avoid the rapids of Sault Ste. Marie and the Welland canal to avoid Niagara; ocean steamers reach Montreal 986 m. from the ocean; steamers connect the ports above

that city with each other and Montreal. The floors of Lakes Ontario, Huron, Michigan, and Superior are below sea level; the drop from Lake Superior to the ocean being only 600 ft., the river is, at least, 100 ft. deep from Quebec to the gulf.

The Richelieu, which drains Lakes Champlain and George, is the chief right-bank tributary; left-bank tributaries include the Monikagan, Outarde, Saguenay, Ottawa. The Thousand Islands fill the wide expanse where the river emerges from Lake Ontario. In the U.S.A. there has been considerable controversy regarding a suggested scheme of further improvement in the St. Lawrence waterway, whereby Montreal would be directly linked with Chicago. This scheme would by-pass the Niagara Falls and adversely affect New York traffic. See Bridge illus. p 1424. Lachine: Montreal.

St. Lawrence, GULF OF. Arm of the N. Atlantic Ocean on the N.E. coast of America. It is due to submergence of the land and has, therefore, deep channels connecting it with the ocean. It receives at the N.W. the waters of the St. Lawrence river. The Strait of Belle Isle lying between Quebec and Newfoundland, 600 ft. deep, and used by ocean steamers en route to Quebec or Montreal whenever it is free from ice; the Gut of Canso, a narrow passage between Cape Breton Island and Nova Scotia; and Cabot Strait, 60 m. in width, 1,200 ft. deep, between Cape Breton Island and Newfound-

St. Kitts, or St. Christopher, British West Indies. The water front at Basseterre, the island's most important town

ministrative unit, which sends representatives to the federal legislative council of the Leeward Islands. The three islands are

St. Kitts arms

part nominated. Discovered by Columbus in 1493, settled by English and French about 1624, St. Kitts became British in 1713, though it has been seized and held for short periods by the French since then.

Saint-Lambert, JEAN FRANÇOIS, MARQUIS DE (1716-1803). French man of letters. Born at Nancy.

St. Laurent, Louis (b. 1882).
Canadian statesman. See N.V.

St. Lawrence. River of North America. It begins as the St. Louis, which enters Lake Superior near Duluth, and has a total length of 1,900 m. Its basin includes the five great lakes; between Lakes Superior and Huron it is known as the St. Mary, between Lakes Huron and St. Clair as the St. Clair, between Lakes St. Clair and Erie as the Detroit, between Lakes Erie and Ontario as the Niagara: below Lake Ontario as the St. Lawrence.

Its basin contains more than half the fresh water in the world, and includes Niagara, the world's

land, connect the gulf with the ocean. Prince Edward Island, Anticosti, and the Magdalen Islands are within the gulf, of which the Northumberland Strait is a detached portion. About 500 m. from N. to S. and 240 m. across, its area is 80,000 sq. m.

St. Leger. British horse race. It takes place at Doncaster, normally on the Wed. of the Sept. meeting. The race was inaugurated by Col. St. Leger, of Parkhill, Doncaster, in 1776. Originally it was a sweepstake for 3-year-olds, over a course of 2 m.; the first winner was Lord Rockingham's Sampson. Afterwards the course was altered to 1 m. 6 fur. 132 yds. Horses which had previously won the 2,000 guineas and the Derby have occasionally also won this last of the classic races: West Australian 1853, Gladiateur 1865, Stockwell 1866, Ormonde 1886, Common 1891, Isinglass 1893, Galtee More 1897, Flying Fox 1899, Diamond Jubilee 1900, Rock Sand 1903, Pommern 1915, Gay Crusader 1917, Gainsborough 1918, (the last three winning a substitute St. Leger) and Bahram 1935.

St. Leonard's Forest. Tract of land in Sussex, England, to the N.E. of Horsham. It formed part of the Andredsweald of the Saxons, and was at one time in the possession of the Braose family.

St. Leonards-on-Sea. Watering-place of Sussex, England, a W. suburb of Hastings (q.v.) with its own rly. stations. There are

St. Leonards-on-Sea, Sussex. Marine Court, a notable landmark

a pavilion, a fine promenade, and an open-air swimming pool.

St. Lô. Town of France. The capital of the dept. of Manche, it stands on a rocky height on the right bank of the Vire, 60 m. S.E. of Cherbourg. An important road centre, it was destroyed during eight days' fighting, July 10-18, 1944, when it was captured from the Germans by the Americans, and by subsequent German shelling. The inhabitants, evacuated by the Germans, soon began to return and to start rebuilding, at first temporary houses. The former church of Notre Dame dated from the 15th century. The abbey of Ste. Croix was founded by Charlemagne in the 9th century. There were manufactures of lace, cotton cloths, and ribbons, and trade in butter, cider, and grain. The town, which derives its name from S. Lô, bishop of Coutances, who built a church here, suffered greatly also in the wars of religion.

St. Louis. Principal city and port of entry of Missouri, U.S.A. The eighth largest city of the U.S.A., it is pleasantly situated on the W. bank of the Mississippi river, 10 m. below its junction with the Missouri river, and is served by

the Missouri, Kansas and Texas and several other rlys. A well-planned city of rectangular shape, it rises in a series of three terraces, respectively 20 ft., 150 ft., and 200 ft. above the river's high-water level, has a river frontage of 19 m., and covers rather more than 61 sq. m. Eads Bridge, erected 1869-74, which crosses the river here, has two storeys, the lower one carrying a rly.; four other bridges connect St. Louis with industrial suburbs in Illinois.

St. Louis has some 2,700 acres of parks, the largest being Forest Park, 1,370 acres, and the most picturesque Tower Grove Park, 267 acres, which is contiguous with the Missouri Botanical Gardens. In Washington Park is the city hall, and other notable public structures include the massive Coliseum and the chamber of commerce.

Washington university and St. Louis university are the chief institutions for higher education, and there are also the Forest Park university for women, the Normal College, the Christian Brothers' College, and the St. Louis Medical School. The public library contains nearly half a million volumes, and the mercantile library about 140,000. The principal churches are the French Walnut Street cathedral, the Protestant cathedral, the cathedral of S. Louis, and church of SS. Peter and Paul.

St. Louis's culture is partly due to 30,000 Germans, mainly of the professional and skilled artisan class, who settled there before 1850. By 1900 its pop. exceeded 500,000. Today it is one of the foremost commercial and industrial centres of America. Tobacco is the principal manufacture, upwards of 80,000,000 lb. being processed annually. Other industries include slaughtering and meat-packing, zinc and lead smelting, printing and publishing, flour-milling, and the manufacture of

St. Lô, France. Left, west front of the 15th century church of Notre Dame whose spires can also be seen in the general view, above (pre-1944)

St. Louis, Missouri. The waterfront stretching along the Mississippi

foundry and machine-shop products, clothing, boots and shoes, wagons, carriages, stoves, hardware, and bricks. An active trade in mules is carried on, and large quantities of cotton, wool, and coal are exported.

St. Louis was named in honour of Louis IX of France, by Pierre Laclède, who established a fur trading post here in 1764. It remained in French hands for several years, but passed to the U.S.A. as part of the Louisiana Purchase in 1803-04. In commemoration of the purchase an international exhibition was held here in 1904. Pop. 813,458.

Opposite St. Louis, in Illinois, is East St. Louis, which is described under that name.

St. Louis. Capital of the French colony of Senegal, Africa. Situated on the small island of Sor, at the mouth of the river Senegal, it is a busy port, and is connected with Dakar by rly. (165 m.) and with the river ports on the Senegal by steamboat, a regular service to Podov (140 m.) running throughout the year. St. Louis is the residence of the lieutenant-governor of the Senegal Colony, and is one of the four communes represented in the French parliament. Pop. 49,160.

St. Louis, EAST. This city of Illinois is described under East St. Louis.

St. Lucia. Largest of the Windward Islands in the British West Indies. It is 25 m. N. of St. Vincent and 25 m. S. of Martinique. The forested and mountainous interior culminates in an active volcano above 3,000 ft. Sugar, cacao, limes, copra, coffee, and spices are the

St. Lucia arms

chief products of the fertile valleys; logwood is obtained from the forests. Its main importance is due to the excellence of the harbour of Castries, the chief town, where there is a coaling station and a naval base. The administra-

tor is assisted by a nominated executive and a partly nominated and partly elected legislative council. The island was discovered by Columbus in 1502, was settled by the French in 1635, and became British in 1803, having been alternately French and British in the interim; French is the language spoken by the natives. Its area is 233 sq. m. In 1940 a site at Gros Islet Bay was leased to the U.S.A. for a naval and air base; a U.S. army aerodrome and military base is at Vieux Fort. Pop. 73,770.

St. Lucia Bay. Shallow landlocked lagoon on the coast of Zululand, Natal. It lies S. of Tongaland, and receives the waters of the Makusi river. At the entrance to the bay the White Umvolosi has its exit. Coal exists in the neighbourhood, and vast quantities of papyrus grow in the lagoon. St. Lucia Bay was claimed by the S. African Republic and ceded by Panda, king of the Zulus, to the British, Oct. 5, 1843. Subsequently a party of Boers, under Luca Meyer, attempted to found the New Republic there, and in 1884-85 the Germans tried to form a settlement. The bay was formally annexed by the British government, Dec. 18, 1884.

St. Luke's. London parish. In the met. bor. of Finsbury (*q.v.*), it was formed, 1732, from the parish of St. Giles's, Cripplegate. The church, 1732-33, by George Dance, sen., and notable for its tower and obelisk-like spire, was restored 1877-78. In the churchyard, now a recreation ground, were buried Caslon, the typefounder, and Thomas Allen, one of London's historians. St. Luke's gives its name to a hospital for the insane, a charity founded 1751 in Moorfields. The buildings in Old Street, by George Dance, were erected 1782-84. The hospital, incorporated 1838, was greatly added to later, a chapel being built in 1842. The buildings were later acquired by the bank of England as a printing works, and the foundation transferred its support to a hospital for nervous diseases at Muswell Hill.

St. Luke's Summer. A spell of fine warm weather popularly supposed to occur about the time of St. Luke's day, Oct. 18.

St. Malo. Seaport and watering-place of N.W. France. In the dept. of Ille-et-Vilaine, on a rocky peninsula at the mouth of the Rance, opposite Dinard, it is connected with the mainland by a sea wall, known as the Sillon. Surrounded by ancient towered ramparts, with eight gates, it has a castle built in the 14th-15th century, and at one time used as a barracks. The church, founded in the 12th century, is mainly of

St. Malo arms

St. Malo, France. The ancient town and its harbours from the air

15th-16th century work. It has a façade built in 1713, and a spire that was added in 1859.

Attached to the hôtel de ville are a library and museum, and there is a municipal casino. Motor-boats, called vedettes, connect with Dinard and Dinan; steam trams with Paramé, St. Servan, and Cancale; and steamers with the Channel Islands and Southampton. Many islets protect the harbour. Normal tides rise 23-26 ft. above low-water mark. Chateaubriand, whose grave is on a rocky eminence of the islet of Grand Bey; Jules Cartier, Lamennais, and Maupertuis were natives. Timber and coal are imported; cattle, game, and dairy produce exported; and the Newfoundland cod-fishery provides employment for many of the inhabitants, who possess seafaring traditions of long standing. Pop. 11,311.

St. Malo is named after a Welsh monk, S. Malo or S. Maclou, who was bishop here in the 6th century. In 1711 the town contributed 30 million francs to support Louis XIV in the wars of the Spanish succession, and it several times defied capture by the English, notably in 1758, when Marlborough landed at St. Servan, and wrought considerable damage, but was unable to take St. Malo. On the fortified islet of Césambre, S. Brendan founded a monastery about 524. St. Malo was in German occupation from the surrender of France in June, 1940, until 1944. On Aug. 3, 1944, U.S. armoured units, advancing from Avranches, reached St. Malo, where the encircled German garrison held out until Aug. 9, the citadel surrendering on the 17th.

St. Margaret's. Residential dist. of Middlesex, England. It is 10½ m. by rly. from Waterloo, and forms part of the urban dist. of Heston and Isleworth.

St. Margaret's. A London church. Founded as the parish church of Westminster in the first half of the 12th century, rebuilt in the 13th century, and again in 1485-1523, since April 17, 1614, it has been the official church of the house of commons. Its bells are rung on the formal admission to office of a new Speaker, baptisms in S. Stephen's Chapel are recorded in its registers, and the banns of M.P.s are here published. The dean of Westminster is usually appointed as rector of S. Margaret's. In 1916 S. Margaret's was created the parish church for the British overseas dominions. It is situated just beside Westminster Abbey,

and is a favourite church for weddings of fashionable members of London society. A remarkable example of Perpendicular architecture, it is rich in memorial win-

St. Margaret's, Westminster. The official church of the House of Commons from the Abbey green

dows and monuments. The headless body of Raleigh was buried here; the memorial window to him was the gift of Americans in 1882; the Milton window was unveiled by Matthew Arnold in 1888; both windows suffered damage in the Second Great War, as did the fine organ. The beautiful E. window, removed to safety during both Great Wars, and in the Civil War, was a gift to Henry VII by Ferdinand and Isabella of Spain, when their daughter Catherine of Aragon was married to Henry's son Arthur. Consult St. Margaret's, Westminster, H. F. Westlake, 1914.

St. Margaret's Bay. Watering-place of Kent, England. It is 4 m. from Dover, the rly. station being Martin Mill. There are golf links, and in the village, known as S. Margaret-at-Cliffe, is a Norman church restored in 1869.

St. Mark's. Cathedral at Venice, one of the most famous extant monuments of Byzantine architecture. The present structure was begun towards the end of the 10th century, and consecrated in A.D. 1094. An earlier church, built from the designs of a Greek architect, occupied the site in the 9th century.

S. Mark's is the largest of the Italian Byzantine churches, covering an area of 46,000 sq. ft., and measuring 260 ft. by 215 ft. externally. It was constructed of brick, which has since been overlaid with coloured marble, in the form of a Greek cross. The façade on the Piazza San Marco consists of two

storeys, of which the lower has the main entrance in the centre of a line of five semicircular arches, the design being repeated on a slightly smaller scale in the upper storey.

A gallery, with a balustrade, extended round the whole building, divides the two storeys. Crowning the roof is a hemispherical dome, 42 ft. in diameter; the western dome is of the same size, and there are three other domes of which the diameter is 33 ft., and several turrets. Between the 12th and 14th centuries a great deal of Italian Gothic detail was added to the exterior, and for this reason the architectural attractiveness of the building must be sought in its colour rather than in its form.

Over the middle and largest portal are four gilded bronze horses, each 5 ft. high, which originally formed part of an ancient quadriga, and probably adorned the triumphal arch of Nero. They were brought to Venice in 1204 from Constantinople by the doge Enrico Dandolo, were taken to Paris by Napoleon in 1797, but were returned in 1815.

The marble used in the fabric of the building is mostly Oriental, and there are 500 columns of this stone in the exterior and interior. Immediately over the principal entrance are modern mosaics depicting the Last Judgement, above are 17th century mosaics of incidents in the life of Christ. At the main entrance itself are some remarkable medieval allegorical sculptures. In the domes of the vestibule are some 13th century Byzantine mosaics representing O.T. scenes. The bronze doors of the cathedral date from the 11th and 12th centuries.

Within, the cathedral's chief glory is the mosaic work in the domes, dating from the 12th and 13th centuries. Remarkable also is the beauty of the pavement.

Upon the High Altar is the Pala d'Oro, only uncovered at Easter, which was made at Constantinople in 1105, and consists of enamelled work and jewels set in plates of gold and silver. Under the altar are deposited the remains of S. Mark, brought here from Alexandria in 879. The Treasury, which is reached from the right transept, contains many valuable pieces of Byzantine church furniture, a 7th century episcopal throne from Alexandria, and various ornaments brought from S. Sophia, Constantinople.

One of the features of the building is the Baptistry, which con-

ST. MARK'S, VENICE: THE WESTERN FACADE AND THE RICHLY ORNAMENTED INTERIOR

One of the great historic churches of Christendom, St. Mark's was consecrated A.D. 1094. The remains of St. Mark, brought from Alexandria, lie under the altar. The building is faced with coloured Oriental marble, contains 500 marble columns, and is famous for its glorious Byzantine mosaic work.

ST. PAUL'S CATHEDRAL, LONDON

The building of Wren's masterpiece, the third cathedral to be built on the site, was begun 1675 and completed 1710, at a cost of under £748,000. The pictures show the western façade, as seen from Ludgate Hill, the nave, and a post-war view from the S.E., looking across the area devastated by the German fire raid of Dec., 1940.

ST PETER'S, ROME: EXTERIOR AND INTERIOR OF THE LARGEST CHURCH IN THE WORLD

Above: the western façade built by Carlo Maderna in 1612, showing (right) the main entrance to the Vatican palace, which rises behind: the Egyptian obelisk was brought to Rome by Caligula. Below: looking towards the High Altar, which stands above the crypt containing St. Peter's tomb

ST. SOPHIA, ISTANBUL

Originally a Christian church, this beautiful Byzantine building became a Mahomedan mosque in 1453, but, apart from the addition of minarets, the structure was little altered. The large plaques in the interior view are inscribed with the names of Allah and His prophets. Below, right - the private worshipping place used by former sultans of Turkey

tains a 16th century font, the bronze lid of which is ornamented with carving. The mosaics of the ceiling are 13th century work, and there is a monument to the doge Andrea Dandolo (d. 1354). Adjoining the Baptistery is the Zeno chapel, containing the bronze monument of Cardinal Giambattista (d. 1501).

S. Mark's, which became a cathedral in 1807, was the state church of the Republic of Venice. In it the doges were crowned, and on the S.W. corner of the building there still remains the Pietra del Bando, a porphyry block from which the edicts of the republic were announced. Also on the S. side are two pedestals, which were brought from Acre in 1256.

It is of interest to note that the pigeons, so prominent a feature of the piazza by the church door, are descendants of birds liberated from the vestibule in the early days of the republic. So long as the republic lasted public funds were devoted to their maintenance. They now depend for a livelihood upon visitors. See *Byzantine Architecture*; Venice; and illus. p. 7241.

St. Martin (Du. *St. Maarten*). Island of the West Indies. It is one of the Lesser Antilles, with an area of 2,159 m., has a mountainous interior, and is lacking in water; sugar, cotton, and tobacco are produced in small quantities. The N. portion, with a pop. of 5,177, is French, and forms part of the overseas dept. of Guadeloupe; the S., with a pop. of 1,877, is Dutch and forms part of the territory of Curaçao (*q.v.*). Early French and Dutch settlers were expelled by the Spaniards, who later abandoned the island, which was occupied simultaneously by the French and the Dutch in 1648.

St. Martin - in - the - Fields. London parish, divided from that of S. Margaret's, Westminster, in 1535. On the site of a chapel of S. Martin, Henry VIII erected the parish church. This was enlarged by Prince Henry, son of James I, and the present structure, at the N.E. corner of Trafalgar Square, was built by James Gibbs in 1721-26. During the two Great Wars it was continuously open as a resting-place for soldiers, and its crypt became a canteen in the daytime and a dormitory shelter at night. In the now covered-in churchyard lie the remains of the murdered Sir Edmundbury Godfrey, John Hunter the anatomist, Robert Boyle the philosopher, Nell Gwynn, Farquhar the dramatist, Roubiliac the sculptor, and Jack Shep-

pard. At a school once adjoining the church Ben Jonson was a pupil. Before the end of the 18th century the parishes of S. Paul,

St. Martin-in-the-Fields. Facade of the London church, from Trafalgar Square

Covent Garden; S. Anne's, Soho; S. James's, Piccadilly; and S. George's, Hanover Square, had been divided from that of S. Martin-in-the-Fields. With the advent of broadcasting the church became famous throughout the world as a result of its services being frequently in the B.B.C. programmes. Successive vicars—"Dick" Sheppard, "Pat" McCormick, and Eric Loveday—became well known to listeners. Its magazine had a circulation far beyond the boundaries of the parish. See London. Consult *A Short History of the Royal Parish of St. Martin-in-the-Fields*, J. MacMaster, 1916.

St. Martin's.

One of the inhabited Scilly Islands, lying 2 m. N. of St. Mary's. Shaped like a boot, it shows remarkable contrasts with its N. and E. coasts wild and the S. and W. luxurious. Pop. 110.

St. Martin's - le - Grand. London street, running S. from Aldersgate Street to Cheapside. Its name commemorates the church, college, and sanctuary of S. Martin that stood here from 1056 to 1548. Here is the h.q. of the G.P.O. To

make way for some of its buildings a French Protestant church and the Bull and Mouth inn were pulled down in 1888. The middle part of the street was heavily bombed in the Second Great War. See Post Office.

St. Martin's Summer. Name given in England to the period of fine weather popularly supposed to occur around S. Martin's Day, Nov. 11. See *Indian Summer*; *Martinmas*.

St. Martin's Theatre. London playhouse in West Street, W.C.2. It was opened Nov. 23, 1916, under the management of C. B. Cochran, with a production of *Houp La!* Here were played *A Bill of Divorcement*, 1921; *The Ghost Train*, 1925; *Berkeley Square*, 1926; *Shop at Sly Corner*, 1945. The theatre seats 600.

St. Marylebone. Met. bor. of London. It is bounded by Westminster (Oxford St.) on the S., Paddington (Edgware Rd.) on the W., St. Pancras and part of Holborn on the E., and Hampstead on the N. Until the 18th century it was only a village, originally called Tyburn, changing its name in 1400 with the building of the new church of S. Mary's-la-bourne, from which the present name is derived. It now includes many famous buildings and institutions, e.g. the B.B.C., Lord's cricket ground, Regent's Park (including the Royal Zoological Society's gardens), Madame Tussaud's, and the Royal Academy of Music. Harley St. and Wimpole St., centre of the medical specialists' world, come within its boundaries, and several hospitals.

Marylebone arms

St. Marylebone, London. The parish church of S. Mary, built 1813-17, standing on the S. side of Marylebone Rd.

e.g. Middlesex, Western Ophthalmic, as well as the London clinic (one of the largest nursing homes in

England). Cavendish, Manchester, and Portman Squares are noteworthy for their architecture. Marylebone station is a main line terminus, and Baker Street an important junction of London Transport. Municipal buildings include the town hall in Marylebone Road.

At the old parish church of S. John (demolished 1949), which figures in Hogarth's *Rake's Progress*, Francis Bacon (1606), Hogarth (1729), and Sheridan (1773) were married. In its graveyard were buried Charles Wesley, Allan Ramsay, the painter, and Mrs. Siddons. The present parish church was erected during 1813-17; here were married, Sept. 12, 1846, Robert Browning and Elizabeth Barrett. Residents in the borough were Dickens, George Eliot, Hallam, Gibbon, D. G. Rossetti, Haydon, J. M. W. Turner, and Faraday.

During the Second Great War many buildings in St. Marylebone were destroyed or badly damaged, e.g. the central synagogue, the Philharmonic Hall, Queen's Hall, and S. George's Hall. Pop. 87,000.

St. Mary's. Largest of the Scilly Islands. About 27 m. W.S.W. of Land's End, Cornwall, it is some 2 m. in length and breadth, and contains a number of antiquities and fine rock scenery. There are traces of a prehistoric village, and Star Castle, an Elizabethan fortress. Hugh Town, on an isthmus joining the two portions of the island, is the only town in the Scilly Islands; it has a good harbour and a pier. Spring flowers and early potatoes are grown. Pop. 1,025.

St. Mary's. Loch of Scotland, in Selkirkshire. It is 16 m. W. of Selkirk, about the same distance N.E. of Moffat, is 814 ft. in alt., about 86 ft. deep, and measures 3 m. in length, with an extreme breadth of $\frac{1}{2}$ m. It receives Megget Water from the W., and discharges into the Yarrow river at its E. extremity. At the S. end is the celebrated Tibbie Shiels inn, and to the E. is Altrieve, the cottage of James Hogg. The lake figures in the poems of Scott, Wordsworth, and Hogg.

St. Mary's. River connecting Lakes Superior and Huron. N. America. It is 65 m. in length, and is divided by large islands into two main channels which each expand at intervals to a width of 10 m. Between the two lakes the fall is 21 ft., most of which occurs in the sault or rapids, which are about 1 m. long. Since 1855 canals have made the rapids navigable. See Sault Ste. Marie.

St. Mary's Hospital. Medical institution in Praed St., Paddington, London. The hospital was founded in 1845 and the present building opened in 1851. It comprises a general hospital of 480 beds, and a medical school of the university of London. In the Clarence wing is the Wright-Fleming institute of microbiology, which was founded by Sir Almroth Wright and perpetuates his name and that of Sir Alexander Fleming, who discovered penicillin while engaged on research in the hospital laboratory.

St. Maurice. River of Canada. A left bank tributary of the St. Lawrence, it flows for 300 m. through Quebec, and joins the main stream at Three Rivers. Considerable quantities of timber are sent down the river. It is navigable for 75 m. between Grand Piles and La Tuque.

St. Maurice. Town of Switzerland, in the canton of Valais. Standing on the left bank of the Rhône, 33 m. by rly. S.E. of Lausanne on the Simplon rly., and 14 m. S.E. of the Lake of Geneva, it is famed for its abbey, originally founded by the Burgundian King Sigismund, and named traditionally after S. Maurice, commander

St. Maurice, Switzerland. The château and bridge over the Rhône

of the Theban Legion, martyred here about 302. The abbey has been occupied by Augustinian canons since 1128. This is a fortified town. Pop. 2,569.

St. Mawes. Small town, seaport, and summer resort of Cornwall, England. It stands on St. Mawes Harbour, an arm of Falmouth Bay, 3 m. E. of Falmouth. Its castle (1542) was captured by Fairfax in 1646. Cables and ropes are manufactured, and fishing is an active industry.

St. Michael and St. George. British order of knighthood. It was founded in 1818 especially for natives of the Ionian Islands and

the Mediterranean area. Later it became an order to reward services rendered in the British dom-

St. Michael and St. George. Collar, badge, and stars of the order

inions. Its statutes have been remodelled several times, one occasion being in 1902. The order has three grades: G.C.M.G., knight grand cross; K.C.M.G., knight commander; and C.M.G., companion. Holders of the first two are distinguished as Sir. The badge is a white cross of 14 points, having in the centre the figure of S. Michael, with sword, trampling on Satan. On the reverse is an equestrian figure of S. George with the dragon. The motto is *Auspicium melioris aevi* (augury of a better age). The ribbon is of saxe blue with crimson centre. Membership is limited to 100 knights grand cross, 300 knights,

and 600 companions, and the order has a chapel in S. Paul's cathedral. See Knighthood, colour plate.

St. Michaels or São Miguel. Largest island of the Azores group. It measures 41 m. by 9 m., and covers an area of 297 sq. m. The island is mountainous, the highest peak being 3,854 ft. alt. Ponta Delgada, the largest town, has a pop. of 21,048.

St. Michael's Mount. Precipitous rock in Mount's Bay, Cornwall, England. About 3 m. E. of Penzance, and connected with the mainland by a low-tide causeway, it rises over 200 ft., is nearly 1 m. in

St. Michael's Mount, Cornwall, from the mainland

circumference, and has at its summit a 6th century monastic castle, long the seat of the St. Aubyn family. In early times this was a place of hermitage. A chapel was founded by Edward the Confessor and affiliated with the Benedictine abbey of Mont St. Michel (*q.v.*), Normandy.

St. Mihiel. Town of France. In the dept. of Meuse, it stands on the slopes of the Côtes de Meuse on the right bank of the river. It is 11 m. N. by W. of Commercy and 20 m. S. by E. of Verdun. It has a noted Benedictine abbey, dating from the 8th century, and the churches of S. Michel and S. Étienne. Its manufactures include lace and embroidery. In the First Great War it was captured by the Germans, Sept. 25, 1914.

The recovery of the St. Mihiel salient was an American exploit. The 1st army, under Pershing, was concentrated around the salient. On the night of Sept. 11, 1918, six divisions lay along the S. side while on the N. were two more divisions, together with the 15th French Colonial corps. The attack took the form chiefly of a drive across the base from both sides simultaneously. It was delivered by Sept. 12, and by the afternoon Pershing had advanced 5 m. and captured several villages. The salient was flattened out, and Pershing took upwards of 13,000 prisoners, more than 200 guns, and immense quantities of booty.

St. Moritz. Village and watering-place of Switzerland. In the upper Engadine, in the canton of Grisons, it

stands at an alt. of 6,090 ft., the loftiest village in the Engadine, on the lake of St. Moritz, 27 m. S.E. of Coire (Chur). It is a favourite resort both for its winter sports—the

St. Nazaire, France. A view across the vegetable market towards the port, an important German submarine base during the Second Great War

Cresta Run was started in 1885, and the Olympic winter games of 1928 and 1948 were staged at St. Moritz—and for its chalybeate, sulphurous, and carbonic springs in summer. Pop. 3,963. *See* Curling.

St. Nazaire. Town of France, in the dept. of Loire-Inférieure. It stands on the right bank of the Loire, 30 m. W. of Nantes, near the sea. Before the Second Great War, when St. Nazaire was vir-

tually destroyed, it had a harbour with tidal wharf, an entrance lock to an older basin, and three dry docks independent of the tides. These docks and a large part of the quays of the old basin were government property. To make St. Nazaire the port of Nantes over £1,450,000 was spent. There were regular sailings to S. America. Trade was carried on in grain, salt, tobacco, coffee, sardines, and cognac.

In the First Great War St. Nazaire was in Aug.-Sept., 1914, a temporary base for the B.E.F. It was the chief disembarkation centre for vehicles and stores for the B.E.F. in Sept., 1940, and became one of the principal embarkation ports for the B.E.F. withdrawing from France in June, 1940. During the evacuation the transport *Lancastria* was sunk

here by a German bomber with heavy loss of life. The Germans developed the port into a base for submarines operating in the Atlantic and it was frequently raided by the R.A.F.

On March 28, 1942, British light naval craft, commando units, and the R.A.F. carried out a combined operation against the port, the principal objectives being the dry dock and harbour installations. An ex-U.S. destroyer, H.M.S. *Campbeltown*, was filled with explosives and blown up after ramming the dock gates. Landing parties destroyed the pumping station and dock-operating equipment, while the U-boat basin was damaged by delayed action torpedoes. The raiders then withdrew, having lost, killed or missing, 212 officers and men out of a force of 353. After the Allied invasion of Europe in June, 1944, U.S. forces supported by the F.F.I. invested St. Nazaire from Aug., 1944: a 12-day truce from Jan. 16, 1945, was arranged to permit evacuation of the civil population.

St. Moritz. Summer view of the Swiss resort

The German garrison remained in possession of the port until, after the general German surrender, it surrendered to U.S. and French forces on May 9, 1945. Pop. 11,802.

St. Neots. Urban dist. and market town of Hunts, England. It stands on the right bank of the river Ouse, 8 m. by rly. S.S.W. of Huntingdon. Named after S. Neot, whose relics were translated from Cornwall to Eynesbury, near by, in 974. St. Neots has a fine parish church and a large market place. The industries include flour milling, malt extracting, and paper making. Market day, Thurs. Pop. 4,709.

St. Nicolas. Town of Belgium. In the prov. of E. Flanders, it lies in the flat and fertile region known as the Waesland, 12 m. by rly. W.S.W. of Antwerp, and is a junction on the Antwerp-Ghent line. A prosperous manufacturing centre, it is interested in cloths, wool, cotton, and silk, hatmaking, carpets, dyeing, cigars, and chicory, and a busy agricultural trade. The 16th century church of S. Nicolas, restored 1900, and the church of Notre Dame, 1844, are noteworthy. On the market place are several buildings of interest. Pop. 43,469.

St. Ninians OR **St. RINGANS.** Parish of Stirlingshire, Scotland. It is partly within the burgh of Stirling, of which it forms a S. suburb. Coal mining and low temperature carbonisation, agriculture and the making of agricultural implements, give occupation. The battlefield of Bannockburn is about 1½ m. S.S.E. Population 14,757.

St. Omer. Town of France. In the dept. of Pas-de-Calais, it is 42 m. W.N.W. of Lille. It stands on the Aa, is connected with the sea by a canal, and has a harbour for its shipping. The chief buildings are the church of Notre Dame, once a cathedral, with objects of reverence and interest, the churches of S. Denis and S. Sepulchre, the town hall, and the court house, once the bishop's palace. The Hôtel Colbert houses a museum. A massive

St. Omer, France. The former cathedral of Notre Dame

tower 190 ft. high, damaged in the Second Great War, is a reminder of the abbey of S. Bertin. The buildings of the Jesuit college remain, although put to other uses. Boulevards have replaced the fortifications. Near St. Omer is a hydraulic lift which raises and lowers boats 40 ft. from one part of the canal to another. The town has a number of manufactures.

St. Omer is named from the saint who, about 700, founded here the abbey of S. Bertin. Another abbey was dedicated to Notre Dame, and the church of this became the cathedral when the bishopric was founded in 1559. A border town in the Netherlands, St. Omer was fortified and for it there was much fighting between the French and their foes. In 1677 it was taken by the French. It ceased to be the seat of a bishop in 1801. In 1592 the English Jesuits opened a college which existed for two centuries. From Oct. 12, 1914, to March 31, 1916, St. Omer was G.H.Q. of the B.E.F. and the place where Lord Roberts died, Nov. 14, 1914. In the Second Great War it was occupied by the Germans during their advance on Calais in May, 1940, and liberated by the British 2nd army advancing on Brussels early in Sept., 1944. Pop. 18,156.

Saintonge. Name of one of the provinces into which France was divided before the Revolution. It lay around Saintes with a seaboard on the Atlantic; its other boundaries were Poitou, Angoumois, and Guienne. About 50 B.C. it was inhabited by the Santones, and later was part of the Roman Empire. It belonged to Henry II of England, and was in English possession intermittently until the end of the 14th century. When the government of France became more centralised, Saintonge was united with Angoumois, and so remained until 1789. It is now covered by the departments of Charente and Charente-Inférieure.

St. Ouen. River port of France, in the dept. of Seine. It stands just N. of Paris on the right bank of the Seine, where there is a small harbour, and has manufactures of wool, stockings, dyes, hats, soap, etc. In the château Louis XVIII signed the declaration which formed the basis of the French constitution, May 2, 1814. The building has been replaced by a modern structure. Pop. 45,465.

St. Pancras. Met. bor. of the co. of London. Bounded E. by Islington, S. by Holborn, W. by St.

Marylebone and Hampstead, and N. by Hornsey and Finchley, it includes the districts of Somers Town, Chalk Farm, Camden Town, Kentish Town, and part of Highgate; the railway termini of Euston, St. Pancras, and King's Cross; University College, Working Men's College, and Royal Veterinary College; the open spaces of Ken Wood,

St. Pancras arms

St. Pancras parish church, Euston Road, built in 1819-22

Waterlow Park, and parts of Regent's Park, Primrose Hill, Parliament Hill Fields. St. Pancras station was opened by the Midland rly. in 1871. The station hotel became British Rlys executive offices. There are a town hall, opened 1937, and six libraries.

The St. Pancras district includes the ancient prebendal manors attached to S. Paul's Cathedral, of Pancras, Tottenham. Cantelows, and Rugmere, and the district was named after a young Phrygian, martyred in the time of Diocletian, after whom S. Augustine named the first church built at Canterbury.

St. Omer arms

The old church in St. Pancras Road, renovated in 1847-48, dates from 1180 or earlier. Seven acres of the burial ground, with the adjoining burial ground of S. Giles's, were converted into a public garden in 1877; the rest being taken by the Mid. rly. when the line into St. Pancras was under construction. Among those buried here were William Godwin and his first wife, Mary Wollstonecraft, whose remains were reinterred at Bournemouth in 1851; General Pasquale Paoli, whose body was removed to Corsica in 1889; Sir John Soane, John Flaxman, William Woollett, and many refugees from the French Revolution who settled in Somers Town. The church, which was succeeded as the parish church in 1822 by that in Euston Road (*q.v.*), contains interesting monuments. The bor. elected three M.P.s up to 1950; it now has one of its own, and shares another with Holborn. Pop. (1948 est.) 140,000.

St. Patrick. Irish order of knighthood. It was founded in 1783 by George III, after Ireland had obtained legislative independence, and its constitution was revised in 1905. It has only one class of knights distinguished as K.P. and limited to 22. They wear a collar adorned with harps alternating with double roses and double knots, the roses being alternately red within white and white within red. The badge which hangs therefrom is an oval composed of a red saltire surrounded by a green crown within a circlet of sky blue. The motto is *Quis separabit* (Who shall separate?), surrounded by a wreath of shamrock. The ribbon is light sky blue. See Knighthood, colour plate.

St. Patrick's Day. Anniversary of the death of the national saint of Ireland, March 17. On it Irish soldiers and others wear shamrock. It is omitted from the Church of England calendar. See Patrick; Shamrock.

St. Patrick's Purgatory. Islands in Lough Derg, co. Donegal, Eire. The two rocky islets, which have long been a place of pilgrimage for the devout from all parts of Europe, are known individually as Saint's Island and Station Island,

and are the legendary scene of S. Patrick's purgatory. A monastery stood on the former, but was destroyed in 1632. There is a hospice for pilgrims on Station Island, and from July 20 to Aug. 15 the islands are full of persons who perform a devotional circuit of the chapels and objects of piety.

St. Paul. City of Minnesota, U.S.A. The state capital and the co. seat of Ramsey co., it stands on the Mississippi river, which separates it from Minneapolis, and is served by the Chicago, Milwaukee and St. Paul, and several other rlys. Among its prominent buildings are the state capitol, the city hall, and the R.C. cathedral. Its educational institutions include Macalester College, Hamline University, Concordia College, S. Paul's College, S. Thomas's College, S. Paul College of Law, the agricultural school of Minnesota university; and of several libraries the chief are the State law library and the Minnesota Historical Society library.

St. Paul is an important rly. and commercial centre.

There is an important cattle trade, and its horse market is the largest in the country. Printing is a leading industry, and manufactures consist largely of foundry and machine-shop products, boots and shoes, clothing, lumber products, and fur

goods. There are also meat-packing establishments and rly. repair shops. St. Paul, state capital, 1849, five years later received a city charter. John Ireland, a destitute Irish immigrant, became the first American cardinal, and settled 800 Irish immigrants on 117,000 acres of rly. land, and made St. Paul the leading R.C. diocese. Pop. 271,606. See Minneapolis.

St. Paul's. Cathedral of London. Its foundation stone was laid June 21, 1675, the entire structure being completed in 1710. It is the third cathedral church

St. Paul's, London. The second cathedral on the site, destroyed in 1688. (After Hollar)

built on this site; it was preceded by a Norman building which was virtually destroyed by the Great Fire in 1666; this in its turn followed a Saxon church, which was burnt in 1086.

The present church was designed by Sir Christopher Wren (*q.v.*). A product of the late Renaissance in Great Britain, it is unique among British cathedrals as the only non-Gothic building of its class. Wren's original plan was that of a Greek cross; but the clergy stipulated that the form should be a Latin cross, with a long nave and aisles, and Wren modified the design. He lived to see his masterpiece finished, but his master-mason, Thomas Strong, who began the work, died in 1681, and was succeeded by his brother Edward. The building cost a little under £748,000.

Its central feature is the dome, crowned by its cupola and lantern with the golden ball and cross. Constructionally, the dome is two-fold, consisting of an inner and outer shell, of which the former is 108 ft. in diameter, and the latter 148 ft. The outer dome, built of timber covered with lead, rests on a brick cone, its lower portion forming the drum, of which the windows admit light to the crossing; within this dome the interior dome is built. The balustrade surrounding the drum was erected in opposition to Wren's wishes.

The two flanking towers at the W. end are crowned by cupolas. Linking the campanile towers together is the main portico, in two storeys, crowned by a triangular pediment (*q.v.*). Two broad flights of stone steps lead up to the entrance. On the N. and S. sides the two-storey construction is repeated in the semi-circular porticoes, two orders, Corinthian and Composite, being used for these.

Within the cathedral, the nave, 118 ft. in breadth, has a large western bay with the S. Dunstan's

St. Patrick. Collar, badge, and star of the Irish order

chapel and the chapel of S. Michael and S. George, once used as the Consistory. The great arches with their domed roof are carried by massive piers, to which are attached Corinthian pilasters with beautiful carved capitals supporting the entablature (*q.v.*). Each aisle has three large windows. The four windows of the N. transept represent the twelve founders of

ecclesiastics like Donne and Dean Milman, scholars like Sir William Jones, all have their monuments in S. Paul's.

Among deans of S. Paul's were Donne, Sancroft, Stillingfleet, Tillotson, Sherlock, Joseph Butler, Thomas Secker, C. R. Sumner, Milman, R. W. Church, W. R. Inge, W. R. Matthews.

1. All Souls Chapel Kitchener Memorial. 2. Officers and men killed in New Zealand, 1861-66. 3. Cavalry Crimea monument. 4. Tomb of Lord Leighton. 5. Afghanistan war monument. 6. Tomb of Wellington. 7. Captain. 8. Lord Mayor's vestry. 9. Minor Canon's vestry. 10. Aisle gates. 11. Choir screen. 12. Choir stalls. 13. Screens. 14. Bishop's chair. 15. High altar. 16. Sedilia. 17. Dean's vestry. 18. Stairs to crypt. 19. Tomb of J. M. W. Turner. 20. Colonial S. African war memorial. 21. Tomb of Nelson. 22. Chapel of SS. Michael and George. 23. Coldstream Guards S. Africa memorial. 24. Coldstream Guards Inkerman memorial.

St. Paul's, London. Ground plan of the cathedral built by Wren

English Christianity, and those of the S. the first twelve English Christian kings.

Grinling Gibbons was responsible for the carved choir stalls, and the mosaics of the choir were the work of Sir W. B. Richmond. Thornhill painted the interior of the dome with scenes from S. Paul's life. Wren himself conceived the idea of decorating the cupola with mosaic, but was prevented from carrying out his scheme. The "whispering gallery" is a feature that attracts visitors. An elaborate reredos was completed in 1888 at a cost of £37,000.

The crypt (*q.v.*) of S. Paul's extends under the entire building, and contains the tombs of many men famous in English history: here are the Nelson sarcophagus, the tomb and funeral car of Wellington, the grave of Wren, and a memorial bust of Lawrence of Arabia. Statues and monuments distributed through all parts of the cathedral commemorate naval and military heroes, famous churchmen, notable engineers, scientists, and artists. Alfred Stevens's Wellington memorial, completed by John Tweed, stands in the N. aisle, and here are the monuments to General Gordon and Lord Leighton; Rodney, Napier, Samuel Johnson are represented by monuments in the N. transept; Reynolds, Turner, Lawrence, Leighton, and Millais in Painters' Corner;

Until 1877 the cathedral was without a proper peal of bells. In that year the city companies subscribed to provide a peal of twelve, and these, inscribed with mottoes of the donors, are hung in the N.W. tower. A new bell, weighing 17 tons, was placed in the S.W. tower in 1882. The chapter house, which was also built by Wren, was converted into a bank in 1921.

In view of the nature of the subsoil, grave anxiety has been felt from time to time as to the safety of the fabric. Repairs in 1781 left something to be desired, and in 1914 an extensive scheme of restoration was begun, five years being spent on the virtual reconstruction of the S.W. pier of the dome, with 3,000 cu. ft. of new masonry.

During the Second Great War a German delayed-action bomb buried itself 27 ft. in the ground near the clock tower, Sept. 12, 1940. It

was conveyed by lorry to Hackney Marshes and Lt. Davies was awarded the G.M. for his work on this operation. A bomb went through the outer roof of the choir, destroying the high altar, Oct. 10, 1940, and the Chapter House (1712) was gutted by fire, Dec. 29, 1940. Further damage was inflicted by a bomb on the N. transept, April 16, 1941, which, piercing the saucer dome, exploded inside the cathedral. Many stained glass windows were shattered.

In the churchyard, which is converted into a public garden, and gives its name to the surrounding thoroughfares, are remains of the famous open-air pulpit known as Paul's Cross. A handsome memorial cross was erected here in 1910. See illus., p. 7242; Altar; Apse.

Bibliography. History, W. Dugdale, 1818; Annals, H. H. Milman, 1868; Chapters in the History of Old St. Paul's, W. S. Simpson, 1881; Old St. Paul's Cathedral, W. Benham, 1902; Memorials of St. Paul's Cathedral, W. M. Sinclair, 1909; St. Paul's Cathedral in Wartime, W. R. Matthews, 1946.

St. Paul's School. English public school. Founded by John Colet (*q.v.*), dean of S. Paul's, London, in 1509, it was early notable among the great schools of England by reason of Colet's devotion to the New Learning.

St. Paul's School arms

Its founder built the first school at the E. end of the old cathedral backing on to Old Change, and provided endowment for the free education in perpetuity of 153 scholars of all nations without distinction. There is a tradition that this number was fixed by that of the fishes taken in the miraculous draught. Clerical influence was kept at arm's length. William Lily, the grammarian, was the first high master and a layman; and as governors of the school Colet chose the

St. Paul's School, London. School buildings, from the playing field;

Mercers' Company. But S. Paul's was not divorced from religion, being dedicated to the Child Jesus and His Blessed Mother Mary.

The first building perished in the Great Fire. Its successor was in use from 1670 to about 1820, and the third and last building on the same site was occupied until 1884, when the school under a new scheme was removed to West Kensington. Here in buildings erected to the designs of A. Waterhouse it grew in numbers, and with F. W. Walker as high master gained a great reputation. Its history was written by M. F. J. McDonnell, 1909. Among the notable Old Paulines may be mentioned Milton, the 1st Duke of Marlborough, Pepys, Halley the astronomer, Boyce the composer, B. Jowett, Chesterton, Eric Kennington, and Lord Montgomery.

St. Peter. Lake of Canada, in Quebec. It is an expansion of the St. Lawrence river, 40 m. below Montreal. It is 30 m. long, 9 m. wide, and has an average depth of 8 ft. The shallowness of the lake prevented ocean steamers from reaching Montreal, and since 1850 a channel at least 300 ft. wide has been deepened at successive intervals in order to keep pace with the increase in size of merchant steamships.

St. Peter Port. Town of Guernsey, the capital of the island. It stands on the E. coast and has an extensive harbour, covering 73 acres, with floating dock, ship-building yards, etc. There are regular steamboat services to Southampton and Weymouth, and to other Channel islands. From the nearby airport services are operated to England and France. On the S. side of the harbour, on a rocky island, is Castle Cornet, an old fort, and S. of the town is Fort George. The chief buildings are S. Peter's church, dating from the 13th and 14th centuries, the court house, where the island legislature meets, and Elizabeth College, a public school. Hauteville House, later a museum, was the residence of Victor Hugo, 1855-70. Pop. est. 18,000. See Guernsey.

St. Peter's. Cathedral in Rome, the chief church of Roman Catholic Christendom, wherein the popes are crowned. A medieval cathedral formerly occupied the site of the present structure, but by the middle of the 15th century this had fallen into ruins. Nicholas V accordingly summoned Rossalini to design a new church. The architect had raised only a few feet of his building when his patron

died, 1455, and the scheme was abandoned. Julius II revived it.

Plans having been prepared by Donato Bramante, the foundation stone of the new building was laid

St. Peter's, Rome. Ground plan of the cathedral

Pietà by Michelangelo. The tombs of the popes are indicated by their names

in 1506. Julius, however, died in 1513, his architect in the following year, and Raphael, who succeeded to the control of the works, lived only six years longer. The last was followed by Baldassare Peruzzi, Antonio Sangallo, Michelangelo, Della Porta, Domenico Fontana, and in the early 17th century by Carlo Maderna.

In the hands of these architects, both the plan and the details of the cathedral underwent much modification. Bramante had planned a Greek cross; Peruzzi's alterations were based on the plan of a Greek cross inscribed in a square; Sangallo, while retaining this form, modified the external design; Michelangelo completed the design for the dome and lantern so effectively that, though he did not live to see its completion, his work was faithfully carried out by Della Porta and Fontana. Maderna reconstructed the nave, and introduced a great deal of architectural detail that has been almost universally condemned. Finally, about

1660, Giovanni Bernini added the piazza with its colonnades.

The result of these changes, extending over 150 years, is not wholly satisfactory. The effect of the dome is obscured by Maderna's nave, while his façade with its heavy engaged columns is ponderous rather than dignified. The interior of the church holds some precious possessions, including a series of panels by Giotto (*q.v.*) and the paintings of angels by Melozzo da Forlì, a great bronze statue of S. Peter, dating probably from the 4th century, Bernini's famous baldachin (*q.v.*) of the high altar, and many religious relics. See Architecture; Colonnade; Renaissance.

St. Petersburg. Former name of Leningrad (*q.v.*).

St. Petersburg. City of Florida U.S.A. It is on the W. coast in Pinellas co., 20 m. S.W. of Tampa, and has a rly. terminus and air service. There are 33 m. of waterfront. The post office is built in the form of an arcade, its clerks dealing with crowds passing on the pavement. The commission-manager form of govt. was adopted in 1920. Only four or five days annually are without sun, and there are 150 hotels. Pop. est. 85,000.

St. Peter's College. Older name of Peterhouse (*q.v.*). (Cambridge)

St. Peter's Hall. College of Oxford university. Founded as a private hall in 1228 by Francis Chavasse, bishop of Liverpool, whose son Christopher Chavasse, later bishop of Rochester, became its first master, it was admitted to university status in 1947. It benefited from the generosity of Lord Nuffield, who doubled all contributions towards endowment up to £50,000. Membership is not confined to ordinands, though many students enter the ministry.

St. Pierre. French island near Newfoundland, forming part of the French colony of St. Pierre and Miquelon. St. Pierre with several adjacent islets has an area of 10 sq. m. and a pop. of 3,636. The town of St. Pierre is the capital of the colony and has cable connexions with the mainland. The colony owes its importance to the cod fishery on the Grand Banks; dried cod is the chief export. On Dec. 24, 1941, Adm. Muselier, commander of the Free French navy, landed on St. Pierre, and was welcomed by the inhabitants, who declared in favour of Free France. The governor, a Vichy partisan, was dismissed, and the wireless station closed. The U.S. govt. protested but no active measures were taken.

St. Pierre. Former capital of Martinique (*q.v.*). On May 8, 1902, the entire population, 30,000, except two, of this prosperous city was exterminated by an eruption of Mont Pelée. See Pelée.

Saint-Pierre JACQUES HENRI BERNARDIN DE (1737-1814). French author. Born at Havre, Jan. 19, 1737, and educated at Caen and Rouen, he became an engineer, and spent some time in rather aimless wandering about Europe. After three years in Mauritius he returned, in 1771, to France, where he became a friend of Rousseau, under whose influence he wrote *Études de la Nature*, and *Harmonies de la Nature*. His famous idyll, *Paul et Virginie* (*q.v.*), published in 1789, though over-sentimental for modern taste, still retains some of its charm. He died Jan. 21, 1814.

B. de Saint-Pierre,
French author

St. Piran-in-the-Sands. Ancient church building, 1½ m. N. by E. of Perranporth, Cornwall. It dates from the 6th or 7th century, and is on a site alleged to be that of a monastic cell built by S. Piran, an early Irish Christian missionary who arrived in Cornwall c. 460. See Perranporth.

St. Pol-de-Léon. Town of France. In the dept. of Finistère, it lies 13 m. N.N.W. of Morlaix,

and ½ m. from the English Channel, where there is a small harbour, Pempoul. The 13th-15th century cathedral, restored in 1866, is dedicated to S. Pol, who founded a monastery here in the 6th century. The bishopric was suppressed in 1790.

St. Quentin. Town of France, in the dept. of Aisne. It is on the Somme on the St. Quentin canal, 95 m. N.E. of Paris. Originally a Roman settlement, Augusta Viro-manduorum, it was renamed in honour of the martyr S. Quintinus, who was buried there. The town was the capital of the Vermandois fief before coming under the direct rule of the French monarchy in 1213. In 1557 Philibert of Savoy and in 1871 the Prussians defeated French armies here. During the First Great War the town was in the fighting line for long periods and was almost destroyed; the Gothic town hall (14th-15th century) was a notable loss, but was rebuilt after the war. Its industry was mainly concerned with textiles. In the Second Great War it again suffered, being captured May 19, 1940, by the Germans, after much confused fighting between armoured columns. After the fall of France it came within the German-occupied zone. St. Quentin was abandoned by the Germans in Aug., 1944, when the British 2nd army made a swift advance from the Seine to the Somme. Pop. 48,556.

St. Quentin arms

St. Raphael. Fishing town of France, in the dept. of Var. It is on the Mediterranean, 2 m. S.E. of Fréjus. Napoleon landed here on his return from Egypt in 1799, and embarked from here for Elba in 1814. The buildings include an

St. Quentin, France. The town hall, built to replace the 14-15th cent. hall destroyed in the First Great War

old church, once fortified, and the modern one of Notre Dame de la Victoire. There are relics of a Roman aqueduct. From here starts the Corniche d'Or, a fine coast road to La Napoule, completed in 1903. The town is a sea-bathing and winter resort.

St. Rémy, OR ST. RÉMY-DE-PROVENCE. A town of France. In the dept. of Bouches-du-Rhône, it is situated on the Alpines or Alpilles, a range of hills between the Rhône and the Durance, 9½ m. E. of Tarascon. It is noted for its Roman remains, which include a triumphal arch supposed to have belonged to the Roman town Glanum Livii, destroyed by the Visigoths in 480. There is also a well-preserved mausoleum, known as the Tomb of the Julii, and dating from the early part of the 1st century. It is 60 ft. in height, and is built in three storeys, the lowest being decorated with reliefs. St Rémy is the birthplace of the Provençal poet Roumanille (1818-91), and Nostradamus (1503-66), the fortune-teller and astrologer. Near the town is the ancient priory of St. Paul-de-Mausole, which has a Romanesque church. There are two places of this name in the Puy-de-Dôme.

St. Rollox. Dist. of N.E. Glasgow, Scotland. It has a rly. station and a basin on the canal. The chief industries are chemical works and machine shops.

St. Ronan's Well. Eighteenth of the Waverley novels by Scott published 1823. A contemporary

study of society at a Scottish spa, with a tragedy underlying the petty jealousies and quarrels of the habitués, the scenes are generally placed at Innerleithen and Peebles. The story, which was altered (and weakened) at the request of James Ballantyne, contains in Meg Dods and the Rev. Josiah Cargill two of the most successful of Scott's characters. See Dods, Meg.

Saints, BATTLE OF THE. Fought between the British and the French, April 12, 1782. It takes its name from the islands of Les Saintes, which lie in the channel that separates Dominica from Guadeloupe in the Leeward Islands. Rodney had come from home with 14 sail of the line, and having taken Hood's squadron under his command, was at Santa Lucia watching the French.

On the night of April 8, De Grasse, in command of the French fleet, lost an opportunity of falling upon Hood, while the remainder of Rodney's fleet was yet almost becalmed behind the island, but he was too much concerned for his convoy, which, by the evening of the 9th, had got clear of the shadow of Dominica. The convoy was sent ahead to Guadeloupe, and up to the evening of April 11 De Grasse succeeded in avoiding battle.

Rodney, however, sending the quickest ships ahead, fell upon the sternmost ships of the French line, and De Grasse was thus compelled to bring back his fleet to rescue the menaced vessels. The attack was made on the lee side, and each ship bore up as she approached, until the lines became approximately parallel on opposite tacks. The French line, heavily damaged by fire, was very ragged, and a great gap opened between the 17th and 18th ships. Through this gap passed Rodney in the Formidable. Thus De Grasse's fleet was broken up, his ships were overwhelmed, and several of them captured.

Saint-Saëns, CHARLES CAMILLE (1835-1921). French composer.

every branch of music, but the creative impulse was often lacking, so that comparatively few works are still played. These include the majestic opera Samson and Delilah, 1877 (Covent Garden, 1909); symphonic poem, Le Rouet d'Omphale, 1871; Le Carnaval des Animaux, which contains a beautiful melody, The Swan; Danse Macabre; second piano concerto in G minor; and third symphony in C minor. Saint-Saëns published volumes of criticism, essays, and poems. He died in Algiers, Dec. 16, 1921. A full biography by J. Bonnerot appeared in 1923.

St. Sampson. Town and parish of Guernsey, Channel Islands. It is on the E. coast, 2½ m. N. of St. Peter Port. It has a tidal harbour, sheltered by a breakwater 650 ft. long, a 12th century church, and an extensive trade in stone procured from the neighbouring quarries.

Saintsbury, GEORGE EDWARD BATEMAN (1845-1933). British scholar and critic. He was born at Southampton,

George Saintsbury, British scholar Russell

Oct. 23, 1845, and educated at King's College School and Merton College, Oxford. After eight years as a schoolmaster, and 20 as a journalist, when he was connected with the Saturday Review, he was professor of rhetoric and English literature at Edinburgh, 1895-1915. He died at Bath, Jan. 28, 1933.

Saintsbury is famous for the long series of critical works in which he displayed an encyclope-

Born in Paris, Oct. 9, 1835, he studied under Benoist and Halévy at the conservatoire, was organist of St. Merri, 1853-58, and of the Madeleine until 1877. A great pianist, he performed in many countries, including the U.S.A., 1906, and S. America, 1916. A master of technique, he touched nearly

C. C. Saint-Saëns, French composer

died knowledge of English and French literature. The expression of a forceful but charming personality sometimes overcame true impartiality. He contributed 21 chapters to the Cambridge History of English Literature; and wrote Dryden (English Men of Letters), 1881; Short History of French Literature, 1882; Essays in English Literature, 1890; History of Criticism, 3 vols., 1900-04; A History of English Prosody, 3 vols., 1906-10; The English Novel, 1913; A History of the French Novel, 2 vols., 1917-19; Notes on a Cellar Book, 1920; Scrap Books, 1922-24. Consult G.S., the Memorial Volume, ed. J. Oliver, A. M. Clark, and A. Muir, 1945.

St. Servan. Town of France. In the dept. of Ille-et-Vilaine, it stands at the mouth of the Rance, about 1 m. S.W. of St. Malo. It is defended by a fort known as the "Cité." The Tour de Solidor dates from the 14th century, the church of S. Croix is modern, and there is a modern town hall. The industries include cod-fishing, boat-building, net-making, and tanning. It was here that Chram was burnt to death by order of his father, Clotaire I, in 558. Pop. 12,832.

Saint's Everlasting Rest, THE. Religious work by Richard Baxter. First published in 1650, it was described on its title page as "Written by the author for his own use in time of his languishing, when God took him off from his public employment." Remarkable for its clear and admirable literary style, the book is a masterpiece of English devotional literature.

Saint-Simon, CLAUDE HENRI, COMTE DE (1760-1825). French economist. Born in Paris, Oct. 17, 1760, he fought as a volunteer against the British in the American War of Independence. Imprisoned as an aristocrat during the French Revolution, he yet sympathized with its principles, but suffered from disillusionment as he gradually realized the incapacity of the mob for government. Extravagant habits having reduced Saint-Simon to poverty, he began to write, but for the remainder of his life he was mainly dependent on the charity of relatives. He died on May 19, 1825.

Comte de Saint-Simon, French economist

Saint-Simon's socialist theories are expounded chiefly in *The Industrial System*, 1821. The corner stone of the socialist community, as outlined by him, was to be an aristocracy of intellect, a body of experts conducting the business of society in the most scientific way. His doctrines enjoyed a wide vogue, among his notable disciples being Comte, the philosopher, Lesseps, the engineer, Carnot, "the organizer of victory," Thierry, the historian, Enfantin, and Bazard, the two last being the most enthusiastic. Saint-Simon's later works include *Industrial Catechism*, 1823, and *New Christianity*, 1825. *Consult Saint-Simon and Saint-Simonism*, A. J. Booth, 1871; *Histoire de Saint-Simonisme*, S. Charléty, 1896.

Saint-Simon, LOUIS DE ROUVROUX, DUC DE (1675-1755). French memoir writer. He was born at

Duc de Saint-Simon,
French writer

Versailles, Jan. 16, 1675, and joined the royal corps of the Grey Musketeers. He fought at Namur, 1692, and Neerwinden, 1694, and succeeded to the dukedom at the age of eighteen. Two years later he married Gabriel de Durfort. Saint-Simon was appointed ambassador to Rome in 1705, but the appointment was almost immediately cancelled. On the death of Louis XIV he became a member of the council of regency. In 1721 he went to Spain to arrange the marriage of Louis XV with the Infanta, and shortly after his return, 1723, retired to La Ferté-Vidame, where he devoted himself to the writing of his memoirs. He had been a tireless collector of material of all kinds, from documents of the greatest importance to gossip of the slightest. He died in Paris, March 2, 1755.

Portions of Saint-Simon's *Memoirs* were published from time to time surreptitiously, but it was not until 1839 that they were issued in full. He was a keen observer and a true artist, and his memoirs take high rank among works of their kind, being unmatched for their pen-portraits of people whom the writer had met, and invaluable for the light they throw on the life of his period. The best complete editions are those edited by P. A. Chéruel, 21 vols., 1873-86, and by A. de Boislisle, in the *Grands*

Écrivains de la France series, 16 vols., 1879-1904. There is an abridged translation in English, by B. St. John, 1857, new ed. 1901. *Consult Saint-Simon*, C. W. Collins, 1880; *Causeries de lundi*, C. A. Sainte-Beuve, Eng. trans. E. J. Trenchmann, 1909-11.

St. Sophia. Mosque in Istanbul. It was originally a Christian church, of which the foundation stone was laid by the Emperor Justinian, Feb. 23, 532, the architects being Isidorus of Miletus and Anthemius of Tralles. The church was completed within six years, and on Dec. 26, 537, was formally dedicated to Hagia Sophia (Holy Wisdom). In ground-plan the church is nearly square, the measurements, excluding the apse and narthex, being 250 ft. by 237 ft. The main building is reached through an outer and an inner narthex. A great central door, or royal gate, leads into an oval-shaped nave of which the centre consists of a square (107 ft. sides) bounded by massive piers, of which the semi-circular arches support a great dome. On either side of the nave is an aisle in two storeys, and the semi-circular ends of the nave are crowned by semi-domes linked up with the main dome. The walls are of brick, lined with precious marbles, and the columns are of porphyry and verd antique.

The church became a Mahomedan mosque in 1453, but beyond a number of minarets and other adjuncts, added by the Turks to its exterior, little alteration was made, and it remains a perfect specimen of the old Byzantine craftsmanship. The Turks, however, have plastered up some of the original decoration of the interior, and Mahomedan pulpits, platforms, and inscriptions have largely ousted the Christian counterparts, though Christian emblems are still to be found among the splendid mosaics. *See Istanbul*; *Pulpit*.

St. Stephen's. Name given to the palace of Westminster, the meeting place of the British houses of parliament. St. Stephen's hall

occupies the site of St. Stephen's chapel, founded 1380, and was long used for meetings of the commons. St. Stephen's court and St. Stephen's porch adjoin it; below is St. Stephen's crypt. St. Stephen's cloisters, on the E. side of Westminster hall, were built by Henry VIII. *See Parliament*. Houses of.

St. Stephen's. Cathedral church in Vienna. It stands in the centre of the inner city, and dates chiefly from the 14th and 15th centuries, but incorporates fragments of the original 12th century building (destroyed by fire 1193). Notable features were the celebrated tower and spire, 450 ft. high, rebuilt 1860-64; high-pitched roof, tomb of Frederick III, 12th century wooden crucifix pulpit by Anton Pilgrim, Baroque

St. Stephen's, Vienna. This beautiful Gothic cathedral as it appeared before being damaged in the Second Great War

organ, 35 marble altars, and late Gothic choir stalls. One of the finest Gothic churches in Europe, it was badly damaged by fire during the Second Great War; the roof was completely destroyed, together with the vaults over the choir, choir stalls, and organ.

Saint Sulpice. Church in Paris. It is situated in the *rue* and *place* of the same name, on the left bank of the Seine, on the site of a 12th century church, and was built during 1646-1733. Five flights of steps lead to the entrance, and the

St. Sulpice. Façade of the Paris church, composed of Doric and Ionic colonnades

façade consists of two colonnades, Doric and Ionic, one above the other. The spacious interior is notable for its spherical vaulting, Corinthian pillars, frescoes, paintings and sculptures. There are 18 chapels. In the *place* is a fountain, 1847, ornamented with statues of Bossuet, Fénelon, Massillon, and Fléchier. The Séminaire de Saint Sulpice, near by, was founded in 1646 and closed in 1906.

St. Swithin's Day. Name given to July 13. For the origin of the legend about rain on this day see under Swithin.

St. Thomas. One of the Virgin Isles, W. Indies, belonging to the U.S.A. It is situated about 38 m. E. of Puerto Rico, is 14 m. long, and has an area of 32 sq. m. The surface is hilly, rising to 1,560 ft. in the centre of the island. It has a warm, temperate climate. It was discovered by Columbus on his 2nd voyage, 1493, but was occupied by the Danish W. India Co. from 1672. During the Napoleonic wars it was twice occupied by the British, and was purchased from Denmark by the U.S.A. in 1916. The harbour of Charlotte Amalie, the capital is valuable as a naval base. The population, mostly descended from negro slaves, was 11,265 in 1940, over 60 p.c. being negro.

St. Thomas or **SAN THOMÉ.** Volcanic island in the Gulf of Biafra. It is 170 m. W. of the mouth of the river Gabun and 100 m. S.W. of the island of Principe.

A Portuguese possession, with the island of Principe (*q.v.*), it constitutes a province under a governor. The vegetation is rich and varied but the climate is unhealthy. The chief products are cocoa, coffee, palm oil, and rubber. There is a rly. to the village of Trinidad, but communications within the island are bad, except around the capital, San Thomé, on the N.W. coast. Area, with Principe, 372 sq. m. Joint pop. 60,490.

St. Thomas. City of Ontario, Canada, the capital of Elgin co. It stands on Kettle Creek, a few miles from Lake Erie, 157 m. S.W. of Toronto, and is served by the C.N.R., the C.P.R., Michigan Central, Père Marquette, and Wabash lines. The industries include rly. shops, flour mills, and the making of clothing, agricultural implements, etc.; and the city is a market for the fruit and other produce of the vicinity. Pop. 17,132.

St. Thomas Mount. Suburb of Madras, India, in the Chingleput dist. It is situated 8 m. S. of Madras city by the Buckingham Canal. The cross of S. Thomas, the apostle, is supposed to have been found on the top of a hill of 200 ft., on the slope of which tradition says the saint was slain in A.D. 68 by Brahmins; a Portuguese church built in 1547, marks the spot. Pop. 19,500.

St. Thomas's Hospital. Ancient medical institution in London, on the Albert Embankment, adjoining Westminster Bridge. It

Akenside (*q.v.*), author of *The Pleasures of the Imagination*, and Sir G. H. Makins. The school of anatomy at St. Thomas's is the oldest in London. The hospital, during the Second Great War, was hit twelve times by bombs, and was extensively reconstructed afterwards. See London. Consult *The Story of St. Thomas's*, 1106-1947, C. Graves, 1947.

St. Trond (Flem. *S. Truiden*). Town of Belgium, in the prov. of Limburg. It lies in undulating country, 11 m. by rly. S.W. of Hasselt, and is a junction on the Hasselt-Landen line. There are industries in tanning, tile-making, tobacco, and brewing, and local agricultural trade. The church of Notre Dame dates from the 14th century, with modern tower and front. The seminary church has a tower which was part of the abbey of S. Trudo, founded in 657, and the 18th century church of the Franciscans is notable. Pop. est. 16,000.

St. Valentine's Day. Feast of S. Valentine (Valentinus), an Italian saint, celebrated Feb. 14. The feast has been regarded since the Middle Ages as a lovers' festival. Chaucer in his *Parlement of Foules* says that every bird chooses his mate on S. Valentine's Day. A friend or sweetheart chosen on that day was a "valentine" for the rest of the year; in some parts of the country the first person of the other sex met on Feb. 14 is a "valentine." The giving of pre-

St. Thomas's Hospital, London. Post-war view of the buildings on the Thames embankment, Westminster Bridge in foreground

was founded in the reign of William II out of the proceeds of a ferry over the Thames near London Bridge. Destroyed by fire in 1207, and rebuilt in 1228, the hospital was endowed and incorporated by Edward VI in 1553. The present building was opened by Queen Victoria in 1871. Before the Second Great War (in which the hospital was heavily damaged) it contained over 1,000 beds, and had a large and excellent medical school. Among distinguished men who have been on the staff of St. Thomas's are W. Cheselden, Sir John Simon, Dr. Charles Murchison, Sir William McCormack, Mark

sents at this festival deteriorated into the sending of cards and other missives, some with messages of the amorous sort, and some merely comic or satiric. The custom survived in country places to the end of the 19th century, but, despite attempts to revive it, almost died out early in the 20th century.

St. Valéry-en-Caux. Coastal town of France, in the dept. of Seine Inférieure. It is situated 20 m. W. of Dieppe, and came into prominence during the Second Great War. During the British retreat of June, 1940, the 152nd and 153rd bdes. of the 51st (Highland) div. reached their final posi-

tions around the town on June 10. A bridgehead was formed round the port, the southern sector being held by units of the French 9th Corps. On June 11 the bridgehead was heavily shelled and bombed by the Germans; and that night a withdrawal to the beaches was ordered. At the same time and unknown to the force at St. Valéry, British troops were being embarked at Veules-les-Roses, only 1½ m. away. The plan for embarking at St. Valéry miscarried, because the Germans forced back the French and took the British positions in the rear, occupying the harbour and beaches. About 200 officers and 5,000 men of the B.E.F. were captured. On Sept. 2, 1944, the 51st (Highland) Division liberated St. Valéry, under command of Maj.-Gen. Rennie, who, captured there in 1940, had escaped ten days later. On June 11, 1950, a memorial to the 51st div. was dedicated here, and the town received the Croix de Guerre.

St. Vincent. Second in size of the British Windward Islands, West Indies. It lies 21 m. S. of St. Lucia. Of oval shape, it is crossed N. to S. by a mountainous ridge near the N. end of which is the Soufrière, an active volcano about 4,000 ft. high. The fertile valleys yield sugar, arrowroot, cacao, spices, molasses, copra, cassava, peanuts, and Sea Island cotton. The administrator is assisted by a legislative council, consisting of three ex-officio members, three nominated members, and five elected members. Columbus discovered the island in 1498; in 1797, subsequent to a rebellion, the majority of the native Caribs were transported to Ruatan in British Honduras. In 1902 the Soufrière erupted, simultaneously with Mont Pelée, and a third of the island was devastated. Kingstown is the capital. Area 150 sq. m. Pop. 61,593.

St. Vincent arms

St. Vincent, CAPE. Promontory forming the S.W. corner of Portugal. The ancient Promontorium Sacrum, or sacred point, it is famed for several naval battles fought in its vicinity. The first of importance was on June 16, 1693, when the British fleet under Rooke was defeated by the French under Tourville. On Jan. 16, 1780, Rodney defeated the Spanish under Langara. On Feb. 14, 1797,

was fought the great battle when the British under Jervis overwhelmed the Spanish fleet. The last was the victory gained, July 5, 1833, by Sir Charles Napier over Dom Miguel's fleet. There is a lighthouse on the cape, and near by is Sagres.

St. Vincent, BATTLE OF. Fought off Cape St. Vincent, 1797, between the British and the Spaniards.

On Feb. 14 the Spanish fleet, which had left Cartagena for Cadiz, its object being to join the French at Brest and cover the passage of the army of invasion, fell in with Jervis off Cape St. Vincent. The military and political situation was exceedingly critical for the British, to whom a victory was essential. Jervis with 15 sail determined to attack the 27 of the Spaniards. The fleets approached on opposite tacks, Jervis in the Victory, with a close well-ordered line, and the Spaniards in a loose formation of two groups. Jervis decided to steer for the wide gap between the groups, calculating that he would be able to tack and engage the Spanish weather group, while the ships to leeward would not be able to come to their assistance. Contrary to his expectations the Spanish lee division did make an unsuccessful attempt to break the British line.

Nelson, who was in the rear, saw also that the leading ships of the Spanish weather line would endeavour to work round Jervis's rear and join their discomfited lee division. Taking, therefore, one of the great decisions of his life, and in splendid disobedience, he wore his ship, the Captain, round, and came athwart the Spanish weather line, which was already bearing up to leeward. His ship was heavily pressed, but was relieved by the Culloden and Blenheim and other ships under Jervis's orders. There was a tremendous conflict, in the course of which Nelson boarded the San Josef and San Nicolas in brilliant fashion. Two other Spanish ships were also taken.

St. Vincent was a famous victory, but the Spanish squadron, shorn of its four ships, returned to Cadiz. Jervis well deserved the earldom he won, though he did not follow up the attack when com-

Cape St. Vincent, Portugal. Lighthouse on the extremity of the cape

plete victory lay before him, and the battle stands as a triumph for Nelson, whose disobedience was condoned by his commander-in-chief, and the battle broke up all the French plans for the invasion of England.

St. Vincent, GULF OF. Indentation of the S. coast of Australia, in S. Australia. It is separated from Spencer Gulf by Yorke Peninsula; off the mouth lies Kangaroo Island. It is 90 m. long and 40 m. wide, and is a submerged portion of the S. Australian rift valley; its shores are low and sandy. Adelaide is on the E. shore.

St. Vincent, JOHN JERVIS, EARL (1735-1823). British sailor. Born Jan. 9, 1735, he went to sea at the age of fourteen, and was promoted lieutenant in 1755. Commander in the fleet which took Wolfe to Quebec, 1759, he served in N. America, the North Sea, West Indies, and the Mediterranean. In 1775 he was appointed to command the Foudroyant, in which he had several actions with the French, took part in the relief of Gibraltar, and in the battle off Cape Spartel, 1782. Promoted rear-admiral in 1787, and vice-admiral in 1793, he sailed to the West Indies the following year, capturing Martinique and Guadeloupe.

Earl St. Vincent, British sailor

In 1795 he was appointed commander-in-chief in the Mediterranean. The combination of the French and Spanish navies forced Jervis to make the Tagus, whence he sailed to attack the Spanish off Cape St. Vincent, and effected a brilliant victory. For this he was made an earl. In command of the Channel fleet, 1799-1801, when he became first lord of the Admiralty, he introduced many reforms and

incurred much enmity before his retirement from office in 1804. After a brief period in command of the fleet, 1806-07, he retired, dying March 14, 1823. St. Vincent introduced a stern discipline which bordered on the brutal, and was intensely disliked by all ranks in the navy. This iron discipline was amply justified, however, by the remarkable state of efficiency the navy reached under his command. *Consult* Life, O. H. Sherrard, 1933.

St. Vitus's Dance. Popular name for chorea (*q.v.*). Sufferers from epidemic dancing mania, which combined physical and mental excitement, in medieval Germany resorted to the shrines of S. Vitus, who was reputed to have the power of cure. His name transferred itself to the disease.

St. Winefride's Well. Sacred spring at Holywell (*q.v.*), Flintshire, Wales. It was named after the 7th cent. saint, S. Winefride, and is said to have arisen at the spot where her head fell when she was beheaded by Caradoc, prince of Wales. Famous as a place of pilgrimage and for the healing qualities of its waters, it was leased by the urban council to the R.C. Church for £125 a year. After flooding the pilgrims' bath, the water, which at one time issued at the rate of 120 tons a minute and flowed on to serve as an adjunct to the industries in the adjacent valley, ran dry in 1917, as a result, it is thought, of local draining operations carried on in connexion with lead-mining.

Sais. Ancient city on the Rosetta arm of the Nile, near Sa el-hagar, Lower Egypt. The residence of the predynastic northern kings and the centre of Neith worship, it subsequently provided the Saitic kings of the XXVIth dynasty, 663-525 B.C., and became a royal capital of much opulence and learning. *See* Egypt.

Saivas or **SIVAITES.** General name for worshippers of the Hindu deity Siva (*q.v.*), notable for extremes of asceticism and psychic philosophy.

Sajo. River of N. Hungary and Czecho-Slovakia. It rises E. of the High Tatra in the Carpathians, and flows in general S.E. for 100 m. to join the Theiss (Tisza). Miskolcz is the chief town on its bank and the Hernád the largest tributary.

Sakai (Malay, servant) Primitive people in the Malay peninsula, mostly in S.E. Perak and N.W. Pahang. Brown, wavy-haired, medium-headed, and averaging 4 ft. 11½ ins. in height, they live on jungle fruits and game hunted with

6-8 ft. bamboo blowpipes; some carry on simple agriculture with digging-sticks. They practise scar-tattooing and body-painting, wear bark-cloth or leaf girdles, and inhabit tree-huts or leaf-shelters.

Sakai. Seaport of Honshu, Japan. It stands on the Inland Sea, in Osaka prefecture, 6 m. S. of Osaka. Iron, cotton goods, bricks, and cutlery are made, and fishing is an occupation. Pop. 72,800.

Sakalava. A negroid people occupying the W. slope of Madagascar. Numbering some 150,000, a tall, dark, frizzy-haired, thick-lipped, long-headed race, they comprise a medley of tribes who c. 1650 came under the dominion of warlike Indonesian immigrants, until these were in their turn subdued by the Hova during the 19th century. Their small, oblong huts, bark-clothing, and animism are Oceanic or W. African, rather than Bantu; they are being increasingly influenced by the Hova culture. *See* Madagascar.

Sakaria. River of Asiatic Turkey, anciently known as the Sangarius. It rises in the ranges E. of Kutaya, and has an extraordinary course, flowing first E., then N., next W., and finally N. It enters the Black Sea about 90 m. E. of Istanbul. On its banks a battle was fought between the Greeks and Turks in Aug.-Sept., 1921. In command of the Turks, Mustapha Kemal had established a fortified zone extending in a wide semi-circle for a distance of 60 m., and 14 m. in depth, on the rocky mt. slopes and summits covering the river. From Aug. 23 to Sept. 5 the Greeks attacked, gaining several successes, but no reinforcements came up, their communications were cut several times, and their ammunition and stores were running out. On Sept. 11-12 the bulk of the Greek army retired without molestation, the victory in effect going to the Turks. Greek casualties were put at upwards of 30,000; those of the Turks were probably as numerous.

Sakchi. Alternative name of Jamshepur (*q.v.*), in Bihar, India.

Saké. Japanese national beverage. A kind of beer, made chiefly from rice, it is an alcoholic, fermented beverage obtained by a complicated process in which bacteria obtained from *Aspergillus oryzae* play an important part. The first fermentation lasts for about a month, the second for a little over a week. Light in colour and unpleasing to the European palate, saké is quickly productive of intoxication.

Sakhalin or **SAGHALIEN.** Island of E. Asia, about 600 m. long by from 15 to 100 m. broad, and with an area of c. 25,000 sq. m., it is situated on the W. side of the sea of Okhotsk, and is separated from the Siberian mainland by the narrow strait called the gulf of Tartary. Its long mountainous backbone rises above 5,000 ft. in the S.E. and in the N.

With summer temps. similar to those of the U.K., it has an average of 33° of frost in Jan. at Alexandrovsk. Larch, fir, spruce, and birch occur in the extensive forests. There are herring and salmon fisheries, the natives, Gilyaks in the N., and Ainus, depending for food almost entirely on fish. Petroleum occurs, and coal is mined. A rly. connects Cape Pogobi with Dué and Alexandrovsk. Until the 20th century the province was reserved as a penal colony. The first convicts were sent in 1869, and all women condemned to hard labour were sent there from European Russia.

Russians first settled in Sakhalin in 1857. The S. part, called by the Japanese Karafuto, belonged to Japan until ceded to Russia in 1875 in exchange for some of the Kurile Is. That part of Sakhalin S. of lat. 50° N. was ceded back to Japan under the treaty of Portsmouth (*q.v.*), 1905, and was annexed by Russia in 1945 in accordance with a secret Allied agreement made at the Yalta Conference (*q.v.*). *See also* Ainu; Gilyak.

Saki (*Pithecia*). Group of American monkeys with long non-prehensile tails. The body is

Saki monkey of the forests of Guiana and the Amazon valley

usually covered with long dark hair, and the face is yellow or whitish. Occurring only in Guiana and the valley of the Amazon, little is known of their habits, as they never live long in captivity.

Saki. Pen-name of Hector Hugh Munro (*q.v.*), British author.

Sakjegeuzi. Village in a valley-plain between the Ghaour-Dagh and the Qurt-Dagh, Asiatic Turkey. It marks the site of a prehistoric settlement. Upon this arose a post-Hittite fortified city, dating between 1100 and 850 B.C., with

a palace and temple, sculptured lions and sphinxes, and reliefs.

Sakkara. Village near the left Nile bank midway between Gizeh and Dahshur, in Egypt. The pla-

Sakkara, Egypt. The IIIrd dynasty step pyramid of Tchecer

teau westward was used under the Old Kingdom as a necropolis presided over by Sokar, "the confined one." Of its 20 pyramids, mostly in ruins, the IIIrd dynasty "step-pyramid" of Tchecer is a transitional mastaba (*q.v.*). The VIth dynasty pyramid of Unas contains a basalt sarcophagus. The Vth and VIth dynasty tombs are many-chambered structures with exquisite mural reliefs. The oldest dated papyrus (VIth dynasty) was found there, 1893. Quibell (1911-12) cleared 400 mastaba tombs of the IIInd and IIIrd dynasties, and an early Coptic monastery. *See* Apis; Serapeum.

Saklatvala, SHAPURJI (1874-1936). British politician. Son of a Parsee merchant, he was born at Bombay, March 28, 1874, and educated at S. Xavier's school and college there. He joined his mother's family business of Tata and Sons, and, in conjunction with his cousin, Sir Sorabji Tata, he spent three years in the jungle prospecting for metal, the result being the foundation of the Tata iron and steel works in Bihar and Orissa. Saklatvala came to England in 1905 and joined the I.L.P. in 1910, but later broke with them, becoming a member of the Communist party and being M.P. for Battersea, 1922-23 and 1924-29, the first Communist elected to the house of commons. He was a popular speaker, and suffered imprisonment for subversive speeches and activities. He died Jan. 16, 1936.

Saktas (Skt. *sakti*, power). Hindu sect. Its members are votaries of the female principle of divine energy or self-created wife of Siva. *See* Siva; Tantras; Vishnu.

Sakurajima. Island of Honshu, Japan. It is situated in the upper part of Kagoshima Bay, and was

famous for the growing of the daikon, a giant radish. The island measures 6½ m. by 5 m. There are mineral springs and an active volcano, 3,745 ft. high.

Sal (*Shorea robusta*). Timber tree of the family Dipterocarpaceae. A native of the Indian subcontinent, it attains a height of about 100 ft., has alternate oval leaves and clusters of sweet-smelling yellow flowers. The resin from the trunk yields dammar, and the tough close-grained wood, stronger and heavier than teak, is extensively used in shipbuilding.

Sal. Flower cluster and leaves; inset, flower

Sala, GEORGE AUGUSTUS HENRY (1828-95). British journalist.

Born Nov. 24, 1828, in London, where, and in Paris, he had a desultory education, he became a clerk, then a theatrical scene painter and book illustrator. In 1848 he edited *Chat*; he wrote *Household Words*, 1851-56; and in 1857 began his long connexion with the *Daily Telegraph*, for which he acted as special correspondent with the North during the American Civil War, 1861-66; with the French, in the Franco-Prussian War, 1870-71; in Russia, 1876; in Australia, 1885; and elsewhere.

He contributed *Echoes of the Week* to the *Illustrated London News*, 1860-86; founded and edited *Temple Bar*, 1860-66; contributed a series of papers on Hogarth to the *Cornhill Magazine*, 1860, which were afterwards published in book form; was a regular contributor to the *Sunday Times*, 1886-94; and edited *Sala's Journal*, 1892-94. His numerous and varied works include *Twice Round the Clock*, 1859, a series of sketches

of London life; *Paris Herself Again*, 1879; several novels, among them *Captain Dangerous*, 1863, and *Quite Alone*, 1864; travel books; *Things I Have Seen*, 1894; *Life and Adventures*, 1895; and *The Thorough Good Cook*, 1895. He died at Brighton, Dec. 8, 1895. *Consult* Life, R. Straus, 1942.

Salaam (Arab. *salām*, peace). Oriental salutation. Strictly the salaam is the verbal salutation between Mahomedans, but the word is applied in the East to any salutation, especially to a ceremonious obeisance, such as that performed in India by bending low the head and body, and placing the palm of the right hand on the forehead. The term has also been used in the sense of compliments or greetings, and the popular phrase, "So long!" in the sense of good-bye is believed to be a corruption of it. A Jewish salutation is Shalom.

Salad (late Lat. *salata*, salted). Mixture of vegetables and other ingredients eaten cold. It is made generally of uncooked material, though cooked vegetables are sometimes used. Lobster, salmon, chicken, or meat salad is made of the uncooked vegetables mixed with the special substance cut small. Fruit salad consists of various fruits cut in pieces, and covered with a syrup of sugar boiled in water.

Salad (Span. *celadn*, from Lat. *caelare*, to engrave). Light helmet. Introduced in the 15th century, its characteristic features were the neck guard, and the smooth, globular form. In place of a vizor, the solid front of the piece was pierced with a slit for the eyes. Alternate names were Sollet and Salet. *See* Helmet.

Saladin (Ar. *Salah-ud-din*, honouring the faith). Sultan of Syria and Egypt. Son of a Kurdish general, he spent his youth in Damascus, of which city his father was governor. In 1164 he accompanied his father on a campaign against Egypt, whose friendship to the Franks was a source of danger to the Muslim powers. For five years he fought the Christians who came to the aid of Egypt, and by 1170 he had become vizier. On the death, in 1174, of his master, Nur-ed-din, sultan of Syria, Saladin hastened north, and by the following year had made himself master of the realm, and been declared sultan.

The next few years were spent in extending his territory, and in strengthening his hand for the inevitable struggle with the Christians, which he opened in 1187 by a

G. A. Sala, British journalist

brilliant sweep through Palestine, culminating in the capture of Jerusalem, Oct. 2, 1187. Only Tyre remained in Christian hands, but thence they marched on Acre. Hastening thither, Saladin surrounded the Christian host, but the latter was reinforced by sea, and the arrival of Richard Coeur de Lion, 1191, followed by the fall of Acre, checked the victorious paynim. Next year, however, he forced the Christians into the unsatisfactory peace, which closed the Third Crusade, Sept. 2, 1192. Six months later Saladin died at Damascus, March 4, 1193. Devout, enduring, kindly, honourable, and chivalrous, Saladin was the Mahomedan leader at his best. See Crusades; Saracens. *Consult* Lives, Yusuf Ibn Rafi, Eng. trans. 1897; S. Lane-Poole, 1898; C. J. Rosebault, 1930.

Saladin Tithe. Tax levied in England in 1188, to procure money for the Third Crusade when Saladin had taken Jerusalem. It was the first tax levied on personal as distinguished from real property. Clergy and laity alike were taxed, except those who joined the crusade themselves.

Salado, Rio (Sp. salt river). River of Argentina, in the prov. of Buenos Aires. It flows in a S.E. direction, through the Pampas, and, after a course of about 400 m., discharges into the Rio de la Plata, which it enters through Samborombom Bay, about 100 m. S.E. of Buenos Aires.

Salamanca. Prov. of W. Spain, in Leon. It is bounded N.W. by the river Douro, W. by Portugal, and S. by the Sierra de Gata. Watered by the Tormes, Yeltes, Agueda, and Alagon, it is level in the N., and generally fertile, producing cereals, wine, oil, and hemp. In the more hilly S.W. part there are forests of pine, beech, oak, and chestnut. Timber, cattle, and sheep are the chief exports. Some minerals, including gold, lead, coal, copper, and rock crystal, are found, but have been little worked. Salamanca was one of the first provs. to declare for Gen. Franco in 1936 and remained in Nationalist hands throughout the civil war. Area, 4,757 sq. m. Pop. 421,965.

Salamanca (anc. *Salmantica*). City of Spain, capital of the prov. of Salamanca. It stands on the right bank of the river Tormes, at an alt. of 2,648 ft., 172 m. by rly. N.W. of Madrid, and at the junction of five rly. lines. The river is crossed by a bridge of 27 arches, more than half being of Roman construction. The city contains many relics of the time when it was

the seat of one of the most celebrated universities in Europe, attended by over 7,000 students.

Its great colonnaded square is one of the finest in Spain, but the streets for the most part are narrow and tortuous, lined with lofty buildings, which display a wealth of striking architecture. The 12th century cathedral is a

Salamanca, Spain. City from the left bank of the river, showing the Gothic cathedral

fine example of the Transition style, while the new one, built 1513-1734, is an imposing Gothic edifice. The university, also Gothic, was founded about 1230, and in it Columbus lectured on his discoveries. There are still 25 colleges and 35 convents. The city was famous for its leather work, which is still esteemed, and there are few other industries of importance, though some cloth, linen, and pottery are manufactured.

Salamanca was already an important place when captured by Hannibal in 222 B.C. Subsequently a Roman city, it passed to the Goths and Moors before its conquest by the Spaniards in 1055. On July 22, 1812, Wellington won at Salamanca (*v.i.*) one of the decisive battles of the Peninsular War. Pop. 90,927.

Salamanca, BATTLE OF. British victory in the Peninsular War, July 22, 1812. In command of the allied army, Wellington had taken up his position S. of Salamanca, and was guarding the road to Ciudad Rodrigo, by which his communications passed to Portugal. The French army, under Marmont, changed its position with a view to capturing this road. The move was frustrated by Wellington, who rapidly moved his men to the intervening North Arapiles Hill. Sending Pakenham to attack the head of the French advancing army, he threw himself on Marmont's right flank. The battle was raging furiously when a cavalry charge, led by Sir Stapleton Cotton, swept on to the French left flank

and decided the day. Unable to re-form his scattered men, who nevertheless fought bravely, Marmont ordered a retreat to Valladolid. The numbers engaged were—Allies, 46,000; French, 42,000; the former lost 6,000, and the latter 15,000. See Peninsular War.

Salamander (*Salamandra*). Genus of tailed batrachians, allied to the newts. Consisting of three species only, they are natives of Europe and W. Asia. In general form resembling the newts (*q.v.*), they differ in having five toes on each of the short, stout limbs, in the tail being rounded instead of compressed,

and in the body being more heavily built. The palate teeth are arranged in two S-like patterns.

The species best known is the spotted salamander (*S. maculosa*) of Europe (except Great Britain), Algeria, and Asia Minor, usually 5 or 6 ins., but occasionally 8 ins. in length. It is black in colour with irregular patches of some tint of yellow on the back and limbs: warning colours, indicating that the animal is poisonous, its venom consisting of a milky fluid squirted from the pores of the smooth skin. The head is as broad as long. The females retain their eggs until the larvae are ready to hatch, then seek the water and deposit either eggs or larvae. The metamorphosis between larvae and adult stages can be induced by the addition of thyroid extract to the water. When the tadpole stage is completed the young leave the water, and live henceforth in moist situations on land, feeding upon insects, worms, snails, woodlice, etc. They hibernate underground. The Alpine salamander (*S. atra*) is somewhat smaller, and uniformly black. It is restricted in its range to the European Alps between 2,000 and 9,000 ft. altitude. The young pass through the larval stage in the body of the female. The third species (*S. caucasica*) is similar to the first, but has a larger tail and the black ground colour bears round yellow spots along the back. Its distribution is confined to the Caucasus. It was formerly and erroneously believed that the salamander could live in

Salamander. 1. Giant salamander of Japan. 2. Spotted salamander. 3. Black or alpine salamander
W. S. Berridge, F.Z.S.

fire, hence the legendary creature (v.l.) of this name. *Amblystoma*, of which the axolotl (*q.v.*) is the larva, is also called a salamander.

Salamander. Legendary creature, supposed to live in fire. It had the form of a dragon, and its skin was so incombustible that a fireproof cloth, really made of asbestos, was said to be made from it. According to Paracelsus, a salamander is an elemental spirit of the fire (see Elemental Spirits). In heraldry it is a four-legged and long-tailed creature, surrounded by flames.

Salamaua. Town and pen. of N.E. New Guinea. Formerly the administrative centre of the area under Australian mandate, the town lies on the W. coast of Huon Gulf, on Samoa harbour, a sheltered inlet between the pen. and Kela pt. on the mainland, and at the mouth of the Francisco river. Forested hills overlook the town, which is the port for the Bulolo goldfields and has air and motor-boat connexion with Lae. During the Second Great War Salamaua was the point of one of the initial Japanese landings in New Guinea on March 8, 1942, and remained for more than a year in the possession of the Japanese, who turned it into a strongly fortified base. By Aug. 9, 1943, the Australians had recovered Kela ridge commanding the town. An Australian militia unit swam the flooded

Salamander in heraldry

Cyprus, on the E. coast. The site, with some ruins, lies near Hagios Sergios, 4 m. N.N.W. of Famagusta. Founded by Greek colonists, probably about 1000 B.C., it became the chief town of the island under Evagoras its king (410-374 B.C.), who made Cyprus into one kingdom. The Romans captured it in 58 B.C. Destroyed by an earthquake, it was rebuilt by Constantius and called Konstantia. It had a famous temple.

Salamis. Island of Greece, in the Gulf of Aegina, W. of Athens. Crescent-shaped, it extends across the Bay of Eleusis, leaving two narrow straits. Its area is 36 sq. m., length 10 m. The Homeric hero Ajax, son of Telamon, was a Salaminian. The island was acquired by Athens about 600 B.C. The population, estimated at 6,000, is almost entirely Albanian.

Salamis, BATTLE OF. Naval engagement fought between the Greeks and Persians, 480 B.C. After the capture and destruction of Athens by the land forces of Xerxes, the commanders of the different contingents of the Greek fleet, then lying off Salamis, disagreed as to their future course of action. Some favoured retirement to the isthmus of Corinth, but Themistocles urged giving battle in the Strait of Salamis. The appearance of the Persian fleet in the Bay of Phalerum decided the question in his favour.

Francisco to capture the airfield on Sept. 13, and next day captured Salamaua itself, finding it almost destroyed by Allied bombing.

Salambria OR SALAMVRIA. River of Greece, anciently known as the Peneus. The principal river of Thessaly, it rises in the N.E. and flows into the Gulf of Salonica, passing near the coast between Mt. Olympus and Mt. Ossa through the Vale of Tempe, famous for its exquisite scenery. It is about 110 m. long. See Larissa.

Salamis. Ancient town of Cyprus, on the E. coast. The site, with some ruins, lies near Hagios Sergios, 4 m. N.N.W. of Famagusta. Founded by Greek colonists, probably about 1000 B.C., it became the chief town of the island under Evagoras its king (410-374 B.C.), who made Cyprus into one kingdom. The Romans captured it in 58 B.C. Destroyed by an earthquake, it was rebuilt by Constantius and called Konstantia. It had a famous temple.

Salar Jung, Sir (1829-83). Indian statesman. Of aristocratic birth, he became prime minister of Hyderabad in 1853, and initiated many greatly needed military and civil reforms. A staunch supporter of the British during the critical days of the Mutiny, he maintained the loyalty of Hyderabad. In 1869 he became co-regent of the nizām, Mir Mahbub Ali, his loyalty and friendship to the British government being rewarded the next year with the G.C.S.I. He visited England in 1876, in an unsuccessful attempt to obtain Berar for the nizām's dominion. He died at Hyderabad, Feb. 8, 1883. Sir Salar Jung, whose actual name was Mir Turab Ali, was also known in India as Nawab Sahib.

Themistocles, to bring the Persians to action, thereupon sent a messenger to them, declaring that the Greeks intended to withdraw and advising them to blockade the entrances to the Bay of Eleusis, and so cut off their retreat. The Persians fell into the trap and proceeded to do so, feeling confident of success with 1,000 ships against 360. After a fight extending over several hours, victory at last rested with the Greeks. They had lost 40 ships, the Persians about 200. Xerxes, for whom a throne had been erected on Mt. Aegialeus to witness his expected triumph, disgusted with the result of the battle, returned to Asia, leaving Mardonius to carry on the campaign by land.

Sal Ammoniac. Ammonium chloride, NH_4Cl . Under the name of sal ammoniacum the salt was known to Geber, and appears to have been derived from volcanoes in Central Asia. It is obtained by neutralising the gas given off in distilling ammoniacal liquor in gas works with hydrochloric acid and evaporating the solution, or by adding sulphuric acid to the ammonia water and sublimating with sodium chloride. It is also produced in large quantities as a by-product in the ammonia-soda process. In nature it occurs in volcanic regions. It is colourless and odourless in the free state, with a strong saline taste. It is used as an electrolyte in batteries, as a flux in soldering, in dyeing and calico printing. In medicine sal ammoniac is used in bronchitis and pneumonia as an expectorant, for rheumatism, and in catarrhal affections. In photography it is sometimes added to a hypo fixing bath to obtain extra rapid fixing, especially in X-ray and oscillograph work. See Ammonia.

Salar Jung, Sir (1829-83). Indian statesman. Of aristocratic birth, he became prime minister of Hyderabad in 1853, and initiated many greatly needed military and civil reforms. A staunch supporter of the British during the critical days of the Mutiny, he maintained the loyalty of Hyderabad. In 1869 he became co-regent of the nizām, Mir Mahbub Ali, his loyalty and friendship to the British government being rewarded the next year with the G.C.S.I. He visited England in 1876, in an unsuccessful attempt to obtain Berar for the nizām's dominion. He died at Hyderabad, Feb. 8, 1883. Sir Salar Jung, whose actual name was Mir Turab Ali, was also known in India as Nawab Sahib.

Salary (Lat. *salarium*, salt money). Recompense given to a person for his labour or services, and therefore identical in law with wages. In common speech, however, it is customary to apply the term to the remuneration by the year or month of a servant of a higher class, such as a manager of a factory, while the word wages is used to describe the pay of a workman calculated on hourly or piece-work basis. See Wages.

Salazar, ANTONIO DE OLIVEIRA (b. 1889). Portuguese statesman. Born April 28, 1889, he was educated at Coimbra university, where he was to become professor of economic studies in 1916. He took to politics early in the 1920s, and became minister of finance for a few days in 1926, and again in 1928, and minister for the colonies, 1930. As prime minister from 1932, he drafted the new constitution next year which made him virtually dictator of Portugal. Foreign affairs soon came under his control, and throughout the Second Great War he adhered to a strictly neutral policy. His *Discursos e Notas Politicas*, 3 vols., 1935-44, have been translated into many languages. Consult also Portugal and her Leader, A. Ferro, Eng. trans. 1939.

Salcombe. Urban dist. and watering-place of Devon, England. It stands on the W. side of Sal-

Salcombe, Devon. A general view of Salcombe Haven, from the harbour

combe Haven, an opening on the S. coast of the county, 11 m. S.E. of Dartmouth. Noted for its mild and equable climate, it attracts visitors both in winter and summer. The nearest rly. station is Kingsbridge, whence Salcombe is reached by bus. It has a coasting trade, and at one time the Salcombe clippers were noted vessels; it is still a centre for yachtsmen. There was once a castle here. Salcombe Regis is a parish, 2 m. from Sidmouth. Pop. 2,500.

Saldanha Bay. Land-locked harbour and whaling-station of

Africa. It is 63 m. by sea N. of Cape Town. The name was at first applied to the bay later named Table Bay, where Antonio de Saldanha landed in 1503.

Saldanha Oliveira e Daun, João CARLOS, DUKE OF (1791-1876). Portuguese soldier and statesman. Born at Lisbon, Nov. 17, 1791, he fought through the Peninsular War under Wellington. After the revolution of 1820, he joined the party of John VI, whom he persuaded to

Duke of Saldanha, Portuguese soldier

issue a proclamation promising constitutional government.

After the death of John, 1826, he became minister of war. During the following years of struggle between Constitutionals and Miguelists he spent much time in exile. When, in 1834, the Constitutionalists definitely got the upper hand, he returned to Portugal, and forced Dom Miguel to capitulate. Prime minister for a few months in 1835, and again during 1846-47, Saldanha definitely secured power in May, 1851, by an insurrection against the dictatorship of Costa-Cabral, and retained it for five years. He established a ministry of reconciliation, and carried through many necessary reforms. He had the support of England while he held power. During the following years he represented Portugal at the Vatican and in Paris, and finally in London, where he died Nov. 21, 1876. Consult Memoirs of the Duke de Saldanha, Da Carnota, 1880.

Sale. Contract whereby one person, called the seller, or vendor, transfers or agrees to transfer property to another, called the buyer or purchaser, in return for a money payment, called the price. If the price is not in money, the transaction is not a sale but barter. See Auctioneering; Sale of Goods Act.

Sale. Mun. bor. of Cheshire, England. It stands on the Mersey, 6 m. S.W. of Manchester, and is connected to Manchester and Altrincham by electric rly. The town is mainly residential, and is of modern growth. There are four

large parks and recreation grounds, and two golf courses. In 1930 the urban districts of Sale and Ashton-upon-Mersey were amalgamated. Pop. 42,680.

Sale. Township of Victoria, Australia. It stands on the Thomson river, 128 m. by rly. E. by S. of Melbourne, and is the chief town in Gippsland. Pop. est. 3,500.

Salé, SALI, OR SALLÉ. Port of French Morocco. It stands at the mouth of the Bu-Regreb, opposite Rabat (*q.v.*). It gave its name to the Sallee Rovers or pirates. Pop. 52,000, including 2,000 Europeans.

Sale, GEORGE (c. 1697-1736). British Orientalist. He entered the Inner Temple in 1720 and for some time practised as a solicitor. Later he helped to revise a translation in Arabic of the N.T. for the S.P.C.K. He contributed Oriental biographies to Dr. Birch's General Dictionary, 1734, and to the Universal History, and helped to found the Society for the Encouragement of Learning, but is best remembered by his translation of the Koran, 1734, and particularly for his invaluable preliminary discourse to that work. He died Nov. 14, 1736. His MSS. are preserved in the Bodleian.

Sale, SIR ROBERT HENRY (1782-1845). British soldier. Born in England, Sept. 19, 1782, he entered the 36th Foot in 1795, and saw his first service against Tippoo Sahib and took part in the storming of Seringapatam in 1799. Further service included the Mauritius

Sir Robert Sale, British soldier

expedition, 1810, the Burmese War, 1824-25, and the Afghan War, 1838. In Nov., 1841, he was invested with about 2,000 men in Jalalabad, but was relieved after six months by Sir George Pollock. He was appointed quartermaster-general in India in 1844, but was wounded in the battle of Moodkee in the second Sikh War, Dec. 18, 1845, and died three days later. Sale exercised an extraordinary ascendancy over his men, by whom he was known as Fighting Bob.

Saleeby, CALEB WILLIAMS (1878-1940). A British physician and author. Born at Worthing, May 3, 1878, and educated at Edinburgh university, he spent some years as a medical practitioner, and then devoted himself to eugenics, writing and lecturing much upon that subject, and tak-

ing a leading part in the movements for prohibition, and divorce law reforms and sociological matters generally. His publications include *Evolution*, the *Master Key*, 1900; *The Progress of Eugenics*, 1914; *The Whole Armour of Man*, 1919; *Sunlight and Health*, 1923. He died Dec. 9, 1940.

Saleier OR **SALAYAR**. Island of Indonesia. It lies S. of Celebes, from which it is separated by Saleier Strait. A mountain chain runs N. and S., and descends steeply on the E. Padang is the chief place. The people are Mahomedans. Area, 245 sq. m.

Salekhard OR **SALEGARD**. Town of Omsk province, Siberia, R.S.F.S.R. It is about 50 m. E. of the Urals, on the Ob, and near the Gulf of Ob. A trading centre, it is the chief town of the Nentsy people living in the Samoyed peninsula on the Arctic Circle. It is linked by rly. with Berezov.

Salem. City of the Jebusites, of which, in Abraham's time, Melchizedek was king (Gen. 14, v. 18; Heb. 7, vv. 1-2). It has been identified with Jerusalem (Ps. 76, v. 2), of which it still serves as a poetical name. The Assyro-Babylonian form of the name, as given in the Tel-el-Amarna tablets, is *Uru-Salim* or *Ur-Salimmu*, city of peace.

Salem. Dist. and town of Madras state, India. The dist., formed in 1792, stretches S.E. from the E. Ghats, with the Cauvery as its W. boundary. It contains the Shevaroy Hills, which range up to 5,400 ft. alt., and include the small hill station of Yerkad. The chief crops are food grains and pulses and a little rice. The town is connected with the Madras-Calicut main rly. by a short branch line. The iron mines near by are no longer worked owing to the difficulty of obtaining smelting materials. A government weaving factory is in operation. Area, 7,073 sq. m. Pop., dist., 2,869,226; town, 129,702.

Salem. City of Massachusetts, U.S.A., a co. seat of Essex co. A port of entry, on the N. side of Massachusetts Bay, it is 16 m. N.E. of Boston, and is served by the Boston and Maine rly. and electric lines. Among its buildings are the city hall, custom house, court house, and armoury. The Essex Institute has a museum and library, and the Athenæum and the Peabody Academy of Sciences, with a valuable museum, are notable. Other buildings include churches and charitable institutions. Some interesting old houses include the one in which Haw-

thorne was born, his House of the Seven Gables, and the witch house, so called because here witches were examined. There are several public parks. Salem makes machinery, boots and shoes, lumber products, cotton goods, and leaden pipes.

One of the oldest Puritan colonies in the U.S.A., Salem was settled in 1626, and the names of John Endecott and Roger Williams are associated with its early history. In 1692 a number of persons were tried for witchcraft here, and 20 were put to death. Wealth poured into the town with the opening of the China trade in 1785, but this prosperous period ended with the war of 1812. Here in 1774 the first assembly of Massachusetts met. Salem became a city in 1835, and was seriously damaged by fire in 1914. Pop. 41,213.

Salem. City of Oregon, U.S.A., the co. seat of Marion co. and the state capital. It stands on the Willamette river, 53 m. S.S.W. of Portland, and is served by the Southern Pacific and other rlys. Its industries include fruit packing, flour milling, and the manufacture of lumber and machine-shop products and woollen goods. Settled about 1840, Salem became a city in 1853, and was chosen as the state capital in 1860. Pop. 30,908.

Salem Chapel. Novel by Margaret Oliphant. It was published anonymously in 1863 as the first of the *Chronicles of Carlingford*—

Salem, Massachusetts. Old witch house, dating from about 1631

to which later additions were The Rector and the Doctor's Family, The Perpetual Curate, Miss Marjoribanks, and Phoebe Junior. A vividly presented story of a minister and his friends, it is told with much humour and pathos. The

hero was supposed to be a fictional representation of Edward Irving.

Salemi. Town of Sicily, in the prov. of Trapani. It stands on the Castelvetro rly. line, 14 m. N.E. of Mazzara. The ancient Halicyae, it is built on a hill at an alt. of 1,450 ft., and is dominated by a castle. The town now presents an abject appearance, and its inhabitants have been characterised as extremely indolent. Here in 1860 Garibaldi proclaimed himself dictator of Sicily.

Sale of Goods Act. Statute of 1893 codifying the law relating to the sale of goods in the U.K. It introduced little new law, and was a successful attempt to compress into some 60 sections the results of an enormous number of decisions on this important business subject, together with one or two statutory provisions. It defines sale and distinguishes between a sale and an agreement to sell. The first is where the property is, by the contract itself, transferred to the buyer. The second is where the transfer of the property is to take place at a future time or on the fulfilment of a condition.

Thus, if A agrees to sell to B "this armchair," the contract of sale is complete. But if A agrees to make and sell to B "an armchair," there is an agreement for sale only until an armchair is made and appropriated to B's contract. The statute re-enacts the old Statute of Frauds as to contracts for the sale of goods of £10 and upwards not being enforceable unless they are (1) in writing; or (2) something is paid on account or as earnest money; or (3) all or part of the goods have been delivered and accepted. It also sets out what conditions and warranties are to be implied on a sale—e.g. that in a sale by sample the bulk shall correspond with the sample in quality, and shall be merchantable. Sections 16-20 define when the property passes from seller to buyer—a very important consideration, because as soon as the property has passed the goods are at buyer's risk. Other sections deal with stoppage *in transitu*, the requisites of a valid performance of the contract, the remedies of buyer and seller respectively on breach of contract, the transfer of title, sale in market overt, the rights of the unpaid seller in the goods, and auction sales. See *Auctioneering*; *Contract*; *Hire Purchase*.

Salerio. Maritime prov. of S.W. Italy, comprising the S. portion of Campania. Facing

the Mediterranean Sea, the surface is largely mountainous, being traversed by branches of the Apennines. The soil yields cereals, flax, hemp, cotton, tobacco, oil, wine, and fruit. Manufactures include paper, glass, hats, leather, and silk. Salerno was formerly the Neapolitan prov. of Principato Citra. Its area is 1,908 sq. m.

Salerno (anc. Salernum). Seaport and city of Italy, capital of the prov. of Salerno. It stands at the head of the Gulf of Salerno, 34 m. by rly. S.E. of Naples. Built on the slopes of a hill dominated by a Norman castle, its walls have been levelled and their place taken by boulevards. The cathedral, built by Robert Guiscard (1076-84), is architecturally and historically interesting, with fine bronze doors, splendid marble ambones, and ivory carvings; its roof was damaged in the Second Great War. The old city presents a quaint appearance, with narrow, tortuous streets and ancient buildings. Fruit preserving, silk and cotton spinning, and printing are carried on, and there are manufactures of glass, cement, wine, and leather. Salerno was colonised by Rome about 194 B.C. Disman- tled by Charlemagne, it was re- fortified and held by the Lombards until captured by Guiscard, and was sacked by the emperor Henry VI in 1194. In the Middle Ages its medical school was world famous, as was its university, founded in 1150 and closed in 1817. Pop. (1939) 67,000.

Salerno, GULF OF (anc. Paes- lanus Sinus). Semi-circular open- ing of the Tyrrhenian Sea in S.W. Italy. It is divided from the Bay of Naples by the promontory ending in Point Campanella, and is bounded S. by Licosa Point. It receives the waters of the river Sale, and on its shores are Amalfi, Salerno, and the ruins of Paestum.

SECOND GREAT WAR. The beaches of Salerno Gulf, between Maiori and Agropoli, were the scene, at 1.15 a.m., Sept. 9, 1943, of the third and main Allied land- ing in Italy.

As originally planned, the main landing was to have been made on Sept. 15, and near to Naples; but the Badoglio govt., after its secret surrender to the Allies on Sept. 3, was doubtful whether it could maintain itself so long without Allied support. In response to Badoglio's representations the date of the landing was therefore ad- vanced to follow immediately the announcement on Sept. 8 of the Italian surrender, and the site

chosen was closer to the troops of the Allied 8th army who were advancing against little opposition from Calabria and Apulia.

Three divs.—two British and one U.S.—in fact comprised the 5th "army" which landed at Salerno under the command of the American Lt.-Gen. Mark Clark (*q.v.*), from a great force of amphibious craft that had sailed from African ports under the pro- tection of Allied naval forces (com- manded by Vice-Adm. Henry K. Hewitt, U.S.N.). British com- mando units landed W. of Salerno and entered the town unopposed. At Maiori, still farther W., U.S. Rangers pushed inland and blocked roads leading S. through the hills. British troops who had landed S. of Salerno completed the occupation of that town on Sept. 10. At Battipaglia, inland from the centre of the gulf, however, the British met fierce German re- sistance and were driven back to the beaches, Sept. 12, by tanks which almost split the 5th army in two; and for a time, despite support by gun-fire from Allied warships offshore, the success of the landing hung on a thread. On Sept. 13 a British armoured div. which had been held in reserve was landed, and a U.S. airborne div. was dropped on the beaches and went straight into action as in- fantry. On the 14th every avail- able Allied aircraft was flung into the battle, R.A.F. and U.S.A.A.F. fighters and bombers flying more than 1,000 sorties a day, and fire from the warships in the bay con- tinued to be used to break up German tank at- tacks. Troops of the 8th army, after advancing 67 m. in three days, made con- tact with the 5th army near Agro- poli on the 17th, and the Germans began to with- draw, maintain- ing their hold, however, on the hills N. of Salerno until British troops cleared Nocera on Sept. 28, and the Allies broke through into the plain of Naples.

Salève, MONT. Isolated mt. mass of France. In the dept. of Haute-Savoie, it is 3½ m. S.E. of Geneva. It trends from N.E. to S.W. for a distance of 11 m., and is divided by the Monnetier depres- sion into the Petit-Salève, alt.

2,950 ft., and the Grand-Salève, culminating in the Crêt de Grange Tournier, alt. 4,524 ft. It com- mands a view of Mont Blanc and the Rhône valley, and is ascended by a mountain rly. to Treize Arbres, alt. 3,746 ft.

Salford. City and county borough of Lancashire, England. It stands on the W. bank of the Irwell, which

Salford arms

divides it from Manchester. It is 190 m. from Lon- don, and is served by British rlys. and has a com- prehensive ser- vice of omni- buses. The chief buildings are the town hall, muni- cipal buildings, technical institute and museum, and art gallery. The town has hospitals and many modern churches. With a large Roman Catholic population, it has a fine Roman Catholic cathedral. Of many open spaces, the chief are Peel Park, Albert Park, Buile Hill Park, and Kersal Moor.

The industries resemble those of Manchester, prominent being the making of cotton goods and chem- icals, while there are large engineer- ing works. Here are the principal docks of the Manchester Ship Canal, and the Manchester racecourse lies within the boundaries of Salford. Salford received its first charter in 1231. Its charter of incorporation dates from 1844, and in 1853 it was enlarged by the addition of Broughton and Pendleton, hitherto separate areas, each with a town hall. In 1926 it was made a city.

Salford, Lancashire. The town hall

From 1832 to 1885, and after 1950, Salford had two M.P.s., three from 1885 to 1950. Its water supply is provided by Manchester. Pop. 175,230. See Manchester.

Salicaceae. Family of trees and bushes, widely spread in the N. hemisphere: sometimes com- prised in the Amentaceae (*q.v.*). See Willow.

Salicin (Lat. *salix*, willow). Crystalline glucoside prepared from the bark of various species of willow and poplars. It occurs as colourless, intensely bitter crystals, and is used in medicine in almost the same way as salicylic acid (*q.v.*).

Salic Law. Code of law of the Salic or Salian Franks of the 5th century A.D. The term in contemporary usage is applied to a law of succession debarring females and those who trace their descent through females from succeeding to the throne. Such a law exists *e.g.* in Denmark. See Franks.

Salicylic Acid, OR ORTHO-HYDROXYBENZOIC ACID. Acid occurring in ester form in many essential oils and plant products, *e.g.* oil of wintergreen, which contains more than 98 p.c. of methyl salicylate. It may be prepared from such natural sources or synthetically by the action of carbon dioxide or sodium phenate. When pure it is in crystals, usually fine needles or a white crystalline powder, with a sweetish, afterwards acrid, taste. It is a powerful antiseptic widely used as a food preservative, though its use for that purpose is forbidden in some countries. Salicylic acid is used in medicine as its salt, sodium salicylate. Acetylsalicylic acid is the chemical name for aspirin, which is non-irritant.

Salient (Lat. *salire*, to spring forward). Term particularly indicating that part of a defence line or series of fortifications which projects in front of the main line towards the enemy. A salient angle has the apex outwards. Examples were the salients at Ypres and St. Mihiel in the First Great War.

Salieri, ANTONIO (1750-1825). Italian composer. Born at Legnano, Aug. 19, 1750, he first attracted attention with his opera *Armida*, 1771, and in 1774 became musical director at Vienna. The contemporary and bitter rival of Mozart, whose death he was at one time supposed to have caused by poison, he retired in 1824, and died May 7, 1825, having taught both Beethoven and Cherubini. One of his best-known works was *La Grotto di Trofonio*, 1785.

Salii. College of priests of Mars at ancient Rome. At the festival of Mars held in March they went in procession through the streets engaging in the dances in honour of the god from which they took their name, the "leaping" priests (Lat. *salire*, to leap, dance).

Salina, OR SALINA LAKE. Term for lakes or dried lake-beds in desert regions which, owing to evaporation, are rich in salt,

Salisbury, Wiltshire. The 14th century cathedral from the north-west

sodium sulphate, alkalis, or borax, used when the surface of the lake-bed is covered with efflorescent minerals. See Playa.

Salina Cruz. Pacific port of Mexico, on the Gulf of Tehuantepec. It was the terminus of the transcontinental Tehuantepec rly., built 1899-1907 by British engineers, destroyed during internal Mexican warfare of the 1910's. The concrete breakwaters that protect the harbour are over a mile in length. It is 190 m. S. of Puerto Mexico on the Caribbean. Pop. 6,000.

Saline (Lat. *sal*, salt). Term loosely used for substances containing salts of various kinds. Salines, in medicine, consist of, or contain chiefly, salts of the alkaline metals or magnesium. The effervescence which some salines exhibit when mixed with water is due to the chemical reaction of an acid (tartaric or citric) with an alkaline salt (usually sodium carbonate or bicarbonate), resulting in the evolution of carbon dioxide.

Salins. Town of France. In the dept. of Jura, it is 22 m. S. of Besançon, standing in the valley of the Furieuse. The name is derived from the salt springs, which attract many visitors. Some trade is done in wine and timber. The chief buildings are the Romanesque church, the hôtel de ville, and a museum. In the Middle Ages Salins was part of Burgundy. It passed to the Hapsburgs, only becoming part of France in 1674. Pop. est. 5,000.

Salisbury. City and mun. bor. of Wilts, England, also the county town. It stands on the Avon, 84 m. by rly. S.W. of London. The glory of Salisbury is its cathedral,

a perfect specimen of Early English work, beautifully situated near the Avon. Built almost wholly in the 13th century, it is 473 ft. long and the spire at 404 ft. is the highest in England. Notable for its perfect proportions and the uniformity of its style, its features include cloisters, chapter house, lady chapel, and library. It was damaged by restoration in the 18th century, but much of the evil was undone in the 19th. (*Consult* Salisbury Cathedral, J. Truby, 1948.)

Around is the spacious close from which gates lead to the city; in it are a number of old buildings, notably King's House, renovated for a training college; the bishop's palace, which became a cathedral school in 1946, when the bishop took up residence at Mompesson House; also several houses occupied by members of the cathedral staff. Other churches include S. Thomas's, founded as a chapel to the cathedral in the 13th century; S. Martin's, and S. Edmunds, originally collegiate.

The secular buildings include the court house, markets, corn exchange, and a museum. The city has a large market place, with statues of Henry Fawcett and Sydney Herbert, and the poultry cross still stands. The hall built by John Halle, the Joiners' Hall, and Audley Hall—as it is sometimes called—now the church house, are notable. Victoria Park, 16 acres in extent, commemorates the jubilee of Queen Victoria. S. Nicholas Hospital is noted for its

Salisbury arms

beautiful chapel. Of many interesting houses may be mentioned the Old George Inn. The city proper is laid out in squares known as chequers. The industries include brewing, and Salisbury is an agricultural and also a military centre.

Salisbury was founded in 1220 by Bishop Poore, who decided to move his cathedral city from Old Sarum to its present site. The city, sometimes called New Sarum, grew up around the cathedral which he built. It was almost at once made a corporate town and became the county town. Here in the 13th and 14th centuries several parliaments were held, and the kings, as late as Charles II, occasionally stayed here. It became famous for its manufacture of woollens and cutlery and had strong trade guilds. The bishop had great authority in the city during the Middle Ages, partly retained until 1835, when the existing corporation was established. Salisbury had two M.P.s until 1885, then one until 1918; it now gives its name to a co. constituency. Market day, Tues. Pop. 31,624. See Chapter House; Georgian; Parapet; Sarum.

Salisbury. City of Rhodesia, the capital of S. Rhodesia. It stands at an altitude of 4,825 ft., and is 300 m. by rly. N.W. of Bulawayo and 1,660 m. N.W. of Cape Town. An aerodrome 2 m. W. of the town is the headquarters of the S. Rhodesian air services. The buildings include government house, town house, library, market hall, and drill hall. The new high court here, opened in 1933, houses the ministries of Finance, Justice, Defence, and Mines and Public Works. There is an Anglican cathedral. A statue of Cecil Rhodes stands in front of the government buildings. The town has public gardens, theatres, a racecourse, and other facilities for amusement. The site was occupied by the British in 1890, and named Fort Salisbury in honour of the prime minister; it became a city in 1935. Pop. 69,049.

Salisbury. City of N. Carolina, U.S.A., the co. seat of Rowan co. It is 115 m. W. of Raleigh, and is served by the Southern rly. Textile plants here produce yarn and cotton blankets; there are also extensive granite quarries. In

Salisbury prison over 3,000 Northern captives died during 1864-65. Founded about 1752, Salisbury was incorporated in 1755 and became a city in 1770. Pop. 19,037. Another Salisbury is in Maryland. Pop. 13,313.

Salisbury, EARL AND MARQUESS OF. English titles now held by the family of Cecil. The title of earl was granted about 1149 to Patrick de Salisbury, a feudal lord in Wiltshire. A later earl was William Longsword, a natural son of Henry II, who married the heiress of an earlier earl. It passed then through two female descents to a certain Alice who married Thomas Plantagenet, earl of Lancaster.

The title was granted to William de Montacute in 1337, but again lapsed by the attainder of the 3rd Montacute earl in 1400. However, it was granted in 1409 to his son, Thomas de Montacute, the earl who won fame as a soldier in France, where he was killed in 1428. From him it passed to his son-in-law, Richard Neville, falling into abeyance when his son Richard Neville, earl of Warwick, was killed in 1471. Further grants of the earldom were made to members of the family of Plantagenet. One of these, Edward, a son of George, duke of Clarence, lost the title, but it was restored to his sister, Margaret, the widow of Sir Richard Pole, in 1513. This lady and her sons became objects of suspicion

the Civil War, but the succeeding earls were not specially distinguished. James, the 7th earl, lord

2nd Marquess of Salisbury, British politician

chamberlain, 1783-1804, was made marquess of Salisbury in 1789. James, the 2nd marquess (1791-1868), was lord privy seal, 1852, and lord president, 1858-59. His marriage with Frances Mary Gascoyne introduced that name into the family. Their son, the 3rd marquess, was the prime minister, and he, and the 4th and 5th marquesses, are separately noticed. The eldest son of the marquess is known as Viscount Cranborne. The family seat is Hatfield House. See Burghley, Lord; Cecil; Hatfield.

Salisbury, ROBERT CECIL, EARL OF (c. 1565-1612). English statesman. A younger son of Lord Burghley, he was educated at Cambridge and soon became an M.P. Trained by his father, he became engaged in political and diplomatic work, and in 1596 was secretary of state. He succeeded his father as Elizabeth's chief adviser, and also advised James I. From 1608 until his death, May 24, 1612, he was also lord treasurer.

Salisbury, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, 3RD MARQUESS OF (1830-1903). British statesman. He was born at Hatfield House, Feb. 3, 1830, second son of the 2nd marquess, and was educated at Eton and Christ Church, Oxford. In 1853 he

Robert Cecil, Earl of Salisbury, English statesman

to the Tudor sovereigns; and in 1539 the countess was attained.

In 1605 Robert Cecil, son of the great Lord Burghley, was created earl of Salisbury, and the title has since been held by his descendants. The 2nd earl was a parliamentary leader during

Salisbury, S. Rhodesia. Upper picture shows the post office; lower picture, First Street, a shopping thoroughfare

was elected fellow of All Souls, and in the same year, as Lord Robert Cecil, was returned unopposed as Conservative M.P. for Stamford, a constituency he represented for the next 15 years. During 1859-66 his reputation grew rapidly with his incisive attacks upon the Russell ministry. In 1865 he became Viscount Cranborne on the death of his elder brother, and in 1866 took office as secretary for India, though he resigned the following year after disagreeing with Disraeli's proposals for franchise reform. In 1868 he succeeded to his father's title, and returned to the India office in 1874. In 1878 he succeeded Lord Derby at the foreign office during the war between Russia and Turkey, and was almost immediately Lord Beaconsfield's colleague at the congress of Berlin, helping to bring back "peace with honour." The Liberal electoral victory of 1880 terminated his tenure of the foreign secretaryship, but on Beaconsfield's death in 1881 he was chosen leader of the opposition in the lords.

On the fall of the Liberal government in June, 1885, Salisbury became prime minister for the first time, combining the office with that of foreign secretary. The government was short-lived, Gladstone resuming office in Dec. But the subsequent general election, fought on the question of Irish Home Rule, brought a decisive majority of Conservatives and Liberal Unionists. Salisbury offered to serve under Lord Hartington in order that Liberal Unionists might be included in the administration; but this offer being declined, he became premier again 1886-1892, with foreign affairs still entirely under his control. He granted royal charters to the British E. Africa Co. (1888) and the S. Africa Co. (1889), and came to agreements with France (in respect of Madagascar) and Germany (ceding Heligoland to that country) in 1890.

In opposition 1892-1895, he was returned to power in the latter year, remaining prime minister until his resignation in July, 1902. The early disappointments of the S. African War told on his health. He was anxious to resign after the election of 1900, which confirmed his party in power; but Queen Victoria persuaded him to remain, though he handed over the foreign office to Lansdowne. He remained premier to the end of the war, resigning six weeks after peace was signed. After one year of retirement, he died Aug. 22, 1903.

Salisbury was a Conservative of the old school, an aristocrat, distrustful of democracy, which he regarded as fatal to the liberty of the individual. He displayed unconcealed indifference for public

Russell

Salisbury

opinion, yet the public came to trust him implicitly, putting faith in his massive experience and his demonstrable lack of self-interest. His policy was uniformly pacific, aiming at the maintenance of the balance of power. At home he was a stalwart defender of the Established Church.

He was elected chancellor of Oxford university in 1869, was made a K.G. and appointed lord warden of the Cinque Ports. He was president of the British Association in 1894. In his early parliamentary days he was a regular contributor on political subjects to the Saturday Review and Quarterly Review. Volumes of his essays were published posthumously. He married in 1857, and his family included his eldest son, who succeeded him as 4th marquess, and Lord Robert (later 1st Viscount Cecil of Chelwood, *q.v.*), Lord Hugh (later Baron Quickwood, *q.v.*), and Lord William Cecil, who became bishop of Exeter. *Consult* Life, Lady G. Cecil, 4 vols., 1921-31.

Salisbury, James Edward Hubert Gascoyne-Cecil, 4th Marquess of (1861-1947). British politician. Eldest son of the 3rd marquess, he was born Oct. 23, 1861, and educated at Eton and University College, Oxford. As Viscount Cranborne, he entered politics in 1885 when he represented Darwen as Conservative M.P., retaining his seat until 1892,

and transferring to Rochester next year. In 1900 he entered his father's administration as under-secretary for foreign affairs. He succeeded to the title in 1903, became lord privy seal, and in 1905 president of the board of trade. Salisbury was Conservative leader of the house of lords, 1925-31. Though he gave valuable service as member of the committee on Indian constitutional reform, 1934, he was a prominent opponent of the government's policy in India. He died April 4, 1947, and was succeeded by his eldest son (*v.i.*).

Salisbury, Robert Arthur James Gascoyne-Cecil, 5th Marquess of (b. 1893). British politician. Eldest son of the 4th marquess, he was born Aug. 27, 1893, and educated at Eton and Christ Church, Oxford. As Viscount Cranborne he represented S. Dorset as Unionist M.P. from 1929, and was parl. under-secretary for foreign affairs, 1935-38, resigning with Anthony Eden as

5th Marquess of Salisbury, British politician

a protest against Chamberlain's policy toward Mussolini and Hitler. Secretary for dominion affairs, 1940-42 and 1943-45, he spent a period between as lord privy seal.

That he might sit in the house of lords during his father's lifetime, he was created in 1941 Baron Cecil of Essendon, and became leader of that house in Winston Churchill's administration, but was still known as Viscount Cranborne until he succeeded to the marquessate on his father's death, April 4, 1947.

Salisbury, Frank O. (b. 1874). British painter. Born Dec. 18, 1874, he studied at Heatherley's

Frank O. Salisbury, British painter

and the R.A. schools, exhibiting regularly at Burlington House from 1899. He executed portraits of George V and Queen Mary, George VI and Queen Elizabeth,

4th Marquess of Salisbury, British politician

Winston Churchill, General Smuts, several American presidents and ambassadors, and Mussolini. Royal occasions called forth other canvases, e.g. the silver jubilee of 1935, the coronation of 1937, the visit to Canada in 1939. Twelve of Salisbury's panels are part of the Victoria Memorial at Calcutta. He painted Alfred the Great rebuilding the walls of London; Catherine of Aragon before the consistory courts; and other historical panels for the Royal Exchange. His *Burial of the Unknown Warrior* is in the houses of parliament.

Salisbury, OATH OF. Oath of allegiance sworn by his tenants and their vassals to William the Conqueror at the moot or council of Salisbury in 1086. This oath definitely differentiated English from Continental feudalism (q.v.).

Salisbury Island. Naval base in Durban Bay, Natal, South Africa. Part of the magisterial district of Durban, it was formerly a convict settlement. During the Second Great War it was converted into a naval base at a cost of £2,000,000. The island is linked to the Bluff by rly. and road, and can accommodate any warship.

Salisbury Plain. Dist. of Wiltshire, England. Composed of rolling chalky downs, it is about 20 m. long by 15 broad, lying in the S.E. of the county to the N. of Salisbury. The highest point is Westbury Down (770 ft.), and the Avon flows across it. On the plain is Stonehenge, as well as Amesbury and other villages, but the greater part is used for military purposes. The principal camps are at Tidworth (Royal Armoured Corps), Bulford, Larkhill (Royal Artillery), while the R.A.F. has aerodromes at Netheravon and Upavon (Army Cooperation). Amesbury and Bulford are served by rly. See Stonehenge.

Salisbury Square. London square, off the S. side of Fleet Street, E.C. Formerly known as Salisbury Court—which is now the thoroughfare joining it to Fleet Street—it was the site of Salisbury, later Dorset, House, residence of the bishops of Salisbury. Here stood Salisbury Court Theatre, 1629–66. Here Samuel Richardson had his printing office, wrote Pamela, printed Maitland's London, and employed Goldsmith as proof-corrector. Pepys was born in Salisbury Court; Betterton, Shadwell, and Dryden were residents. In the adjacent Hanging Sword Alley was Blood Bowl House, depicted in Hogarth's *Industry and Idleness*, plate 9; and

the home of Jerry Cruncher, in Dickens's *Tale of Two Cities*. See Fleet Street.

Salish. American Indian stock in British Columbia, and the states of Washington, Idaho, Montana,

Salish Indian from Montana

and Oregon, U.S.A. They number perhaps 10,000 in Canada and 8,000 in the U.S.A. The true Salish tribe, now congregated at Flathead agency, Mont., are officially known by the early nickname Flatheads, although they never practised head deformation. They are typical of various inland hunting tribes, such as the Thompson river Indians congregated at Kamloops and Lytton, B.C.

Saliva (Lat., spittle). Secretion poured into the mouth from the salivary glands. It contains about 0.5 p.c. of solids, chiefly mucin and ptyalin, and is slightly alkaline. The functions of the saliva are twofold: first, to moisten and lubricate food, thereby facilitating swallowing; secondly, by virtue of its ptyalin, to act upon starchy constituents of the food, preparing them for absorption by splitting them into simpler sugars. Saliva plays a part in preventing decay of the teeth, as it counteracts local acid reactions in the mouth.

The salivary glands are made up of lobules in which the saliva is secreted. They are three in number on each side, namely, the parotid gland (the largest), lying between the ear and the upright part of the lower jaw; the sub-maxillary gland, lying low down inside the horizontal part of the lower jaw; and the sub-lingual gland, under the mucous membrane of the floor of the mouth.

Secretion of saliva is to a considerable extent under the control of nervous stimuli. To see or smell savoury food causes the "mouth to water," as may the mental suggestion of any salivary stimulant. In this connexion is told the old story of the trombone player who lost a competition because his adversary spoke to him about lemons. Conversely, there is the Oriental presumption of guilt

when a mouthful of rice given to a suspected man is spat forth unaltered, fear having dried the secretion of saliva.

Salivation. Excessive flow of saliva. It may be due to ulceration of the mouth, or to chronic poisoning by mercury and certain other drugs. It was once commonly seen in persons taking mercury for the treatment of syphilis.

Sall, ANDREW (1612–82). Irish scholar. Born at Cashel, he was educated at St. Omer, and became a Jesuit. He was rector of the Irish college at Salamanca, 1652–55, and professor of divinity at Pamplona and other places in Spain. Returning to Ireland about 1664, he underwent a change of belief, and in 1674 he publicly joined the Church of England at Cashel. After taking the degree of D.D. at Trinity College, Dublin, he went to Oxford, going back, in 1680, to Dublin where he died April 5, 1682. He wrote *A Declaration for the Church of England*, 1674, in defence of his change of faith. His ed. of the Bible in Irish was uncompleted at his death.

Sallé. This town of French Morocco is described under its alternative spelling of Salé.

Sallow (*Salix caprea*). Tall shrub belonging to the family Salicaceae. Known also as goat willow, and, popularly, as palm and pussy willow, it grows in woods, thickets, hedges, and along streams throughout Europe and temperate Asia to the Arctic Circle. Common in Britain, it flowers in early spring, and is distinguished by its cottony down and wrinkled leaves.

Sallust (86–34 B.C.). Roman historian whose full name was Gaius Sallustius Crispus. He was

Sallust, Roman historian

born at Amiternum in central Italy and had a distinguished public career, his offices including those of tribune (52), praetor (46), and ending with the governorship of Numidia, a post he owed to Julius Caesar, with whose fortunes he had been largely associated. Returning to Rome a wealthy man, Sallust passed his time in luxurious retirement, devoting himself to literature.

Only two of his works have been preserved complete, histories of the war with Jugurtha, and of the conspiracy of Catiline. His chief effort, of which only fragments

remain, was a history of Rome from 78 to 67. Sallust ranks high as a scientific historian, though his chronology and geography are often confused. Although a partisan, a moralist, and a pessimist, he is free from prejudice, and took great pains to make sure of his facts. In the *Jugurtha* he made a careful study of all original documents available. Thucydides was avowedly his model. Sallust's style is curiously unlike that of his contemporaries (Cicero and Caesar; in his fondness for antithesis, pointed brevity, and other rhetorical characteristics, he anticipates the prose which came into vogue a hundred years later.

Sally Lunn. Form of thick teacake which is cut open, toasted, and buttered. The buns were first made by Sally Lunn, of Bath, who sold them in the street in 1797. The following year a Bath baker and musician named Dalmar bought her business and wrote a song called Sally Lunn. The shop from which Dalmar sold the buns survived German air attacks on Bath during the Second Great War.

Salmasius, CLAUDIUS. Latinised name of the French scholar Claude de Saumaise (1588-1653).

Claudius Salmasius,
French scholar

Born at Sémur, Burgundy, April 15, 1588, he studied in Paris and Heidelberg. Vast classical learning won for him in 1631 a professorship at Leyden, and his reputation was European. He is chiefly remembered for his Latin defence in 1649 of Charles I, to which Milton replied; but his great work was his commentary on the *Polyhistor* of Solinus. Salmasius, who became a Protestant when at Heidelberg, and was a pupil of Casaubon, died Sept. 3, 1653.

Salmon (*Salmo salar*). Large food fish of the sub-class Neopterygii, family Salmonidae, inhabiting the seas and rivers on both sides of the Atlantic; in Europe from the White Sea to N. Spain; and in America from Cape Cod to Ungava Bay. In Maine and New Brunswick it is found in landlocked lakes. It is elongated in form, the upper side slightly curved, the underside more so, and the length five and a half times the greatest height.

Large salmon are about 4 ft. long, but may be 5 ft.; and weigh from 20 lb. to 40 lb., though occasionally they turn the scale at 60

lb. In common with the other members of the family, the salmon bears a second dorsal fin, though this is without rays, and is composed of fatty tissue. Adult salmon, in the sea or ascending the rivers, have the upper side of a dark blue colour paling to bright silver on the sides and under parts, the sides

more or less spotted with X-like or star-shaped marks. After their return to the streams for the purpose of spawning the silver becomes coppery. The flesh is pink.

The spawning season is some time between Sept. and Feb., but chiefly in Nov. and Dec., the salmon that have reached maturity in the sea entering the estuaries of favourite rivers, and journeying many miles up stream to reach the shallow waters near the source. They do not feed in fresh water, and consequently their condition deteriorates, until after spawning, when they return to the sea and are called "kelts." To reach the breeding grounds they have often to overcome considerable obstacles, such as waterfalls, and to do so leap clear of the water from pool to pool. As soon as they arrive at the selected spawning ground, the female scoops out a deep trough or "redd" in the gravel bottom and deposits her eggs, laying 800-900 eggs for every pound of her weight. The male follows close behind and fertilises them; they are then covered with gravel, and other redds are constructed and furnished. The eggs hatch in from a month to five months, according to conditions and the larval salmon quits the egg furnished with a yolk sac containing sufficient nourishment to sustain it for some weeks. This is known as the "alevin" stage, and at its termination the fish, now nearly a year old, becomes a "parr," of an olive tint, the back dark, the sides barred and spotted, and the underside white. About six months later—that is, in their second spring or summer—their backs assume a bluish tint, and the sides and under parts become silvery. They are now "smolts," and leave the narrow streams for the broader river, where they congregate in large companies, before starting on their journey seaward.

Hitherto, they have fed upon worms and insects, and have attained a length of about 5 ins.

Little is known of their life in the sea, but the evidence from marked smolts of two or three ounces that

have returned to fresh water a year later weighing from two to five pounds, shows that the change of diet results in rapid development. Most of them do not return for another year or two, and may be

as heavy as 10 lb. or more. These returned fish are "grilse," and mostly sexually mature males. The females and many males remain at sea for several years longer, feeding chiefly upon herrings, and ascend the river at varying ages. Although the migratory behaviour described is that, according to recent research, which is habitual among salmon, in Canada it is by no means rigidly fixed and incapable of variation.

The life-history of an adult salmon is recorded in its scales, the concentric ridges of its surface which mark its growth being fine and close when formed in fresh water, bolder and with wider spaces when added in the sea, and the fact that the fish has spawned is indicated by the fraying of certain rings. Many of the marked smolts that have gone to sea return after one or two years as grilse to the river of their origin.

SALMON FISHING. The right of fishing a salmon river belongs to the riparian landowners, who often lease the sporting rights for very large rents. The capture of salmon on economic lines is effected by nets when the fish are proceeding up the river for spawning. British salmon fisheries are estimated to produce food to the value of £1,000,000 a year; those of British Columbia are of greater value. There is a close time for salmon in English waters; usually between Sept. 1 and Feb. 1 for nets, and between Nov. 1 and Feb. 1 for rods. See Angling; Close Time.

Bibliography. The Life of the Salmon, W. L. Calderwood, 2nd ed. 1908; The Migrations of Fish, A. Meek, 1916; Modern Salmon Fishing, A. Bridges, 1947; Salmon Fishing, a New Philosophy, R. Waddington, 1947; A History of Fishes, J. R. Norman, 1948.

Salmond, SIR JOHN MATTHEW (b. 1881). British airman. Born July 17, 1881, son of Major-Gen. Sir W. Salmond, he entered the army in 1901, and served in South Africa, 1901-02. He learnt flying at his own expense and

Salmon leaping while being played on a line

joined the R.F.C. in 1912, becoming instructor at the central flying school at Upavon. He reorganized the system of training British airmen, and in 1917 became director-general of military aeronautics. In Jan., 1918, he succeeded Sir

Sir John Salmond,
British airman

H. M. Trenchard (*q.v.*) as head of the fighting air force in France, and under him it definitely established its ascendancy over the Germans. In 1922 he became commander of the R.A.F., Iraq (Mesopotamia), retiring from that post in 1924. Made a major-general in 1918, he became air vice-marshal and received the K.C.B. in 1919. He was c-in-c. Air Defence of Great Britain, 1925-29, visiting Australia and New Zealand in 1928 to make recommendations for future development. Chief of the air staff in 1930, he was made G.C.B., 1931, and retired in 1933 with the rank of marshal of the R.A.F. He became a director of Imperial Airways in 1933 and in 1939-45 was director of armament production at the ministry of Aircraft Production.

Salmond, SIR WILLIAM GEORGE FREY HANSON (1878-1933). British soldier and airman. Born Aug. 19, 1878, and brother of Sir J. M. Salmond (*v.s.*), he entered the army, 1898, and served in the South African War, 1899-1902. He joined the R.F.C., 1913, and in the First Great War, after serving on the staff and commanding a brigade, was employed in the Air Ministry from April, 1918. Appointed to command the R.A.F. in Egypt in 1919, he made a long-distance flight from Egypt to Delhi in Dec. of that year. He was made director-general of supply and research, R.A.F., in Oct., 1921, and in 1927 went to India to command the R.A.F. there, where in 1928 he took charge of the British evacuation of Kabul by air. Appointed c-in-c. Air Defence of Great Britain in 1931, he died on April 27, 1933.

Salmon Fungus (*Saprolegnia ferroz*). Mould-like fungus of the family Saprolegniaceae, which was long supposed to produce the salmon disease. It forms greyish patches upon the parts of the fish not protected by scales. These patches are at first about $\frac{1}{4}$ of an inch in diameter, but soon increase and join up with adjacent patches. The skin beneath is deeply

ulcerated. The whole of the back and sides and the mouth become involved, and the death of the salmon follows. The fungus takes the form of delicate threads similar to those of the moulds, and is propagated by the production of zoospores in capsules (sporangia), which burst to liberate them, and for a short time the zoospores have the power of movement through the water. On coming into contact with a sickly fish they germinate.

Salmon Trout. Alternative name for sea trout (*Salmo trutta*), a fish closely related to the salmon. In the sea this trout ranges from Iceland and N. Europe to the Bay of Biscay, and as a fresh-water fish extends to S. Europe and Sardinia, Algeria, and Morocco. It is silvery in colour, with X-shaped blackish spots. At breeding times it ascends rivers and enters lakes where it forms colonies. The average sea trout weighs about 8 lb. 4 oz., though in large lakes it is reputed to attain 50 lb.

Salol ($C_{13}H_{10}O_3$). Phenyl salicylate. It is prepared by the action of salicylic acid on phenol, and forms colourless, almost tasteless crystals. It is used in medicine as an intestinal disinfectant, but its value is questionable.

Salômê. Sister of Herod the Great, assassinated for plotting against his sons. Another Salômê was the daughter of Herodias, who, at her mother's instigation, danced before Herod Antipas, and as a reward was granted the head of John the Baptist. This was the name also of the sister of Mary, the mother of Jesus. Oscar Wilde wrote in French a play called Salome, produced in Paris in 1894 with Bernhardt as lead, and in London at the Bijou Theatre, Bayswater, May 10, 1905. Salome is also the name of an opera by R. Strauss, 1905. See Herod; Herod Antipas; John.

Salon or **SELUNG**. Burmese name for an Indonesian tribe of nomadic fishers in the Mergui archipelago. Calling themselves Mawken (sea-drowned), and numbering about 1,900, these "sea-gypsies" appear to have been land-dwellers in the Indo-Chinese peninsula, akin to the Chams, before they were forced by the pressure of stronger immigrant peoples to take to boats. Short, brownish, and lank-haired, they have no fixed villages or agriculture.

Salon. In general, a room used for the reception of guests, a drawing-room. The term is often applied to the literary or social groups centring round some lady whose house is their recognized

meeting-place, as was Holland House (*q.v.*) in the 18th century. In France salons have greatly influenced political, literary, and artistic life, e.g. those of Catherine de Vivonne at the hôtel de Rambouillet and those known by the names of Scudéry, Scarron, De Lespinasse, Necker, De Staël, etc.

L'ancien salon—in short, the Salon—is a French exhibition of fine art held annually in Paris. Since 1890, when Meissonier headed the schism that resulted in the formation of the Société Nationale des Beaux Arts, the "old" Salon, which represents the Société des Artistes Français, constituted in 1880, has been less conspicuous. Exhibitions of painting and sculpture were organized as early as 1648. It was established in the Champs Elysées in 1856.

Salona. Village of Yugoslavia, in Dalmatia. Formerly an important Roman city, its prosperity was greatest about 300; in 535 it was sacked by the Goths. Spalato, $3\frac{1}{2}$ m. away, was built round the empty palace of Diocletian, who was born here. Many ruins of the ancient city were laid bare by excavations during the 19th century.

Salonica or **SALONIKA** (Gr. *Thessaloniki*). City of Greece. Situated at the head of the gulf of the same name, Salonica is the terminus of the rly. from Belgrade-Nish, has a branch line W. to Monastir, and a line E. through Doiran, Serres, and Drama, which connects with the trunk Sofia-Istanbul rly. It has a magnificent harbour, and when under Turkish rule was the second port of the Turkish Empire.

The city was founded from Corinth in 315 B.C., and became the capital of Macedonia. S. Paul knew it as Thessalonica, and addressed the two Epistles to the Thessalonians to its Christian people. The Saracens captured it in 904, Venice held it during the Middle Ages, and it passed to the Turks in 1430, until 1912, when it capitulated to the Greeks.

The people are mostly Jews, the descendants of Jews who fled from persecution in Spain and settled there, and they speak a corrupt form of Spanish called Ladino.

Salonica has an imposing appearance, as it rises from the shore in a series of terraces to the turreted citadel. It was half destroyed by fire, Aug. 18, 1917. Pop. 236,524.

FIRST GREAT WAR. Salonica was a base for Allied campaigning from 1915 to 1918. A British-French force landed there, Oct. 3-8, 1915, in anticipation of a Bul-

garian declaration of war, although Greece was a neutral state. Venizelos, the Greek premier, made a formal protest and resigned, but his successor, Zaimis, promised that Greek neutrality would be benevolent towards the Allies. By the end of Oct. the Salonica Expeditionary Force (called in France the Army of the Orient) consisted of 30–40,000 men, mainly French. On the invasion of Serbia by Bulgaria, Oct. 11, the Allied troops moved forward from Salonica, but were unable to gain touch with the Serbian army. But it was decided to hold Salonica as a base for future operations and personnel was increased to eight divisions, three French, five British. A fortified line, 50 m. long, was drawn around the city. During the winter of 1915–16 the force grew to 300,000, to whom were added 100,000 Serbians from Corfu in May, 1916, and Russian and Italian forces later in the summer.

Advances from Salonica were made in June and July, and the French linked up with the Serbians at a point W. of the Varda. The British, under Gen. Milne, occu-

pied the R. bank of the Struma. In Aug., the Bulgarians attacked this line in force, and gained some temporary successes against the Serbians. To help Rumania, who had joined the Allies, Gen. Sarrail, the French c.-in-c., ordered a general offensive in Sept. In the subsequent action Monastir was occupied by French and Russians. Trench warfare followed until Feb., 1917, after which further Allied advances were made against the Bulgarians and Germans. In May, another general offensive was less spectacular in its gains, and the stalemate position remained until Sept. 15, 1918, when a further offensive ordered by Gen. Franchet d'Esperey, the new French c.-in-c., resulted in the unconditional surrender of Bulgaria a fortnight later, followed by the expulsion of Germans and Austrians from Albania (Nov. 1), Serbia (Nov. 3), and Montenegro (Nov. 4). Part of the Salonica army was marching through Rumania towards Bukarest when the end of hostilities came on Nov. 11.

SECOND GREAT WAR. Salonica was bombed from the air several times by the Italians after their invasion of Greece, Oct. 28, 1940, six raids occurring on Nov. 1. The city fell to the Germans April 9, 1941, when they entered Greece over the Rupel pass from Bulgaria; and it remained in German occupation until they with-

drew after destroying port installations shortly before British patrols reached there on Nov. 1, 1944. A larger British force landed from the sea Nov. 4 and set to work to restore the port to use. One quay, 300 yds. long, was called the Lancashire quay, having been constructed by Royal Engineers from that county.

Salop. Alternative name for the English county Shropshire. It is said to be derived from an old name for the capital, Shrewsbury. It is not, as is often supposed, an abbreviation.

Salopian. In geology, a time period of the Silurian (*q.v.*) system, now divided into the Wenlock and Ludlow series. The name is derived from Salop or Shropshire, where strata of this period are well known at Wenlock and Ludlow.

Salpa. Genus of the Tunicata, a class of marine chordates, found in large numbers in many seas. There are about 15 species of Salpidae, each occurring in asexual and aggregated sexual forms. The two forms alternate regularly. They are free-swimming animals, unlike many of the Tunicata, which fix themselves to shells or stones at the bottom of the sea. *See* Ascidian; Tunicata.

Salpi. Lagoon of Italy, in Foggia. Separated from the Gulf of Manfredonia in the Adriatic Sea by a narrow strip of land, 22 m. E. of the city of Foggia, it is 10 m. long by 2 m. wide, and yields considerable quantities of salt. The village of Salpi is close to the site of the ancient Salapia.

Salpingitis. Inflammation of the Fallopian tube or channel which connects the uterus with the

Salonica, Greece. 1. The Arch of Galerius. 2. The White Tower. 3. An imposing view of the waterfront and harbour, the second largest port in south-east Europe

ovary. Gonorrhoea is a frequent cause. If occurring on both sides, the condition often results in sterility. See Fallopian Tubes.

Sal Prunella. Fused potassium nitrate, moulded into balls or flat cakes. The name is derived from a belief in Germany in the 16th cent. that the salt was a remedy for a plum-coloured quinsy.

Salsette. Island in Thana district, Bombay state, India. It is situated N. of Bombay Island, and with it forms a breakwater for Bombay harbour against the monsoon winds and storms. Connexion is maintained between the two islands by a causeway, a stone bridge, and rly. embankments. A range of low hills, rising to 1,500 ft., runs N. and S.; the coastal lowlands yield coconuts and rice. Near Thana, on the E. coast, the chief town, are rock caves with colossal statues of Buddha. Ruins of convents, churches, and villas are a reminder of the Portuguese occupation, which ended in 1739, when the Mahrattas conquered the island. To forestall a Portuguese expedition sent out in 1774 to retake it, the E. India Co. govt. of Bombay dispatched a force to take Thana, and by the treaty of Surat, March 6, 1775, the Mahrattas ceded Salsette to the company. Area, 153 sq. m. Pop. 251,147.

Salsify or **SALSAFY** (*Tragopogon porrifolius*). Biennial plant of the family Compositae. It has an

Salsify. Leaves and root

edible root, and is known generally as the vegetable oyster. It requires deeply dug soil, similar to that suitable for parsnips (*q.v.*), and a sunny, open position. The purple flowers are seen in May or June, and should be removed as soon as they appear, for the benefit of the root. The roots are ready for use

at the end of Oct., and throughout the winter, and may be preserved in the same way as parsnips. Salsify is raised from seed sown in spring, and thinned out. To get the best flavour, the roots should be parboiled, and then fried in slices, or grated.

Salso. River of Sicily, Italy. The longest river in the island, it rises in the Madonian Mts. in the prov. of Palermo, and flows S. across the prov. of Caltanissetta to reach the Mediterranean Sea at Licata on the S. coast. Its length is 70 m. Like the other rivers of Sicily, it has but a small volume of water and may dry up completely during the summer droughts.

Salsomaggiore. A city and watering-place of Italy, in the prov. of Parma. Situated on the foothills of the Apennines, 6 m. S.W. of Borgo San Donnino, 70 m. by rly. S.E. of Milan, it possesses saline and sulphur springs, and is in normal times visited by invalids from all parts of Europe. There are interesting excursions into the neighbouring mountains.

Salt (Lat. *sal* and various Teutonic forms, *e.g.* Ger. *salz*). In chemistry the word is applied to all compounds formed by reaction between an acid and a base—the metal of the base replacing the hydrogen of the acid (*see* Salts). Specifically the term has long been applied to sodium chloride which occurs naturally in enormous deposits in many parts of the world. Salt is soluble in water, 100 parts of water dissolving 36.5 parts of salt at 0°C. and 39.6 at 100°C. In sea water the salt content varies from 3.3 p.c. in the tropics to 2.9 p.c. in polar regions. Natural deposits occur in various geological strata, being generally lenticular in shape. They have invariably been formed by the evaporation of saline solutions, *e.g.* sea water, especially in shallow coastal lagoons subject to periodical flooding, where repeated evaporation would occur. The great Polish salt mines at Wieliczka have galleries running six miles in one direction and two miles in the other and contain virtually an underground city with more than 1,000 inhabitants. Salt-bearing strata are sometimes thousands of feet thick, the rock salt having flowed, as a result of irregular stresses.

In the U.K. the most important deposits are in Cheshire (Northwich), Worcs (Droitwich), Staffs, and Durham, those of Cheshire being the most valuable. Near Northwich the Romans made salt by the evaporation of brine in open pans, using a local brine spring. Salt had previously been obtained by allowing the liquid to trickle over faggots and collecting the incrustation formed. The production of salt by evaporation

in pans was practised by the Chinese from very early times, but when the Romans learned and first practised the art is not known. The mining of salt began in England about 1670, when the deposit under Marbury (Northwich) was discovered. Only one rock salt mine is now operated in England, at Winsford, Cheshire, and of the annual salt production of about 800,000 tons, only about 180,000 is rock salt.

In addition to the salt actually recovered, much is used in industry direct as brine. It is estimated that about 2½ million tons of salt are used in this way, so that the British production of salt is of the order of 3,000,000 tons a year.

METHODS OF PRODUCTION. The evaporation of sea water has been carried on since very early times in primitive fashion and is still used. Large quantities are so obtained in Portugal, Italy, Spain, and France. As the salts in sea water differ in solubility the composition of the deposit alters as evaporation proceeds. The process can therefore be scientifically controlled. Usually the crude salt from sea water contains about 15 p.c. impurities but purer grades are made, particularly in France.

Methods of mining used are similar to those in coal mining. The rock salt is blasted and then dug out, leaving pillars of the natural rock standing at intervals to act as supports for the roof. The salt so recovered is about 95 p.c. pure sodium chloride.

Various methods of evaporation of brine are used. The simplest is in open pans. The brine pumped from the workings requires no preliminary treatment, going direct to the pans. The fineness of grain of the product depends upon the temp. and rate of evaporation. The lower the temp. and correspondingly longer time, which may vary from 24 hours to six weeks, the coarser the product.

During evaporation the small quantities of calcium and magnesium salts present are precipitated as a scale adhering to the pan. This is removed and the salt obtained is therefore very pure. The magma of salt crystals can be moulded and subsequently dried in special chambers. For many purposes, however, it is sufficient to allow the salt to drain on the side of the pan and then remove it to sheds to dry naturally.

The finest grained salt is prepared by a vacuum pan process for which the brine has first to

Salt. 1. Working on the face of a rock salt deposit. 2. Making salt from brine by the open pan method. 3. Blocks of salt ready for crushing into domestic salt

be purified by precipitation of calcium and magnesium salts. The evaporator is a large cylindrical vessel with a conical bottom and containing vertical pipes through which the brine passes continuously. Steam is admitted on the outside of the pipes and thus a large surface of evaporation is provided. The evaporators are arranged in series. The steam passes through the series, being finally condensed and returned to the boiler. The precipitated salt falls to the conical bottom and is continuously removed as a thick magma. The salt is dried and packed and the brine returned to other evaporators. In this way a very fine, free running, and pure salt is obtained.

Salt is one of the most widely used and vitally important natural products. It is an essential ingredient in the diet of both human beings and animals and in agriculture is a constituent of many fertilisers. It is also used as a dressing for pasture land. In the heavy chemical industry it is the basic raw material for alkalis and for chlorine derivatives. It is also used in pigment and dyestuff manufacture. In the soap industry it is used for "salting out" the curd (*see Soap*). As a preservative it is widely used in foodstuffs such as bacon, fish, and butter; and in many industrial products such as hides and skins. *See Gabelle; Geology; Mineralogy; Sodium.*

Salt, SPIRIT OF. Name given by Glauber to crude hydrochloric acid (*q.v.*) which he first prepared by pouring oil of vitriol (sulphuric acid) on sea salt. It is yellowish in colour, owing to the presence of

impurities which fit it only for certain industrial and similar uses. "Killed" spirit was used as a soldering flux; it is prepared by dissolving scraps of metallic zinc in the strong acid, and is used after effervescence has ceased. It has generally given place as a flux to a solution of zinc chloride; but for soldering zinc itself a dilute form of spirit of salt is used. It is unsuitable for electrical work and other uses where corrosion of the soldered joints must be avoided. But acid fluxes, where suitable, have an important cleansing action which is useful. In the home, the spirit is used for cleansing dirty w.c. pans, being applied on a mop and washed off quickly with water. Here it is giving place to less corrosive commercial preparations.

Salt, Sir Titus (1803-76). British manufacturer. Born at Marley, Yorks, Sept. 20, 1803, he went to Bradford as an apprentice in the woollen trade. With his father he started in business in 1824, and with great inventive genius devised a method of using alpaca for the manufacture of cloth. The business of woollen and worsted manufacturers then grew so enormously that the town of Saltaire was erected for it just

outside Bradford. In 1859-61 Salt was Liberal M.P. for the latter. He was a prominent Congregationalist and a generous donor to charities of all kinds. Made a baronet in 1869, he died Dec. 29, 1876. His Life was written by R. Balgarnie, 1877.

Salta. Northernmost prov. of Argentina lying S. of Bolivia. Very mountainous in the W., rising to 20,000 ft., it also contains fertile valleys, woodland tracts, and pastures. It is watered by the rivers Vermejo, Salado, and Pasage, and holds extensive salt swamps, while to the E. it forms part of the Gran Chaco (*q.v.*). Minerals abound, chiefly gold, silver, and copper; there are also considerable oil deposits. Agriculture is the main industry, the principal crops being maize, alfalfa, sugar, grapes, coffee, tobacco, and fruit. Irrigation is necessary in many parts. Large herds of cattle are raised, and the prov. is noted for its ox-hides, which are exported in large quantities. Its area is 48,872 sq. m. Pop. 564,622.

Salta, the capital, stands at an altitude of over 4,000 ft., on the Salta river, an affluence of the

Salta arms

Sir Titus Salt

Salado, 145 m. N.W. of Tucuman. It has a cathedral, college, and high school, and its trade is chiefly with Bolivia. In 1948 a rly. was completed, linking Salta with the Chilean port of Antofagasta. Pop. est. 45,000.

Saltaire, Yorks. Congregational church
Frith

Saltaire. Village of the W.R. of Yorks, England. On the Aire, 4 m. N.W. of Bradford, it is served by rly. and by the Leeds and Liverpool canal. It owes its name and origin to Sir Titus Salt, who, in 1853, opened a factory here for the manufacture of alpaca. Sir Titus made Saltaire a "model village," and provided schools and a chapel. Saltaire is administratively part of the urban district of Shipley (*q.v.*).

Saltarello (Lat. *saltare*, to jump). A 16th century dance movement in triple time. It followed immediately upon another movement in common time such as a galliard, the two forming one dance. The saltarello was probably a round dance, while the first part, the galliard, was performed in the country dance manner, those taking part facing each other in two lines. Saltarello is also the name of a modern Italian dance of vigorous character for one or two persons. The music has a rhythm suggestive of leaping, whence the name.

Saltash. Mun. borough, Cornwall, England. It stands on the Tamar, 4 m. W. of Devonport, with a rly. station. The chief industry is fishing. The fine, lofty bridge across the Tamar is 2,240 ft. long, and was built by Isambard Brunel. Cattle markets are held. Saltash was an important place in the Middle Ages, and its fisheries

were valuable. Queen Elizabeth made it a corporate town, and it sent two members to parliament until 1832. The medieval corporation was re-formed in 1886. Market day, alternate Thurs. Pop. est. 7,000.

Saltilion (Lat. *saltatio*, leap). In geology, the movement by water or wind of particles too heavy to be carried in suspension, and too light merely to roll. The particles bounce and are carried forward only to drop, bounce and be swept along again. In this way grains and small pebbles get rounded, by having corners knocked off.

Saltburn-by-the-Sea. Urban dist. and watering-place of N. Riding of Yorks, England. On the E. coast, 16 m. E. of Middlesbrough; it has a rly. station. The prosperity of the place as a seaside resort dates from the opening of the rly. in 1861. Its attractions include bathing, golf links, and a pier, while there are fine cliffs and pleasure grounds. But the most notable feature is the magnificent stretch of sand which, starting here under the lee of the Huntcliff runs W. for 8 m. to the mouth of the Tees. Pop. 4,500.

Saltburn, Yorkshire. Bay, with the pier and cliffs

Salt Cellar. Receptacle for holding salt, placed upon the table at meals. Apart from the general use of salt, such were important because in the Middle Ages in large households a great salt cellar marked the division of the table into two parts; above it sat the guests of rank, and below it the inferiors, hence the phrase "below the salt."

Saltcoats. Police burgh and watering-place of Ayrshire, Scotland. It stands on the E. shore of the Firth of Clyde, 30 m. from Glasgow and one from Ardrossan, and is served by two branches of British rlys. It has become a popular watering-

Saltcoats
borough arms

Saltash, Cornwall. Entrance to Brunel's famous railway bridge across the Tamar, connecting Saltash with Devonport

place, but its shipbuilding industry has declined. The name is due to the salt industry which flourished here about 1600-1800. Pop. 10,173.

Salter, Sir (James) Arthur (b. 1881). A British economist and politician. Born March 15, 1881, at Oxford, where he was educated at Brasenose College, he entered

the transport dept. at the Admiralty in 1904, and was director of ship requisitioning, 1917. An expert on distribution and supply, he was in charge of the economic and finance section of League of Nations at its inception and again 1922-31, going on missions to India, 1930, and China, 1931 and 1933. Sir Arthur was knighted in 1922. In 1932 he published *Recovery*, a celebrated book. During the Second Great War he held junior parliamentary offices and headed the British merchant shipping mission at Washington, 1941-43. In 1944 he was senior deputy director-general of U.N.R.R.A. Gladstone professor of political theory at Oxford, 1934-44, he was Ind. M.P. for Oxford University, 1937-50. In 1947 he became chairman of the advisory council of the international bank.

Salters' Company. London city livery company. Originating in a guild of Corpus Christi in All Hallows, Bread Street, it received its first licence as a fraternity and guild from Richard II, in 1394. Arms

Salters' Co. arms were granted in 1530, and a charter of incorporation in 1559. The company participated in the colonisation of Londonderry in the time of James I. Its first hall, in Bread Street, a bequest by Thomas Beaumont in 1454, was burnt in 1539; the fifth, in St. Swithin's Lane, built 1823-27, was destroyed by German bombing from the air in 1941. The company administers almshouses at Watford and Maidenhead.

Saltito. Town of Mexico, capital of the state of Coahuila. It is 46 m. W. by S. of Monterey, and is served by rly. Its prominent buildings include the cathedral, Madero institute, and Athenaeum. Among industries are the manufacture of cotton and woollen goods, flour milling, etc. Pop. 75,721.

Salting, GEORGE (1835-1909). British art collector. Born at Sydney, N.S.W., Aug. 15, 1835, the son of a wealthy merchant of Dan-

ish origin, he was educated at Eton and Sydney university, and then studied art and archaeology in Rome. Settling in England, he passed his life in collecting Oriental porcelain, majolica, small statuary of every description, and pictures and drawings. He died Dec. 12, 1909, and by will divided his collection among the Victoria and Albert Museum, the British Museum, and the National Gallery.

Saltire. In heraldry, one of the ordinaries. A four-limbed figure, composed of two bands placed over

Saltire in heraldry

each other diagonally, it has been described by some heraldic writers as a park gate or barrier, by others as a house gable, but it is generally recognized as the cross of St. Andrew, or *crux decussata*. A shield may be divided "per saltire," and charges grouped "in saltire." See Heraldry, colour plate; Ordinary.

Salt Lake City. City of Utah, U.S.A. The state capital and the co. seat of Salt Lake co., it is 11 m. S.E. of Great Salt Lake, and is served by the Denver and Rio Grande and other rlys. It is the

eccles. capital of the state, and the headquarters of the Mormons or Latter-Day Saints. Among their buildings are the granite temple, 1853-93, and the tabernacle, which holds 8,000 persons. Other structures include the city and co. building, the federal building, and S. Mark's cathedral. Salt Lake City is the seat of the university of Utah, and has a state normal school, the Latter-Day Saints' university, and public and state law libraries. It is a planned city of broad streets and green lawns. Manufactures are boots and shoes, confectionery, tobacco, cigars, etc. There are large smelters, and extensive business in minerals and stock.

The city was founded in 1847 by Mormons (*q.v.*) under Brigham Young, and incorporated four years later. Deemed the capital of a rebellious state, it was occupied by U.S. troops 1858, but a truce was arranged. The arrival of the Pony Express (*q.v.*) and the rly. ended the isolation of this city. Pop. 149,934.

Salto. Dept. of N.W. Uruguay, fronting the Uruguay river. The surface is hilly, and is watered by numerous streams. The soil is fertile, producing a large quantity of fruit, from which wine is made. Its area is 4,865 sq. m. Pop. 100,840. Salto, the capital, stands on the Uruguay river, 260 m. N.W. of

Salt Lake City, Utah. 1. Main Street, the city's commercial centre, 132 ft. wide in accordance with Brigham Young's original plan. 2. Utah State Capitol. 3. Temple Square, showing the granite temple of the Mormons, or Latter-Day Saints, right; the squat Tabernacle, centre, and the Assembly Hall, left

Montevideo, with which it is connected by rly. Its port is used for the transshipment of goods from Buenos Aires and Montevideo to S. Brazil. Salto is often called the city of oranges, the groves covering 12,000 acres. Pop. 30,000.

Salt of Sorrel. Potassium quadroxalate ($\text{KHC}_2\text{O}_4 \cdot \text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$). It is so called because it was first prepared from wood sorrel (*Oxalis acetosella*). It is now made by partially neutralising oxalic acid with potassium carbonate, and is also sold under the dangerous misnomer of salt of lemon, although lemons do not contain oxalic acid, which is poisonous.

Salt of Tartar. Potassium carbonate. It is so called because it was first prepared by the action of heat on tartar. It is the deposit which forms in casks during the fermentation of wine.

Salton. Name of two villages of East Lothian, Scotland, also known as Saltown and Saltoun. It is also the name of a stream which here unites with the Tyne. East Salton is 16 m. S.E. of Edinburgh and West Salton is about $\frac{1}{2}$ m. away. The place is noted for its connexion with Andrew Fletcher, who bought the estate. Under his patronage it became famous for its barley, while his nephew, Lord Milton, helped the British Linen Co. to start its first bleachfield here. The chief building is the parish church at E. Salton. Gilbert Burnet was at one time minister here.

Salton Sea or **SINK.** Lake of California, U.S.A. The Salton depression in S. California, N. of the Gulf of California, is 260 ft. below sea level in its most depressed portion, and lies between the San Bernardino and Chocolate Mts. and the Superstition Mts. In 1905-07, during the operations incidental to the construction of the All America irrigation canal from Yuma, Arizona, on the Colorado river through Imperial Valley, water flooded 400 sq. m. of the basin and formed the sea, now c. 200 sq. m. in area.

Saltoun, Baron. Scottish title now borne by the family of Fraser. The first baron was Sir Lawrence Abernethy (cr. 1445), and his family held it until the 9th baron died in 1668. It then passed to a descendant of the 7th baron. His daughter had married Alexander Fraser of Philorth, and in 1670 the title was confirmed to their son Alexander, who became the 10th baron. It has been borne by his descendants ever since, Alexander Arthur (b. March 8, 1886) becoming the 19th baron in 1933. The

family seat is Cairnbulg Castle, Fraserburgh.

Saltpetre (Lat. *sal*, salt; Gr. *petra*, rock). Potassium nitrate or nitre, KNO_3 . It is a colourless solid, with a bitter, salty taste, and is found as a superficial deposit on the soil of many hot, arid climates. The name is also given to Chile saltpetre, or sodium nitrate, NaNO_3 , and calcium nitrate wall or lime saltpetre, $\text{Ca}(\text{NO}_3)_2$. In pharmacy, potassium nitrate is known as *sal prunella*.

Extensive deposits occur in Chile, where it is found associated with nitratine (see Nitrates.) Ordinary saltpetre is also found in superficial deposits in parts of Europe and N. America; but is largely produced in India by lixiviation of the saline earth. Common saltpetre is a powerful oxidising agent and is used in metallurgy, in the making of gunpowder, as a brine in salting meat, in the treatment of asthma, etc.

Chile saltpetre is found in deposits spread over a large area in S. America, and known locally as *caliche* (g.v.). Also known as cubic saltpetre from the shape of its crystals, it is largely used in the manufacture of ordinary saltpetre, nitric acid products, as a fertiliser, etc.

Wall or lime saltpetre is manufactured by fixation of nitrogen from the air, and absorbing the nitric acid so formed by lime. It is a fertiliser. See Potassium.

Salt Range. Hilly tract of the W. Punjab, Pakistan. It lies between the Jhelum and the Indus, and is a W. extension of the Siwalik Hills, culminating at its W. end in Sakesar, 5,000 ft., where local officials have established hot-weather headquarters. The great deposits of rock salt are at Kheora. The hills are bare, but shelter populous and fertile valleys. The range is of great geological interest; the rock salt occurs in strata of Cambrian age; resting unconformably upon the Cambrian strata are Carboniferous rocks containing a glacial boulder-bed. At the other end of the range are fossiliferous Tertiary strata, including nummulitic limestones associated with coal.

Salts. In chemistry, substances derived from the reaction of an acid on an alkali in certain definite proportions. As an example, if to a quantity of sulphuric acid is added sodium hydroxide until the acid is neutralised, the resulting liquid when evaporated yields a substance exhibiting neither the properties of the acid nor those of the alkali. This is the salt known

as sodium sulphate. There are other methods of making salts, e.g. dissolving a metal in sulphuric acid, or dissolving a basic hydroxide or oxide in an acid. When a metal, e.g. zinc, dissolves in sulphuric acid, the hydrogen of the acid is replaced by the metal, so that salts may be considered as acids in which the hydrogen has been replaced by a metal.

The varieties of salts are as follows:

Neutral or normal salts, as the name implies, are neutral to litmus, or the whole of the hydrogen of the acid has been replaced by the alkali, e.g. Na_2SO_4 (sodium sulphate). Acid or acidic salts are those in which only part of the hydrogen has been replaced, e.g. K H SO_4 , acid sulphate of potassium. Basic salts contain a higher proportion of a base than is necessary for the formation of a normal salt, e.g. $\text{Bi}(\text{OH})_2 \text{NO}_3$, basic bismuth nitrate. Double salts are those which in their formula show two complete salts, e.g. iron ammonium sulphate.

In mixed salts half the acid is neutralised with one base and half with another, e.g. tartrate of sodium and potassium or Rochelle salt. Complex salts are formed in some reactions by mixing two or more single salts in solution, but they differ from double salts in having the composition of a single salt, e.g. potassium ferrocyanide. Hydroxy-salts contain hydrogen and oxygen in the proportion to form water. When this water is separated an oxy-salt results. Pyro-salts are salts in which water has been driven off by means of heat. See Acid; Alkali; Chemistry; Solution.

Saltwood. Village of Kent, England. It overlooks the sea near Hythe, and is noted for the ruins of its castle. This was a residence of the archbishop of Canterbury, and from here the knights set out to murder Becket. Tradition says it was founded by Hengist. There is an old church, SS. Peter and Paul.

Saltwort (*Salsola kali*). Annual herb belonging to the family Chenopodiaceae. It is a native of Europe, Asia, Africa, Australia, N. and S. America. It has a prostrate, many-branched stem and fleshy, awl-shaped leaves. The small, greenish flowers are without petals, and are produced at the base of the leaves. Saltwort grows on sea-shores, and was formerly important as the source of barilla, an impure carbonate of soda, still used in the production of glass

and soap. To obtain this the plants are dried and burnt on a grating over a pit, into which the fluid barilla drops. The name is sometimes applied also to the marsh samphire or glasswort (*Salicornia europaea*), also a member of Chenopodiaceae, which is used for a similar purpose.

Saltwort. Leaves and flowers of the sea-shore plant

Saluda. River, co., and town of S. Carolina, U.S.A. The river rises in the Blue Ridge and flows, in general, S.E. for 200 m. to unite with the Broad river and form the Congaree river. The small town, which lies 12 m. N. of Johnston, is the county seat. Here was started a famous system of libraries for negroes. The co. has an undulating surface, drained mainly by the river.

Saluki. Breed of dog. Believed to be the oldest representative of the greyhound family, it was the coursing dog of the Arabs, and widely distributed throughout the Middle East, especially Persia. Dogs bred in Great Britain are of milder temperament than imported ones, many of which are savage. They should have a long, narrow head; the ears should be long and drooping, and covered with long, silky hair. Salukis are

Saluki. A champion of this breed of dog, oldest representative of the greyhound family

white, cream, red, fawn, golden, grizzle and tan, black and tan, or three-coloured.

Salus. In Roman mythology, the goddess of health and prosperity, public and private. The Romans identified her with the Greek goddess Hygieia.

Salut, ÎLES DU (Fr., Safety Islands). Group of three islands off the coast of French Guiana, to which they belong. They rise from 100 ft. to 200 ft. alt. The headquarters are on Île Royale, which is nearest the mainland; this is a coaling station, and has

a large hospital. Formerly it was a convict settlement. Next is the Île de St. Joseph, and beyond it is the Île du Diable.

Salutation (Lat. *salutatio*, from *salus*, wish for welfare). Form of address and gesture used on ceremonial occasions, and in social

intereourse, to express worship, submission, respect, or affection. Among oral salutations may be mentioned the Oriental "Peace be on thee," "The Lord be with thee"; the old Babylonian formula "O king, live for ever," cf. the Irish "Long life to your honour"; the Greek *χαίρε* (Be joyful), used for both greeting and parting; and the Roman *Salve* and *Vale* (Be well), used respectively at meeting and parting; the modern English, "How do you do?"; "Good-bye," with its religious origin, "God be with you," cf. the French *Adieu* and the Spanish *Vaya usted con Dios* (Go with God).

The origin of the almost universal and ancient custom of saluting after sneezing is unknown. Salutations by gesture include prostrations, ranging from the profound obeisances of ancient Egypt and the East generally to the modern European nod or almost imperceptible bow. In China ceremonial bowing and kneeling are regulated by a rigid etiquette. In Christian religious ceremony, worshippers bow before the Host and at the name of Jesus. In Europe in the Middle Ages, kneeling on both knees was reserved for divine worship, or one for homage to the sovereign. In England the curtsy is retained in court ceremonial, and lingered in the form of a "bob" until the 20th century in country districts.

The grasping of hands in token of a compact—as seen in the Roman and later in the Christian marriage ceremony—and the early Christian "right hand of fellowship" grew into the modern handshake. The Chinese shakes hands with himself. Secret societies have their own handshakes, by which initiates may make themselves known to each other.

Uncovering or disrobing as a form of salutation varies in degree in different countries—from the baring of the head by men in the West and of the feet in Burma and

elsewhere in the East, to the stripping to the waist in Polynesia, and the total stripping in some parts of Africa. See *Kissing*.

Salute. In the army and navy, the paying of a compliment or showing respect. Compliments are paid on the approach of royal or other distinguished personages, commissioned officers of superior rank, when bodies of troops or ships meet, at the burial of officers or rank and file, and on other ceremonial occasions. The form of salute varies according to the occasions and the persons to whom the compliment is being paid. An unarmed soldier or sailor meeting an officer, and an officer meeting a senior of, or above, field or equivalent rank, salute by raising the right hand smartly to the forehead. A soldier carrying his rifle slung salutes by extending his arm to the butt and turning his head to left or right. A sentry with his rifle at the slope salutes by placing his right arm across his body with his right hand on the butt; officers of field rank and bodies of armed troops are saluted by presenting arms. The royal salute to the sovereign consists in the band playing the national anthem, the presenting of arms, and the lowering of colours. Uncased colours are saluted by troops at all times.

In the R.N., boats' crews salute by tossing the oars, lying on the oars for a captain, and, with a powered boat, stopping for the sovereign. Other naval salutes are the firing of guns, the number of rounds fired depending on the rank of the recipient, dipping flags, and manning ship. Indian princes are entitled to salutes of guns according to their status.

Saluzzo. City of Italy, in the prov. of Cuneo. It stands on an affluent of the Po, at the E. base of the Cottian Alps, 42 m. S. of Turin. The old part of the town is built on a hill at an alt. of 1,200 ft. It retains part of its old fortifications and the castle, now utilised as a prison. The lower part of the town contains the handsome cathedral (modernised), which dates from 1480. There are also abbey ruins. The 16th century Casa Casazza houses a well-stocked museum. Silvio Pellico and Bodoni, the painter, were natives of the city. Manufactures include silk, hardware, leather, and hats. The capital of a marquiseate from medieval times down to about 1550, Saluzzo was seized by the French, who in 1601 handed it over to Savoy. Pop. 16,170.

Salvador, El. Republic of Central America, area 13,173 sq. m., bounded on N. and E. by Honduras; W. and

Salvador Republic arms

N.W. by Guatemala; S. by the Pacific. The coastline is about 160 m. long, with three main ports of Acajutla, La Libertad, and La Unión. San Salvador, the capital, is 2,000 ft. above sea level and 23 m. from its port, La Libertad, to which there is a modern asphalt motor road. It is also connected by rail or road with the main cities of El Salvador and with the international railroad of Central America.

The extensive inland plateau has several active volcanoes. The Izalco is the most active in Central America and its flames make a well known landmark to mariners on the Pacific. Between two mountain chains which cross the country lie valleys of great fertility, e.g. the valley of Lempa, 2,000 ft. above sea level, comprising most of the area of the country and watered by the Rio Lempa. In the cones of some extinct volcanoes lie beautiful lakes, sometimes used as landing places for seaplanes.

The main crop is coffee, planted intensively on the mountain slopes, the plantations often extending to the summits of hills and volcanoes and covering altogether about 265,000 acres. Coffee constitutes 80 p.c. of the country's exports. Crops, if destroyed by volcanic dust from eruptions, grow again with renewed vigour. Sugar, corn, beans, and wheat are among other crops. El Salvador is the sole producer of balsam of Peru, a healing drug, misnamed in early Spanish times, when Peru was the better known country. The production of henequen or sisal fibre has greatly increased in the 20th century. Gold, silver, copper, and mercury occur, but there is only one important gold mine. The country has luxuriant forests, which have been little exploited.

Conquered by Pedro de Alvarado in 1524 and freed from Spanish control in 1821, the history of El Salvador is chequered by many revolutions and wars. In 1939 a new constitution was adopted, but in 1945 the old constitution of 1886 was reinstated. There is only one legislative body, the national assembly with three deputies from each department, elected by vote for one-year terms. There is universal suffrage, the vote being con-

ceded to women in 1945. The executive is the president, in whom large powers are vested. He is elected by direct popular vote for a four-year term. Military service is compulsory between the ages of 18 and 50. Education is free and compulsory. The language is Spanish, and the dominant religion is Roman Catholic. The colon is the monetary unit with a fixed exchange value (2.5 colóns=\$1). The climate is almost temperate on the tableland, but the lowland is often hot. There is a wet season, with wind and thunderstorms, from May to October, but the rest of the year is usually dry and warm.

The population is about two million, of whom about 10 p.c. are Spanish; 50 p.c. mixed Spanish and Indian; and 40 p.c. Indian. The majority live on farms, but the government aspires to convert

Salvador flag. Blue, white, and blue

El Salvador into an industrialised country; and its density of population, the character of the people, and its geographical location seem to fit it for this.

Salvador DA HORTA (1527-67). Spanish saint. Son of a poor, pious family of Catalan stock, he was born near Gerona, and after working as a shoemaker in Barcelona, became a Franciscan monk, in the same diocese. He was venerated for his supernatural gifts. He was canonised April 17, 1938.

Salvage (Lat. *salvus*, safe). Term applied to the saving of any property from total loss or destruction by retrieving it for re-use in its original form, or retrieving its component materials for conversion to other uses. Used almost exclusively at one time in connexion with the raising of marine wrecks or abandoned vessels, the term has become more widely extended in meaning to cover the recovery of almost every kind of re-usable material.

From crude beginnings limited by the mechanical devices of the period, marine salvage has developed into a highly technical process demanding an expert knowledge of seamanship, naval architecture, and general engineering principles and practice. This knowledge has to be applied in the recovery of the vessel from the position where it has been wrecked, sunk, or disabled; in transporting it when raised to a place of safety; and in carrying out repairs, or in breaking it up if it is beyond economical repair.

A ship, even if not totally immersed, may present a most serious problem in salvage. Frequently a simple stranding of a vessel on a sand bank at high spring tide (when no structural damage directly results) can bring about a total loss as the ebb and flow of succeeding tides tend to break the vessel in two by the sheer weight of her unsupported fore and aft structure. A vessel so situated is cut in two, water-tight bulkheads are made good, each half is

pumped out, and, when tides are suitable, the portions are towed separately to the repair port where, often, the two halves are skillfully rejoined.

Comparatively small vessels submerged in water that is not very deep can be raised by passing wire hawsers under the hull. This can be done by "feel" on sandy or mud bottoms, but divers must be employed, if the sea bed is rocky and irregular. At greater depths the hawsers are placed in position by mechanical

Salvage. A diver descending with oxy-acetylene cutting gear to work on a half-submerged wreck

devices. A dozen or more hawsers form a cradle which is made fast to tank lighters on each side of the vessel to be raised. These lighters are then sunk by admitting water into the tanks; the cradle is shortened and made fast, the water is pumped out of the tanks which rise buoyantly to the surface with the weight of the wreck supported in the cradle. Lighters and suspended wreck can then be towed to a place of safety. Often this procedure must be repeated a number of times to shorten the cradle support as shallower water is reached.

Pontoons or tanks are sometimes attached direct to the hull of a small wrecked vessel, and pumped out, raising the wreck with, as it were, a life-belt around her.

The enormous weights involved in salvaging big vessels preclude the use of hawsers and attached at tanks. The hull of the vessel is made comparatively water and air tight by welding patches to damaged plates and sealing all openings. Compressed air is then pumped into the vessel to force out the water and bring her to the surface. Much of the super-structure is removed before floating the hull. This system was made practicable through the development of underwater welding and cutting by salvage operators in diving equipment.

In the U.K. the ministry of Supply allocates the tonnage available to the three or four firms equipped for large-scale shipbreaking. Merchant ships, passenger ships, warships, and all kinds of smaller craft are broken down to the last smallest scrap. Iron and steel is identified metallurgically, cut to furnace size, and sent to blast furnaces; non-ferrous metals such as lead, copper, brass, gun-metal, and bronze are sorted, graded into categories, and made suitable for remelting. Timber and fittings, and every item of plant or equipment that can be reconditioned are salvaged and repaired for renewed service.

Until oxy-acetylene flame cutting apparatus became available to the shipbreaker his tools were shears, a winch, a hammer and chisel. On the other hand, the hulls with which he had to deal were less robust. Cutting gases are piped along the quays and aboard the ships to be broken up; blasting pits deal with heavy forgings such as propeller shafts; magnet cranes move heavy sections as they are cut from the ship to the quay, where they are cut down pro-

gressively to furnace size. Since scrap metal salvaged from ships returns to the steel works for re-conversion, the safety razor blade may well contain steel that once formed part of a naval ship or of a rusty tramp steamer.

SALVAGE AT SEA. A person who renders salvage service which saves a vessel, her cargo, or the lives of those on board from danger at sea is entitled to a reward for his services so long as they are given voluntarily and not in performance of any legal or official duty. Before salvage award can be claimed, the services must have been successful. There may be an agreement on the sum to be paid for salvage services, but in the absence of such agreement the amount is fixed by the court. As a general rule it will not exceed half the value of the property saved. In the U.K. salvage matters come before the Admiralty division of the high court.

SALVAGE OF WASTE. Under the Hitler regime, salvage of domestic and other waste materials which could be turned to fresh use was enforced in Germany; and in the U.K. the increasing call on shipping space during the Second Great War led to the development of salvage schemes, and to the introduction of orders under the defence regulations making it an offence to destroy or throw away e.g. paper, string, metal, rubber, foodstuffs. In June, 1940, local authorities were required to organize waste collections, while such bodies as the W.V.S. and the Boy Scouts instituted voluntary collections of salvage. From all sources, 1,946,971 tons of waste paper, 8,000,000 tons of domestic salvage, 65,597 tons of bones, 1,500,000 tons of scrap metal, and 125,242 tons of rags and textiles were collected during the war years. Total value of these materials exceeded £45,000,000; more than 130,000 voluntary collectors assisted in its collection. The collection of salvage was continued after the war.

Salvage Corps. Organization maintained at the expense of an insurance co. for salving property damaged or endangered at fires. Calls to fires are passed to the corps by the fire service, with which close cooperation is maintained. Salvage tenders with necessary appliances and equipment are dispatched immediately,

and, while the firemen are at work extinguishing the fire, salvagemen enter the premises to protect property as far as possible from damage by water, smoke, and heat. Goods are covered by waterproof sheets, machinery is oiled, water pumped from basements, and roofs temporarily repaired.

The London Salvage Corps was established in 1866, after

Salvage Corps. Uniform of the London salvage men

responsibility for fire brigadework (previously undertaken by insurance companies) was transferred to the municipality. It has three stations, the h.q. being at 63-66, Watling Street, E.C.4, a chief officer, and a staff of 60-70 men. The equipment includes nine motor tenders, three portable pumps, approx. 1,000 waterproof covers, and miscellaneous plant. The number of

fires attended each year in London is about 2,000. Similar organizations are maintained in Liverpool and Glasgow.

Salvarsan (late Lat. *salvare*, to save; *sanitas*, health). German trade name given to arsenphenamine, called also 606 because that was the number of the successful experiment, made in 1907, in a long series conducted by Ehrlich and Hata in their search for a remedy for syphilis. It is a yellow powder, soluble in water, and its discovery was the first practical demonstration of chemotherapy. It has been largely replaced by neosalvarsan (*g.v.*), and the term 606 now describes sodium salvarsan, a further improvement.

Salvatierra. Town of Mexico, in the state of Guanajuato. It stands on the river Lerma, 17 m. S. of Celaya, and is served by the national rlys. of Mexico. It has cotton and other industries, and was founded in 1613. Pop. 12,000.

Salvation. In a religious sense, the deliverance from original sin, the attainment of holiness, and, finally, immortal life, the reward of believers through the life, death, and resurrection of Jesus Christ. See Redemption.

London Salvage Corps badge

THE SALVATION ARMY AND ITS WORK

Col. Robert Sandall, Author, *History of the Salvation Army*

An account of the revivalist mission which, under William Booth's inspired leadership, developed into a world-wide religious and reforming force. See also biographies of the generals of the army

The Salvation Army is a religious, social service, and social reform organization that originated in the E. of London in the 1860s. Its work is based upon a twofold conception: (1) that human failure and sinfulness can be remedied only by divine action as seen in the spiritual regeneration

Salvation Army badge

known as conversion; (2) that it is obligatory upon all Christians to serve others, as revealed in our Lord's commendations of those who in doing so had served Him (Matthew 25, vv. 40-45). On July 2, 1865, in a tent in a disused Quakers' burial ground in Thomas Street, Whitechapel, in place of an evangelist who had been taken ill, William Booth (*q.v.*) began what was intended to be a week's revival services. The tent was one of a number of religious endeavours set on foot by the E. London special services committee formed in 1861 as an outcome of the 1859 religious revival. The workers at the tent invited William Booth to stay, and he, with the agreement of his wife Catherine, having come to the conclusion that he had there found his destiny, agreed.

The E. London Christian Mission

A number of these workers, together with converts made during William Booth's first meetings, were formed by him into the Christian revival association, later renamed the E. London Christian mission. In 1870, the mission having been extended outside London, the limiting prefix was dropped. In this year Booth set up the Christian mission conference, transferring to that body all his own powers. In 1875 a deed poll embodying full provisions for self-government was enrolled in chancery, but before two years had passed a deputation of the most ardent leaders of the mission waited on Booth, pointed out that government by conference and committee was becoming too cumbersome, and besought him to re-assume full responsibility. He agreed, and the conference (June, 1877) unanimously ratified the change. The next and last con-

ference (Aug., 1878), annulled the 1875 deed poll and replaced it by a new deed, the principal provision of which was that the E. London Christian mission should be always thereafter under the oversight, direction, and control of some one person.

In May, 1878, the name Salvation Army was written into a leaflet by Booth as explanatory of the nature of the Christian mission. By the end of the year it had been universally adopted and the former name was thereupon dropped for good.

The first move outside the U.K. was made in 1880 when Commissioner George S. Railton was sent to the U.S.A. to organize work in Philadelphia begun by a family of Salvationists (Shirley) who had emigrated from Coventry.

Salvation Army uniforms, 1948

The reform side of the Army's service was begun in the early 1880s by individual women Salvationists in many parts of the U.K. who took into their own homes girls who desired to "leave the streets." It was first established on a permanent official basis by the opening of a rescue home in Melbourne, Australia, in Jan., 1884; a small home was opened in Whitechapel, London, in the following May. Efforts to aid men who had been in prison began in Australia in 1885.

The missionary field was first entered in India (1882) by F. St. George de L. Booth Tucker, who gave up a commissionership in the Indian civil service. Native costume and the native way of life were adopted. By 1947 there were in India, Pakistan, and Ceylon 3,641 officers (most of them native) and 6,836 centres of work, which included schools, hospitals, dis-

pensaries, and leper colonies. An outstanding feature of Indian service was the gathering into settlements and setting to work of criminal tribes (dacoits and outlaws). For this Salvation Army officers were awarded the Kaiser-i-Hind gold medal.

The Salvation Army is worldwide; its officers preach in 102 languages. It publishes 111 periodicals with an aggregate circulation of one and three-quarter million copies per issue. Everywhere it is one Salvation Army, and its members and officers of all nations are of equal standing.

Its full-time officers number 32,000; another 15,205 persons without rank are also fully employed. Local officers (part time voluntary workers) number 102,400. More than fifty thousand bandmen and bandswomen give unpaid service (instruments and music only are provided; they buy their own uniforms). Evangelistic work is carried on at 18,000 corps and outposts.

In 1881 the international h.q. of the Salvation Army was moved from Whitechapel Road to a building at 101, Queen Victoria Street, E.C.4, which was burnt down in 1941 during a German air raid. An international training college (at Clapton, 1882) is now housed at Denmark Hill, London. Training colleges have also been established in every country occupied. Beginning with the South African War, 1899, whenever troops have been in the field Salvation Army welfare workers have served with them; also Salvation Army chaplains. The annual self-denial appeal, which is everywhere observed, is the basis of the financial help on which the Army depends for such of its work as is not self-supporting.

Violent Opposition

The great expansion of the Salvation Army during the early 1880s aroused bitter opposition. When it was making converts from drunkenness by the thousand, many of the then existing poor type of beer shops were forced into bankruptcy. Bands of roughs were organized into "skeleton armies," plied with drink, and set to attack Salvationists. Opposition was also organized by vested interests of a still more vicious character, and the police and magistracy at first found it easier to suppress the victims rather than their attackers. Judgements by the Queen's Bench eventually established the Salvationists' right to go in procession; and to protection when

exercising that right; but before that hundreds of Salvationists were injured—some indeed to the death—and many suffered imprisonment.

The publication in 1890 of *In Darkest England and the Way Out* by General Booth marked the beginning of a change in the general attitude to the depressed and criminal sections of the population (the so-called submerged tenth). All the methods Booth proposed for their relief and reclamation, with the exception of the suggested colony overseas, have been put into effect, with many developments not in the original plan. The *Darkest England* trust deed, signed by William Booth in 1891, provides that monies given for this scheme shall be kept entirely separate from other Salvation Army accounts. In many countries the Army is an officially recognized agency for putting into effect legislation for the protection and care of young people; in the U.K., for instance, it has established approved schools.

In the U.K. the Army maintains district nurses and clinics, and Eventide Homes for the aged, and has helped to procure legislative reform when social and non-party in character, e.g. the Criminal Law Amendment Act of 1885, the Children Act of 1908, and various temperance enactments. In Japan, at the cost of severe handling by mobs, the Army pioneers brought about a fundamental change in social law which resulted in the immediate release of 12,000 young women from "white slavery."

The Army's Red Shield canteens served the armed forces at home and on the battlefield, and succoured the civilian victims of German bombing, in the Second Great War. Its welfare workers visit the blind and afflicted in their own homes and take them on holiday excursions.

When General William Booth died in 1912, Bramwell Booth, chief of the staff to his father since 1880, succeeded to the office of general. He was judged unfit for office, for health reasons, by the Salvation Army high council in 1929, and Edward J. Higgins was elected in his place. Every office in the Salvation Army is open to women. From 1934 to 1939 its International Leader was General Evangeline Booth, fourth daughter of William Booth. Albert Orsborn, C.B.E. (Mrs. Orsborn is a daughter of the late General Higgins), was elected general in 1946, on the retirement of General Carpenter.

Mackenzie, 1930; *A Missionary's Memories*, Bullard, 1946; *History of the Salvation Army*, vol. 1, 1865-1878, R. Sandall, 1947.

Salva y Perez, VICENTE (1784-1851). Spanish philologist. Born and educated at Valencia, he became professor of Greek at the university of Alcalá de Henares about 1804, but was compelled by the French invasion in 1808 to retire to his native town. Elected to parliament, 1820, he became a marked man owing to his Liberal principles, and withdrew in 1823 to London, where he became a bookseller. Removing to Paris, he published Spanish classics and works of his own, including a *Grammar of the Spanish Language*. 1830. Freed from fear of arrest by an amnesty, 1835, he returned to Spain, and again became a deputy and secretary to the cortes.

Salve Regina (Lat., Hail, O Queen). Antiphon said, or sung, in the R.C. Church, after lauds and compline, from Trinity Sunday to Advent. The earliest antiphon is addressed to the Blessed Virgin Mary, and placed in the Roman Breviary by Pius V, its composition is attributed to an 11th century Benedictine monk, Hermannus Contractus. The closing words, *O clemens, O pia, O dulcis, Virgo Maria*, are said to have been added by S. Bernard.

Salvia. Genus of plants of the family Labiatae, including the aromatic garden sage (*q.v.*). The genus has many showy species which are much cultivated in greenhouses and flower gardens. Some favourites are the brilliant scarlet *Salvia splendens*, a half-hardy species; *S. patens*, a beautiful blue; *S. pratensis*, purple; and the pineapple-scented *S. rutilans*, a scarlet greenhouse species.

Salvini, TOMMASO (1829-1915). Italian actor. He was born at Milan, Jan. 1, 1829, and first attracted attention in Rome in 1847 by playing Orestes to Adelaide Ristori's *Electra* in Alfieri's *Orestes*. His greatest part was Othello, which he first

played at Vicenza in 1856. Other great rôles were Hamlet, Romeo, Macbeth, King Lear, Conrad in Giacometti's *La Morte Civile*, Oedipus in Nicolini's play of that name, Paolo in Pellico's *Francesca da Rimini*, and the title-rôle in Alfieri's *Saul*. Died Dec. 31, 1915.

Salvo. Controlled fire of artillery in consecutive discharge by batteries. In battleships salvos are fired by each turret in turn.

Sal Volatile OR AROMATIC SPIRIT OF AMMONIA. Alcoholic solution containing ammonium carbonate and ammonium hydroxide, with small amounts of oil of nutmeg and oil of lemon. It is used as a stimulant in cases of fainting. *Pron.* sal volatilee.

Salween (Chinese *Lu-kiang*). River of China and Burma, rising in the Tibetan plateau and entering the Gulf of Martaban near Moulmein. It is navigable only for a stretch of about 100 m. at its mouth, a steamer service running between Moulmein and Shwegoon. After entering Burma from China the Salween flows directly S. It is a fast running river with incomparable scenery of forests, crags, and waterfalls. Its tributaries include the Gyaing and Attaran. From the Karenni country it forms the boundary between Burma and Siam for some 80 m. It is 1,750 m. long.

During the Second Great War the Japanese occupied Moulmein, from which the British had withdrawn, Jan. 31, 1942. By Feb. 2 they were in possession of Kadu I. in the estuary of the Salween, between Moulmein and Martaban. They occupied Martaban, on the W. bank, after heavy fighting on Feb. 10. Fighting continued E. of the river some 30 m. to the N. in the Paan area until by Feb. 15 the British had been forced back to the Bilin river.

The Burma Road crosses the upper Salween E. of Tengyueh, and in this area there was severe fighting between the Japanese, attempting to advance across the Salween from occupied Burma, and the Chinese in May-June, 1942, Dec., 1942, Feb., 1943, and Oct.-Nov., 1943. In May, 1944, on the nights of the 10th and 12th, a U.S. armed and trained Chinese army of 20,000 under Marshal Wei Li-Huang crossed the Salween, swollen with the melting snows of Tibet, on a 130-m. front N. and S. of the Burma Road to meet Stilwell's forces advancing through N. Burma.

Salwick. Village of Lancs, England. It is about 6 m. N.W.

Tommaso Salvini,
Italian actor

of Preston, with a rly. station on the Preston-Fleetwood line. During the Second Great War a chemical defence factory was established here which later became one of the factories concerned with the development of atomic energy for industrial purposes.

Salzach. River of Austria. It rises in the Hohe Tauern, a branch of the E. Alps, flows first E. in a long, narrow valley, and then N. to join the Inn at Braunau after a course of 130 m. In its lower section it forms the boundary between Austria and Bavaria.

Salzbrunn (Pol. Szezawno). Village of Silesia, under Polish administration since 1945. It lies along the valley of the Salzbach, 40 m. S.W. of Wroclaw, and was famous for its saline springs, the waters being used for pulmonary complaints, dyspepsia, gout, and rheumatism. Pop. (1935) 9,571.

Salzburg. Former duchy of Austria, now a province. The duchy had an area of 2,760 sq. m. It originated in the lands ruled by the archbishop of Salzburg, and until 1802 was an important German state. At the settlement of 1815, although somewhat smaller in extent, it became an Austrian duchy. In 1849 it was made a crownland. Salzburg was the capital; other towns were Hallein and S. Johann. The duchy, which was divided into six departments, had its own diet and sent members to the Reichsrat in Vienna. It is a mountainous and beautiful region, with agriculture as the staple industry, although there is some mining. In the district are a number of mineral springs, those at Gastein being the best known. Pop. 330,704. After the Second Great War the district of Salzburg was in the U.S. zone of occupation in Austria.

Salzburg. City of Austria. The capital of the prov. of Salzburg, it stands on the Salzach, 156 m. W.

by S. of Vienna.

The picturesque old town, which stands at a height of 1,400 ft., is on the left bank and is overlooked by the citadel of Hohen-Salzburg, on the top of the

Salzburg arms

Monchsberg. The chief building is the cathedral, a model of that of S. Peter's at Rome, put up in the 17th century by Santino Solari on the site of a building dating from 774. There are also the Franciscan church of the 13th century, those of S. Sebastian with the

tomb of Paracelsus, S. Peter, a Romanesque basilica of the 12th century, and a number of others. The palace was long a residence of the Hapsburg family, and there is another for the archbishop. The Mirabell palace, once another archiepiscopal residence, is now public property. The Benedictine abbey of S. Peter and the Capuchin monastery are two of several religious houses. There are modern government buildings, a medieval town hall, the old house in which the diet met, and museums. In the new town is the Gothic church of S. Andrew. The Neutor is a tunnel, cut in the Monchsberg, to connect the old town with one of its suburbs.

Mozart was born here, and his memory was perpetuated by a museum and a statue in the Mozartplatz. Salzburg was founded about 700 on the ruins of the Roman Juvavia, and developed because it was the seat of an archbishop who became one of the most powerful German prelates. It was a fortified town, its walls remaining until 1861. From 1623 to 1810, and again from 1928, it was the seat of a R.C. university. Near the city are the palace of Hellbrunn with its noted mechanical theatre, the castle of Aigen, and a number of beauty spots. An annual summer music festival was inaugurated in 1920,

Salzburg, Austria. The river Salzach with the old town on its left bank. Top, the fortress palace of Hohen-Salzburg

a festival opera house being built 1926. Salzburg surrendered without a fight to units of the U.S. 7th army, May 4, 1945, and was in the U.S. occupation zone. Pop. 106,919.

Salzkammergut. Dist. of the E. Alps in Austria. It extends E. from Salzburg into the prov. of Upper Austria and Styria. It is famous for its scenery, which owes much of its charm to the lakes, of which the chief are Traun, Hallstatt, Atter or Kammer, and Mond. Here are numerous popular resorts—Ischl, Gmunden, Traun-Kirchen, and Hallstatt. The Traun is the chief river. Salt is mined in large quantities, mainly at Ischl.

Samain, ALBERT VICTOR (1858–1900). French poet. He was born at Lille, April 3, 1858, and obtained municipal employment in Paris, 1881. He was one of the founders of the *Mercur de France*, 1890, and published a volume of poems, *Au Jardin de l'Infante*, 1893, which showed his great gifts as a writer of musical and sensitive poetry. It was awarded the *Prix Archon-Despérouses* by the Acad-

émie Française, and was followed by *Aux Plancs du Vase*, 1898, and *Le Chariot d'Or*, 1901. After a long illness he died at Magny-les-Hameaux, Aug. 18, 1900. A volume of *Contes* appeared posthumously, 1902, and a play, *Polypème*, was produced, 1904.

Samara. In botany, a dry, two or more celled fruit, elongated by wing-like extensions, as in the maple, sycamore, ash, etc. A popular name for them is keys, as ash-keys, etc. See Fruit.

Samarai. Island and port of the Pacific. The island is 3 m. S.E. of the S.E. end of the island of Papua, and is 250 m. S.E. of Port Moresby. It was discovered in 1873 by Captain Moresby, who called it Dinner Island, and it has an area slightly less than 1 sq. m. It is under the governmental control of Australia. The port serves the isolated settlements on the neighbouring goldfields of New Guinea, and has a wireless station. There is a steamer service to Port Moresby, Papua, and Sydney, Australia, sailings being made every three weeks.

Samaria. District in central Palestine. It was colonised by the remnants of the tribes of Manasseh and Ephraim, with an admixture of Assyrian immigrants. The city of Samaria was founded about 920 B.C. by Omri, who transferred the seat of government to it from Shechem. Destroyed by Sargon, it was rebuilt by Herod the Great, who styled it Sebaste. The city was captured by the British in 1918, and the district conquered by them in their campaign in Palestine. See Palestine.

Samaritans. Inhabitants of the region of Samaria, a small community of whom still exists in Nāblus, the ancient Shechem. After the fall of Samaria, 721 B.C., Sargon deported a large part of the population, and replaced it with captives brought from Babylonia, Syria, and Arabia (2 Kings 17). These and later colonists mingled with the old Hebrew population that remained, and the resultant new and mixed race came to be known as the Samaritans. The foreign colonists decided to worship Jehovah, the god of the land, but they blended this worship with their own heathen cults. This syncretism naturally offended the Jews, who were strict worshippers of Jehovah, and accounts for the strife between Jews and Samaritans that manifested itself early, and increased rather than diminished throughout the centuries (*cf.* John 4, v. 9; 8, v. 48).

When Jesus said a good word for a Samaritan, He added fuel to the fire of hatred that was raging already against Him. The Jews who returned from exile were not disposed to be friendly towards a people whom they regarded as half heathen, and the bitter feeling between the two peoples was intensified, either because the Jews refused to allow the Samaritans to participate in the cultus at the temple in Jerusalem, or because they would not permit them to help in the rebuilding of Jerusalem. It is said that, in retaliation, the Samaritans tried to prevent the latter undertaking (Ezra 4, v. 7; Nehemiah 4, v. 7).

However this may have been, the Samaritans decided to have a rival temple of their own, and in 332 B.C., according to Josephus, they were allowed by Alexander to build one on Mount Gerizim, near Shechem (mod. Nāblus), their holy city. About that time they made the Hebrew Pentateuch their one authoritative sacred book.

The claim of the Samaritans to be the only true descendants of Israel and their denial of the sanctity of Jerusalem and its temple were a constant cause of annoyance to the Jews. The friction between the two increased to such an extent that in the Jewish wars the Samaritans often aided the enemy. Naturally the Jews took reprisals, and in 128 B.C. John Hyrcanus destroyed the Samaritan temple on Gerizim. The Samaritans had also wars more peculiarly their own to wage. In the reign of Hadrian (A.D. 117-138), the Romans punished them for rebelliousness by destroying their sacred books.

When Christianity became the state religion of the Roman Empire, they were in frequent conflict with the Christians or the Roman emperors. In the reign of Justinian a Samaritan revolt (529) brought punishment of such severity that the Samaritans were deprived of their synagogues and other privileges. Under Justin II (565-578) they lost all their privileges, and were outlawed. They fared little better under the rule of Islam. During the Crusades Nāblus was plundered frequently. In 1517 it came under the rule of the Turks.

Samaritan religious customs and institutions have much in common with those of the Jews, but peculiar features have been added. The Samaritans lay great stress on the unity of God, and carefully avoid all anthropomorphic and anthropopathic expressions. With the Jews they shared the expectation

of a Messiah, but he was not to be greater than Moses. According to the Christian Fathers, they did not believe in angels, the resurrection, or a future life; but their own literature seems to prove that at any rate since the 4th century A.D. these beliefs have been held.

Their language is a dialect of Western Aramaic. The oldest manuscript of the Samaritan Pentateuch, ascribed by the Samaritans to Abisha, the great-grandson of Aaron, and preserved with great veneration at Nāblus, is not earlier than the 12th or 13th century B.C. A translation of this was made into an Aramaic dialect, and is known as the Samaritan Targum. The other Samaritan literature includes the Book of Joshua, a work in Arabic, dating perhaps from the 13th century; *El-Tōlīdeh*, a book of annals from Adam to modern times, in Samaritan-Hebrew, with an Arabic translation—a work begun in the middle of the 12th cent.; and *The Chronicle of Abulfath*, a compilation in Arabic, written A.D. 1355. See Jews; Palestine.

Samarium. One of the cerium family of rare earth metals, forming an almost insoluble potassium sulphate. The earth was first isolated in 1878 by Delafontaine. The element, chemical symbol Sm, falls in the third long period of the periodic table. It has an atomic number of 62; atomic weight, 150.43; melting point, 1,300° C.; specific gravity, 7.7 to 7.8. The metal is not easily prepared, because of its high melting point, but can be obtained by the electrolysis of the fused anhydrous chloride, mixed with one-third its weight of barium chloride. Samarium has a number of isotopes, the most abundant of which has mass 152. See Rare Earths.

Samarkand. Town of Uzbek S.S.R., giving its name to a region of the republic. It stands near the left bank of the Zarafshan (Kara Daria) and has been famous through history for its squares, gardens, and fountains, and the decoration of its public buildings. Since its occupation by Russia in 1868 a modern town has been built, with electric power and textile and leather plants, distinct from the native Mahomedan quarters. There is a rly. to Bokhara, 135 m. W. The chief trade consists in the export of corn, rice, silk, cotton, fruit, and horses. Samarkand, the ancient Maracanda, and the capital of Sogdiana, in the 14th century became the capital of the empire of Timur, who was buried here, and

the centre of the intellectual life of Mahomedan Asia. Babar, founder of the Mogul empire, seized

City of London school and the S. Kensington school of art, he was apprenticed at 16 to a firm of

artillery fire Canadian infantry fought towards Mons, first entered at midnight of Nov. 10-11.

Samarkand, Uzbek S.S.R. The Madrasah, or college of Shir Dar, in the city

Samarkand in 1511. It was long subject to the emirate of Bokhara until taken by the Russians. Pop. 134,346.

Samarra. Town of Iraq. It is situated on the left bank of the Tigris, 65 m. N.W. by N. of Baghdad, and was founded in A.D. 842 by the Abbasid caliph Motassim. Its brick mosque has a square-based minaret 163 ft. high, ascended by an external spiral stairway recalling the old Babylonian ziggurats, and copied 36 years later by Ibn Tulun at Cairo. Samarra is one of the four places of pilgrimage for Shiah Muslims. It was captured by the British, April 23, 1917. Photographic surveys of the Samarra region by the British Mesopotamian force revealed the planning of an ancient city 20 m. long and 2½ m. wide, above and below the present town, between the Tigris and a canal.

Sambalpur. District and town of Orissa, India. The dist. is part of the Chota-Nagpur plateau and occupies both sides of a section of the Mahanadi river. Rice is the chief crop. The town is on the left bank of the Mahanadi, and is the terminus of a branch of the rly. from Calcutta to Nagpur. Here Pandit Nehru laid in 1948 the foundation stone of the Hirakud dam. Area, 5,419 sq. m. Pop., dist., 1,182,622; town, 16,000.

Sambhal. Town of the Uttar union, India, in Moradabad dist. It is situated in the S. of the dist. on a branch rly., and has sugar refineries. It is built on a mound, the debris of an ancient city, and was important during the earliest period of Mahomedan rule. Pop. 53,887.

Sambourne, EDWARD LINLEY (1844-1910). British black-and-white artist. Born in London, Jan. 4, 1844, and educated at the

means of hatching in parallel lines. Some of his most delightful work is seen in his original illustrations to Kingsley's *The Water Babies* (1869). Sambourne died at Kensington, Aug. 3, 1910.

Sambre. River of France and Belgium. Rising in a forest in the dept.

of Aisne, it flows N.E. through Nord into the Meuse at Namur in Belgium. Its length is 112 m., and it is navigable for barges almost throughout; it is connected with the Oise and Schelde by canals.

Sambre, BATTLE OF THE. Name given to a final battle of the First Great War. It was fought between British and German forces, from Nov. 1, 1918, until the armistice of Nov. 11. The British 1st, 3rd, and 4th armies were engaged against the German 2nd and 18th. The general front of the British attack was from the Schelde, W. of Valenciennes, to Oisy, N. of Guise. Valenciennes was captured by an enveloping movement as a preliminary to the main battle. This capture was complete by Nov. 4, and from that time the story was one of steady British advance. The impediment to the advance was less the German fire than the difficulty of maintaining communications and supplies. The weather was deplorable, roads had been wrecked, and the rlys. mined with delayed-action charges. But by the night of Nov. 7-8 there were clear signs of a general German retreat. On Nov. 9 Maubeuge was captured without any German defence of this famous fortress. In the face of heavy

Linley Sambourne, British artist

When the news came that an armistice would take effect at 11 a.m. on Nov. 11, there was no halt to the advance. Canadians killed or captured the entire Mons garrison, and the firing remained heavy and the advance continued almost until the appointed hour. In the whole battle the British had advanced 25 m. and taken 19,000 prisoners, together with the second largest Allied capture of guns (460) in any engagement of the war, and every kind of store, munitions, rly. rolling stock, etc. The British line in the last map of the battle-front ran from Sivry in the S., through Erquelines, Bousoit, Jurbise, Herchies, Ghislenghien, and Lessines, to Grammont in the N.

Sam Browne. Name applied to the uniform leather belt worn by commissioned and warrant officers in the British army. Designed by General Sir Samuel Browne (1824-1901), it consists of a belt and two straps which pass over the shoulders, crossing at the back; though only the strap passing over the right shoulder is usually worn. There are rings for attaching the sword-frog. The Sam Browne belt was adopted in the field uniform of most of the Allied armies during the First Great War, but, after 1939, was not worn on active service in the British army.

Sambur Deer (*Cervus aristotelis*). Species of large deer, belonging to the family Cervidae,

Sam Browne belt with sword-frog attached

Sambur Deer. A male of this Indian species of deer

occurring in India and Ceylon. It stands about 4½ feet high at the shoulder, has dark yellowish-brown hair, and bears a fine pair of branched antlers, which sometimes exceed 3 ft. in length. The neck bears a conspicuous mane of long hair. The sambur is found in the forests, and visits its grazing grounds chiefly by night.

Samian Ware. Red or black earthenware of primitive type. It is supposed to have originated at

Samian Ware. Portion of a vase found among Roman remains at Manchester

Samos, the Greek isle, but was manufactured in every country that came under Roman influence. It is glazed and sometimes ornamented in relief.

Sammons, ALBERT EDWARD (b. 1886). British violinist. Born in London, Feb. 23, 1886, he was mainly self-taught. In 1908 he attracted the attention of (Sir) Thomas Beecham, becoming leader of the Beecham orchestra for five years; later he achieved distinction by his interpretation of Elgar's violin concerto, and edited that of Delius. Leader of the London string quartet for nine years, he introduced new works at sonata recitals given in conjunction with the pianist William Murdoch. He became professor of the violin at the R.C.M. He wrote *The Secret of Technique*.

Samnites. Ancient Italian people of Umbr-Sabellian stock. Starting from Sabine territory, they settled in the mountainous country between the plains of Apulia and Campania, their chief centre being Bovianum (Bojano). Their language was adopted from the subjugated Oscans. A warlike and aggressive people, they first came into collision with the Romans in 354 B.C., and the appeal of Capua for Roman aid led to the first Samnite war (343-341). The second war (328-304), in which the incident of the Caudine

forks occurred, ended in the victory of the Romans. In the third war (298-290) the Sabine power was broken at the battle of Sentinum in Umbria (295). Still determined enemies of Rome, they fought for Pyrrhus and Hannibal, and in the Social War (90-88) they were the mainstay of the rebellion. During the war between Marius and Sulla, they joined the former, and were annihilated at the Colline gate, Nov. 1, 82. See Rome.

Samoa OR NAVIGATORS' ISLANDS. Group of nine large islands and five islets in the W. Pacific. They lie 130 m. N. of Tonga, and 400 to 500 m. N.E. of Fiji. Except Rose Island they are of volcanic origin and are fringed with coral reefs. By an agreement between Great Britain and Germany made

in 1899 and ratified by the U.S.A. in 1900, Great Britain renounced all rights in the group in favour of Germany in the case of Savaii, Upolu, Apolima, and Manono, and for Tutuila and the remainder in favour of the U.S.A. When the First Great War broke out New Zealand forces on Aug. 30, 1914, occupied without bloodshed the German islands, which were subsequently held by New Zealand under mandate and trusteeship. The administration, inaugurated in 1920, includes a legislative council consisting of six official members, two European non-official members, and four nominated native members. There is also an elective native advisory council. Of the

total area of more than 1,250 sq. m., Savaii has 660 sq. m.; Upolu more than 500 sq. m.; Tutuila 77 sq. m. British Samoa contains 69,532 inhabitants, U.S.A. Samoa 10,055.

The islands are elevated and forest-clad in the interior; in Savaii a height of 5,413 ft. is attained; the coasts are usually high and steep. The only good harbour is at Pago Pago, on Tutuila, a U.S.A. naval station. Copra, cacao, rubber, and fruit are the principal products. Apia, on Upolu, is the chief British town.

The group was probably discovered in 1722 by the Dutch navigator Roggweein; in 1768 Bougainville gave it the name Navigators' Islands; in 1830 John Williams introduced Christianity

Samoa. Map showing some of the islands of the Pacific group

therein. Internecine struggles between rival chiefs for supreme authority commenced in 1868, and led to the interference of Britain, Germany, and the U.S.A., which culminated in the agreement of 1899-1900. In 1905 a volcano, in an interior valley in Savaii, emitted quantities of lava which filled the main and side valleys and

Samoa. Natives of these Pacific islands. Left, a professional orator; right, girls making kava, a beverage concocted from the root of the same name

Samovar, used by the Russians for making tea

flowed out to sea. Samoa is one of the places at which the International Date Line (*q.v.*) deviates, in order to give the islands the same calendar as New Zealand.

In 1890 R. L. Stevenson (*q.v.*), travelling in search of health, made his home at Vailima, where he lived for the rest of his life, and his sympathy with the friendly natives, by whom he was surrounded, drew him into political controversy with the German officials. The substance of his complaints was embodied in A Footnote to History, 1892. See Apia. Consult History of Samoa, R. M. Watson, 1919; Modern Samoa, F. M. Keesing, 1934.

Samos. Greek island in the Aegean. It lies off the W. coast of Asiatic Turkey about 40 m. S.W. of Izmir, and has a length of 27 m., a breadth at its widest of 10 m., and an area of about 180 sq. m. It is mountainous, the highest mt. being Kerkiis, 4,700 ft., and has many fertile valleys, with forests leading up the slopes of the hills. Silver, lead, and marble are produced, and fine wine, fruits, and tobacco exported. Colonised by the Ionians about 1000 B.C., Samos passed to the Persians in the 6th century, but regained its freedom after the victory of Mycale, 479. Rome took it in 84 B.C. It was a centre of art, and renowned for its poets and sculptors. The chief city was Samos, near which was the famous Heraeum, or temple of Hera. The modern capital is Vathy, at the head of a small bay looking N. Pop. 77,858. For its part in the Second Great War see Dodecanese.

Samosata. Ancient city at Samsat, on the right Euphrates bank above Carchemish, N. Iraq. It is situated at the mouth of the Euphrates gorges, and a prehistoric settlement is indicated by cliff-dwellings. An inscribed sculptured stela marks the region as a Hittite outpost, which became subject to Assyria in 708 B.C., and eventually to Rome in A.D. 72. *Pron.* Samossahta.

Samothrace. Greek island in the Aegean Sea. It is 8 m. in length by 6 m. in width, and rises to 5,240 ft., the highest point in the Aegean archipelago. Its area is 30 sq. m. Pop. est. 5,000.

Samovar (Russ. *samovar*). Russian hot-water urn, principally used for making tea. The word itself means self-boiler. It is usually made of copper, and is kept always boiling with the least evaporation, by means of a tube running upwards through the urn, and filled with lighted pieces of charcoal. A similar vessel is used in China for keeping soup hot.

Samoyed. Russian name for a people of primitive Altaian stock and speech in Arctic Russia (tundra dwellers). Extending from the Kanin to the Taimir peninsula, they number some 27,000. Darker, flatter-faced, narrower-eyed than the Finnic stock, they may descend from Yenisei Tubas driven N. and W. by stronger Ugrian tribes. Under a Christian veneer nature-worship and shamanism for long prevailed.

The domestic dog of the Samoyed people—generally called the Samoyed—was introduced into Great Britain at the end of the 19th century. The Samoyed is put to many uses in his own land: he herds reindeer, guards tents, and is used in hunting bears. This dog

Samoyed natives from Archangel

has also been of great use to Arctic and Antarctic explorers. In colour the animal is pure white, or white with biscuit-coloured ears.

Sampan in Hong Kong harbour

Sampan. Light boat about 15 ft. long in common use in the Eastern inland and coastal waters.

It is wholly or partly covered in and sometimes used as a house-boat.

Samphire (*Orihimum maritimum*). Fleishy perennial herb of the family Umbelliferae. It is a native of the coasts of the Mediterranean, Black Sea, and N. Atlantic, growing on rocks above sea level; it is common on rocks

Samphire. Flower head and much-divided leaves

in S. and W. England, and S. Ireland, and rare in N. England and Scotland. It has a woody base and stout stem, which, like the leaves, is of a blue-green tint. The real outline of the leaves is wedge-shaped, but they are so broken up into slender, rounded leaflets that the latter look like leaves. The minute flowers are white, but the umbels in which they are clustered give the general effect of yellow. The leaves have a salt, spicy flavour, and are made into a kind of pickle.

Sample (O.F. *essample*; Lat., *exemplum*). A specimen; a part taken from a bulk and assumed to be typical of it. Samples are of great importance in trade, in manufacture, and in statistical investigation of all kinds. Many orders given to wholesalers and manufacturers are based on samples. Much natural produce, imported or home-grown, is sold by auction on sample. In such cases it is implied that the sample shall reasonably represent the bulk, and that the buyer shall have a reasonable opportunity of comparing the bulk with the sample. To lessen the likelihood of disputes through sale by sample,

organizations of merchants have wherever possible agreed on standard samples or grades of goods, and have arranged standard forms of contract with a scale of allowances for deviations from the stipulated grade. Coffee, rice, tapioca, spices, wheat, maize, jute, hemp, cotton, and rubber are all thus graded. Metals, chemicals, etc., are graded by analysis. During the 20th century many forms of standard specification have been introduced for materials, components, etc., so that sampling of them is no longer necessary. The international postal union has arranged special facilities for the sending of samples from one country to another; the G.P.O. gives special facilities through its sample post (*consult P.O. Guide*).

Manufacturers sample (a) materials purchased, to ensure that they are as ordered; (b) goods manufactured, to see that they are of the required quality; (c) goods in process of manufacture, to ascertain that the manufacture is proceeding within the limits of accuracy expected and that cutting tools, etc., are functioning properly.

Most statistical investigation involves sampling, i.e. the use of a few items selected from a much larger group in order to study the characteristics of the whole group. Thus, the Gallup poll aims at discovering the views of millions of people by considering those of a few thousand. The theory of such sampling is an important part of modern statistical method. See Public Opinion.

Sampler (late Lat. *exemplarium*, a copy). Piece of embroidery usually on canvas or silk, worked as a specimen of skill in needlework. Samplers, which in England date from the 17th century onwards, continued in fashion until well into the 19th century, and many interesting specimens are

Sampler. An 18th century woollen sampler

preserved in private ownership, and in museums. In its simplest form the sampler consisted of the letters of the alphabet, but more elaborate designs are common, e.g. maps of England and Wales.

Sampling. In mining, obtaining a portion of ore which is representative in all respects of the whole for the purposes of assaying (*q.v.*).

Samson strangling the lion. From the wood engraving by Lord Leighton, F.R.A.
By courtesy of George Routledge and Sons, Ltd.

Sampson, ABEL. Character in Scott's novel *Guy Mannering*. The personality of Dominie Sampson, a lovable village schoolmaster, whose favourite exclamation "Prodigious!" is proverbial, was suggested by Dominie Sanson, sometime tutor in the family of Scott's uncle at Elliection.

Samshu (Chinese *san*, three; *shao*, fire). Chinese alcoholic beverage, distilled from rice or millet.

Samshui. Town in Kwangtung prov., China. Situated at the junction of the N. and W. Rivers, 30 m. W. of Canton, it was opened as a treaty port in 1897. The town walls date from 1527. Pop. 8,581.

Samson. Biblical character. A Danite who adopted the calling of a Nazirite, he became one of the judges of Israel. A man of miraculous strength, for which his name has become a synonym, he was a redoubtable foe of the Philistines until, succumbing to the influence of Delilah (*q.v.*), who cut off his hair, he fell into the hands of his enemies. They put out his eyes, and that he might make them sport in connexion with a feast celebrating his capture, had him brought to the house in which they were assembled. His strength having been restored to him in answer to

prayer, he pulled away the supports of the building and was involved with the Philistine assembly in the common ruin (Judges 13-16). His story inspired a poem by Milton, an oratorio by Handel, and an opera by Saint-Saëns.

Samson Agonistes. Dramatic poem by John Milton published in

1671. Its subject is the death of Samson (*v.s.*), but it is chiefly remarkable for the passages given to the chorus, and the lines in which Samson laments his blindness.

Samson and Delilah. Opera in three acts, text by Ferdinand Lemaire, music by Saint-Saëns. Based on the Biblical story, it contains the well-known aria *Softly A wakes My Heart*. The most popular of the composer's dram-

atic works, the music is voluptuous. First produced at Weimar under Liszt, Dec. 2, 1877 (having been rejected by the Paris opera, though later becoming a stock piece there), it was performed at Covent Garden (in concert form), 1909, and first given in English by the Moody-Manners co. at Dublin, 1910.

Samsonite. Permitted explosive of the plastic gelatine type, containing approximately 60 p.c. nitroglycerine in addition to 3 p.c. nitro-cotton. The explosive is of a soft rubber-like consistency and is able to withstand moisture, so that it is of great advantage in wet workings. The high rate of detonation of this type of explosive is particularly valuable in stone drifts or in very hard ripplings. See Permitted Explosives.

Samsonov, ALEXANDER VASILIEVITCH (1859-1914). Russian soldier. Born Feb. 2, 1859, he entered the cavalry in 1875, and became a general in 1902. In the Russo-Japanese War, 1904-05, he commanded a Siberian Cossack brigade. On the outbreak of the First Great War he was placed in command of the army of the Narev, which invaded E. Prussia, Aug., 1914. After winning the battle of Frankenau and ad-

vancing to Allenstein, he was defeated at Tannenberg and shot himself on Aug. 31.

Samsun. Turkish seaport on the Black Sea. The ancient Amisus, it lies 170 m. W. of Trabzon. It has an open roadstead and exports wool, cereals, and tobacco, of which commodity the vilayet of Samsun leads in Turkish production. Pop. vilayet, 409,354; town, 38,417.

Samuel. First prophet of Israel and the last of the judges. He was born at Ramah, in answer to the prayers of his mother Hannah, was dedicated to the service of God from birth, and was taken to Eli the priest to serve him as a boy attendant. The misconduct of Samuel's sons, who were expected to succeed to the judgeship, led to a popular demand for a king, and Saul was chosen. Samuel was often brought into conflict with him, and later he anointed the youth David, who afterwards took refuge with him from the king's anger. In his later days he seems to have conducted a school of the prophets, and he had a house of his own at Ramah, where he was buried. The name has become a popular one in both Christian and Jewish communities.

Samuel, THE BOOKS OF. The O.T. First and Second Books of Samuel are so called in the Hebrew Bible because one of the chief characters in their story is the prophet Samuel. In the Septuagint (cod. Vat.) they are called the First and Second Books of Kingdoms, and in the Vulgate the First and Second Books of Kings (our 1 and 2 Kings being the Fourth and Fifth Books). The contents of the books of Samuel fall into five sections: (1) Eli and Samuel, 1 Sam. 1-7; (2) Samuel and Saul, 1 Sam. 8-14; (3) Saul and David, 1 Sam. 15-31; (4) David, 2 Sam. 1-20; (5) an Appendix, 2 Sam. 20-24. The period covered is therefore from about 1070 or 1050 to 970 B.C. The only ancient source mentioned in the books is the Book of Jashar (2 Sam. 1, v. 18; cf. Josh. 10, v. 13). From this, David's elegy over Saul and Jonathan is said to have been taken. Other poems include the Song of Hannah (1 Sam. 2, vv. 1-10), the language of which has literary parallels in the Psalms. The song has even been described as an "extra-canonical Psalm."

The text of the books of Samuel presents a number of literary and historical problems. There are sometimes two rather different accounts of the same events (cf.

1 Sam. 9, v. 1-10, v. 16 with 10, v. 17-27; 1 Sam. 13, vv. 8-14 with 15, vv. 1-30); or marked differences in literary style (cf. 1 Sam. 1-3, with 2 Sam. 8). Moreover the text of 2 Samuel has suffered greatly from corruption. The books in their present form can hardly have been written by Samuel. They are composite works containing narratives of various dates. Consult Samuel, by H. P. Smith, in International Critical Commentary, 1899.

Samuel, HERBERT LOUIS SAMUEL, 1ST VISCOUNT (b. 1870). British politician.

1st Viscount Samuel,
British politician

Born of Jewish parentage at Liverpool, Nov. 6, 1870, he was educated at Balliol, Oxford, and, entering politics in 1895, was Liberal M.P. for Cleveland, 1902-18, and Darwen, 1929-35. As parl. under-secretary to the home office, 1905, he was responsible for setting up the probation system and juvenile courts. He entered the cabinet as chancellor of the duchy of Lancaster, 1909. P.M.G., 1910, president of the local govt. board, 1914, and again P.M.G. and chancellor of the duchy of Lancaster, 1915, he was home secretary, 1916, when he introduced Summer Time (g.v.). He left office with Asquith, 1916.

Samuel was among the men of note whose support Chaim Weizmann secured during the First Great War for the cause of Zionism; and the choice of Samuel in 1920 as first high commissioner for Palestine under the British mandate proved a happy one. He remained in Palestine until 1925. After his return he was chairman of a commission of enquiry into the coal industry, and assisted in the settlement of the General Strike (g.v.). He led that section of the Liberal party which adhered to free trade, and afterwards took a leading part in the formation of the National govt., 1931, in which he was again home secretary, resigning on the free trade issue 1932. Knighted in 1920, raised to the peerage in 1937, he was Liberal leader in the house of lords from 1944.

In his later years he acquired a new reputation as a philosopher (he was president of the British, later royal, institute of philosophy from 1931), and as a broadcaster.

His publications included Philosophy and the Ordinary Man, 1932; Belief and Action, 1937. His Memoirs appeared in 1945.

Samurai (Jap., guard). Former Japanese military class. In early feudal times the term was applied to all who bore arms, but eventually it was restricted to the gentry, and roughly corresponded to the esquires of medieval times, as distinguished from the daimio or nobles. On the abolition of the feudal system in 1871 the samurai were forbidden to wear swords, and in 1878 the designation was changed to *shizoku* or gentry. In his A Modern Utopia H. G. Wells used the term samurai to suggest an intellectual aristocracy of the modern world.

San. River of Poland. Rising in the Beskid Mts. (Carpathians), it flows N.N.W., then E. past Przemysl (g.v.), thence N.W., and joins the Vistula 4 m. N.E. of Sandomierz. Its length is about 260 m.

The area of the San was the scene of two major battles of the Eastern Front in the First Great War. The first was fought between Austrians and Russians, Oct. 13-Nov. 6, 1914. The Austrians attacked in an attempt to relieve Przemysl but the Russians defended the San crossings stubbornly, and a struggle of increasing violence ended in complete Russian victory and a Russian advance towards Cracow. The second battle was fought between Austro-German troops and Russians, May-June, 1915. After losing battles at Donajetz the Russians retreated to the San, and a series of fierce Austro-German attacks and Russian counter-attacks, resulted in the Russian evacuation of Przemysl.

During the Second Great War, the Russians began a new offensive in Poland in Jan., 1945, from a bridgehead across the San, near Sandomierz (g.v.).

Sana or SANAA. Town of Arabia, capital of the imamate of Yemen. Lying in a fertile valley, about the middle of the E. side of the Yemen, it is a walled town with eight gates,

Samurai in official
dress

has a handsome mosque, and does a considerable trade in coffee and fruit, besides manufacturing silks, arms, and jewelry. Population about 25,000.

Sanad OR **SUNNUD** (Arab., a law). Term used in India for a document, such as a patent, charter, or warrant, or any official instruction or decree.

Sanaga. River of Cameroons, French Africa. It rises on the Central Cameroon plateau, and flows in general S.W. to the Bight of Biafra, at Malimba, about midway between the mouths of the Cameroon and the Nyong. Below the confluence with the Uyim tributary are the Nachtigal Rapids. The chief town on its banks is Edea, where the river is bridged by rly. and the road from Douala.

San Angelo. City of Texas, U.S.A., the co. seat of Tom Green co. Situated 240 m. S.W. of Fort Worth, it is a rly. junction. It trades in the produce of the surrounding dist., exporting chiefly cattle and sheep, wool and cotton. Sheet metal and saddlery are other industries. Formerly it was a centre of cowboy life. Pop. 25,802.

San Antonio. Third city of Texas, U.S.A. The co. seat of Bexar co., it stands on the San

Sanatorium (Lat. *sanare*, to heal). Building where sick persons are treated, especially those suffering from tuberculosis. Most boarding schools have a sanatorium with a matron in charge. The word is also used for an establishment in the country where convalescents reside.

San Bernardino. Mountain pass of Switzerland, in the Mesocco valley and the canton of Grisons. It is on the road from Coire (Chur) to Bellinzona, and reaches an alt. of 6,770 ft. The pass was known to the Romans, but its present name comes from S. Bernardino of Siena, who preached here in the 15th century. The carriage road was constructed 1818-23. The summit, on which is a hospice, is $4\frac{1}{2}$ m. N. of the village of San Bernardino, which has celebrated mineral springs.

San Bernardino. City of California, U.S.A., the co. seat of San Bernardino co. It is 58 m. E. of Los Angeles, and is served by the S. Pacific and other rlys. Among its industrial establishments are rly. workshops, machine shops, foundries, and lumber mills. The surrounding dist. is noted for oranges and lemons. Founded in 1851 by a company of Mormons, who were recalled to Utah by Brigham Young in 1857, San Bernardino was incorporated in 1864. Pop. 43,646.

San Carlos de Ancud. Seaport of Chile, capital of the prov. of Chiloe. Situated on the N. coast of Chiloe Island, at the head of a bay in Chacao Channel, 575 m.

S. of Valparaíso, it has a safe and spacious harbour. Founded in 1768, it was long resorted to by Antarctic whale fishers, and was the last Spanish stronghold in Chile, surrendering only in 1826. Pop. est. 3,000.

San Cataldo. City of Sicily, in the prov. of Caltanissetta. It stands in the valley of Mazzara, 5 m. by rly. W. of Caltanissetta. In the vicinity are sulphur mines. Population 18,000.

Sanchez, THOMAS (1550-1610). Jesuit author. Born of noble parents at Cordova, he entered the Society of Jesus, and acquired a reputation for sanctity. He wrote a famous treatise on marriage, *Disputationes de Sancto Matrimonio*

Sacramento, published at Genoa in 1592. This book, written by a man the purity of whose morals is undoubted, is stated to exceed in its pornography the efforts of secular writers. Sanchez died at Granada, May 19, 1610.

Sancho Panza. Squire and attendant on Don Quixote. He is a farm labourer, who, mounted on his ass Dapple, accompanies the Don on his adventures, ever dreaming of the governorship of an island with which the knight promises to reward him. Sancho Panza (Panza means paunch) is a droll person, a coward, a misuser of words, and repeater of innumerable proverbs. Sancho Panza, as the victim of a joke, is dressed in fine clothes and placed at a banquet; but the court physician strikes each dish with a wand as soon as Sancho has tasted it, and a page thereupon bears it swiftly away, leaving the squire hungry. See Don Quixote.

San Cristóbal. Town of Venezuela, capital of the state of Táchira. It stands on the Rio Torbes, amid the Andes, at an alt. of 2,770 ft., 105 m. W.S.W. of Mérida. It is on the trans-Andine highway to Caracas. Cattle-rearing and production of coffee are the chief occupations. The town was destroyed by an earthquake in 1875. Pop. 22,000.

San Cristóbal de las Casas. Town of Mexico, in the state of Chiapas. It occupies the site of an ancient Indian city, 485 m. S.E. of Mexico City. Formerly the state capital, it has a cathedral, and manufactures textiles. Bishop Las Casas, the great Spanish defender of the aborigines of the Spanish Main, resided here. Pop. 15,000.

Sancroft, WILLIAM (1617-93). English prelate. Born at Fressingfield, Suffolk, Jan. 30, 1617, he was educated at Emmanuel College, Cambridge. He became chaplain to Charles II, master of Emmanuel College, and in 1664 successively dean of York and of S. Paul's. After

the Great Fire he, with Wren, devoted his energies for many years to the rebuilding of the cathedral. In 1678 he became archbishop of Canterbury, carrying out his duties with notable single-mindedness and strength of

San Antonio, Texas. The Mission of San José de Aguayo, built by the Spaniards in 1720-31.

Antonio river, 212 m. by rly. W. of Houston, and is served by rlys. The San Fernando cathedral is notable, and here is Trinity university, founded 1869. San Antonio is an invalid resort, with hot mineral wells.

It is the h.q. of an army area. There are some 300 manufacturing plants, a large trade in livestock, and annual royalties of some 125 million dollars accrue from oil-wells near by. Skyscraper buildings contrast with old Spanish settlements. San Antonio was permanently settled in 1718, and became a city in 1809. In 1836 Fort Adams was stormed by Mexicans, the entire garrison of 188 being massacred. Pop. 253,854.

William Sancroft, English prelate.

purpose in an age of political profanity. Sancroft was one of the Seven Bishops (*q.v.*) who in May, 1688, drew up and signed the petition against the second declaration of indulgence (*q.v.*). He refused to recognize William of Orange as lawful sovereign, and, with five other nonjuring bishops, was suspended in 1689 and deprived of the archbishopric in Feb., 1690. He died at Fressingfield, Nov. 24, 1693. See Nonjurors.

Sanction (Lat. *sanctio*, a making sacred). Authority or confirmation derived from law, custom, etc., *e.g.* the sanction of public opinion. In jurisprudence, sanction is used in a special sense, meaning a penalty imposed for neglect to carry out the terms of a covenant or agreement, particularly applied to a defeated country, *e.g.* Germany under the terms of the treaty of Versailles of 1919.

The League of Nations was authorised to apply economic sanctions against any member who persisted in waging aggressive war. Its only attempt to do so, against Italy in 1935, was unsuccessful. See Italy: History.

Sancti Spiritus OR SANTO ESPIRITU. Town of Cuba, in the prov. of Santa Clara. It is about 25 m. by rly. N. of Tunas de Zaza, its port, and 240 m. by rly. from Havana. Founded in 1514, its chief feature of interest is its old church. Sugar and high-grade cigar tobacco are the chief products, and are exported. Pop. 92,299.

Sanctuary (Lat. *sanctus*, sacred). In a religious sense, any consecrated place, or a place where sacred things are kept. Specifically, the term was applied to the Temple at Jerusalem, especially to that part of it, the *sanctum sanctorum*, or Holy of Holies, which none but the high priest might enter, and then only on the Day of Atonement (Lev. 4; Num. 10; 2 Chron. 20 and 26; Josh. 24). In Ps. 20 it means God's dwelling-place on Mt. Zion; in Isaiah 8 and Ezek. 11, a place of refuge. Christian churches, like pagan temples, at one time afforded temporary sanctuary from the processes of the law, a privilege abolished in England in the 17th century, but still supposed to attach to Holyrood in Scotland. A criminal who claimed such sanctuary had to confess his crime and abjure the realm. The Sanctuary at Westminster was a privileged precinct; here the widow of Edward IV sought security, and here Skelton found shelter from Wolsey. The name survives in the area

called Broad Sanctuary. That part of a church in which the altar is placed is known as the sanctuary. See Alsatia; City of Refuge; Westminster.

Sanctus, THE (Lat., holy). Hymn said or sung before the prayer of consecration at the Holy Communion service. The words Holy, Holy, Holy, etc., are based on Is. 6, v. 3; Ps. 118, v. 26; and Matt. 21, v. 9; but the closing words were altered in 1549 from Hosanna in the Highest to Glory be to Thee, O Lord most High. The Sanctus, also known as the Tersanctus, the seraphic hymn, and the angelic hymn, appears in most liturgies. In the R.C. rite, except in the pontifical chapel and during exposition of the Sacrament, a small bell, the sacring bell, is rung.

Sand. Loose, incoherent mass of small particles of various minerals. If the particles are more than about 0.1 in. diameter, the term gravel is used. The chief minerals in sand are quartz, mica, feldspar, etc., and it is formed by

sand is often applied to them. Compacted sands of geological deposits are known as sandstones.

Apart from their value as a source of material present in small quantity, *e.g.* gold in quartz, sands are widely used in industry. In making glass, silicious sands have been used, though pulverised quartz is now more usual (*see* Glass). In building, sand is an essential constituent of concrete, the properties of the finished article depending on the grading of the sand according to the size and angularity of its grains. In foundry work, moulding sand is much used, though a certain amount of clay is necessary to bind the mass together coherently. Sand is also used for lining the furnaces for brick making. Lime-sand bricks, which are very strong, are made by moulding a mixture of lime and sand, moistened with water, and subjecting the block to high-pressure steam.

Sand. River of S. Africa. It rises in the Wittebergen, O.F.S., and flows mainly W. until it joins the Vet. On the banks of this stream was signed the convention by which, in Jan., 1852, Great Britain granted independence to the emigrant farmers beyond the Vaal river. See Orange Free State; South Africa; Transvaal.

Sand, GEORGE (1804-76). Pen-name of Armandine Lucile Aurore Dupin, Mme. Dudevant, French novelist and letter-writer. She was born in Paris, July 5, 1804, a month after her parents' marriage, to Maurice Dupin, a soldier, and Sophie Victoire Delaborde, a typical grisette. Her father was killed by being thrown from his horse when Aurore was a child, and for a time she was brought up in an old manor house at Nohant, Indre, by her paternal grandmother, a daughter of Maurice de Saxe.

The rest of her life was the passing from one disillusion to another; disillusion with mystical Catholicism in the Convent des Anglaises at Paris; with married life, when her husband, Casimir Dudevant, took to drink—she married him in 1822 and left him, after the birth of two children, in 1831; with romanticism, after her trip to Venice with Alfred de Musset in 1834, and her stay at Majorca with Chopin, 1838-39; with socialistic and republican idealism, after the revolution of 1848; with the empire after Sedan and the Commune. Towards the end she wrote to Alexandre Dumas fils: "I believe henceforward without

After A. Charpentier

the chemical and mechanical disintegration of rocks by weathering and other causes. Those sands which contain the greatest amount of quartz are nearly white, and form the silver or glass sands of commerce, used for polishing, etc. Green sands, which cover a large part of the bed of the ocean, contain glauconite. New sands are composed of sharp-edged particles. The older are smoother, consequent on the constant movements of the particles together. Desert sand grains are usually more rounded than water-worn grains of the same size; the term millet-seed

illusion, and that is the secret of all my little strength."

After 1831—when she entered the life of the Latin Quarter, with ideals of woman's emancipation, which led her to adopt male attire—she wrote 120 volumes: novels, autobiography, letters, and plays which reflect the successive stages of her emotions and experiences, her sympathy with suffering, her sensitiveness to art in all its phases, and her love of rural life. From 1848 her home was at No-hant, where she died June 8, 1876.

George Sand's first novel, *Rose et Blanche*, 1831, was written in collaboration with Jules Sandeau and published as by Jules Sand. Among the more noteworthy of its successors are *Mauprat*, 1837; *Consuelo*, 1842-44; *Lucrezia Floriani*, 1847; *La Petite Fadette* and *François le Champi*, 1848, dramatised by herself, 1849; *Les Beaux Messieurs de Bois-Doré*, 1857; *Le Marquis de Villemer*, 1861; *Mlle. la Quintinie*, 1863; *Flammarande*, 1875. Her picture of Alfred de Musset as Jacques Laurent, in *Elle et Lui*, 1859, was supplemented by her correspondence with him, published in 1897 and 1904. Of her other correspondence that with Flaubert is the most interesting. Her *Histoire de Ma Vie*, 1876, fills several volumes. See *Chopin*; *Musset*, A. de.

Bibliography. Works, 120 vols., 1862-84; *Lui et Elle*, P. de Musset, 1859; *Lives*, W. Karenine, 3 vols., 1899-1912; R. Doumic, 1909; G. S. et Alfred de Musset, in *Études et Portraits*, P. Bourget, 1906; *Intimate Journal*, trs. M. J. Howe, 1929; *Letters*, trs. V. Lucas, 1930; *The Other George Sand*, M. Toesca, 1947.

Sandakan. Seaport of British North Borneo. It stands on the N. point of the Bay of Sandakan, which provides one of the finest harbours in the East. Now the headquarters of the east coast residency, it was formerly the

capital of the colony and a fortified place, but was completely burnt by the Japanese during the Second Great War, in May, 1945. Timber, forest produce, rubber, copra, and cutch provided industries for a pop. largely Chinese and variously estimated up to 20,000.

Sandal (Persian, slipper). Light shoe consisting of a sole attached to the foot by straps or thongs, with perhaps a shield for the heel and toe. Sandals were generally worn by the Greeks and Romans and other

Sandal. Patterns of light shoe worn in ancient Rome

people of antiquity, and among the Romans especially were very elaborate and showed exquisite workmanship. They were made of leather, wood, cork, wickerwork, and even gold and silver. Primitive forms of leathern sandals are still worn by the Italian peasants, and by certain friars. See *Boots* and *Shoes*, colour plate.

Sandal Magna. Village of the W. Riding of Yorkshire, England. It is 3 m. S.S.E. of Wakefield, and connected therewith by rly. and bus. It is famous for the remains of its castle built about 1300. It was a stronghold of Richard, duke of York, who from Sandal went to the battle of Wakefield, which was fought near here. See *Wakefield*, Battle of.

Sandalwood (*Santalum album*). Small evergreen tree of the family Santalaceae. A native of the E. Indies, it has oval or lance-shaped leaves with pale undersides. The heart-wood when dry gives off a sweet perfume, and is esteemed for incense.

Sandalwood Oil. Oil distilled from wood of *Santalum album*. It is a viscid pale yellow oil with strong aromatic odour, and is used in medicine to soothe inflammation of the urinary tract; also in perfumery.

Sandarac (Gr. *sandarake*, red sulphide of arsenic). Variety of resin found in N. Africa. A product of the sandarac tree, *Callitris quadrivalvis*, a native of Algeria,

it is a pale yellow resin which becomes brittle on drying and is soluble in turpentine. Known also as gum juniper, it is used in the manufacture of varnishes.

Sanday. One of the Orkney Isles (q.v.). It is 2 m. N. of Stronsay, and its area is 26 sq. m. Its coastline is irregular and its surface generally flat, except in the W., where it rises to a height of 175 ft. Pop. est. 1,500.

Sandbach. Urban dist. and market town of Cheshire, England. It stands 4 m. N.E. of Crewe by rly. It has a grammar school, founded in 1594. In the market place are two antique crosses dating from the 7th century. Manufactures are road transport vehicles, motor bodies, chemicals, salt, silk, and wire. Pop. 8,700.

Sandbach, Cheshire. Crosses in the market place
Valentine

Sandbag. Small sack filled with sand or earth and used in the making of trenches, bomb-proof shelters, etc. Sandbags are made of hessian, and when filled with about half a cubic foot of earth or sand they measure over all about 20 ins. by 10 ins. by 5 ins., and weigh about 60 lb.

Sandbank. Accumulation of finely divided alluvium in the bed or estuary of a river. Rivers acquire a load of silt from the erosion of the banks, from the washing off the valley surface of soil, and from the gradual disintegration of rocks and stones rolled along the upper course. The load which the stream can transport depends largely upon the speed of the water, and whenever the stream slackens some of the load is deposited on the river bed; this deposit forms a sandbank. Near the river mouth salt water may mingle with the muddy fresh water and cause coagulation of the clay, which rapidly settles and accumulates. Hence lower courses of unregulated rivers, such as the Congo, are marked by a

Sandalwood. Leaves and flower sprays. Inset, single flower

stead of sand as the abrasive. The jets or nozzles of the blasting pipe are themselves subject to intense and prolonged abrasive action, and for this reason they are often made of an artificial material, e.g. boron carbide, claimed to be the hardest material made by man. Compressed air is used to project the sand, shot, or grit, pressures up to 100 lb. per sq. in. being employed for steel, and lower pressures for softer materials.

Sand-box. Receptacle fitted on a rly. vehicle or tramcar, containing grit for sanding the rails when greasy. It is fitted

having allusion to this fact. Unripe fruits used to have the seeds extracted by cutting into the centre. They were then bound round with wire and used to hold the fine sand formerly employed in place of blotting-paper.

Sandby, PAUL (1725-1809). British artist. Born at Nottingham, he gained early employment

Paul Sandby,
British artist
After P. Jean

in the military drawing school at the Tower of London, and was later draughtsman to the survey of the Scottish Highlands, and drawing master at Woolwich. He was an original

member of the Royal Academy, and one of the first to apply water-colour to topographical drawings. Sandby greatly influenced the development of water-colour art and introduced the aquatint process of engraving. His etchings, e.g. Cries of London, are well known. He died in London, Nov. 9, 1809.

Sand Clock. Instrument used by the Greeks for measuring time. In one form, sand passed successively through the compartments of a drum-shaped cylinder acting as a pulley to a cord with a counter-weight, the rapidity of motion being determined by the quantity of the sand, or the bore of the orifice through which it escaped. See Clock.

Sand-crack. Crack or fissure in the horn of a horse's hoof. It may be either in front or at the side, and appears to be most common in districts with sandy soils, hence the name. Severe cases cause lameness with inflammation.

Sandefjord. Seaport and watering-place of Norway. Situated at the head of the Sandefjord, an inlet of the Oslo Fjord, it is 32 m. direct and 54 m. by rly. S.S.W. of the capital. It has sulphurous, saline, and chalybeate springs. Pop. est. 5,000.

Sandeman, ROBERT (1718-71). Scottish setary. Born in Perth, where he followed the occupation of a linen manufacturer, he came under the influence of John Glas (q.v.), whose daughter he married, and with Glas founded the sect known as Glassites (q.v.)

Robert Sandeman,
Scottish setary

series of sand-banks which continuously alter their shape and position as the river varies its speed, and the set of the tidal and other currents changes. When the bank forms an obstacle to the entrance of ships by forming a submarine ridge it is frequently known as a sand-bar.

Estuarine banks sometimes appear above water-level and immediately wind action piles the surface sand into a dune; a bank of this type may stretch across the estuary. Shingle banks, such as that off the mouth of the Adur in Sussex, are due to the tidal current rolling shingle along the coast until it accumulates upon a growing sandbank.

Sandblasting. Use of a stream of sand suspended in air as an abrasive. Sandblasting is used to give a "ground-glass" effect; if parts of a sheet of plain glass are protected by a resistant mask or stencil, a pattern is produced, thus names, etc. can be left imperishably on the surface. Etching by acid is an alternative means which has largely replaced sandblasting. Sandblasting is employed for cleaning the walls of buildings. Similar apparatus is used for cleaning metal castings or forgings where the shape of the objects precludes grinding. The work is done in an enclosed booth, or the operator is protected by a mask or respirator. Steel shot or steel grit is extensively employed in-

with a spout and a valve actuated by a lever. The spout delivers the sand on to the rail just in front of a driving wheel.

Sand-box Tree or **MONKEY'S DINNER-BELL** (*Hura crepitans*). Evergreen tree of the family Euphorbiaceae. A native of tropical America, it grows to a height of about 40 ft. and has glossy,

Sand-box Tree. Leaves and flower spike; inset, unripe fruit from which boxes for blotting-sand were made

heart-shaped leaves. The small, inconspicuous, reddish flowers are succeeded by a large fruit, the size of an orange, but compressed above and below, with rounded ribs. When dry these ribs split with a loud report, to release the seeds, the name Monkey's Dinner-bell

or Sandemanians. His main contention was that faith is a simple assent to the Divine testimony concerning Jesus Christ, in no way differing essentially from belief in human testimony. After officiating as minister in Perth, Dundee, Edinburgh, and London, he crossed the Atlantic in 1764, and founded a church at Portsmouth, New Hampshire, in 1765. He died April 2, 1771.

San - de - Pu or HEIKOUTAI, BATTLE OF. Fought between the Russians and the Japanese, Jan. 26-27, 1905. After the battle of the Sha-ho, both sides had reorganized for the further contest, but the fall of Port Arthur, Jan. 2, 1905, made it necessary for Kuropatkin to attempt to strike the Japanese before they were reinforced. The Japanese resistance was superb, and Oyama immediately prepared a counter-attack, and the Russians decided to withdraw. The Russians lost about 10,000 men, to 8,000 Japanese casualties.

Sanderling (*Crocethia alba*). Shore bird, related to the plover. It is about 8 ins. long, and has

Sanderling. Migratory bird found by the sea and on the shores of lakes
W. S. Berridge, F.Z.S.

brown and grey plumage on the upper parts, with white beneath, and a long and straight beak. It is a migratory bird, arriving in Great Britain in Aug., and leaving about April, but breeding farther N.

Sand Fly. For details of the insect sometimes given this name see Moth-Flies.

Sandford and Merton. Moral story for the young, by Thomas Day. It was first published, anonymously, as The History of Sandford and Merton, 3 vols., 1783-89. It contrasts the pampered selfish

Sand Grouse. Specimen of Pallas's sand grouse
From the Cambridge Natural History (Macmillan).

boy, Tommy Merton, with the healthy, unselfish Harry Sandford. Their tutor, Mr. Barlow, never loses any opportunity of improving the occasion with appropriate moralising. The book long enjoyed popularity among parents and teachers, if not among children.

Sanderson, FREDERICK WILLIAM (1857-1922). British schoolmaster. Born May 13, 1857, he was educated at Durham university and Christ's College, Cambridge. Having been mathematical lecturer at Girton, 1882-85, and assistant master at Dulwich from 1885, he was in 1892 appointed headmaster of Oundle. There he did much for education by innovations in both the curriculum and methods of teaching. He laid particular stress on practical engineering and scientific work, even for classical students, and raised Oundle high among British public schools. He died, following a collapse on the platform at a public meeting, June 15, 1922. H. G. Wells, one of his greatest admirers (Wells's own sons were at Oundle under Sanderson), wrote a biography of Sanderson, The Story of a Great Schoolmaster, 1924.

Sandgate. Urban dist. of Kent, England. It is 2 m. by rly. W. of Folkestone. The castle, built by Henry VIII in 1539, and restored in 1806, formerly one of the coast defences, is now a museum. The church of S. Paul is a modern building of debased Gothic architecture. Close by is Shorncliffe Camp. Considerable damage was done by a landslide at Sandgate in 1893. The climate is generally milder than that of many S. coast resorts, and sufferers from pulmonary complaints derive benefit from it. Pop. est. 3,000.

Sand Grouse. Game bird of the family Pterocletidae, related to the pigeon. Occurring in Africa, in

Central and S. Asia, and occasionally in Europe, the best known species is Pallas's sand grouse (*Syrhaptes paradoxus*), which visited Great Britain in considerable numbers in 1863 and 1888. The plumage is buff, grey, and black, and is well adapted to make the bird inconspicuous in its native haunts. It travels in flocks, and feeds upon insects and vegetable matter.

Sand Hopper (*Talitrus locusta*). An amphipod crustacean, which swarms in the sand between tide marks, and may usually be found under decaying animal matter. It is dirty white in colour. When

Sand Hopper. The crustacean which acts as a shore scavenger at low tide

alarmed it burrows rapidly in the sand. It serves a useful purpose as a scavenger of the shore.

Sandhurst. Village of Berks, England. It is 33 m. S.W. of London and 4½ m. S.S.E. of Wokingham, where is the nearest rly. station. Its chief interest is the Royal Military Academy (*q.v.*), formerly called the Royal Military College, for the training of army officers.

Sandhurst. City of Australia, in Victoria, officially known as Bendigo (*q.v.*).

San Diego. City of California, U.S.A., the co. seat of San Diego co. A port of entry on San Diego Bay, it is 126 m. S.S.E. of Los Angeles, and is served by the Atchison, Topeka, and Santa F^e, and other rlys. San Diego Bay forms a secure and commodious harbour. The city is favoured as a watering-place, and has a military and naval academy, a Carnegie library, and nearly 2,000 acres of public parks. Some 10 p.c. of all retired U.S. naval officers live there. Except for

Sandhurst, Berkshire. Buildings of the Royal Military Academy, where officers are trained for the British army

San Diego, California, U.S.A. Air view of the city showing the civic centre and port

a single large-scale aircraft plant, the city's 335 factories are mostly small. Pop. 203,341.

Sandila. Town of the Uttar union, India, in Hardoi dist. It is situated near the S. border of the dist., on the rly. between Hardoi and Lucknow. 34 m. S.E. of Hardoi. Pop. 18,400.

Sanding Machines. Machines by which the surface of wood is cleaned and finished, the abrasive being sand or other sharp material cemented to cloth or paper. The abrasive is attached to a moving belt, or to a revolving disk or drum, against which the surface of the article is pressed. Smaller sanders are electrically operated; one type has a flexible disk bearing the abrasive paper or cloth, and can be used for sanding flat or curved surfaces; another has an endless belt bearing the sandpaper and travelling between two pulleys. Both these machines are pressed down on to the article to be cleaned or finished. A sanding disk can be used with portable electric drilling machines.

Sand Launce OR **SAND EEL** (*Ammodytes*). Genus of small carnivorous fishes of the family

Sand Launce. Fish resembling an eel, that buries itself in wet sand

Ammodytidae. They have long bodies with a dorsal fin extending nearly the whole length of the back and a pointed head with protruding lower jaw. They frequent sandy shores, and swim near the

surface of the water. When the tide is out they bury themselves in the sand. They feed chiefly upon small sprats and the fry of other fish; and are themselves much in demand as bait for anglers. Great Britain has two species, varying in length from 6 to 18 ins.

Sand Lizard (*Lacerta agilis*). British lizard. The average size of the male is $7\frac{1}{2}$ ins., the female a

Sand Lizard. Small reptile that lives in sandy districts
W. S. Derridge, F.Z.S.

little larger. The male is a pronounced green colour, the female brown and grey, and they affect sandy districts. The eggs are laid in the sand, and are hatched by the sun. See Lizard.

Sandomierz OR **SANDÓMER**. Town of Poland. It is 50 m. S.W. of Lublin. The town crowns a lofty bluff on the left bank of the Vistula, a few miles above the confluence with the navigable river San, and was before the First Great War a frontier town on the border of Austria with Russian Poland. It has rly. connexions with Lodz and Warsaw and, less directly, with Lublin. It is the seat of a R.C. bishop. The chief industries are brewing, tanning, and the cultivation of fruit. Sandomierz was a residence of the Polish kings, and here a union (*consensus*) of Polish Protestants

was formed in 1570. Sandomierz figured in battles of 1914-15 on the river San (*q.v.*).

During the Second Great War the Germans captured Sandomierz Sept. 8, 1939. Under the Russo-German partition of Poland, it remained in German occupation. The 1st Ukrainian army, widening a bridgehead at the W. of the Vistula, carried Sandomierz by assault Aug. 18, 1944. From Baranov in this bridgehead and a little to the W. of Sandomierz, the same army advanced Jan. 12, 1945, to take Kielce, Jan. 15.

San Domingo. Former name of the capital of the Dominican Republic. The city is described under Ciudad Trujillo.

Sandow, **EUGEN** (1867-1925). Wrestler and physical culturist. Born at Königsberg, April 2, 1867, he was educated at the university of Göttingen, and at an early age acquired a reputation as an amateur gymnast and wrestler. Proceeding to Brussels, he toured Holland before coming to England to secure an engagement at the Crystal Palace. His crowning achievement as a wrestler, however, was his defeat of his former adversary, the Italian Sali, and two others, who were permitted to attack him simultaneously.

Eugen Sandow, physical culturist

Proceeding to London again, he secured the £100 offered by Samson, the "strongest man in the world," to anyone performing the weight-lifting feats of Frank Cyclops, his pupil, and shortly after in the Aquarium, Westminster, successfully repeated the feats performed by Samson himself. On Jan. 28, 1891, he defeated Hercules in a weight-lifting contest, and was awarded the world's championship belt. In 1897 he wrote *Strength and How to Obtain It*, revised edition, 1911, and in 1898 founded a magazine, *Physical Culture*. He died Oct. 14, 1925. Consult *Sandow* the Magnificent, C. T. Trevor, 1946.

Sandoway. Dist. and town of Burma, in the Arakan div. The dist. has a long coastline on the Bay of Bengal, and an excessive rainfall of 208 ins. Rice is grown, but only $\frac{1}{4}$ p.c. of the area is cultivable. The town is almost the mid-point of the coast of the dist. Area 3,784 sq. m. Pop., dist., 139,747; town, 5,500.

Sandown, Isle of Wight. An air view of the sea front and parade looking north-west

Sandown. An urban dist. and watering-place of the Isle of Wight. It stands on Sandown Bay, an opening of the S.E. coast of the island, 6 m. S. of Ryde, with a rly. station. It has a fine, sandy beach, pier, good bathing, and golf links. Pop. 7,000.

Sandown Park. Racecourse in Surrey, England. It is 15 m. S.W. of London, near Esher rly. station. The July meeting is one of the most celebrated of the British racing season, the principal race being the valuable Eclipse Stakes, run over $1\frac{1}{4}$ m.

Sandpaper. Stout and durable paper to which crushed sand is stuck; it is used for cleaning and smoothing wood, paintwork, etc. The sand is graded, and sandpaper is prepared in various types. See Emery; Glass Paper; Polish.

Sand Pipe. Name given to certain tubular or funnel-shaped formations in chalk caused by the solvent action of rain water. These pipes are generally filled with sand, gravel, or earth, reach a depth of 40-50 ft., and may be ten or more feet diameter.

Sandpiper. Group of migratory birds, related to the plover. The common sandpiper (*Actitis hypoleucos*) is about eight ins. long, and has olive-brown upper parts, white chin, ash-coloured breast, and white under parts. It is often known as the summer snipe,

and is not uncommon about streams between April and Sept., especially in the wilder parts of Scotland. It nests in hollows beside streams. The green sandpiper (*Tringa ochropus*) is rather larger, and has a greenish tinge on the olive-brown plumage of the upper parts. It breeds in N. Europe, and usually visits Great Britain later.

The purple sandpiper (*Calidris maritima*) is found about the coasts of Great Britain during the autumn and winter, and has blackish upper parts with purple reflections. The curlew sandpiper (*C. testacea*) has a curved beak like a curlew, and occurs in the migrating season on the E. coast of Great Britain. The wood sandpiper (*T. glareola*), which closely resembles the green sandpiper, is found in autumn on the E. and S. coasts.

Sandringham. Parish and village of Norfolk. It is 6 m. N.E. of King's Lynn, 2 m. E. of Wolferton. Sandringham House, built 1869-71 by Edward VII, when prince of Wales, was a favourite residence of reigning monarchs. A building of red brick in the Elizabethan style, it stands in a picturesque park of 200 acres. It was considerably damaged by fire in 1891. George V died at Sandringham, where for several years he had given his Christmas broadcasts. There was for long a tradition that the clocks at Sandringham House were kept permanently half an hour fast; the first act of Edward VIII on his accession was to make the clocks correct. At the home farm agricultural experiments have been carried out, e.g., flax-growing. Pop. est. 200. *Consult* Sandringham Past and Present, Mrs. C. Rachel Jones, 1883.

Sandringham. A town in Bourke co., Victoria, Australia. Situated 11 m. by rly. S. of Melbourne on the shores of Port Phillip, it is a residential suburb of the capital. Pop. est. 3,000.

Sandstone. In geology, name given to strata of compacted sand. The binding materials of sandstones are usually lime carbonate, iron oxide, or silica. According to the size of the sand grains sandstones grade insensibly from conglomerates to shales. Grits are coarse-grained rocks like sandstones, but the grains are sharp and angular.

Sandstones occur in all geological formations, and deposits vary from a few inches up to many hundreds of feet in thickness. They make excellent building stones and road-making materials. The Devonshire bats, as the sandstones from the Blackdown Hills are called, make first-class grindstones, as do the Craigleith stones quarried near Edinburgh, the sandstones of Newcastle and Bilston, the Berea sandstones of Ohio, U.S.A., etc.

Sandstorm. Desert storm in which large quantities of coarse sand are carried by the wind relatively close to the ground. Although the sand particles are rarely raised beyond 100 ft. (and are not carried far from their source), the finer dust particles may reach greater heights. One type of sandstorm is caused by a strong current of air blowing steadily in a constant direction, facilitating the formation of sand dunes. Another consists of a

Sandringham House, Norfolk. Private country residence of the British Sovereign.

cyclonic swirl of wind which sweeps up the sand into a great pillar of cupola-shaped masses and frequently causes much destruction. The simoom, the sand-storm of the African and Arabian deserts, has a narrow track and passes in a few minutes. See Dust-storm.

Sand-table. Ledged board holding a layer of sand, used for elementary lessons in reading, writing, and arithmetic. The

Sandpiper. Common sandpiper or summer snipe

system, based on native Indian practice, was employed by Joseph Lancaster. In his Borough Road

Sand-table, on which children learned to write, at Dennington, Suffolk
From a drawing by C. G. Harper

school, in London, sand-trays covering long desks enabled 50 scholars to write with the fore-finger at the same time. The letters and figures, about 3 ins. long, were effaced by shaking, or by levelling with wooden rollers; writing sticks were sometimes used.

Sandur. Mahratta-ruled state of the Bellary district of Madras, India. It comprises a valley between two hills. Near Ramandrug manganese is mined. Food grains are the chief crops. In 1933 the ruler decreed that all temples, wells, and schools should be thrown open to the depressed classes. Its area is 167 sq. m. It acceded to the dominion of India in 1947. Pop. 15,000.

Sandusky. City of Ohio, U.S.A., the co. seat of Erie co. A port of entry on Sandusky Bay, an arm of Lake Erie, it is 50 m. by rly. S.S.E. of Toledo, and is served by the Baltimore and Ohio and other rlys. Sandusky Bay, 15 m. long and 5 m. broad, forms an excellent harbour. It has a state fish hatchery. The industries include the making of chemicals, paper, motor engines, glass, agricultural implements, and lumber products, and a trade in fruit and coal. It has retained its early pre-eminence as a grain-shipping centre.

Owing to its position Sandusky was a trading station early in the 18th century. The English had a fort here during the Seven Years' War; but in 1763 it was destroyed by the Indians. After the independence of the U.S.A. it was rebuilt, and during the war of 1812-13 it was assailed by the British. The attempt to capture it, however (Aug. 22, 1813), was a failure. The present settlement dates from 1817, and Sandusky was made a city in 1845. Pop. 24,874.

Sandwich. Name for an article of food consisting of two slices of bread between which ham or meat of other kind, fish, or some other

food, sweet or savoury, is placed. The name is said to be due to the 4th earl of Sandwich (d. 1792), who had food of this kind provided for him when gaming, in order that he might continue at play for long periods.

Sandwich. Mun. borough, market town, and one of the Cinque Ports of Kent, England. On the right bank of the Stour, 2 m. from the sea and 13 from Dover, it has a rly. station. The chief buildings are the guildhall, S. Clement's church, with its Norman tower, S. Peter's church, S. Mary's church, S. Bartholomew's hospital, with its beautiful Early English chapel, and S. Thomas's hospital. Fisher Gate and the Barbican remain of the town's fortifications. The grammar school is an old foundation in modern buildings. There are a number of old houses, and some streets retain their mediæval appearance. Promenades occupy the site of the town walls. The golf links, both the Prince's and the Royal S. George's, are among the most noted in the country. Sandwich, owing to its position, was one of the chief English ports for some centuries after about 1000, but it began to decay owing to the gradual closing in the 16th century of the channel on which it stood. Until 1885 it was separately represented in parliament. About a mile away is Richborough (q.v.). Market day, Tues. Pop. 3,800.

Sandwich, EDWARD MONTAGU, 1ST EARL OF (1625-72). English sailor. Born July 27, 1625, he sided as a young man against his family, staunch Royalists, and fought for the parliament at Marston Moor and Naseby. M.P. for Huntingdonshire in 1645, he retired from politics 1648-53, becoming a commissioner of the Admiralty, and hoisting his flag as part commander with Blake three years later. One of Cromwell's new peers, on the death of the Protector and the abdication of Richard he took the fleet over to the side of Charles, and brought the prince to England. Created earl of Sandwich in 1660, Montagu distinguished himself in the Dutch war of 1664-65, and was ambassador to Spain, 1666-68. Returning to take part in the second Dutch war, he was killed in his victory of Southwold Bay, May 28, 1672.

Sandwich arms

The title of earl of Sandwich passed to his eldest son Edward, while another Edward (d. 1729) was the 3rd earl. John Montagu, who became the 4th earl on his grandfather's death in 1729, was the father of John, the 5th earl (d. 1814), from whom the present holder, the 9th earl (b. Dec. 29, 1874), is descended. The earl's eldest son is known as Viscount Hinchingbrooke.

Sandwich, JOHN MONTAGU, 4TH EARL OF (1718-92). British politician. Born Nov. 3, 1718, he became earl in 1729. Educated at Eton and Trinity College, Cam-

Sandwich. The north gate or Barbican of the old Kentish Cinque port. It is a relic of the ancient fortifications

bridge, he became associated with the duke of Bedford, and his first important public work was helping to arrange the peace of 1748. During 1748-51 he was first lord of the Admiralty, and during 1763-65 was a principal secretary of state. Having been postmaster-general, he was again secretary of state, 1770-71, and first lord of the Admiralty, 1771-82. The earl, who gave his name to the Sandwich Islands (as well as to the sandwich), let the navy fall into a corrupt and deplorable condition. An associate of Wilkes, and a member of the Hell-fire Club, he won, when he took part in prosecuting Wilkes, the name of Jemmy Twitcher. He died April 30, 1792. Basil Montagu the writer was a natural son of the earl.

Sandwich Islands. A name for the Hawaiian Islands (q.v.).

1st Earl of Sandwich,
English sailor
After Lely

Sandwichman. Name applied to men who parade the streets bearing two boards, one in front and one behind, on which are displayed advertisements. A common form of publicity in the 19th century, the sandwichman, sometimes dressed in appropriate costume, was later used chiefly for advertising entertainments and political meetings. During and after the Second Great War the sandwichman almost disappeared.

Sandwip. Island of E. Bengal, Pakistan. It is the most S. island of the easternmost channel of the Ganges-Brahmaputra delta, and is separated from Chittagong by Sandwip Channel. In 1876, 40,000 people, it was estimated, lost their lives here from a tidal inundation during a great storm. Like the neighbouring islands and the Sundarbans, Sandwip is a low-lying alluvial tract. In the 16th century it was a great port with a large trade in salt and timber; in the first half of the 17th century it was a pirate stronghold, first for Portuguese under Gonzales, and then for Arakanese, who were dispersed in 1665. Descendants of Portuguese pirates have adopted the local dress, customs, and language. The E. India Co. came on the scene in 1756. Area, 167 sq. m. Pop. 178,185.

Sandwort (*Arenaria*). Genus of annual and perennial herbs of the family *Carvophyllaceae*. They

Sandwort. Foliage and flower-heads of *Arenaria bavarica*

are natives of temperate and cold regions. They have slender, jointed stems, swollen at the nodes, where the pairs of broad or narrow stalkless leaves arise. The flowers are small and of regular form, in loose, forking clusters, mostly white—a few rosy or purple.

Sandy. Parish and village of Bedfordshire, England. Standing on the little river Ivel, 7 m. E. of Bedford, and on the rly. and the Great North Road, it is the centre for the agricultural produce of the

Sandy Hook, New Jersey. Lighthouse, built in 1784, one of the oldest in the U.S.A.

neighbourhood. Sandy is said to be the Salinae of the Romans, and in the vicinity are two ancient Roman camps, of which Caesar's Camp covers an area of 30 acres. Evidences of Roman occupation have been excavated. Pop. 3,140.

Sandy Hook. Narrow sandy peninsula of New Jersey, U.S.A. Stretching N. for 6 m., and partly enclosing New York Lower Bay, it has a lighthouse, 90 ft. high, state ordnance proving grounds, and a fort. The America's Cup course lay off Sandy Hook. See New York.

Sandys, EDWIN (c. 1516-88). English prelate. He was born at Hawkshead, Lancs, and was educated at S. John's College, Cambridge, becoming master of S. Catharine's Hall in 1547, and vice-chancellor in 1553. For supporting Lady Jane Grey he was imprisoned in the Tower of London. On his release he fled to Flanders, where he remained till the accession of Elizabeth. He was then appointed bishop of Worcester in 1559, bishop of London in 1570, and archbishop of York in 1575. He helped to prepare the Bishops' Bible in 1565, and was a supporter of the Puritan party. Archbishop Sandys died July 10, 1588.

Pron. Sands.

Sandys, FREDERICK (1832-1904). British artist. He was born at Norwich, May 1, 1832, and in art was mainly self-taught. Working on Pre-Raphaelite lines, he exhibited many notable portraits at the R.A., though all his life he was in opposition to that

body, and he was one of the brilliant artists who revived English illustration in the 'sixties and 'seventies. He died at Kensington, June 25, 1904.

Sandys, SIR JOHN EDWIN (1844-1922). British scholar. Born May 19, 1844, he was educated at

Repton and S. John's College, Cambridge, of which he was tutor 1870-1900. He was public orator in the university, 1876-1919, and was knighted 1911. Editor of many Greek and Latin texts, his reputation will rest largely upon his *History of Classical Scholarship*, 1903-08, a comprehensive study in 3 vols. He died July 6, 1922. A *Life*, by N. G. L. Hammond, appeared in 1933.

San Felipe. Town of Chile, capital of the prov. of Aconcagua. It stands in a valley at the base of the extinct volcano Aconcagua, on the Trans-Andean rly., 55 m. E. of Valparaiso. It is connected by motor road with Santiago, 41 m. away. Pop. est. 20,000.

San Felipe. Town of Venezuela, capital of the state of Yaracuy. It is situated on a branch rly. 26 m. from the main line from Tucacas to Barquisimeto, and 40 m. W.N.W. of Valencia, in a valley which produces coffee, sugar, cacao, cereals, tobacco, and fruit. Pop. est. 10,000.

San Felú de Guixols. Seaport of Spain, in the prov. of Gerona. Situated on the Mediterranean, 25 m. by rly. E.S.E. of Gerona, the town is now the chief port for the Spanish cork industry. Pop. 12,800.

San Fernando. Seaport of Spain, in the prov. of Cadiz. It stands on the rocky island called

San Fernando, Spain. Law courts and principal square

Isle de Léon (which name the town bore until 1813), in the Bay of Cadiz, $4\frac{1}{2}$ m. S.E. of Cadiz. One of the three chief naval ports of Spain, it has an arsenal and naval workshops and academy. The industries include the manufacture of salt, ropes, sails, and soap. Near the town are an astronomical observatory, a Roman bridge, and the site of the temple of the Tyrian Hercules. Pop. 36,000.

San Francisco. Highest mt. in Arizona, U.S.A. Situated on a plateau, 5,000 ft. high, in the N. central part of the state, it is of volcanic formation and reaches 12,795 ft. Extinct volcanic cones lie around it.

San Francisco. Chief commercial city of the Pacific states of the U.S.A. It stands on San Francisco Bay, in California. Though the gate to the western ocean, the city faces E., turning its back on the Pacific and looking across San Francisco Bay. This landlocked sheet of water, 50 m. long and 5 m. broad, has access to the ocean only through a strait, 5 m. long and a mile wide, the far-famed Golden Gate. The city stands on the peninsula to the S. of this and is built on the E. slope of a semicircle of hills. Below the twin peaks of Las Papas stands the Mission Dolores, built in 1778, a relic of the old Spanish days.

Four cities E. of the bay—Alameda, Berkeley, Oakland, Richmond—are satellite ports. Some 20 shipping lines have their headquarters at San Francisco, with 16 m. of berthing space. Golden Gate Bridge has the longest single span in the world, 4,200 ft. Bay Bridge takes annually 24 million vehicles and 50 million passengers on trains.

Market Street, starting from the Ferry Building and running due S.W. for 3 m., is the main business thoroughfare of San Francisco. It is 120 ft. wide and is bordered on either side by a skyline of tall buildings and hills. Telegraph Hill rises abruptly 300 ft. Nob Hill, named from the early "nabob" millionaires, is covered with marble and stone buildings of the early residents.

The city, "born of the meeting of sea captains and gold seekers, is extraordinarily cosmopolitan, having the largest Chinese colony outside the Orient and a densely peopled Latin quarter. Chinatown is near Nob Hill, and has virtually its own administration, with shops, postal service, journals, etc. Until 1942 the Japanese colony equalled the Chinese in numbers. With its

banishment the city lost its skilled market gardeners.

The U.S. branch mint is a massive building of classical design. Some of the most impressive offices are those of newspapers. Hotels are prominent in the business district, and the Fairmont boasts a splendid view over the bay. It stands on Nob Hill, once the best residential quarter, and opposite to it is the institute of the San Francisco Art Association.

In Pacific Street is "Barbary Coast," the region of dance halls, saloons, and wild amusement, frequented by sailors from the extraordinarily varied shipping of San Francisco. Mingled with the shipping are the fishing boats and

collection of British parliamentary papers. In the Ferry Building is a fine museum of mining and in Golden Gate Park is another museum devoted to natural history, ethnology, and botany. The most important manufacturing establishment is the Union Iron Works, where many warships have been built.

Spanish soldiers and missionaries were the first settlers on the peninsula, in 1776, but in 1846 the United States flag was hoisted. Two years later gold was discovered and the great rush followed, raising the population in a year from 900 to 20,000. Hordes of reckless characters were attracted by the prospect of sudden riches, and for

San Francisco. Plan of the chief commercial city in the Pacific states of America

coasting craft from which the fruit and vegetable markets draw their supplies. The Presidio, situated at the end of the peninsula, was built as, and still is, a military post, and its guns, the complement of those on the opposite cliff of the Golden Gate, make the entrance to the harbour impregnable. But the reservation of 1,500 acres is laid out as a park open to the citizens. It is surpassed by Golden Gate Park of 1,014 acres, which runs over the heights to the Pacific. With its semi-tropical vegetation, Stow Lake, and Strawberry Hill, this is full of beauty, and it leads to Sutra Heights, where the Cliff House, overlooking the Seal Rocks and their hundreds of sea-lions, stands on the very verge of the western world.

The public library of the city is remarkable for its collection of 16th century literature and Macaulay's

some years life in San Francisco was as wild and dangerous as in any other mining camp; but in 1856 the vigilance committee enforced order with severity and established decent government.

On April 18-19, 1906, came the great earthquake, followed by a three-day fire, in which 452 persons were killed, 2,000 acres devastated and nearly 500,000,000 dollars' worth of property was destroyed. Undaunted, the people of San Francisco, by replacing the old wooden houses with brick or concrete structures, improved their city. It is governed by a mayor and a board of supervisors, and its citizens can take a share in public affairs by referendum and recall. Pop. est. 634,536. *See* Bridge illus. p. 1424; Earthquake illus. p. 2903. *Consult* Golden Gate, F. Riessenberg, 1942; Golden Gate Country, G. Atherton. 1945.

San Francisco Bay. Deep indentation of the coast of California, U.S.A., forming the harbour of San Francisco. It is a land-locked bay, stretching S.E. for about 40 m. to 50 m., with a breadth varying from 5 m. to 12 m. The Golden Gate, a channel 5 m. long and from 1 m. to 2 m. broad, provides the entrance to the bay, which communicates N. with San Pablo Bay. See Bridge illus. p. 1424; California; Golden Gate.

San Francisco Conference. Meeting held at San Francisco April 25–June 25, 1945, at which the charter of the United Nations organization was drawn up. The conference was composed of delegations of 46 nations, joined later by four others, which had adhered to the United Nations' declaration embodying the Atlantic Charter and signed at Washington, Jan. 1, 1942, by 26 of them. Adherence to this declaration before March 1, 1945, which meant repudiation of Axis ties, was a condition of invitation laid down by the U.K., the U.S.A., and the U.S.S.R. at Yalta in Feb., 1945. The 50 nations which at San Francisco signed the charter on June 26, 1945, were: Argentina, Australia, Belgium, Bolivia, Brazil, Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Denmark, Dominican Republic, Ecuador, Egypt, Ethiopia (Abyssinia), France, Greece, Guatemala, Haiti, Honduras, India, Iran (Persia), Iraq, Lebanon, Liberia, Luxembourg, Mexico, Netherlands, New Zealand, Nicaragua, Norway, Panama, Paraguay, Peru, Philippines, Salvador, Saudi Arabia, S. Africa, Soviet Union, Syria, Turkey, Ukraine, U.K., U.S.A., Uruguay, Venezuela, White Russia, and Yugoslavia. A preparatory commission set up on June 26 made arrangements for the first meeting of the general assembly of the United Nations (*q.v.*) held in London Jan.–Feb., 1946.

Sangallo. Florentine family of architects. Giuliano da Sangallo (d.1516), architect and military engineer, studied under Francione, and was employed by Lorenzo the Magnificent to design various buildings, including a convent by the gate of San Gallo, Florence. Settling in Rome, he was patronised by the popes Alexander VI and Julius II, and became one of the founders of the Roman school of architecture. He returned to Florence to build fortresses for defence against Pisa, but in 1514 was made architect to S. Peter's in conjunction with Raphael.

His brother Antonio (1455–1534), also an architect and military engineer, built the fine church of S. Biagio, Montepulciano. Antonio the younger (1485–1546), nephew of Giuliano, studied under Bramante in Rome, where he designed the church of S. Maria di Loreto, and in part that of S. Giovanni dei Fiorentini.

Sangay. Volcano of Ecuador, in the Andes. It is situated near Riobamba, and in Chimborazo dept., is active and snow-covered, reaching an alt. of 17,390 ft.

Sanger, GEORGE (1827–1911). English showman, who called himself Lord George Sanger. He was

"Lord" George Sanger, circus proprietor

born at Newbury, Dec. 23, 1827, the son of a travelling showman. George led a wandering life with his parents, and at Stepney Fair in 1848 he met Nellie Chapman, then performing with Wombwell's lions, and married her in 1850. With his brother John (1816–89) he started in 1854 a travelling circus. One of his greatest successes was his spectacle of Mazeppa, the name part of which he impersonated over 9,000 times. In 1871 Sanger purchased Astley's amphitheatre and menagerie, and then leased the Agricultural Hall, Islington. Besides these, he ran circuses at Birmingham, Liverpool, Glasgow, Dundee, Aberdeen, Bath, Bristol, and Plymouth. He was shot dead by one of his employees, Nov. 28, 1911. His book, *Seventy Years a Showman*, was repr. 1926.

His son, George Sanger (1868–1947) carried on as circus proprietor, and contributed memoirs of famous shows to Sunday newspapers. He died Jan. 30, 1947.

Sanger, MARGARET. American protagonist of contraception. Born

at Corning, N.Y., she was educated at Claversack College, and trained as a nurse. Her chief claim to fame was that she originated the term birth control for contraception. She was arrested in 1916 for conducting a birth control clinic in Brooklyn. In 1921 she organized the first U.S. birth control conference, and in 1927 a world population conference at Geneva. She set up 50 teaching centres for birth control in India. Founder of the U.S. Birth Control League, in 1928 she formed a committee to press for federal legislation on the subject. Such legislation was achieved in 1937. Margaret Sanger, who was Mrs. J. H. N. Slee, published books, including her autobiography in 1938.

San German. Town of Puerto Rico, West Indies. Situated in the S.W. part of the island, 10 m. by rly. S.E. of Mayaguez, it has a large export trade in coffee, cocoa, fruit, tobacco, and sugar.

San Gil. Town of Colombia, in the dept. of Santander. It stands on the Gil river, 148 m. N.E. of Bogotá, and 65 m. S.S.W. of Pamplona. The manufactures include farming implements, tobacco, straw hats, cotton, sugar, and quinine. It has a large trade in the agricultural produce of the dist. Pop. approx. 12,000.

San Gimignano. City of Italy, in the prov. of Siena, commonly called in Italian "San Gimignano delle Belle Torri" (S. G. of the beautiful towers). It stands at an alt. of 1,100 ft., 22 m. N.W. of Siena. An old Tuscan city, its ancient walls, towers, and the Gothic architecture of many of its buildings preserve its medieval aspect. The former 12th century cathedral was rebuilt in the 15th, and contains many masterpieces and frescoes, the work of Ghirlandajo and Gozzoli, the latter being badly damaged by shrapnel in the Second Great War. The Palazzo Pubblico, built 1288–1323, had a museum containing many fine

which climb Nob Hill and other steep streets of the city. 5. The ancient Mission Dolores nestling in the shadow of the parish church of the same name. 6. Market Street, the principal thoroughfare of the city. 7. Headquarters of Pacific Telephone and Telegraph Co.

SAN FRANCISCO: VIEWS OF THE OLDEST SEAPORT ON THE PACIFIC COAST OF N. AMERICA

paintings. The town was wantonly shelled by the Germans after they had withdrawn from it, and the French had taken it July 13, 1944, but was less badly damaged than was at first feared. All its 12 towers survived. A choice wine is produced from the vineyards of the surrounding dist.

Sangir, SANGUR, OR SANGI. Chain of islands in Indonesia. They lie in a north-easterly direction from Celebes towards Mindanao in the Philippine Islands, and are coral fringed. Of volcanic origin, the peak Abu on Sangi erupted in 1856, 1883, and 1892. The only settlement of importance is Taroena on Great Sangi Island. Cabinet woods, Manila hemp, coconuts, and nutmeg are the main products. Area, 408 sq. m. Pop. 134,930.

Sangli. Town and former state of India, in Bombay state. The state was the largest of the Southern Mahratta Jagirs, and lies E. of the W. Ghats, part being drained by the Kistna. Since 1948 it has been merged administratively in Bombay state, having acceded to the dominion of India in 1947. The town, 77 m. N.W. of Bijapur, is the terminus of a short branch rly. from Miraj. Area, 1,136 sq. m. Pop., state, 293,381; town, 21,112.

Sangre de Cristo. Mt. range in Colorado, U.S.A. A branch of the Rocky Mts., it has a mean alt. of about 12,500 ft., and reaches its culminating point in Blanca Peak, 14,390 ft. Several other peaks exceed 13,000 ft.

Sangro. River of Italy, in the prov. of Chieti. It rises near Palena, and runs generally N.W., reaching the Adriatic coast at Fossacesia. During the Italian campaign of the Second Great War the Allied 8th army was in control of 12 m. of the S. bank of the Sangro from its mouth by Nov. 20, 1943. But the Germans had destroyed all the bridges, and four days later, in heavy rain, British troops waded the swollen river, breast high, through a current running at 15 m.p.h., to secure a bridgehead 5 m. long and 1 m. deep on the N. bank. British and Indian sappers, working under fire, constructed three bridges, and on the night of Nov. 27-28 Gen. Montgomery was able to deliver an attack which dislodged the Germans from their intended winter line on the ridge overlooking the Sangro valley. This was the last battle in which Montgomery led the 8th army.

Sanhedrin (Gr. *synedrion*, council). Supreme council or senate of

the Jews. It had charge of all the internal affairs of the nation. Established apparently shortly before the time of Antiochus the Great, its exact origin is unknown, but it does not seem to have anything to do with the Mosaic council of seventy elders. It consisted of persons of the upper classes, seventy-one in number, who met under the presidency of the high priest. It acted as the supreme court of justice, with jurisdiction over Jews in all countries, and was allowed considerable freedom of action by both Greeks and Romans; but the power of inflicting the death penalty was taken from it about forty years before the destruction of Jerusalem. See Jews.

Sanicle (*Sanicula europaea*). Perennial herb of the family Umbelliferae. A native of Europe,

Sanicle. Rootstock, leaves, and flower-heads; inset, umbel of flowers

Asia, and Africa, it has a stout, creeping rootstock, and long-stalked, glossy leaves, cut into five wedge-shaped lobes. The minute white or pink flowers are clustered in compound umbels about $\frac{3}{4}$ in. across. The leaves have a bitter taste, and were formerly held in high repute for their supposed healing virtues.

Sanidine. In geology, name of a variety of potash feldspar. Clear, glassy, with a tabular crystallisation, it is common in many volcanic rocks. See Feldspar.

Sanitary Authority. Body charged with the duty of enforcing the Public Health Acts in Great Britain. In a county borough outside London the authority is the council of the borough. In counties it is in part the county council and in part the council of a non-county borough, the urban district council, or the rural district council. In London the authorities are the L.C.C., the common council of the City of London, and the metropolitan borough councils. In ports special port health

authorities may be created by the minister of Health.

Sanitary Institute, ROYAL. British institute, founded 1876, to promote the study of sanitary science. Examinations in this subject and in other subjects relating to public health are held in London and provincial centres. The Parkes Museum, which is maintained by the Institute, contains an interesting collection of objects, models, and specimens pertaining to public health. An annual congress is held, and a journal is published bi-monthly. The address of the institute is 90, Buckingham Palace Road, London, S.W.1.

Sanitation (Lat. *sanitas*, health). Term for the processes needed to maintain conditions conducive to human health, and used in particular for the system of waterborne removal of excreta. In scattered rural communities earth closets are sanitary if their contents are buried, or better, composted with kitchen waste to be used subsequently as manure. Water from a well in such a community is wholesome, provided it is not polluted by seepage from a farmyard or other source of contamination. With the installation of a piped water supply and waterborne sewerage, sanitation becomes more complicated, even in a country district. Waste water must be discharged in such a way that it cannot contaminate the water supply. Bath water can be run out over ground, e.g. in a garden, which will absorb it. Discharge from sinks and w.c.s. can be run into cesspools which must be emptied periodically, or, if there is land available to absorb its effluent, into a septic tank. Individual owners can do what is required, subject to by-laws, rules, or regulations in force in their locality.

In areas of any density of pop. wells and septic tanks are impossible. Water must be brought in from an outside source, and sewage and refuse must be removed outside the community area before they can be disposed of. This involves the installation of public utility services, either by a water undertaking or by the local authority. But the individual owner remains responsible within his own establishment. All his private installations must comply with standards laid down for the community as a whole, and the larger the community the more strict should be the com-

pliance, for failure to comply endangers a greater number of people. An insanitary solitary cottage may damage the health of one family; an insanitary tenement in a crowded street may lead to damage to the health of thousands. House pipes and fittings must be such that foreign matter cannot enter them. All pipes and fittings used for draining w.c.s, sinks, and baths should be such that, if gas forms in the connecting or main sewer (it never should if the sewers are properly ventilated), it cannot make its way back into the house. If there is no garden in which it can be used as compost, kitchen waste must be put in suitable refuse bins to be cleared by the local authority.

The local authority must maintain an adequate supply of water which must not be corrosive or liable to fur pipes and boilers, and must be chemically and bacteriologically fit for human consumption. The standard of purity is determined by the presence or absence of the common bacillus coli. The coli bacilli are harder than the pathogenic germs, and it is almost certain that if bacillus coli is absent the more vulnerable pathogenic germs will not be present. Coli and pathogenic germs are neutralised by some sterilising agent, of which chlorine is the simplest, though if used in any quantity it gives the water a nasty taste. Ozone is pleasant but more expensive. Excess lime is convenient with a hard water as it softens and sterilises at the same time. The local authority must remove sewage sufficiently rapidly to prevent it from causing bad smells, and must see to its disposal, or, better, its utilisation: sewage sludge and refuse composted together form a manure welcome to farmers.

Sanjak OR **SANYAT** (Turkish, standard). Name given to an administrative subdivision of the former Turkish empire. The empire was divided into vilayets or governments, each under a vali or governor-general. Each vilayet was subdivided into sanjaks, over which supervision was exercised by inferior authorities responsible to the vali. A famous sanjak was that of Novi Pazar, Serbia.

San Joaquin. River of California, U.S.A. Rising in the Sierra Nevada, to the S. of the Yosemite National Park, it follows a S.W. and N.W. course to Suisun Bay, which it enters close to the mouth of the Sacramento river. It is about 350 m. long, and navigable

to Stockton, 50 m. up. The valley yields grain and fruit. The huge Friant Dam in Fresno co. impounds the river waters, which are carried by pipeline, with a capacity of 2,000,000 galls. a minute, to the Friant-Dern canal system. San Joaquin is also the name of a county of California.

San José, California, U.S.A. Court house and hall of records

San José. City of California, U.S.A., the co. seat of Santa Clara co. A popular health resort, it is 48 m. S.S.E. of San Francisco on the rly. It is the seat of the university of the Pacific, and contains the R.C. college of Notre Dame. San José lies in a fruit-growing region and has fruit canning and packing houses, and metal works. The mercury mine of New Almaden is reached by rly. from here. San José was founded by Spaniards in 1877, the first Californian town as distinct from forts and mission centres. It was the state capital, 1849-51. Pop. est. 80,495.

San José. Capital city of Costa Rica, Central America. It is situated in a depression of the central plateau, at an alt. of 3,860 ft., 16 m. by rly. W.N.W. of Cartago, the former capital, and is also connected by rly. with Puerto Limón on the Atlantic and with Punta Arenas on the Pacific. The buildings include a cathedral, library, museum, institute of physical geography, school of law, and one of the finest opera houses in America. Its former university is used as a museum. The bishop of San José is a suffragan of the archbishop of Guatemala. There are steam flour mills, foundries, and distilleries. La Sabana on the outskirts has an aerodrome and facilities for sports. Pop. 97,557. See Costa Rica.

San José. Seaport and airport of Guatemala, on the Pacific coast. It is the terminus of the transcontinental rly. from the Gulf of Honduras, 27 m. by rly. S. of Escuintla. The chief Guatemalan port on the Pacific, it has a harbour and pier, and is a port of call for liners. Pop. 10,800.

San José. Department of S. Uruguay, bordered on the S. by the Río de la Plata. The surface is

undulating, the soil fertile, and the inhabitants are mainly engaged in agriculture and rearing cattle and horses. Area, 2,688 sq. m. Pop. est. 97,687. The capital is San José, 46 m. by rly. N.N.W. of Montevideo. It carries on a trade in agricultural produce. Pop. 13,000.

San Juan. Range of mountains in Colorado, U.S.A. A branch of the Rocky Mts., they reach an alt. of 14,280 ft. in Mt. Wilson and Uncompahgre Peak, and contain rich deposits of silver.

San Juan. Prov. of W. Argentina. It is bounded N. and E. by the prov. of La Rioja, S.E. by San Luis, S. by Mendoza, W. by Chile. Mountainous in the centre and N., it has sandy plains and salt marshes in the E., while the Andes are on the W. border. The prov. is watered by the Río Blanco, Vermejo, and other streams, and stock breeding and agriculture are the chief occupations. Minerals abound, including gold, silver, copper, iron, malachite, and coal. The principal crops are wheat, alfalfa, maize, and grapes, and from the latter an excellent wine is made. Area, 34,432 sq. m. Pop. est. 243,303. The capital was San Juan, a well-built town 98 m. by rly. N. of Mendoza, but in Jan., 1944, it was destroyed by an earthquake.

San Juan. Seaport of Puerto Rico, capital of the island. A fortified city, dominated by a Morro castle, it stands on a small island off the N. coast, and is connected with the mainland by bridges and a causeway. It is the chief port and naval station on Puerto Rico, and its harbour is being improved. Among the prominent buildings are a cathedral, town hall, government offices etc. The university of Puerto Rico is established at Río Piedras, a few miles from the city. Sugar and coffee are exported. Founded by Ponce de León about 1511, it has several times repulsed British fleets. Its fortifications were bombarded by the U.S. naval forces under Admiral Sampson, May 12, 1898, seven months before Puerto Rico was ceded to the U.S.A. The water supply and sanitation were greatly improved under the American occupation. Pop. 222,839.

San Juan Bautista. City of Mexico, capital of the state of Tabasco. It stands on the river

San Juan arms

Grijalva, about 30 m. from the Gulf of Mexico. Manufactures include soap; candles, tiles, bricks, and cigars. Founded in 1598, it was called Villa Hermosa till 1821. Pop. est. 17,000.

San Juan del Norte OR GREYTOWN. Seaport of Nicaragua, Central America. It stands on the Atlantic coast, at the mouth of the navigable San Juan river, which separates Nicaragua from Costa Rica. The harbour is declining in importance, owing to deposits of silt, although a huge breakwater has been constructed to help to keep the waterways open. In spite of this, only small motor launches are able to enter. Mahogany, hides, rubber, bananas, tortoise-shell, and coconuts are exported. A wireless station has been established at the port. Pop. est. 1,000.

Sankey, JOHN SANKEY, 1st Viscount (1866-1948). British judge. Born Oct. 26, 1866, he was educated at Lancing, and

Viscount Sankey,
British lawyer
Russell

and Jesus College, Oxford. Called to the bar in 1892, he made a reputation as an ecclesiastical lawyer, and from 1909 to 1914 was chancellor of the diocese of Llandaff. Judge of the high court, 1914, when he was knighted, he presided over the commission of 1919 (often referred to as the Sankey commission), which inquired into the coal mining industry, and which recommended state ownership and management of the mines. He was a lord justice of appeal during 1928-29 and lord chancellor in the Labour government, 1929, a position he retained under the National govt. until 1935. Raised to the peerage in 1929, he was made viscount in 1932. He played a prominent part in the Indian round table conferences of 1930-31. He died Feb. 6, 1948.

Sankey, IRA DAVID (1840-1908). American evangelist. Born at Edinburgh, Penn., Aug. 28, 1840, he devoted himself to mission work and became famous through his association with D. L. Moody (q.v.), which began in 1870. The pair conducted revival services all over

Ira D. Sankey,
American evangelist

the U.S.A., and met also with great success in their visits to Great Britain in 1873-75, 1881-84, and 1891-92. Responsible for the musical part of the services, Sankey used his fine voice with great effect. He was the compiler of Sacred Songs and Solos, 1873, for which he composed a number of tunes, including the popular Ninety and Nine. In 1903 he became blind, and he died Aug. 14, 1908. Consult Sankey's autobiography, *My Life*, 1907.

Sankhya (Skt., enumeration). Brahmanic system of materialistic philosophy. Attributed to the sage Kapila, of unknown date, it was expounded later in the Sankhya sutra. It holds that a material first cause evolved into the phenomenal universe, through the interaction of the inherent qualities of matter. Souls, co-eternal with Nature, acquire attributes from matter, and retain them until they ultimately attain absolute unconsciousness.

Sankt Pölten. Town of Austria. It is on the river Traisen, 38 m. W. of Vienna. The medieval cathedral was rebuilt in the 18th century. Flour milling and the manufacture of cotton and iron goods, including firearms, are the principal industries. Pop. 38,759.

San Lorenzo. Seaport of Honduras, Central America. On the Pacific coast, it stands on the N. side of the Gulf of Fonseca, about 80 m. S. of Tegucigalpa. Amapala, on Tiger Island, is reached in three hours by motor-launch from San Lorenzo. There are also good motor-roads. Pop. est. 2,700.

San Lorenzo. Church in Florence. One of the oldest in Italy, the first church on the site was consecrated by S. Ambrose in 393. The present Early Renaissance building was begun under Brunelleschi in 1419, and consists of a nave, aisles, and transept. The roof and windows were somewhat damaged by shellfire during the Second Great War. The interior contains several striking pictures, and among others the tomb of Cosimo de' Medici, and the artist Donatello, who helped decorate the church. Adjoining the church is the library with some 10,000 Greek and Latin MSS. In the New Sacristy, built to designs by Michelangelo, 1520-24, is the Medici mausoleum, containing the monument of Giuliano and Lorenzo. The sarcophagus of the former is adorned with statues of Day and Night, which inspired Swinburne's sonnet, *In San Lorenzo*. Leading out of the sacristy is the chapel of the princes, where

later grand dukes of the Medicifamily were buried. See Michelangelo.

San Lorenzo FUORI LE MURA. One of the principal churches in Rome. The original church, founded by Constantine over the graves of SS. Lawrence and Cyriaca, was rebuilt by Pope Pelagius II in 578, and Honorius III made further important additions and alterations early in the 13th century. Subsequent popes restored and altered the church, Pius IX adorning the façade with paintings. The interior has been much restored and changed. The old church of Pelagius was excavated at the east side of the present building in 1870, and contains some restored mosaics of the 6th century. In the vestibule of this old church is the tomb of Pius IX.

Sanlúcar de Barrameda. Seaport of Spain, in the prov. of Cadiz. It stands on the left bank of the Guadalquivir estuary, 15½ m. by rly. N.W. of Jerez, and 26 m. by sea N. of Cadiz. An ancient city, probably of Phoenician origin, it is protected by forts, has many villas among the surrounding pine woods and vineyards, and is a summer bathing resort. The old, or higher town, has a ruined Moorish castle, and there are a 14th century church, a palace of the dukes of Medina-Sidonia, and a 16th century hospital for British sailors, founded by Henry VIII. Captured from the Moors in 1264, it became, after 1492, a great centre of trade with America. Columbus sailed hence in 1498, on his third voyage of discovery, and Magellan embarked here in 1519 on his voyage round the world. Sherry is made, and salt, cereals, and fruit exported. About 2 m. to the N. lies Bonanza, a shipping and fishing river port. Pop. 29,000.

San Luis. Prov. of central Argentina. It lies between the prov. of Mendoza, on the W., where

San Luis arms

the rivers Desaguadero and Salado form its boundary, and Córdoba on the E. Mountains in the N., where it is traversed by the Sierra de San Luis (alt. 7,000 ft.), the remainder is of a steppe-like character. It is sparsely watered, and agriculture depends to a large extent on irrigation. Stock-rearing is the chief occupation; vegetables and fruit are grown for local consumption. The prov. is rich in minerals, having mines of gold,

silver, copper, iron, lead, graphite, and manganese. Its area is 29,700 sq. m. Pop. 165,376.

San Luis, the capital, is 140 m. by rly. S.E. of Mendoza. It stands on a plateau, and is connected by rly. with the capital. The town is noted for its manufacture of ponchos. Horses, hides, wool, and other animal products are exported. Pop. est. 18,000.

San Luis Potosí. State of Mexico. Mainly situated on the central plateau, it is well wooded, and covers an area of 24,415 sq. m. Tropical fruits, cereals, and pepper are produced, and mining is carried on, the chief metals obtained being gold, silver, copper, and lead. Pop. 678,779.

San Luis Potosí. City of Mexico, capital of the state of the same name. Situated on the edge of a plateau 6,250 ft. alt., 327 m. N. of Mexico City by rly., it is regularly built, and has a cathedral and a handsome city hall. It has rly. workshops, smelters, and cotton, woollen, furniture, match, flour, and soap factories. In the neighbourhood are important silver mines. Pop. 77,161.

San Marco in Lamis. Town of Italy, in the prov. of Foggia. It stands on the slopes of Monte Gargano, 12 m. by road E. by N. of San Severo and 18 m. N.W. of Manfredonia on the gulf of that name. Fruit-growing is the chief pursuit. Pop. est. 17,000.

San Marino. European republic, entirely surrounded by Italian territory. Situated 12 m. S.W. of

San Marino arms

Rimini between the provinces of Forlì and Pesaro e Urbino, it claims to be the oldest state in Europe, and is one of the smallest states in the world. Authority rests in

the great council of 60 popularly elected members, a third of whom are renewable every three years, and from whom two selected councillors act as regents for a period of six months. Wine, cattle, and stone from quarries on Mt. Titano are exported. The frontier is 24 m. long, and encloses an area of 38 sq. m. The state is hilly, embracing spurs of the Apennines, on one of which, Mt. Titano, 2,650 ft., is the capital, San Marino, a walled city with a fine parliament house. In 1932 an electric rly. from Rimini to San Marino City was completed.

By repute a foundation of S. Marinus of Dalmatia, the city belonged to the exarchate of Ravenna

and, later, it came under the protection of the counts of Montefeltro. In 1631 the pope formally

San Marino. Citadel of the mountain republic situated in the heart of Italy

acknowledged its independence, which was recognized by Italy in 1862. Government is by two regents, elected every 6 months, and a council of 60 members. During the Second Great War, when fighting approached its frontiers, in Sept., 1944, San Marino mobilised its army of 300 and erected along its borders large signs with the words "Neutral—Keep Out" in four languages. The Germans, nevertheless, invaded San Marino and were followed by troops of the Allied 8th army. On Sept. 23, 1944, the republic declared war on Germany. Pop. 14,545. *Consult* in the Margin of History, H. Luke, 1933.

San Martín, José de (1778–1850). South American soldier. Born at Yapeyu, Argentina, Feb. 25, 1778, and brought up in Spain, he entered the Spanish army, and in the war with the French rose to the rank of lieutenant-colonel. In 1812 he went to Buenos Aires and joined the patriot party in the struggle to throw off the authority of Spain. After two years of preparation he led an army of Argentines and Chileans from Mendoza across the Andes and by his victories at Chacabuco, 1817, and the Maipo, 1818, ended the dominion of Spain in Chile. In 1820 he led an expedition against Peru, and in the following year entered Lima, the capital, and was chosen Protector. In 1822 he handed over the reins to Bolívar (q.v.), who had arrived with an army of liberation from the north, and after a brief stay in Chile and Argentina San Martín departed for Europe. He died at Boulogne, Aug. 17, 1850. A skilful soldier,

J. de San Martín, S. American soldier

and a man of fine personal character, San Martín's memory is revered by the people of Argentina, Chile, and Peru, the Peruvian dept. of San Martín being named after this national hero.

San Matías Bay. Wide and deep opening of the Atlantic Ocean in S. America. It penetrates inland between the territories of Rio Negro and Chubut, Argentina, for about 100 m. It is bounded S. by the Valdes Peninsula, from the N. point of which to Punta Vermejo is 77 m. To the S. lies the smaller enclosed bay of St. José.

San Miguel. Bay of E. Panama. It forms an E. extension of the Gulf of Panama, is 22 m. wide and 25 m. deep, extending farther in fjord-like branches running N.W. and S.E., forming San Miguel Harbour and Darien Harbour.

San Miguel. Dept. of S.E. Salvador, Central America. Bounded S. by the Pacific and W. by the river Lempa, its surface is mountainous with many fertile valleys, the land being drained by the San Miguel river. Thermal and medicinal springs abound. San Miguel, the capital, stands on the San Miguel river, 75 m. E.S.E. of San Salvador, and many of its houses are built of lava. It is situated in a rich agricultural region, trades in indigo, and holds a yearly fair. Nine miles to the S.W. is the active volcano of San Miguel. Pop., town, 53,817.

San Miguel de Allende. Town of Mexico. In the state of Guanajuato, it is 30 m. E. of Guanajuato city. It is named after Ignacio Allende (1779–1811), the Mexican patriot. It is a centre of trade in blankets, harness, etc. Population est. 12,000.

San Miniato. City of Italy, in the prov. of Pisa. It stands on a hill, overlooking the river Arno, 21 m. by rly. W.S.W. of Florence. It has a 10th century cathedral, partly rebuilt in 1488, the roof and frescoes of which were damaged during the Second Great War, and a medieval castle, the tower of which was blown up by the Germans in 1944. The original home of the Bonapartes, it trades in olive oil, glass, leather, and hats. The city was considerably damaged during the fighting for Florence, July–Aug., 1944.

Sann or Savinja. River of Yugoslavia in Slovenia. It rises S. of Guschowa peak in the Karawanken and flows S.E. to Cilli and then S.S.W. to join the Save.

Sannazaro, Jacopo (1458–1530). Italian writer. He was born at Naples, July 28, 1458, and is

believed to have been of Spanish descent. The most important of his works, *Arcadia*, 1504, is a pastoral romance of mingled prose and verse which had much influence on writers of other lands. Sir Philip Sidney (*q.v.*) borrowed its title and many of its episodes; the Portuguese pastoralists, Bernardim Ribeiro and G. de Montemayor, modelled their works on it; to it Shakespeare owed the name of Ophelia, and its influence is traceable in the work of Keats. Upwards of 60 editions of Sannazaro's *Arcadia* are known. It is regarded as the only Italian prose classic of the 16th century. Sannazaro died April 27, 1530. *Consult* Life, F. Colangelo, 1819.

Jacopo Sannazaro, Italian writer

San Nicolás. Town of Argentina, in the prov. of Buenos Aires. It stands on the river Paraná, 148 m. N.W. of the capital and 38 m. below Rosario, with both of which it is connected by rly. A thriving river port, it has a national college and normal school, flour mills, and a large beef-preserving industry. Frozen meat, soap, animal products, maize, and linseed are exported. Pop. est. 30,000.

San Pedro. Town and river port of Paraguay, and capital of the department of the same name. Situated on the river Paraguay a few miles above its junction with the Jejui, 95 m. N.N.E. of Asunción, it is a centre for exporting yerba maté (Paraguayan tea), and in the surrounding districts cattle are reared (canned meat being exported) and tobacco, rice, and sugar grown. Pop. 14,790.

Sanquhar. Royal burgh of Dumfriesshire, Scotland. It stands on the Nith, 26 m. N.W. of Dumfries, with a rly. station. The principal buildings are the town hall, erected by the duke of Queensberry, and the parish church. Textiles, mainly gloves, are manufactured, as are iron goods of various kinds. In the vicinity are coal mines, and the town is an agricultural centre with cattle and sheep fairs. There are

ruins of a castle which, evidently a building of great strength, belonged in turn to the families of Ross and Crichton. The Admirable Crichton (*see* Crichton, James) was born near Sanquhar, which was confirmed as a burgh in 1484. Pop. est. 2,000.

San Rafael. City of California, U.S.A., the co. seat of Marin co. It is 15 m. N. of San Francisco in a small valley not far from the N. end of the Bay of San Francisco, and is served by the North Shore and other rlys. It is a favourite pleasure resort, and has many beautiful villas and gardens. Here are the Hitchcock and Mt. Tamalpais military academies. Pop. 18,022.

San Remo. City of Italy, in the prov. of Imperia. It is 26 m. E.N.E. of Nice on the Riviera, has an exceptionally mild winter climate, and is a resort for sufferers from lung diseases. The old city, crowning a steep hill, with narrow crooked streets, provided a contrast with the new city along the coast, with its promenades, villas, and gardens. Perfumes and mosaics are manufactured, and Italy's only authorised casino is here. It was attacked by Horouk Barbarossa in 1544, by the French in 1625, and bombarded by the

San Remo arms

San Remo, Italy. Market place, showing the old cathedral

San Roque. Town of Spain, in the prov. of Cadiz. It stands near the head of the Bay of Gibraltar, 9 m. by rly. N.E. of Algeciras, and 7 m. N.W. of Gibraltar. A modern town, it was founded by Spaniards, who left Gibraltar after its capture by the British in 1704. It was for long a summer resort for British officers' families. Pop. 11,500.

San Salvador. The capital of Salvador (*q.v.*) republic, Central America. It is near the base of the extinct volcano of San Salvador, 8,360 ft., 25 m. from the Pacific coast, and stands at an altitude of some 2,000 ft. The dist. is subject to serious and frequent earthquakes, and the buildings are low, most of them, including the new cathedral, being of wooden construction. Considerable damage by earthquake was done in 1917 and 1919. The university, president's palace, and observatory are the prominent edifices. Indigo and tobacco are grown in the dist. Rlys. run to the ports Acajutla and La Libertad. The city was founded in 1525 by Jorge de Alvarado. Pop. 123,143.

San Salvador OR **BANZA.** Town in the N. of Angola. Capital of the ancient kingdom of Congo, it is about 170 m. from the coast. In the 15th cent. it was an important Portuguese settlement, and there are remains of ancient ecclesiastical buildings.

San Salvador, OR **WATLING'S IS.** One of the Bahamas. It was the first land in the New World sighted by Columbus, who gave it its name. Pop. 693.

San Salvatore. Mountain of Switzerland, in the canton of Ticino. It is situated near Lugano,

San Salvador, Central America. Calle Comercial, a business street in the centre of the city

British fleet in 1745. During the Second Great War the old city was little damaged, but the modern city suffered severely. Pop. est. 21,000.

overlooking the lake, and is approached by mountain rly. from Lugano. On the summit, alt. 3,000 ft., is a pilgrimage chapel. *See* Lugano.

Sansanding OR **SANSANDIG**. Town on the left bank of the Niger. It is in the French Sudan, about 370 m. S.W. of Timbaktu. The Sansanding barrage is the centre of an important irrigation scheme, to assist in the cotton and maize production of the district. Pop. about 4,000.

San Saturnino de Noya. Town of Spain, in the prov. of Barcelona. It is 18 m. direct and 29 m. by rly. N.W. of the city of Barcelona, and was known to Pliny as Noela.

Sansculottes (Fr., without breeches). Term applied by the court to the common people in the French Revolution. According to Littré, the Sansculottes were so called because they gave up the knee-breeches in fashion previous to the Revolution, and wore trousers or pantaloons. The excesses of the Revolutionaries gave a sinister association to the word, which is occasionally used of persons advocating political revolution.

San Sebastián. Seaport and bathing resort of Spain, capital of the prov. of Guipúzcoa. It stands

worthy buildings. There are breweries, saw and flour mills, and manufactures of sail-cloth, paper, cotton, soap, and glass, while the exports include cork, wine, fruit, turpentine, and wool. Long a formidable fortress, San Sebastián has been often besieged, notably in 1719, 1794, and 1808, when it was taken by the French; in 1813, when the Allies, under Wellington, drove out the French and utterly destroyed the town; and in 1836, during the first Carlist War, when the Carlists had to raise the siege. Pop. 124,892.

Other but smaller San Sebastián is the chief town of the island of Gomera in the Canaries, and a town in Puerto Rico, 12 m. direct E.S.E. of Aguadillo.

San Sebastián, SIEGE OF. Operation in the Peninsular War, July-Aug., 1813. San Sebastián commanded the road by which Wellington intended to cross the Pyrenees from Spain to France, and come to grips with Soult in what proved to be the final campaign of the Peninsular War. The reduction of the town was therefore a necessary preliminary. The siege opened July 10, and a furious but ineffectual assault was made on July 25, but it was only after constant skirmishes and battles that the town, excluding the castle, was

frescoes; in the new cathedral in the lower town there is a beautiful altarpiece by Pinturicchio. It was anciently known as Septempeda. Overrun by the Allies at the end of June, 1944, it suffered no damage during the Second Great War. Pop. est. 4,000.

San Severo. City of Italy, in the prov. of Foggia. It stands at the base of Monte Gargano, 18 m. N.N.W. of Foggia. Some remains of its old fortifications are still extant, and it has a handsome cathedral. Fruit growing is the chief pursuit. The city was ruined by the army of Frederick II, and destroyed by the French in 1799; it has suffered from earthquake. San Severo was captured by the Allied 5th army advancing from Foggia on Oct. 1, 1943. Pop. est. 35,000.

Sanseveria. Genus of perennial herbs of the family Liliaceae, called the bowstring hems. Found in the tropical regions of the Old World, they have no stems but throw out runners. The lance-shaped root-leaves are thick and fibrous, and the flower clusters are pale yellow or green, or white. The E. Indian fibre plant or moorva belongs to the genus.

Sans-Gêne, MADAME (1774-1861). French adventuress. Thérèse Figueur, daughter of a grain merchant, was born at Talmay, Côte d'Or. Enrolled in a cavalry regiment at 19, she was vivandière at Hohenlinden, Toulon, Austerlitz, Jena, and Waterloo, had four horses shot under her, and was a prisoner at Lisbon and Southampton. She married in 1818 Clément Sutter, a dragoon, and, left a widow, died in poverty, Jan. 4, 1861. She is sometimes confused with La Maréchale Lefebvre, duchess of Danzig, to which mistake she possibly owes her fame, the duchess of Danzig being the subject of a play by Sardou and of two light operas.

Sanskrit. Old sacred language of the Hindus, in which the bulk of their literature is written. It is a member of the Indo-European family. The name means "carefully made," as opposed to Prakrit (*q.v.*) (common, natural). The relation of Sanskrit to Prakrit may be compared to that of Latin to the Romance languages of Europe.

Its most ancient form is to be found in the Vedas, certain parts of which may go back to about 1400 B.C. The Sanskrit of the Vedas may to some extent be considered a popular dialect, differing from classical Sanskrit as the Greek of Homer from classical Greek.

San Sebastián, Spain. General view of this port and holiday resort from Monte Urgull

on the Bay of Biscay, 11 m. by rly. W. of Irun, on the French frontier. Built on a peninsula ending in a steep, fort-crowned hull, enclosing a beautiful bay with a fine beach, it was chosen as a summer residence of the court in 1886, and speedily became the most fashionable seaside resort in Spain. It was defended by forts, but the old walls were razed in 1863, and the S. rampart was replaced by a boulevard.

The Palacio de la Diputación, the church of Santa Maria, and the royal palace of Miramar are note-

carried, Aug. 31. The castle fell Sept. 8. *See* Peninsular War; Wellington.

Sans-Serif. A printers' type without serifs. During the 20th century such types have been increasingly used in the U.K. and U.S.A., especially for display. This sentence is set in Gill Sans, a type designed by Eric Gill (*q.v.*).

San Severino. City of Italy, in the prov. of Catanzaro. It stands on the river Potenza, 18 m. by rly. W.S.W. of Macerata. The former cathedral in the upper town (alt. 1,130 ft.) contains some fine

About the 4th century B.C. the famous grammarian Pāṇini stereotyped the rules of grammar and syntax, and from that time Sanskrit became to all intents and purposes a dead language. Sanskrit is usually written and printed in the Devanagari character (*g.v.*), a development of the Semitic alphabet. In the matter of grammatical forms, it is richer than Greek and Latin: it has eight cases, including an instrumental and a locative; the verbal formations are extremely varied, and the power of making compound words is practically unlimited. A number of euphonic rules, called *sandhi* (putting together), are drawn up for the regulation of verbal combinations. The importance of Sanskrit consists not only in the fact that it is the language of an extensive and important literature, but it also forms the starting-point for the investigation of the Indo-European family. Modern comparative philology dates from the introduction of a knowledge of Sanskrit into Europe towards the end of the 18th century.

Like the language, Sanskrit literature may be divided into two main periods, the Vedic and the classical, beginning in the 5th or 6th century. Veda (knowledge) is the name given to four collections of hymns: Rig-Veda, Yajur-Veda, Sama-Veda, Atharva-Veda, the Veda of verses, of sacrificial formulae, of chants, of the priestly family of the Atharvas. The use of the hymns and the nature of the ritual are discussed in the Brahmanas, theosophical and metaphysical questions in the Upanishads; the Sūtras (rules) are concise manuals of ritual.

Sanskrit Epic and Drama

An especial characteristic of Sanskrit (not Vedic) literature is the general absence of prose, even scientific works being composed in metrical form. The commonest metre is the Sloka, used in epic poetry, of which there are four kinds, *itihāsa* (legend), *akhyāna* (narrative), *purāṇa* (ancient tales), and *kāvya* (artificial epic). The two great epics are the *Mahābhārata* and *Rāmāyana*, the Indian *Iliad* and *Odyssey*. These were followed by the *Purāṇas*, mythical

accounts of the creation, destruction, and renovation of the worlds.

The drama, as in other countries, appears to have originated in India in religious festivities and processions. To what extent it owed its origin and development to Greek influences, the result of Alexander's Indian expedition, is a disputed question. But, considering the time (some 400 years) that elapsed between the new Attic comedy of Greece and the earliest Sanskrit play, a Greek origin is doubtful, and its development in any case was national. The subjects are chiefly taken from mythology, history, and civil life. The dramatic masterpiece is the *Sakuntala* (name of the heroine) of Kalidasa, with which may be mentioned the *Mṛichchhakatika* (claycart) of Sudraka. Lyric poetry is almost entirely of an erotic char-

acter. Kalidasa's *Meghaduta* (cloud messenger) and Jayadeva's *Gita-govinda* (cowherd in song) are most meritorious. Considerable importance attaches to the tales and beast fables, by reason of their close connexion with the West; it is a disputed question whether the Indian are derived from the Greek, or the Greek from the Indian. The most important fables are the *Panchatantra* (so called from being divided into five books), the source of much of the fable-literature of Europe, and the *Hitopadesa* (salutary advice). Real historical works can hardly be said to exist, all writings of the kind containing a large element of poetical fiction. The only one that has any claim to the name is the *Rajatarangini* (river of kings) by Kalhana, of value for the antiquities of Kashmir. (See Drama.)

In scientific literature the most important place is taken by grammar. Its chief representative is

Pāṇini (probably about 300 B.C.), whose 4,000 rules for all time settled the norm of correct language. Philosophy is represented by five great systems: Sāṅkhya, dualistic; Yoga (*g.v.*); Nyāya, specifically a detailed treatise on logic; Vaiśeṣika, in which great stress is laid on the atomistic theory; Vedānta (end of the Veda), the chief doctrine of which is the identity of the individual soul with God, the non-existence of phenomena. It is the system that has the greatest number of adherents at the present day.

Law, Medicine, and Astronomy

The law-books (*Dharma Sūtras*), representing the social Brahmanic ideal, are of considerable importance in the later literature; the laws of Manu and Yajñavalkya were the oldest and enjoyed the greatest reputation. Astronomy and the auxiliary sciences, although no doubt known to the Indians during the Vedic period, only assumed an important position under Greek influence. Through the Arabs, who became their pupils in the 8th and 9th centuries, the Indians exercised considerable influence over the West.

Astronomy, however, gradually degenerated into astrology, in spite of a temporary revival in the 18th century, and at the present time is in the hands of the astrologers and almanac-makers. The number of books on medicine, which was regarded as a supplementary branch of learning, is very large. Surgery, especially, reached a high standard of excellence; the making of artificial noses is an Indian invention introduced into Europe. With Buddhism medicine began to decline, but since the English occupation and the foundation of medical colleges, it has again revived.

Sansovino, ANDREA, OR CONTUCCI (1460-1529). Italian sculptor and architect. Born at Monte

Andrea Sansovino, Italian sculptor

was employed in the decoration of

Born at Monte Sansovino, Tuscany, he studied under Antonio Pollaiuolo. After a visit to Portugal at the invitation of John II, he returned to Florence in 1490, when he

S. Spirito, and in 1500 executed the well-known statues of Christ and S. John Baptist over the E. door of the baptistery. His chief work, however, was the Storza monument in S. Maria del Popolo, Rome, 1506. He also carried out important architectural undertakings at San Sovino and Arezzo, and statuary at Genoa. Sansovino's sculpture was based on a study of nature, tempered by the classical tradition. A study by G. H. Huntley was pub. in 1935.

Sans Souci (Fr., without care). Palace near Potsdam, Germany, until 1918 the property of the German emperor and his predecessors, the kings of Prussia. With his love of French ideas, Frederick the Great gave this name to the residence he built at Potsdam in 1745-47, and also to the extensive park around it. It was a one-storey building, to be distinguished from the newer and larger palace built also by Frederick at the other end of the park in 1763-69.

San Stefano. Town of European Turkey. It is situated on the Sea of Marmara, 7 m. W.S.W. of Istanbul by rly. The Russian war monument above the Cape of San Stefano is a landmark.

San Stefano, TREATY OF. Signed between Russia and Turkey, March 3, 1878, on the conclusion of a war between them. By it the state of Bulgaria was created under Turkish suzerainty; Rumania, Serbia, and Montenegro were declared independent; and Russia secured various advantages. Reforms were promised to Armenia. The treaty, however, was greatly disliked, notably by British statesmen, and its terms were modified by the congress of Berlin. See Berlin, Congress of; Bulgaria; Eastern Question; Europe; Rumania; Russo-Turkish Wars; Turkey.

Sant, JAMES (1820-1916). British artist. Born at Croydon, April 23, 1820, he studied at the R.A. schools and showed subject pictures at R.A. exhibitions, also making a reputation as a portrait painter. Elected A.R.A. in 1861, he became R.A. in 1869, and his picture, *The Schoolmaster's Daughter*, is in the diploma gallery. In 1871 he became painter-in-ordinary to Victoria, and executed several royal portraits. Sant's most popular picture, widely circulated in reproduction, was *The Soul's Awakening*, 1888. He died July 12, 1916.

Santa Ana. Town of Salvador, Central America, capital of the

dept. of the same name. It is 48 m. by rly. N.W. of San Salvador, and the second most populous city in the republic, being the seat of a bishop. The centre of a coffee and sugar raising region, the neighbourhood also abounds in minerals, silver, copper, iron, and zinc being found. Pop. 98,942.

Santa Anna, ANTONIO LOPEZ DE (1795-1876). Mexican soldier and politician. Born at Jalapa, Vera Cruz, Feb. 21, 1795, he served in the Spanish army, but first came into prominence in Mexico's struggle for independence under Iturbide (*q.v.*). An astute but un-

A. L. de Santa Anna,
Mexican soldier

principled adventurer, he secured the presidency in 1833, but during his term of office completely alienated Texas, which secured its independence in 1836 after a war conducted with ferocity on the part of Santa Anna, who was finally captured and deposed.

In 1838 a memorable defence of Vera Cruz against the French, in which he lost a leg, brought Santa Anna a fresh accession of popularity, but he was again overthrown in an insurrection and banished in 1845. He returned in 1846, to become president again, and to take the field against the U.S.A. Defeated at Buena Vista and Cerro Gordo, he disappeared from Mexico in 1847, but came back to hold his last presidency from 1853 to 1855, when he was again compelled to leave the country. He made two further attempts to gain power, and died June 20, 1876.

Santa Barbara. City of California, U.S.A., the co. seat of Santa Barbara co. Situated on the Pacific coast, it is 105 m. by rly. W.N.W. of Los Angeles, and is served by the Southern Pacific rly. The Franciscan mission, the chief of the Californian missions, dates from 1786. Settled about 1782, Santa Barbara was long a centre of Spanish colonial life, and still shows Spanish architecture. It was incorporated in 1850 and is mainly a pleasure resort, devoid of industry. Pop. 34,958.

Santa Catharina. State in S. Brazil, bordering on the Atlantic. It is bounded N. by the state of Parana, S. by Rio Grande do Sul, and W. by the Misiones territory of Argentina. It has a much indented coastline and is

largely mountainous. Watered by the upper Uruguay (Pelotas), the Rio Negro, Iguassu, and other rivers, it is well adapted for agriculture, producing yerba maté, coffee, sugar, cotton, tobacco, etc. There are forests and good pastures, which maintain herds of cattle. Coal is known to exist. Many German settlements are scattered throughout the state. Education is compulsory. The capital is Florianopolis (*q.v.*). Area, 20,785 sq. m. Pop. est. 1,267,417.

Santa Clara. Fourth city of Cuba. Capital of Las Villas (formerly Santa Clara) prov., 180 m. E.S.E. of Havana by rly. and road. Its port is Cienfuegos, 40 m. S.W. Public buildings and parks have been recently designed, and industries are concerned with sugar and tobacco. Pop. 122,241.

Santa Claus. English variant of the Dutch popular corruption Sinter Klaas of the name Saint Nicholas (*q.v.*), bishop of Myra. In the Netherlands S. Nicholas's day, Dec. 6, is the children's festival. On the eve of his feast the saintly bishop comes riding from Spain, accompanied by his black servant and bringing with him presents which he places in the shoe each child has put on the hearth of the living room, taking in exchange the carrot left in the shoe for his horse. To good children he gives a present they want or will enjoy, to the bad (at least in theory) a bundle of rods. The morning of Dec. 6 is depicted in several of Jan Steen's paintings. The Calvinists fought in the 17th century against the perpetuation

Santa Claus. From a drawing by Sir John Tenniel, published in *Punch*, Dec. 28, 1895

By courtesy of the proprietors of *Punch*

of this "popish" festival, but in vain, and it is universally celebrated in the Netherlands. When the Dutch, first settlers in New Amsterdam (now New York), went to America in the early 17th century they took the festival with them. It was adopted by later English settlers, its observances, however, being transferred to Dec. 25 and added to the customary English celebrations of Christmas day. Santa Claus, in America and England, has become identified with Father Christmas, and is a figure greatly encouraged by retail shops in the interests of trade. The bundle of rods does not figure in the Anglicised legend; Santa Claus, from whom the saintliness has evaporated, comes from the North Pole in a sledge drawn by reindeer (a borrowing from Hans Andersen's fairy tales); and the English and American child hangs up a stocking, or even a pillow-case, for the receipt of presents.

Santa Cruz. Group of small islands in the Pacific, part of the British protectorate of the Solomon Islands. Ntendi, Tupua, and Vanikoro are the largest islands of the group, which lies S.E. of the Solomons and 100 m. N. of the New Hebrides. A dozen coral islets known as the Swallow Islands are included. The main islands are high, unhealthy, yet fertile. Ntendi, sometimes called Santa Cruz, has an area of 212 sq. m. Tinakula is an active volcano. The La Pérouse expedition was wrecked on Vanikoro in 1788. The group, known also as the La Pérouse or the Queen Charlotte Islands, was discovered by Mendana in 1595. The native pop. is declining and is less than 2,000.

Santa Cruz or **St. Croix.** Island of the Virgin group, belonging to the U.S.A. It is situated in the Caribbean Sea, 60 m. E.S.E. of Puerto Rico, is 21 m. in length, and has an area of 82 sq. m. The surface is largely level and well watered; the soil is fertile, and the main crop is sugar. The capital is Christiansted (*q.v.*) and the only other town is Fredericksted. English is the prevailing language.

Columbus landed on the island in one of his early voyages, and it was successively held by the Spaniards, English, and Dutch. In 1651 it was bought for the Knights of Malta, who sold it in 1664 to the French West India Co., by whom it was sold to the Danes in 1733. In 1801 it was taken by the British, who restored it after the battle of Copenhagen in the same year.

Re-taken by the British in 1807, it was again restored in 1814 to Denmark, who finally sold it to the U.S.A. in 1916. Pop. 16,200.

Santa Cruz. Southernmost territory of Argentina. It stretches S. from Chubut (*q.v.*), between the Andes and the Atlantic, to Tierra del Fuego, a portion of which is included. The coast-line is broken by several inlets, where the surface is low. Further inland are a series of desolate plateaux, and in the extreme W. there are outlying spurs of the Andean system. Several rivers traverse the territory from W. to E., and discharge into the Atlantic, *viz.* Desire, Bajos, Salado, Chico, Chalia or Sheuen, Santa Cruz, Coile or Cuheyh, and the Gallegos. There are many large lakes in the W., several of which it shares with Chile.

The territory is named after the river, which rises in Lago Argentino, an extensive expanse of water amid the outliers of the Andes, and empties into the Atlantic on the W. side of a deep gulf, forming the only good harbour in E. Patagonia; it is navigable for 160 m. The climate is dry and cool; agriculture is backward, sheep-rearing being the main industry. Great numbers of wild horses roam the plateaux. The capital is Gallegos, which stands on the estuary of the river Gallegos in the extreme S. Area, 93,952 sq. m. Pop. 24,491.

Santa Cruz. Easternmost dept. of Bolivia. It is situated W. of Brazil and N. of Chuquisaca. The surface is largely a level plain, with isolated mountain ranges, and there are large tracts under forest and swamp. It is well watered by the Mamore, Guapai, and Rio Grande, and is very fertile, but the climate is hot and unhealthy. The chief products are maize, rice, cotton, indigo, sugar, coffee, cocoa, and fruits. The forests yield rubber, dye-woods, and medicinal plants. Petroleum, iron, quicksilver, gold, and silver are found. Its area is 144,941 sq. m. Pop. 393,000.

Santa Cruz, Tenerife. The harbour from the Plaza de la Constitución. Top, Calle Castillo, the main business centre

Santa Cruz de la Sierra is the capital. It stands, at an altitude of 1,500 ft., near the river Piray, 185 m. N.E. of Sucre, and has a cathedral and a national college. The chief industries include flour milling, distilling, tanning, sugar refining, and the manufacture of boots, saddles, and blankets. Pop. 33,000.

Santa Cruz. City of California, U.S.A., the co. seat of Santa Cruz co. It stands on Monterey Bay, at the mouth of San Lorenzo river, 75 m. S. of San Francisco, and is served by the Southern Pacific Rly. It is a favourite seaside resort. The locality is noted for its superb sea-cliff scenery and its groves of giant redwood trees (*Sequoia sempervirens*). Leather, cement, asphalt, and lumber products are manufactured. Here Spanish friars built Santa Cruz mission in 1794; it was destroyed by an earthquake in 1864, and a replica erected in 1931. The Spanish regime having ended in 1846, Santa Cruz became a city in 1876. Pop. 16,896.

Santa Cruz. Capital of Palma, one of the Canary Isles, belonging to Spain. It stands on the E. coast in an open bay, having a depth of from 7 to 10 fathoms. Shipbuilding is extensively engaged in and exports include wine, fruit, and

cochineal. Pop. est. 7,000.

Santa Cruz. Seaport and coaling-station on the island of Tenerife, belonging to Spain. The capital of the island and also of the Canary Isles, it stands on the N.E. coast, and its good harbour, guarded by

the forts of the port, is well protected from the sea by a modern mole, and has good coaling facilities. The houses, built in the Spanish style, have flat roofs and central patios or courtyards. Situated on a small plain, amid volcanic rocks, it has little vegetation; water is supplied by a long aqueduct. The exports include silk, sugar, cochineal, tomatoes, bananas, potatoes, wine, and brandy. The place was twice bombarded by British fleets: under Blake, April 20, 1657, and Nelson, July 24, 1797. Nelson lost his arm in this action. Pop. 79,928. Santa Cruz gives its name to a prov. with area 1,329 sq. m. and est. pop. 401,283.

Santa Cruz, ALVARO DE BAZAN, MARQUESS OF (1526-88). Spanish admiral who conceived the design of the Armada. He was born at Granada, Dec. 12, 1526. He commanded the Neapolitan galleys against the Turks at Lepanto, 1571, and by his victory against the Portuguese at Tercera, 1583, secured for Spain the Atlantic islands of her rival. Designer of the huge Atlantic galleons for carrying troops as well as commerce, Santa Cruz proposed here 1583 to invade England, but there were continued delays, and he died Feb. 9, 1588.

Santa Elena. Town of Argentina, in the prov. of Entre Rios. It stands on the Paraná river, S. of La Paz, and manufactures meat extract, and trades in jerked beef, hides, horns, and other animal products.

Santa Fé (Span. Holy Faith). Prov. of central Argentina. It is bounded N. by the Chaco territory,

E. by Corrientes and Entre Rios, W. by Santiago del Estero and Córdoba, and S. by Buenos Aires. In the N. are vast forests (see Gran Chaco, El); in the S. are rich grazing lands. Stock-raising is the most important industry. Quebracho and other valuable woods are obtained from the forested areas. The chief crops are wheat, corn, flax, lucerne, alfalfa, and linseed. The land is drained by the Rio Salado and its tributaries. The climate is healthy, with ample rainfall, and the prov. is well served by rlys. Area, 52,056 sq. m. Pop. 1,700,026.

Santa Fé, the capital, stands on the Rio Salado, 95 m. N. of Rosario (*q.v.*), and its port is Colastiné on the Paraná, 7 m.

Santa Fé, Argentina. The palace of the provincial government

away. It has a cathedral, university, and schools. The most important industry is shipbuilding—there are two large docks for ocean-going vessels—and the principal exports are timber, cattle, and wool. The city was founded in 1573. Pop. 154,173.

Santa Fé. City of New Mexico, U.S.A., second oldest city in the Union. The state capital and the co. seat of Santa Fé co., it stands on the Sante Fé river, 50 m. W. of Las Vegas. It is still 16 m. from the nearest rly., although it has been a capital under the flags of four nations—Spain, Mexico, the Confederacy, and the U.S.A. Here three cultures meet, Indian, Spanish, and American. The ancient palace, built 1609-10, was the centre from which for 212 years the Spanish ruled a vast territory. Under Mexican rule for 75 years, Santa Fé passed to the U.S.A. in 1846 with the territory of New Mexico, receiving a city charter in 1851. The cathedral is the oldest Christian church in the U.S.A. Some traffic in cattle is carried on, but the main activity of the city is the tourist trade and the sale of brightly coloured Indian blankets and hand-worked silver jewelry. About 60 p.c. of the pop. is Spanish-speaking. Santa Fé has attracted artists and writers, including D. H. Lawrence. Pop. 20,325.

Santal or **SONTHAL**. Primitive tribe, occupying mainly the Santal Parganas, and the Chota-Nagpur plateau in W. Bengal, Bihar, and Orissa states, India. Numbering some 2,700,000, they are a partly Hinduised branch of the Munda-speaking people, whose customs, although still mostly primitive, have been affected by the Aryan subjugation. Thus, although primarily jungle dwellers and hunters, using the bow, many thousands have become skilful ploughmen and coal-miners.

Santalaceae or **SANDALWOOD FAMILY**. Family of trees, shrubs, and herbs. They are usually root-

parasites, natives of tropical and temperate regions. They have mostly alternate leaves and small greenish flowers. The fruit is nut-like or plum-like. The only important members of the family are the sandalwood (*q.v.*) trees.

Santa Maria.

Ship in which Columbus (*q.v.*) made his first voyage across the Atlantic in 1492. A decked vessel of 130 tons burden, she was 90 ft. in length, and carried a crew numbering 52.

Santa Maria. Town of Brazil, in the state of Rio Grande do Sul. It is an important rly. junction, about 170 m. by rly. W. by N. of Porto Alegre. Here are tanneries, breweries, and hat factories, while the surrounding district supports cattle and horses.

Santa Marta. Seaport of Colombia, S. America, the capital of the dept. of Magdalena. Situated at the head of Ciénaga Bay on the Caribbean Sea, and connected by rly. with Heredia on the Magdalena, it has a good harbour. Founded in 1525 by the Spaniards, Santa Marta was the second city to be established on the mainland, and was long a centre of exploration and conquests. A disastrous earthquake in 1834 laid the city in ruins. The surrounding dist. yields bananas. Pop. 43,950.

Santa Marta, SIERRA NEVADA DE. Range of snow-capped mountains in Colombia. The range is situated in the N. part of the dept. of Magdalena, and trends from W. to E. from near the coast to the borders of Venezuela, whence the mts. run N.E. The loftiest attain an alt. of over 17,000 ft. The N. face descends abruptly to the Caribbean Sea.

Santa Maura. One of the Ionian Islands. The ancient Leucadia, it is also known as Leukas (*q.v.*).

Santa Monica. City of California, U.S.A., in Los Angeles co. It stands on the Pacific Ocean, 15 m. by rly. W. of Los Angeles, and is served by the Pacific Electric rly. There is a military academy here. It is a favourite seaside resort, and above the sea front is Palisades Park. Pop. 53,500.

Santander. Maritime prov. of N. Spain, on the Bay of Biscay. It is bounded W. by the prov. of Oviedo and E. by Vizcaya. Largely mountainous, it is traversed in the

Santa Fé province arms

S. by the Cantabrian Mts., and is watered mainly by small streams flowing N. to the sea. The highest point is Peñas de Europa, alt. 8,600 ft. Large tracts are covered with forests and pasture. It has considerable coal, copper, iron, lead and zinc mining and manufacturing industries. There are several rlys. and many good high roads. Area, 2,108 sq. m. Pop. 414,204.

Santander. Seaport and watering-place of Spain, capital of the prov. of Santander. It stands on a

Santander, Spain. The castle of Don Beltrán de la Cuevas

sheltered bay, 316 m. by rly. N. of Madrid. There is an old town and a new town, the latter being laid out with large open plazas and boulevards. Its 13th century cathedral has been spoilt by bad restoration. A summer palace for the Spanish royal family, built here by public subscription, was used to house refugees after a great fire in Santander in 1941. In 1947 the title deeds were made over by the state to the heirs of Alfonso XIII. A large export trade is carried on in iron ores, and there is commerce in fish and tobacco. Santander has a fine harbour, accessible to the largest vessels. Exports normally include flour, wine, metals, and foodstuffs. Ironfounding and shipbuilding are carried on, and there are manufactures of paper, flour, beer, cotton, and iron goods. Part of the town was destroyed by the explosion of a dynamite-laden vessel, Nov. 3, 1893, when hundreds of the inhabitants perished. It figured in the Peninsular War, and was sacked by Soult in 1808. During the Spanish Civil War it was captured by the Nationalist forces, Aug. 25, 1937, the climax of an offensive from the S. lasting only 11 days. Pop. 114,348.

Santander. Dept. of N.E. Colombia. It is bounded W. by the river Magdalena, and E. by Venezuela. The surface is mountainous and rich in minerals, yielding gold, silver, and emeralds. In the fertile districts, tobacco, coffee, cacao,

and wheat form the principal crops. The capital is Bucaramanga (*q.v.*). Area, 12,379 sq. m. Pop. 615,710.

Santander Norte. Dept. of N.E. Colombia. It is bounded N. and E. by Venezuela, and W. by Bolívar dept. Mountainous and well watered, it produces gold, silver, precious stones, coffee, cocoa, cereals, rice, and sugar. The capital is Cúcuta (*q.v.*). Area, 8,295 sq. m. Pop. 346,181.

Santarem. Dist. of central Portugal, in the prov. of Estremadura. It lies to the E. of the Lisbon dist., and is well watered by the Tagus and its tributaries. The chief towns are Santarem and Thomar (*q.v.*). Area, 2,555 sq. m. Pop. 421,996.

Santarem. City of Portugal, capital of the dist. of the same name. It stands on the right bank of the Tagus, 51 m. by rly. N.E. of Lisbon. The key of the Tagus, here spanned by a fine, modern bridge, Santarem has played an important part in Portuguese history. Placed on a hill, and partly surrounded by old walls, it has a ruined castle, once a royal residence. There are 13th and 14th century and other churches, a large seminary, a museum containing many Roman relics, and a saline spring in the vicinity. Here are the tombs of Diniz I, Ferdinand I, and the explorer Cabral. Santarem carries on a trade in wine and oil, and there is a small modern river-port on the Tagus. Twice taken from the Moors, it was finally captured in 1147. In the neighbourhood of the city, the army of Dom Miguel was defeated by the allied army of Dom Pedro, under Napier and Villaflores, May 16, 1834. Pop. 12,000.

Santarem, Portugal. Church of the Asilo de São Antonio

Santarem. Town of Brazil, in the state of Pará. It stands on the right bank of the river Tapajós, near its junction with the Amazon, 450 m. W. by S. of Pará, and 62 m. S.W. of Montalegre. The surrounding districts yield rubber, cocoa, tobacco, nuts, medicinal plants, sugar, and cattle, all of which are exported. Pop. 40,000.

Santa Rosa. Town of Honduras, capital of the dept. of Copán. It stands at the foot of a mt. 140 m. N.W. of Tegucigalpa. It trades in tobacco, coffee, sugar, and grain. In the vicinity are gold and silver mines. There is an air service to San Pedro Sula. Pop. 6,018.

Santa Rosa de los Osos. Town of Colombia, in the dept. of Antioquia. It stands at an alt. of 8,560 ft., near the river Cauca, 170 m. N.W. of Bogotá. The chief occupation of the neighbourhood is gold mining. Pop. 16,000.

Santa Scala (Ital., holy steps). Flight of 28 marble steps at the Lateran palace in Rome, brought

Santa Scala, Rome. The holy staircase brought by S. Helena from the house of Pilate in Jerusalem

by the empress Helena from the house of Pilate in Jerusalem. Said to have been ascended by Christ, they are protected with wood and are ascended only on the knees. An adjacent flight is provided for the descent. See Lateran; Rome.

Santayana, GEORGE (b. 1863). Spanish-born American philosopher. Born in Madrid, Dec. 16, 1863, he went young to the U.S.A. Educated at Harvard, he lectured there during 1889-1911 on the history of philosophy. Meanwhile

and later he visited and lectured at Paris and Oxford.

A philosopher and poet in whom devotion to beauty struggled with the love of wisdom, he revealed in *Sonnet's and Other Poems*, 1894, the conflict between his mysticism and his scepticism. The first of his philosophical works, *The Sense of Beauty*, 1896, established his reputation in aesthetics, which was confirmed by essays, *Interpretations of Poetry and Religion*, 1900. *The Life of Reason*, 1905-06, won Santayana a high place among contemporary philosophers. While accepting the idealism of Aristotle and Hegel, he insisted upon a materialistic interpretation of experience. The persuasive charm of his writings may have inspired a conviction which his logic failed to sustain, but his influence upon contemporary thought was considerable. Later works included *The Realm of Matter*, 1930; *The Realm of Truth*, 1937; *The Realm of Spirit*, 1940; *The Realm of Being*, for which Columbia university gave him the Butler gold medal in 1945.

G. Santayana,
American philosopher

He pub. memoirs: *Persons and Places*, 1945; *The Middle Span*, 1948. **Santerre**. Dist. of France lying around Péronne. It is watered by the Somme and the Avre, and is sometimes divided into upper and lower Santerre. The name, which probably means the *sana terra* or healthy land, appeared in the 9th century, but the district never became a province, remaining for purposes of government part of Picardy.

Santerre, ANTOINE JOSEPH (1752-1809). French revolutionary. Born in Paris, March 16, 1752, he was a prosperous brewer, popular for his liberal treatment of his workpeople. He took part in the capture of the Bastille, 1789, and protected the royal family during the summer of 1792, in which year he was put in command of the national guard. He had charge of the royal prisoners in the Temple. Santerre commanded an army in La Vendée, 1793, but was later arrested as a suspected Orleanist. On release, 1794, he returned to civil life; but his business was ruined, and he died in poverty in Paris, Feb. 6, 1809.

San Thomé. Alternative name for the island of St. Thomas (q.v.).

Santi, GIOVANNI (c. 1430-94). Italian painter. He was born at Castello di Colbordolo, and is chiefly famous as the father of Raphael (q.v.). There is a Madon-

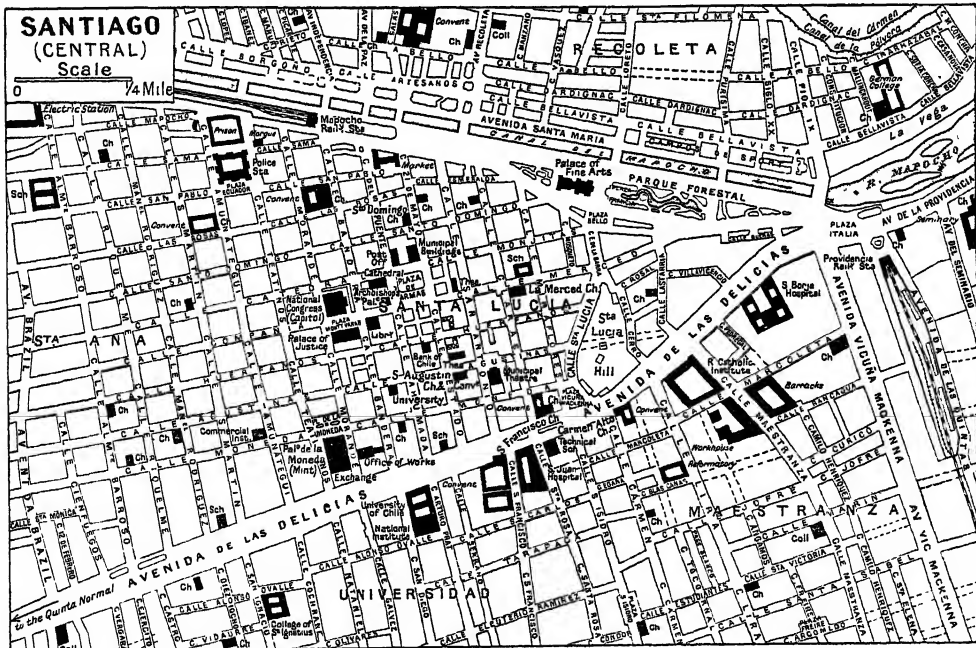

na and Saints by him in the church of S. Francesco, Urbino, and other works of no great distinction are preserved in that town's museum and in the neighbourhood. He died at Urbino.

Giovanni Santi,
Italian painter

Santiago. Prov. of central Chile, lying S. of Aconcagua and Valparaíso. Traversed E. and W. by mountain ranges, enclosing a valley, the loftiest point is Tupungato, alt. 21,500 ft., an extinct and craterless volcano near the Argentine boundary. The principal river is the Maipo, but the prov. is poorly watered. Cattle-rearing is the chief occupation, and vegetables, cereals, and forage are grown. Its area is 5,557 sq. m. Pop. 1,261,717.

Santiago. Capital of Chile, S. America. The largest city in the continent W. of the Andes, covering about 8 sq. m. in area, it is situated, 1,706 ft. above sea level, in the great longitudinal valley of Chile, 68 m. E.S.E. of Valparaíso. One of the best built and most attractive cities of Latin America, Santiago is unrivalled for the picturesqueness of its immediate surroundings. The Plaza de Armas in the centre of the town is also the heart of its life, and here on

Santiago, Chile. Plan of the central districts of the city, showing the Avenida de las Delicias and the principal buildings

Santiago, Chile. 1. Avenida de las Delicias, also called the Alameda. 2. The Congress Building or Capitol, in the Calle Compañía. 3. Palacio de la Moneda, the president's residence. 4. The imposing Academy of Fine Arts. 5. The Cathedral, in the Plaza de Armas, the centre of the city

the W. stands its historic cathedral, on the N. the fine post office buildings, while there are arcaded commercial structures on the E. and S. It has become an essentially modern city, and "sky-scrapers" and smaller ten-storey buildings line the principal streets.

Congress building, farther W. in the Calle Compañía, is an imposing edifice occupying the site of the church of the Compañía, where in 1863 a large number of women and children of the most aristocratic families were burned to death. To the S. stands the Plaza de la Moneda, another fine public square, the whole of one side occupied by the immense Palacio de la Moneda, containing the residence of the president.

Grouped here are most of the other government buildings. The most notable feature of the city is the magnificent Avenida de las Delicias, better known as the Alameda, a spacious boulevard running E. and W., bordered with oak, elm, and acacia trees, and with little canals of running water, the avenue having been originally the bed of the river Mapocho. It is embellished with numerous statues and fountains, and to the N. rise the heights of Santa Lucía, a detached hill in the centre of the town,

while to the E. tower the snow-capped Andes, and W. the lower ranges of the Cordillera de la Costa encloses a view probably unsurpassed from any street in any city of the world, especially at sunset.

The hill (Cerro) of Santa Lucía, where the Spanish governor of Chile, Pedro de Valdivia, in February, 1541, made his camp and fortified himself against the Araucanian Indians at the founding of the city, has been turned into a public resort unique in interest and beauty. There are numerous other public parks, such as the Cousiño, beautifully kept, the Forest Park, and the Quinta Normal, where are horticultural and agricultural schools. Several of the buildings of the university, which dates from 1743, are noteworthy. There is a fine military school, a beautiful municipal theatre, and an art gallery in the style of the French Renaissance. Among the numerous churches the most notable, other than the cathedral, is that of La Merced, and in the general cemetery are monuments to many of the famous men of the nation, including Bernardo O'Higgins. Santiago is S. America's fourth largest city; more than half of Chile's industry is located there. Pop. 639,546.

Santiago. City of Cuba, capital of Oriente prov. Situated on the Bay of Santiago, 540 m. S.E. of Havana, with which it has road and rly. connexion, its chief buildings are the municipal offices and the cathedral. The bay forms a land-locked, deep, and commodious harbour, 5 m. long, with a mean breadth of 1½ m. Mining is an important industry, iron-manganese and copper being the principal minerals worked at Oriente. Ironfoundry and the manufacture of machine-shop products and tobacco are carried on, and the port has a large home and foreign trade. The city was the capital of Cuba 1515-56. During the Spanish-American War of 1898 the Spanish fleet was destroyed near the harbour on July 3, and the city surrendered on July 14. Pop. 120,827.

Santiago de Compostela. City of Spain, in the prov. of Corunna. It stands on the river Sar, 26 m. by rly. N.N.E. of its port, Carril, and 33 m. S.S.W. of Corunna. It has been the see of an archbishop since 1120. A pilgrim resort, its cathedral contains the shrine of the patron saint of Spain—Santiago el Mayor (James the elder). This striking edifice, the best example of early

Romanesque architecture in the peninsula, was founded in 1078, on the site of an earlier structure destroyed by the Moors in 997, and was consecrated in 1211. Alterations and additions in the 16th and 18th centuries have markedly altered its exterior. The superb cloisters are regarded as the finest in Spain. The doorway called the Portico de la Gloria was executed by Maestre Mateo during 1168-88.

Santiago possesses numerous churches, chapels, and religious fraternities, with hospitals, hospices, etc., for pilgrims. The university, founded in 1504, has a library containing over 70,000 vols. and many rare old MSS. The Hospital Real, another fine building, was founded by Ferdinand and Isabella for the benefit of pilgrims, while the convents of San Martin and San Francisco are worthy of note. The see of an archbishop, it is the headquarters of the Order of Knights of Santiago. The ancient Campus Stellae (field of a star), it was here, according to tradition, that the bishop of Iria found the bones of the saint. In the Middle Ages it was a centre of Christian art and chivalry, but it now presents a decayed and gloomy aspect, with its numerous ruined buildings. It carries on manufactures of linen, soap, spirits, matches, chocolate, and paper. Pop. 28,000.

Santiago del Estero. Prov. of north-central Argentina. It is bounded N. by the provs. of Salta and Formosa, S. by Córdoba, W. by Tucuman and Catamarca, and S.E. by Santa Fé. It lies partly in the Gran Chaco region (see Gran Chaco, El), and is watered by the rivers Juramento, Salado, and Dulce. It is well forested, has pampas and salt marshes, and is fertile along the riverside tracts. The climate is hot and dry, but healthy. The chief products are cereals, cotton, which was grown here as early as the time of the Incas, alfalfa, tobacco, sugar, indigo, hides, and grapes. The grazing areas support large numbers of cattle and horses, and the forests yield valuable woods. Area, 53,451 sq. m. Pop. 574,383.

The capital, Santiago del Estero, stands on the Rio Dulce, about 100 m. by rly. S.E. of Tucuman. A well-built town, it has a considerable agricultural trade. Founded by the Spaniards in 1553, it is the oldest town in Argentina. Pop. 76,445.

Santiago de los Caballeros. Town of the Dominican Republic. The capital of the prov. of Santiago de los Caballeros, it stands on the Yaqui river, 25 m. S. of Puerto Plata, in the valley of Vega Real, the most healthy dist. in the republic. The chief inland city, it lies in a fertile region, and has a large trade in tobacco, coffee, and hides. Pop. 59,605.

Santiago Zamora. Province of Ecuador, part of the region of Oriente (*q.v.*).

Santipur. Town of W. Bengal, India, in Nadia dist. It is situated on the left bank of the Hooghli, 45 m. above Calcutta. Formerly it was noted for its muslins and weaving, and was a centre of Sanskrit learning. Pop. 30,200.

Santley, Sir Charles (1834-1922). British singer. He was born at Liverpool, Feb. 28, 1834, and studied at Milan, and later in London under Garcia, and made a speedy success as a baritone

oratorio singer. He first appeared in grand opera at Covent Garden, 1859, and from 1875 toured extensively with the Carl Rosa Opera Company. He sang in the U.S.A. in 1871 and 1891, and in Australia, 1890. Knighted in 1907, he published *The Art of Singing*, 1908, and *Reminiscences*,

Sir Charles Santley, British singer

M. Levien, appeared in 1930.

Santo Antão (Ilha de Santo Antão). Most northerly of the Cape Verde Islands. It was discovered by Diogo Afonso in 1462. It contains several extinct volcanoes; the highest, Pão de Assucar, 8,200 ft. Area, 265 sq. m.

Santo Domingo. Former name of the country described under its new name, Dominican Republic.

Santonin ($C_{15}H_{10}O_3$). Crystalline substance obtained from dried flower-heads of species of *Artemisia*. It is colourless, odourless, and insoluble in water. It is used in medicine to expel roundworm from the body.

Santorin or Thira. Island of the Greek archipelago, in the Cyclades group. Crescent-shaped, and mostly of volcanic origin, its steep W. shore, with the adjacent islands of Therasia and Aspronisi, represent the edges of a submerged caldera (*q.v.*); other volcanic islets in the vicinity have been uplifted within historic times. The last truly volcanic activity occurred in 1925. The culminating point on the island is Hagios Elias, or Mount St. Elias, alt. 1,900 ft. From the numerous vineyards a choice wine is produced and exported, and there is also trade in pozzolana earth. The chief town is Thira, on the W. coast, at an alt. of 900 ft. The site of ancient Thira, it is rich in prehistoric and Mycenaean dwellings and pottery. Thira was first settled about 2000 B.C. The modern name is a corruption of St. Irene. Area, 30 sq. m. Pop. 20,000.

Santos. Seaport of Brazil and leading coffee port of the world. It is situated on the Atlantic seaboard, in the state of São Paulo. Only a few feet above sea level, it is drained by deep channels. It ranks as a Brazilian port next to Rio de Janeiro, from which it lies

Santiago, Spain. Romanesque cathedral of St. James

Santos, Brazil. A general view from the heights overlooking the town

200 m. S.W. Hides, cacao, tobacco, frozen meat, bananas, and oil are exported, in addition to large quantities of coffee. The town is built on an island protected on the sea side by a larger island, and in the 20th century it was rapidly modernised, modern roads connecting it with São Paulo and other cities, and its streets being widened and rebuilt. Pop. est. 190,000.

Santos-Dumont, ALBERTO (1873-1932). Brazilian aeronaut. Born at São Paulo, Brazil, son of

A. Santos-Dumont, Brazilian aeronaut

a prominent coffee planter, July 20, 1873, he went to Europe and took up the study of aeronautics. He made his first balloon voyage at the age of 24, and thereafter devoted his attention to the problem of the navigable balloon. Between 1898 and 1906 he constructed numerous small airships, from which the non-rigid airship developed. He won the Deutsch prize of £10,000 at Paris in 1901. During the next few years he turned his energies to inventing heavier-than-air machines, and created world-wide interest when, on Aug. 22, 1906, he made the first hops from the ground with a power-driven machine, and on Oct. 23 achieved a flight of 200 ft. He published *My Airships: a Story of My Life*, 1904. He died July 25, 1932. Santos-Dumont airport at Rio de Janeiro was named after him.

San Toy. Musical comedy by Edward Morton and Sidney Jones. Produced at Daly's Theatre, London, Oct. 21, 1899, it had a run of 778 performances. Marie Tempest appeared in the title-rôle, and Hayden Coffin and Huntley Wright played leading parts. The setting is pseudo-Chinese, and famous songs include *Chinese Soldier Man*, *Rhoda and her Pagoda*, and *When Chinaman Him Go Flirtie*.

Santuao. Former treaty port in Fukien province, China. It was opened to foreign trade in 1899. There is a fine harbour. Pop. 11,561.

San Vicente. Dept. of Salvador, Central America. It is bounded E. by the river Lempa and S. by the Pacific. Low-lying in the coastal region, it is mountainous elsewhere. There are several extinct volcanoes, active geysers, and thermal springs. Pop. est. 100,000. The capital is San Vicente, standing amid indigo and tobacco plan-

tations, 24 m. E. of the city of San Salvador. Pop. 34,361.

São Francisco. River and town of Brazil. Rising in the Serra da Canastra, in the state of Minas Geraes, it flows N.E. through Bahia, and, curving S.E., discharges its waters by two arms into the Atlantic between Sergipe and Alagoas, after a course of about 1,800 m. Its course is impeded by the falls of Paulo Afonso, which descend 265 ft. in a series of leaps. The falls are circumvented by a rly., 68 m. in length. Ocean-going steamers of moderate draught can ascend the main stream for a distance of 135 m. The town of São Francisco is on the river, some 500 m. N. of Rio de Janeiro.

São Luiz de Maranhão. Seaport city of Brazil, capital of the state of Maranhão. It stands on the W. coast of the island, also called Maranhão, between the bays of San José and San Marcos, facing the entrance of the river Itapicourú. The harbour is accessible to ocean-going steamers. There are sugar, spinning, and weaving factories, and manufactures and exports of cotton, linen, skins, drugs, rubber, etc. Pop. 70,272.

Saône. River of France. It rises in the Faucilles Mts. of the Vosges, and flows S. into the Rhône at Lyons. It flows across the plains of Burgundy, and is connected with the Rhine by the Rhine and Rhône canal, and with the Loire by the Canal du Centre. Its wide valley, the N. continuation of that of the Rhône, formed the connecting link via the Gate of Burgundy for medieval traffic between Marseilles, the Mediterranean, and the Rhine. See Fribourg; Lyons; Rhône.

Saône et Loire. Dept. of France. In the E. of the country, its area is 3,330 sq. m. It is crossed by the Saône and watered by that river and its tributaries. The Loire is a boundary river, and others are the Grosne, Arroux, and Arconce. Mainly hilly, the dept. contains the mountains of Morvan, Maconnais, and Charollais, the two latter being spurs of the Cévennes. Cereal crops are largely grown. Cattle, horses, sheep, and pigs are reared. Coal and iron are mined. Mâcon is the chief town and others are Châlon-sur-Saône, Autun, and Louhans. In the Middle Ages this dept. was included in Burgundy. Pop. 506,749.

São Paulo. Maritime state of S.E. Brazil. A narrow, low coastal plain is backed by a mountainous ridge parallel to the coast, the Serra do Mar; farther inland is a

plateau sloping gently to the Paraná, of which the tributaries Pardo, Tiete, and Aguapehy drain the sparsely populated W. portion of the state. São Paulo grows more coffee than any other state in Brazil; nearly half Brazil's cotton factories are here; and coal deposits occur. In the E. rlys. are well developed, the capital, São Paulo city, being connected with its port, Santos, and Rio de Janeiro. Education is compulsory. A separatist revolution against the federal authority in this state took place in 1924. Area, 91,310 sq. m. Pop. 7,230,168.

São Paulo. Second city of Brazil, capital of the state of the same name. It is situated, at an alt. of 3,000 ft., 45 m. inland from its port, Santos, with the Serra do Mar in between. The municipal theatre is one of the finest buildings of its type in the world. The magnificent Ypiranga palace was built as a memorial of the declaration of independence of 1822. The government building was formerly a Jesuit college, one of the oldest buildings in the city. The cathedral, bishop's palace, and the treasury are other prominent edifices. In the 20th century fine

São Paulo, Brazil. Office buildings in the commercial centre of the town, second largest city in Brazil. Top, the municipal theatre

new streets have been built, wide avenues being driven through former slums. This industrial and commercial capital of S. Brazil is one of the most prominent coffee centres of the world; it also supplies cotton, and is a great meat-packing centre. It is the most rapidly growing city in Latin America. Pop. 1,120,405. The origin of the city was a Jesuit mission station founded 1554.

São Salvador (Port., Holy Saviour). First name of the city in Brazil later called Bahia (q.v.).

São Thiago (*Ilha de São Tiago*). Most southerly of the Cape Verde Islands, its name being anglicised as Santiago. It was discovered by Antonio de Noli in 1460. It rises in the Sugar Loaf to about 7,500 ft., and has an area of 450 sq. m. Pop. (including that of the island of Maio), est. 110,000.

Sap. Juices of plants. The ascending sap consists of water in which mineral salts are dissolved, collected by the root-hairs from the soil, and conducted through the roots and the wood cells and vessels of the stem and leaf stalks to the leaves. Here it is vaporised by contact with the air circulating around the cells of the leaf, and passes out through the stomata. The mineral matter is retained and combined with carbon dioxide from the air, and from the mixture sugar, amides, etc., are formed, which are carried away in the descending sap through the phloem (q.v.) to those parts of the plant where they are required as cell-forming materials for present use or stored for future purposes. See Photosynthesis; Plant.

Sap. In military engineering, a ditch or road sunk below the surface of the ground, by which the ramparts of a fortress can be safely approached. In order to protect the traffic along this road from an enfilade fire the road, or sap, is not made straight, but zigzag from one parallel to another. The "parallels" are trenches, running at right angles to the sap, from which fire is opened on the fortress. Thus, the parallel corresponds to a fire trench and the sap to a communication trench. In trench warfare saps are frequently employed to provide exits from the fire trenches for raids, etc. The fact that all sapping was originally done by engineers accounts for the corps of Royal Engineers being popularly known as Sappers. See Fortification; Sapper; Trench.

Sapajou. Group of American monkeys of the genus *Cebus*, also known as Capuchin monkeys (q.v.).

Sapodilla Plum OR BULLY-TREE (*Achras sapota*). Evergreen tree of the family Sapotaceae. A native of Central America and W. Indies, it has wide-spreading branches, the bark is astringent,

and the juice milky. It has elliptic-oblong leaves, and large, whitish, urn-shaped flowers. The fruit is apple-shaped, luscious, and edible.

Saponification (Lat. *sapo*, soap). Term denoting the conversion of fats into soap by means of potash, soda, or ammonia. The method is practised on a large scale in the industrial manufacture of soap (q.v.). Different fats and oils require definite amounts of alkali for saponification, and this saponification value is employed as a test for the identity and purity of fats. The term in a more

general sense in organic chemistry denotes the resolution of esters into acids and alcohols.

Saponins. Glucosidal substances which occur in several plants, characterised by their property of giving a froth when shaken with water. The chief sources are soapwort (*Saponaria officinalis*), soap bark (*Quillaja saponaria*), and senega root (*Polygala senega*). Saponins usually have an acid taste, and cause sneezing when distributed in the air. They have been used for giving a froth to aerated and other beverages, and as cleansing agents. They are also the basis of certain "wetting agents" used in photographic processes for lowering the surface tension of solutions and permitting more even action on immersed objects.

Sapotaceae. Family of trees and shrubs. They are natives of tropical and sub-tropical regions, with milky juice and berry-like fruits. They have mostly leathery, alternate leaves, and bell-shaped or urn-shaped flowers. Several species yield gutta-percha. *Palaquium gutta*, formerly the chief source of this important material, has been killed out as a wild tree by the rapacity of the collectors, and the supply now comes from *Paysona Leeri* and others. *Lucuma*, *Achras*, *Chrysophyllum*, and *Bassia* have edible fruits; and *Sideroxylon* and *Argania* provide hard timber.

Sapper. Originally a soldier employed in cutting saps and also in building fortifications. It has come popularly to mean a member of the Royal Engineers (q.v.).

Sapper. Pseudonym of Cyril McNeile (1888-1937), British novelist. He was educated at Cheltenham and Woolwich, and in 1907 was commissioned in the Royal

Engineers; hence his pseudonym. After service in the First Great War, he retired as a Lt.-col. in 1919, and devoted himself to writing, having already published

novels about the war, notably Sergeant Michael Cassidy, 1915. Almost at once he sprang into popularity with Bulldog Drummond (q.v.), 1920, his particular type of swashbuckling good-humour, mingled with exciting action, striking what was then a new note in English light fiction. Drummond, his hero, appeared in several later novels, notably The Final Count, 1926, and Bulldog Drummond Hits Out, 1937. McNeile died Aug. 14, 1937.

Sapphic Metre. Form of metre attributed to Sappho. The Sapphic strophe as adapted by Horace and made familiar to us consists of four lines, the first three of which are identical, composed of a trochee, spondee, dactyl, trochee, and spondee or trochee, with the caesura usually at the end of the fifth syllable, while the fourth line is a dimeter containing a dactyl and a spondee or trochee. The formula thus is:

— u | — — | — u u | — u | — —
(three times)
— u u | — —

Sappho used this metre in her magnificent ode to Aphrodite. It is rarely encountered in English, though at least one familiar hymn, Lord of Our Light and God of Our Salvation, is written in it. It was also used by Cowper:—

Hard lot! encompassed with a thousand dangers
Weary, faint trembling with a thousand terrors,
I'm called, if vanquished, to receive a sentence
Worse than Abram's.

See Metre; Poetry; Sappho.

Sapphire. Blue variety of the mineral corundum. It has the same composition as the ruby, Al_2O_3 , and is found usually in the same localities. It is slightly harder than the ruby, and is dichroic, the most valuable varieties being pure cornflower blue. Sapphires are often spotted with yellow and white, and the blue colour disappears if the gem is heated. Asteria is the name given to a variety of transparent sapphire which shows six starlike rays

"Sapper,"
British author

Sapodilla Plum. Foliage and flower; inset, fruit

by reflected light. White topaz is sometimes called water sapphire, while yellow sapphire is a yellow variety of corundum. Colourless corundum is known as white sapphire or leucosapphire. The most valuable sapphires are found in Siam with the ruby, and Ceylon has long been known for the gem. Burma, Kashmir, Australia, the U.S.A., etc., are all sources of the stone, and poor qualities, valueless as gems, are found in many other localities. See Corundum; Precious Stones colour plate.

Sappho. In astronomy, one of the minor planets. It was discovered in 1864, and revolves round the sun at a mean distance of 275,000,000 m. Together with Iris and Victoria, it was used by Sir David Gill, 1888-89, to establish a measurement of the sun's distance.

Sappho (c. 580 B.C.). Greek poet. She lived at Mitylénē, and with her contemporary Alcaeus was one of the greatest of the Aeolic group of poets, and the leader of a literary society of women. Of noble birth, she is said to have been banished for political reasons, and to have gone to Sicily. The story that unrequited love for Phaon led her to leap from the Leucadian rock is fictitious. The social freedom of Aeolian women having been misunderstood in later ages, her moral character was traditionally blackened, but, whatever the inspiration of her verse, its quality is beyond all doubt. Only two complete poems are extant, including the fine ode to Aphrodite. These show that her genius was extraordinary, and she has been called the greatest woman poet. Her work, almost entirely erotic, is marked by depth of passion and exquisite grace. She used at least 50 different metres. Consult S. of Lesbos, A. Weigall, 1932.

Sapporo. City of Japan. The capital and chief garrison headquarters of the island of Hokkaido, it is about 100 m. N.N.E. of Hakodate, the chief seaport, and is connected by rly. with that port, with Otaru, its own seaport, and with the coal mines of Poronai. It contains a university, a museum, an agricultural school, and a botanical garden, and has manufactures of hemp, flax, beer, and flour. The city was laid out in 1869. Pop. 206,103.

Sapremia (Gr. *sapros*, rotten; *haima*, blood). Form of blood poisoning, in which toxins formed by bacterial activity are present in the blood stream, but the bacteria themselves are not present.

Saprophytes (Gr. *sapros*, rotten; *phyton*, plant). Plants which, lacking chlorophyll, are unable to manufacture carbohydrates in their leaves from the carbon-dioxide of the atmosphere. They were formerly classed with parasites, but the latter are known to live at the expense of other living things, whereas saprophytes live upon the decaying remains of animals or plants. Most of them get this from the humus of the soil, which is composed of the broken down remains of plants. Saprophytes are leafless, the leaves having disappeared altogether, or having been reduced to small scales. Flowering plants that are saprophytes obtain their food from the humus indirectly, by means of fungal hyphae (*mycorrhiza*, *q.v.*), investing the plants' roots. Most fungi that grow in the ground or on dead trees are saprophytes, as distinguished from those that attack living plants. See Botany; Plant.

Sapwood. Layers of wood near the periphery of a tree trunk, serving as channels for the flow of water, etc. It is also known as alburnum. As the tree grows, with the formation of newer rings at the outside, the former sapwood hardens into heartwood, and the later growths take on the function of sap transportation. In some trees, *e.g.* beech, more of the wood remains as sapwood than in other species. Sapwood layers are softer and have a more open grain than heartwood. Sapwood is lighter in colour, weak, and spongy; it is more prone to decay than wood nearer the centre of the trunk. For these reasons it is unsuitable for building work. See Timber.

Saraband (Span. *sarabanda*). Dance, probably of Hispano-Moorish origin, dating from the 16th century, and of a slow and stately character. The music, in triple time, was accented on the second beat of the bar. It was at first generally danced as a solo, as when Richelieu performed it before Anne of Austria, but when it reached England it became a kind of country dance. Later, as a purely instrumental form, it was incorporated in the suite (*q.v.*), of which it was the slow movement.

Sarabat. Small river of Asiatic Turkey, in Lydia. It is believed to be ancient Pactolus, rises in the Boz Dag, the ancient Mt. Tmolus, and joins the Gediz Chai or Hermus a few miles below Sardis. The gold washed from its sands was almost exhausted in Roman times.

Saraburi. This place, 108 m. N.E. of Bangkok (*q.v.*), was in

1945 selected as the future political capital of Siam, Bangkok remaining the commercial capital.

Saracens. Name formerly applied to Mahomedans. The name was given in classic times to the Arab tribes of Syria and the adjacent deserts, and thence came to include all Arabs. In the Middle Ages the term Saracen was applied to Mahomedans generally, but especially to those who fought the Crusaders in Palestine and Spain. See Arabia; Crusades; Louis IX: Mahomedanism; Saladin.

Saragossa (Sp. *Zaragoza*). Inland prov. of N.E. Spain. It stretches from near the Pyrenees on the N. to Teruel on the S., and is bounded N.W. by Navarre, W. by Logroño, Soria, and Guadalajara, and E. by Huesca. Mountainous in the N. and S.W., it is watered by the Ebro and its tributaries. The chief products are minerals, timber, sheep, cattle, wine, oil, flour, and fruit. Various industries are carried on in the towns, the most important of which are Saragossa, the capital, Calatayud, and Caspe. One of the largest provs. in Spain, it is one of the least densely populated, but is well served by rlys., most of which follow the river valleys. Area, 6,611 sq. m. Pop. 637,039.

Saragossa (Sp. *Zaragoza*). Fifth largest city of Spain, capital of the prov. of Saragossa. It stands on both banks of the river Ebro, here spanned by three bridges, 212 m. by rly. N.E. of Madrid. The former capital of Aragon, and the see of an archbishop, it has two cathedrals, a university, a Moorish citadel, and many fortress-like palaces. The old part of the city has tortuous and ill-paved streets.

The old cathedral of La Seo dates from the 12th century; the façade and the octagonal tower were built at the end of the 17th century. The new cathedral of Nuestra Señora del Pilar contains a beautiful altar; it is much resorted to by pilgrims. Manufactures include cloth, silk, leather, spirits, machinery, glass, porcelain, soap, etc., other industries being iron-founding, tanning, and brewing. The Celtiberian Salduba, Saragossa derives its present name from Caesar Augusta of the Romans, after whom it was occupied successively by the Suebi, the Visigoths, and the Moors. It was conquered by Alfonso of Aragon,

Saragossa arms

in 1118, after a nine months' siege, and was the capital of the kingdom of Aragon until the end of the 15th century. In 1710 the British and Austrians here defeated Philip V. In the Peninsular War, Saragossa became famous by its heroic defence against the French, 1808-09. During the civil war of 1936-39 Saragossa was a bulwark of Gen. Franco's forces. Pop. 292,965.

Saragossa, Spain. 1. Main building of the university. 2. Stone bridge across the Ebro, showing the Cathedral del Pilar. 3. Torre Nueva, the 16th century clock tower, leaning 10 ft. from the perpendicular. 4. Façade and tower of La Seo, or church of the Saviour

Saragossa, MAID OF. Name given to Agustina (d. 1857), a Spanish national heroine, so called for her courage during the defence of Saragossa, 1808-09. Her deeds are described in Byron's *Child Harold*, canto 1, stanzas 54 ff.

Sarah OR **SARA**. Feminine Christian name. A Hebrew word, meaning princess, it was the name

of Abraham's wife, and was long very popular among both Jews and Christians. *See* Abraham.

Sarajevo. Variant spelling of the Yugoslav town *Serajevo* (*q.v.*).

Sarajoglu, SHUKRI (b. 1890). Turkish statesman. He was born at Odemis, and educated at Izmir and at Lausanne university. He joined Kemal Ataturk after the First Great War, and was minister of justice, 1932-38. After Ataturk's death in 1938, Sarajoglu was appointed foreign minister negotiating a treaty of

mutual assistance between Great Britain, France, and Turkey in 1930. He became prime minister in 1942. Sarajoglu favoured the Allied cause and soon severed diplomatic relations with Germany. His policy, while sometimes appearing ambiguous, was, in general, pro-Ally. In 1946 his cabinet resigned.

Saransk. Capital of the Mordovsk autonomous region, R.S.F.S.R. It is 75 m. N. of Penza, on the rivers Inzara and Saranka, and the Moscow-Penza rly. There are numerous tanneries, and considerable trade is carried on in grain, hemp, and furs. Pop. est. 15,000.

Sarapul. Town of R.S.F.S.R. It is on the Kama, 150 m. S.W. of Perm, in Sverdlovsk region. There are tanneries, boot and shoe factories, and considerable trade in grain. At Votkinsk, in the dist., are state ironworks for the manufacture of gun-carriages, railway engines, etc.

Sarasara. Volcano of Peru, in the dept. of Ayacucho. It is one of the peaks of a volcanic chain dominating the coastal region of Tarapacá. Its height is 20,000 ft.

Sarasate, PABLO MARTIN MELTÓN (1844-1908). Spanish violinist and composer. Born at Pampelona, March 10, 1844, he early showed signs of great technical ability and studied at the Paris Conservatoire 1856-59. He speedily made a European reputation as a violin virtuoso, and later acquired a new name as a composer of Spanish dances for the violin. He first played in London at the Crystal Palace, 1861, first visited the U.S.A. in 1870, and toured in all parts of the world except Australia. He died at Biarritz, Sept. 21, 1908.

Sarasvati. In Hindu mythology the wife of Brahma, goddess of eloquence, music, literature, and the arts. She is represented riding on a peacock, with a musical instrument in her hand. *See* Brahma; Hinduism.

Saratoga, BATTLES OF. Engagements in the American War of

P. M. M. Sarasate, Spanish violinist

Independence, 1777. Marching S. from Canada to join forces with Howe, who was near the Hudson, General John Burgoyne (*q.v.*) encountered the army of Horatio Gates near Saratoga. The first battle took place Sept. 19, and was a hotly contested fight between Burgoyne's forces, numbering some 4,000 men, and the American troops of Benedict Arnold (*q.v.*), 3,000 strong. Two hours of severe fighting ended inconclusively, though both sides lost heavily. On Oct. 7 Burgoyne launched another attack on the American position, but it was met by a counter-attack which, after a sharp battle, ended in the repulse of the British, who retreated 12 m. from Saratoga. There they entrenched themselves, but on Oct. 17 Burgoyne surrendered to Gates with the honours of war, his force at the time numbering some 5,000 men.

By the capitulation, sometimes known as the convention of Saratoga, the English were to embark as soon as they reached Boston, and were to pledge themselves not to serve in America again. The ratification of the convention was refused by Congress, however, and the British had to remain prisoners in America until peace was signed. See American Independence, War of.

Saratoga Springs. City of New York, U.S.A. It is 38 m. by rly. N. of Albany, and is served by the Delaware and Hudson and the Boston and Maine rlys. There are some thirty mineral springs here, all carbonated, the waters of which are efficacious in the treatment of rheumatism and dyspepsia. The resort which grew up around these springs became even more popular with the increasing following of the races. In 1933 a federal agency appropriated over \$3,000,000, to preserve the atmosphere of the spa and modernise it. Pop. 13,705.

Saratov. Town of R.S.F.S.R., capital of the region of the same name. It is on the right bank of the Volga, and on the Kozlov-Saratov rly. There are flour mills, leather, tobacco, and candle factories, and distilleries. There is also a big trade in grain, salt, and fish. The oil industry is important and prosperous, a pipe-line running 500 m. to Moscow and crossing rivers, swamps, lakes, and rlys. The university was founded in 1909; the Alexander Nevski cathedral was built in 1825. Other principal buildings include a Lutheran and a R.C. church and the Radishtchev museum. Pop. 376,000.

Sarawak. British crown colony in N.W. Borneo. It is bounded N.W. by Brunei, N.E. by British North Borneo, elsewhere by the Netherlands Borneo and the China Sea. The est. area is 50,000 sq. m. and pop. 500,000, most of whom are Dyaks, Malays, and Chinese. It is intersected by numerous rivers, many of which are navigable for considerable distances, and has a coast-line of about 450 m.

Kuching, the capital, situated on the Sarawak river, has a pop. of about 30,000. Sibü, on the Rejang river, has a large pop. of Chinese traders, who are the intermediaries between the tribes of the interior and the merchants of Singapore. Miri is the h.q. of the oil industry. Other places are Rintulu, Kapit, Sadong, Limbang, and Igan. The chief agricultural products are coffee, grown in Matang, pepper, sago, rubber, camphor, rattans, and tapioca. The principal mineral product is oil, from the neighbourhood of Miri. Gold is worked, and coal, of which there are considerable reserves, is mined at Sadong and elsewhere. Other products include antimony, diamonds, copper, and manganese. There are large exports of timber. Communication along the coast is by government steam launches, inland by road, around the capital, and waterway. There are no railways.

HISTORY. Sarawak was acquired Sept. 24, 1841, from the sultan of Brunei by Sir James Brooke (*q.v.* 1803-68), an officer of the East India Company, adding the Limbang river in 1890 and the Lawas river in 1904. Rajah Brooke, as he came to be called, secured British recognition of the independence of Sarawak in 1861. He was succeeded by his nephew, Sir Charles Brooke, who placed Sarawak under British protection in 1888. He was in turn succeeded by his son Sir Charles Vyner Brooke in 1917. In Nov., 1941, under a supplementary agreement, a British representative with certain limited powers was appointed.

On Dec. 16, 1941, the Japanese landed at Miri and Lubong Pt., British troops having been previously withdrawn after they had destroyed the oil refinery and installations at Miri. The Japanese occupied Kuching on Dec. 28, and by Jan. 1, 1942, British forces had retired W. from Sarawak to Netherlands Borneo. Units of the Australian 9th div. landed unopposed on June 20, 1945, at Lubong Pt. and on the 25th reoccupied Miri, where the Japanese had fired the

wells. Operations in Sarawak, linked with others in other parts of Borneo (*q.v.*) were continuing when Japan surrendered in Aug. The Japanese remaining in British Borneo surrendered at Labuan, Sept. 10, 1945, to Maj.-Gen. G. F. Wootten, commanding the Australian 9th div. Military administration of Sarawak ceased on April 15, 1946, when the rajah's rule was restored; but on May 21 Sir Charles Brooke signed an agreement ceding Sarawak to the crown, and on July 1 an order-in-council made Sarawak a crown colony with a constitution providing for a governor (Sir Charles Arden Clarke being the first to be appointed), a supreme council, and a legislative council. Divisional and district advisory councils representing the various peoples of Sarawak were also created. See Borneo; consult also History of Sarawak, S. Baring-Gould, and C. A. Bampfylde, 1909: *My Life in Sarawak*, Rance of Sarawak, 1913; *A Naturalist in Borneo*, R. W. C. Shelford, 1917.

Sarcey, FRANCISQUE (1827-99). French writer. Born at Dourdan, Oct. 8, 1827, he was educated at the Lycée Charlemagne and the École Normale. During 1851-58 he held teaching posts at Chaumont, Rodez, and then entered upon a literary career in Paris. Following on this he published critical articles in a variety of journals, and also several novels, which included *Le Nouveau Seigneur de Village*, 1862, and *Le Siège de Paris*, 1871, and acted as dramatic critic for *L'Opinion Nationale*, 1859-67. His fame is based chiefly, however, on his regular dramatic criticism for *Le Temps* from 1867 until his death on May 16, 1899. A selection of these articles appeared 1900-02. He was a sternly consistent critic, staunch to his clear if narrow standards, and showed hostility to the modern tendencies in drama.

F. Sarcey, French writer and critic

Sarcoma (Gr. *sarx*, flesh). Malignant tumour which differs from cancer in being formed from connective tissue, and in containing more fibrous tissue. Sarcomata may originate in the skin or subcutaneous tissues, the periosteum which invests bone, deeper parts of bone, the breast, testicle, or other organ of the body which con-

tains connective tissue. The tumour may occur at any age, but is more common below the age of 40, while cancer tends to occur after that age.

A sarcoma as it extends invades adjacent tissues, and the growing tumour may come to press upon a vital organ and so cause death. In its early stages a sarcoma is confined to the locality in which it originates, but in course of time small particles become detached and are carried away in the blood stream to other parts of the body, where they come to rest and give rise to secondary growths. No drug is of effective service in the treatment of sarcomata, and the only hope of saving life is in complete removal in the early stage before dissemination has occurred.

Sarcophagus (Gr. *sarx*, flesh; *phag-ein*, to eat). Coffin, usually of stone, especially one bearing sculptural enrichments or funerary inscriptions. The term denotes the supposed caustic action of certain stones. Originating in early Egypt for providing the dead with a house of eternity, the reproduction of contemporary dwellings passed into a mummiform type. The finest in England is the semi-translucent coffin of Seti I (Soane Museum). In Istanbul a splendid series from Sidon includes the so-called Alexander sarcophagus. Christian art adapted pagan sculpture to its ends; famous examples are the Julius Bassus, the Helena, and the

Constantia at Rome. A series at Ravenna of the 6th century includes that of S. Barbara. Etruscan terra-cotta coffins were surmounted by reclining effigies. See *Invalides*; *Phoenicia*.

Sard. Variety of the cornelian. It ranges in colour from a light chestnut hue to an orange brown, and is much valued for signet-rings.

Sardanapālus. Legendary Assyrian king. According to Ctesias, Diodorus, and other Greek writers, he was an effeminate voluptuary who reigned in the 9th century B.C. Besieged in Nineveh for two

bodies also confused memories of authentic events two centuries later, especially under the peaceably disposed but not effeminate Ashurbanipal (q.v.), and under his brother Shamash-shum-ukin, who in 648 burned himself in his palace in Babylon. See *Nineveh*.

Sardica, COUNCIL OF. Assembly of the Church. It took place about A.D. 344, at Sardica, now called Sofia. It was convened by the emperors Constans and Constantius; but at the outset the bishops of the Eastern and Western Churches differed over the admission of Athanasius. The Eastern bishops withdrew, and held a rival council at Philippopolis. Hence neither of these councils can be regarded as oecumenical, and their decrees have never been formally recognized.

Sardine. Word originally used for a small fish of the herring family, when it is preserved in oil. The name is a corruption of Sardinia, as many fish for preserving were taken around that island. It has been held, however, that the word sardine is only applicable to the pilchard (q.v.).

Sarcophagus. 1. Aragonite or calcite sarcophagus of Seti I. 2. Etruscan terra-cotta sarcophagus, ornamented with hunting and battle scenes. On the lid are figures of the deceased and his wife. 3 and 4. End and side views of the so-called sarcophagus of Alexander, ornamented with coloured reliefs representing scenes of hunting and fighting

1. Soane Museum, from the Description of the House, by permission of the Trustees 2. British Museum 3 and 4. Istanbul

Sardinia. Italian island in the W. Mediterranean, forming a region of Italy. It is 89 m. wide and 168 m. long, with area 9,302 sq. m.; is separated from Corsica by the Strait of Bonifacio; and is 115 m. from Italy. The gulfs of Oristano and Cagliari are connected with the low plain of Campidano. S.W. of the plain the highlands are rich in minerals, especially copper and silver-lead ores; N.E. of the plain are other mts. which are well marked along the E. coast; the culminating peak in the Gennargentu mts. is 6,365 ft., near the centre of the island. Forests cover a fifth of the area, though the rainfall is slight, and summer is a season of drought. Wheat, wine, and olive oil are produced. Agriculture, despite the fertility of the soil, is backward, owing to the smallness of the holdings and the liability to floods and malaria on the low plains. Charcoal, fish, salt, wine, olives, and various minerals are the principal exports. There are universities at Cagliari, the capital, on the S. coast, and Sassari. Pop. 1,196,000.

Sardinia abounds in remains of the Bronze Age, including *nuraghi* or fortified dwellings, and so-

called giants' graves. Whether the Shardana, who served as mercenaries in Egypt under Ramesses II, were Sardinians is uncertain. Sardinia was partially conquered and settled by Carthage about 500 B.C., and there were a few Greek colonies. A mutiny of Carthaginian mercenaries in 238 B.C. gave the Romans a pretext for annexation, and the island, with Corsica, was made a province. The natives resisted stubbornly, and there were repeated revolts, and constant brigandage.

The Vandals held the island during 456-534, and after a brief Ostrogothic occupation, it was conquered by Narses for the E. Roman empire, to which it belonged for four centuries. The Saracens having long harassed Sardinia, Pope John XVIII offered the island to any power that would expel them. Pisa thus acquired the sovereignty early in the 11th century, though Genoa at times gained a footing in the island. From 1164 Sardinia was at least nominally a kingdom. Aragon expelled the Pisans, 1323-26, and Sardinia was under Spanish viceroys from 1478 to 1713, when it passed to Austria, and in 1720 to Savoy, whose duke became king of Sardinia.

Sardinia was used as an air and naval base by the Italians during the Second Great War, military targets being frequently bombed by the Allies. On Nov. 27, 1940, there was a running fight off the W. coast of the island between units of the R.N. and Italian warships, in which an Italian battleship and several cruisers were damaged. In Aug., 1941, British aircraft set fire to the cork forest on the outskirts of Tempio. After the surrender of Italy Sept. 3, 1943, the Italian garrison forced the German troops on the island to evacuate it.

Sardinia. Former Italian kingdom, whose ruler became king of Italy in 1861. By the treaty of London, Aug. 24, 1720, Victor Amadeus II, duke of Savoy, agreed with Austria to exchange Sicily for the island of Sardinia, of which he became king. The island which thus gave the family of Savoy its regal title was of subsidiary importance to their realms, which were otherwise on the mainland, with the capital at Turin.

Victor Amadeus abdicated in 1730 in favour of his son, Charles Emmanuel I, but the latter's son, Victor Amadeus, having sided with the French royalists, was driven from his throne by the Republican armies under Napoleon in 1796. Savoy and Nice were annexed to France. Charles Emmanuel II (1796-1802) vainly strove against Napoleon. In 1802 Piedmont became French, the new king, Victor Emmanuel I, brother of Charles, holding sovereignty only over the island of Sardinia. The congress of Vienna, 1814, reinstated the house of Savoy and added the territory of the former republic of Genoa to their realm.

The kingdom thus comprised Genoa, Savoy, Aosta, Piedmont, Nice, and Sardinia. An insurrection against the misgovernment of Victor Emmanuel I caused his abdication in 1821 in favour of his brother, Charles Felix, upon whose death ten years later the crown of Sardinia passed to the Carignano branch in the person of Charles Albert. This king's liberal tendencies and staunch devotion to the cause of Italian freedom saved his throne in the revolutionary whirlwind of 1848, though he himself, who had led his army against the forces of despotic Austria, was hopelessly defeated at Novara, March 23, 1849. He abdicated on the battlefield in favour of his son, Victor Emmanuel II, who made the name of Sardinia synonymous with liberty and the union of Italy.

By participation in the Crimean War of 1854-55 Victor Emmanuel raised Sardinia to the dignity of a seat in the council of nations at Paris. By the sacrifice of Nice and Savoy in 1860, his prime minister Cavour bought the assistance of Napoleon III to drive the Austrians from Italy; but the kingdom ceased to exist when Victor Emmanuel was crowned king of Italy in 1861. See Cavour; Italy; Savoy; Victor Emmanuel II.

Sardis OR SARDES. Ancient capital of the kingdom of Lydia.

Sardinia. Map of the Mediterranean island forming a region of the republic of Italy

Captured by the Persians in 546 B.C., it figured later in the Ionian revolt. After Alexander the Great took it in 334 B.C. it became a Greek city of importance, and was still a considerable place when it passed under Roman rule. It was the seat of one of the earliest Christian bishoprics, and was one of the seven churches of Asia addressed in the Apocalypse. The city was destroyed by Tamerlane in the 15th century, and is now represented by Sart, a village lying about 50 m. E. of Izmir.

Sardonyx. Variety of chalcedony. It displays alternate bands of white and brown. It is mounted in jewelry with a plain table surface, carved or engraved, and is used for other ornamental purposes. See Precious Stones.

Sardou, VICTORIEN (1831-1908). French dramatist. Born in Paris, Sept. 7, 1831, he suffered dis-

Victorien Sardou,
French dramatist

appointments with early plays and endured privation before achieving success in 1860 with *Monsieur Garat* and *Les Prés Saint-Gervais*, written for the actress Déjazet.

A writer of extraordinary fertility and cleverness, he succeeded in almost all forms of drama: the comedy of intrigue, e.g. *Les Pattes de Mouche*, 1860, familiar in English as *A Scrap of Paper*; the comedy of manners, e.g. *La Famille Benoiton*, and *Nos Intimes*; political comedy, e.g. *Rabagas*; historical drama, e.g. *Patrie*, *Thermidor*, and *Madame Sans-Gêne*. Many later melodramas, e.g. *La Tosca*, were written for Sarah Bernhardt, and Sardou also wrote *Robespierre*, 1902, and *Dante*, 1903, for Irving. Dora was popular in England under the title *Diplomacy*. Sardou's merits were essentially theatrical; his psychology was superficial, but he was a consummate master of technique and stage effect. He died in Paris, Nov. 8, 1908.

Sargasso Sea. Region of the Atlantic Ocean, lying off the American coast about the latitude of Florida and reaching about halfway towards Africa. It is composed of floating masses of brown seaweed characterised by numerous small berry-like bladders. This dense gulf weed (*Sargassum bacciferum*) is the home of many small marine animals, crabs, prawns, etc. It is supposed that the weed grows on the American

coasts and is torn away by the waves and washed by the currents round the North Atlantic into the comparatively still waters, where it floats in accumulated masses. The older masses of weed slowly lose their power to float and then sink and perish. Columbus discovered the Sargasso Sea, which for long had an unenviable reputation, as it was thought that any ship forced into it was doomed to destruction. Recent scientific expeditions have demonstrated that ships need have little fear of the masses of weed.

Sargent, SIR (HAROLD) MALCOLM (WATTS) (b. 1895). English conductor, born April 29, 1895.

Sir M. Sargent,
English conductor

From school at Stamford he went to study music at Peterborough cathedral, and was a church organist at Melton Mowbray until 1924. A professorship at the R.C.M. came in 1923. This inspiring conductor was associated with productions of *Hiawatha* at the Albert Hall from 1926; Royal Choral Society from 1928; Courtauld-Sargent concerts, 1929-40; Liverpool Philharmonic orchestra from 1942; promenade concerts from 1947; and countless provincial festivals. Sir Malcolm, who was knighted in 1947, became known as the British musical ambassador by his European tours for the British Council, and was often on the B.B.C. Brains Trust. In 1950 he succeeded Sir Adrian Boult as conductor of the B.B.C. symphony orchestra.

Sargent, JOHN SINGER (1856-1925). Anglo-American painter. Born in Florence, of American parents, he studied at Florence, and in Paris under Carolus-Duran. Settling in Chelsea, he soon attracted attention as a portrait painter. He became A.R.A. in 1894, and R.A. in 1897; and was a

John S. Sargent. *Carnation, Lily, Lily, Rose.* A masterly example of the artist's subject painting
Tate Gallery, London

conspicuous exhibitor at the Salon. Among his works are portraits of Ellen Terry as Lady Macbeth, the Misses Wertheimer, Mrs. Carl Meyer and Children, Joseph Chamberlain, and "*Carmenita*." Later the slashing bravura of his earlier style refined itself, and sunlit land-

John S. Sargent,
Anglo-American
painter

scapes occupied him, though his chief reputation remained that of a portraitist. His *Carnation, Lily, Lily, Rose* is in the Tate Gallery. He died April 14, 1925.

Sargon. King of Assyria, 722-705 B.C. The Biblical spelling represents the cuneiform Sharrukin, assumed by a military usurper who founded the Sargonid, the last Assyrian, dynasty. After the capture of Samaria he deported its inhabitants. He overthrew Hamath, 720; Carchemish, 717; Ashdod, 711 (Is. 20); and Mita of Mushku and Merodach-baladan of Babylon, 709. His son Sennacherib succeeded him. See Assyria; Karkar; Mushki; illus. p. 7322.

Sargon, or, more correctly, **SHARRUKIN.** King of Akkad, N. Babylonia. The Neo-Babylonian tradition which dates him about 3800 B.C. is regarded by many scholars as 1,000 years too early. Of humble origin, a gardener and temple-warder, from Kish in

Sargon, King of Assyria. From a relief copied by C. Chipiez. See p. 7321.

Sumeria, he captured Ur and Lagash and founded a powerful Semitic dynasty. See Naramsin.

Sarik. Turcoman tribe, living mostly in Turkmen S.S.R., E. of the Caspian. Numbering perhaps 60,000, they were ousted from the Merv oasis by the Tekke tribe in 1850, and now occupy the Murg-hab basin between the Yulatan oasis and Penjdeh, with an offshoot in Afghan Turkistan. Organized in five or six clans, they practise horse-breeding and agriculture.

Sar-i-Kul OR **GAZ KUL.** Lake of Central Asia, also known as Lake Victoria. Lying on the S. of the Pamir, the high plateau N.E. of Afghanistan, from which the chief mountain chains of Asia diverge, it is the source of the Pamir river, a parent stream of the Amu-Daria (Oxus). It is at about 14,000 ft. above sea level.

Sariputta. Name of a disciple of Buddha, who lived in the 6th century B.C. The son of a Brahman, he early devoted himself to an ascetic life, and was one of the first to join the Buddhist movement. His piety and learning placed him at the head of the disciples, and his discourses with the Buddha are collected in the Buddhist scriptures. He died shortly before his master, and an urn containing some of his ashes was discovered at Sanchi in 1851.

Sark OR **SERQ.** One of the Channel Islands. It is 3 m. long and about 1,270 acres in area. It lies 6 m. E. of Guernsey, and consists of two peninsulas, Great Sark and Little Sark, joined together by a narrow, elevated causeway called the Coupée. Almost surrounded by rocks, it has a tiny harbour on the E. coast known as Creux, and access to the interior is gained through tunnels cut in the rocks. Sea fowl and fish abound, and there is some agriculture. Sark is remarkable for the grandeur of its cliffs and caves, and its praises have been sung by Swinburne in *A Ballad of Sark*, and by John Oxenham. It has a seigneur (or a dame) and forms part of the bailiwick of Guernsey.

On June 28, 1940, the Home office announced that Sark had been demilitarised; and on July 1 a small German force occupied the island. Sibyl Mary Hathaway, dame of Sark, remained on the island, her husband being taken to Germany 1943-45. A British Commando raid made on Sark on the night of Oct. 3-4, 1942, to confirm suspicions of ill-treatment of the population, found evidence of deportations to Germany for forced labour. On May 9, 1945, the Channel Islands were liberated; British military government ceased on Aug. 25. Pop. 600.

Sark. Stream of Dumfriesshire, Scotland. It rises in the Collin Hags and flows mainly S. to the E. end of Solway Firth. For the lowest 7 of its 13 m. it forms the boundary between England and Scotland. Its chief affluent is the Black Sark.

Sarlat. Town of France. In the dept. of Dordogne, it is 44 m. E. of Bergerac. The chief building is the former cathedral, which has some interesting architectural features. There is a building of the 12th century. Sarlat trades in cattle, while coal, iron, and lithographic stone are mined in the vicinity. The town grew up round an abbey founded soon after 800, and was the seat of a bishop until 1790. Pop. 6,200.

Sarmatia. Name given in ancient times to the large tract of country bounded roughly by the Carpathians, the Vistula, the Volga, and the Black Sea, but stretching to the N. as far as the Baltic. Its chief inhabitants were the Sarmatae, probably a Slavonic people. These, after conquering the Scythians, were themselves in turn conquered by the Goths. The chief Sarmatian tribes were the Iazyges and the Roxolani.

Sarmiento. Isolated mountain of S. America. It is situated on the S. side of Gabriel Channel, in the Chilean portion of Tierra del Fuego, alt. 6,910 ft. It was named after Pedro Sarmiento, the Spanish navigator (c. 1530-87), who explored the Strait of Magellan.

Sarmiento, DOMINGO FAUSTINO (1811-88). Argentine statesman and author. Born Feb. 14, 1811, at San Juan, of a Spanish family, he joined in 1829 the army of Gen. Paz, after whose defeat in 1831 he fled to Chile, where he remained until 1836, and again, 1840-52, in consequence of his newspaper attacks on the Argentine government. He joined Urquiza in his revolt against the tyrant Rosas,

Sark, Channel Islands. The road along the Coupée, showing the wild scenery on the wonderful natural causeway which connects the two parts of the island.

fought at Monte Caseros, 1852, and on the fall of Rosas became inspector-general of schools. In 1864-65 he was ambassador to Chile and Peru, then minister at Washington. President of Argentina 1868-74, Sarmiento carried out educational reforms. His books include *L'Education Populaire*, 1847, and *A Life of Lincoln*. He died Sept. 11, 1888.

Sarnen. Town of Switzerland. The capital of Obwalden, the W. half of Unterwalden (*q.v.*), it stands on the river Aa, at the N. end of the small Lake of Sarnen, 13 m. S. of Lucerne on the rly. It is situated at an alt. of 1,556 ft. Pop. 5,282.

Sarnia. City and port of Ontario, Canada. Situated on the river St. Clair, near Lake Huron, opposite Michigan, 170 m. S.W. of Toronto, it is a station on the C.N.R. and the Pêre Marquette rly. Steamers go from Sarnia to ports on the Great Lakes and the St. Lawrence. It is connected with Port Huron on the American side of the St. Clair by a rly. tunnel and the International Bridge. The industries include lumber mills, and it is here the largest oil refinery in the British Empire is situated. Pop. 18,734.

Sarno. City of Italy, in the prov. of Salerno. The ancient Sarnus, it stands near the source of the river Sarno, 14 m. by rly. N.W. of Salerno. It has the ruins of an old castle and a 17th century cathedral. The chief manufactures are linen, cotton, silk, paper, leather, and wine. There are mineral springs in the vicinity. In 553 Sarno was the scene of an overwhelming defeat inflicted on the Ostrogoths under Teias by the troops of Justinian under Narses. Pop. approx. 15,000.

Sarolea, CHARLES (b. 1870). Belgian administrator and scholar. Born at Tongres, Oct. 25, 1870, he was educated at Liège university. In 1901 he became Belgian consul at Edinburgh, where during 1894-1931 he was lecturer first and head later of the French and Romance dept. at the university. He was founder editor of *Everyman*, 1912-17. During the First Great War he raised over £100,000 for Belgian relief in Great Britain and the U.S.A., and as political adviser accompanied Albert I to Brazil and W. Africa, 1920. The famous people of whom Sarolea wrote studies include Ibsen, 1891; Hugo, 1911; Tolstoy, 1912; Joan of Arc, 1918; Masaryk and Lincoln, 1920. *Daylight on Spain* was published in 1938.

Sarong (Malay, covering). Traditional dress of all Malayan women. A length of cotton material, patterned by the batik (*q.v.*) method, the sarong is wound closely about the body from the breast to the feet, and is surmounted by a dainty short jacket, the *kabaya*.

Saronno. Town of Italy, in the prov. of Varese. Situated on the rly. between Milan and Como, 13½ m. N.N.W. of the former city, it is a junction, has large lace factories and machine works, and produces the *amaretti* gingerbread which is considered a luxury in all parts of Italy. The pilgrimage church of Our Lady contains frescoes representing a concert of angels, by Ferrari, and others by Luini (*q.v.*), and has a campanile built in 1516.

Saros. In astronomy, a period of 18 years 11½ days, which roughly marks a cyclical period of eclipses both of the sun and of the moon, and enables them to be predicted. It is a period of 223 lunations, and is less than 19 eclipse years by eleven hours. This is the period of the retrograde revolution of the nodes. It was used in very ancient times to predict eclipses. Saros, in Babylonian numeration, was the number 3,600. See Eclipse.

Saros OR XEROS, GULF OF. Inlet of the Aegean Sea, the ancient Sinus Melas. Situated N.W. of the peninsula of Gallipoli, which separates it from the Sea of Marmara and the Dardanelles (*q.v.*), its length is 40 m. and its width at the broadest about 20 m.

Saroyan, WILLIAM (b. 1908). American playwright. Born at Fresno, Calif., Aug. 31, 1908, he was educated there. In 1934 he was acclaimed as a writer of vitality and originality with *The Daring Young Man on the Flying Trapeze*. Turning

for some years to the theatre, he wrote plays which were surrealistic in treatment and provoked controversy. In 1939 came *My Heart's in the Highlands*, and *The Time of Your Life* (this was awarded the Pulitzer prize, rejected by the author); in 1941, *The Beautiful People*. Saroyan opened his own theatre in New York in 1942. A story, *The Human Comedy*, was filmed. The *Adventures of Wesley Jackson*, a novel based on a soldier's letters, appeared in 1947

W. Saroyan, American playwright

Sarpedon. In Greek legend, a prince of the Lycians. He came to fight for the Trojans at the siege of Troy, but was slain by Patroclus, the friend of Achilles.

Sarpi, PAOLO (1552-1623). An Italian historian. Born in Venice, Aug. 14, 1552, he was given the name of Pietro,

Fra Paolo Sarpi, Italian historian

but on becoming a member of the Augustinian order called himself Fra Paolo. He devoted himself to scientific studies, and his reputation long

rested mainly upon his experiments and researches in optics, anatomy, and other sciences. When Paul V attacked Venice in 1606, Sarpi came forward as champion of the Venetian republic against the pope, meeting the papal interdict with a series of polemical tracts and pamphlets. Called to Rome to answer for his conduct, he refused to obey, was excommunicated, and in 1607 an almost successful attempt was made to assassinate him. Undeterred by the attacks of his enemies, he continued his work as a patriot and reformer, being state counsellor in jurisprudence at Venice. He died Jan. 15, 1623.

Sarpi's chief work is the *History of the Council of Trent, 1619*, translated into English by Sir N. Brent, 1620, which gives him a position among Italian historians immediately after Machiavelli. Sarpi has been summed up as a Catholic whose creed approached without quite attaining the Protestant standpoint; he opposed the papal claim to infallibility.

Sarpsborg. Town of Norway, in the fylke of Østfold. It stands on the river Glommen, near its entry into Oslo Fjord, 68 m. by rly. S. by E. of Oslo. The river here forms the huge falls of Sarpsfos, which supply water-power to numerous sawmills, cellulose, paper, and calcium carbide factories, and electrical works. A large quantity of timber is exported. Pop. 13,000.

Sarrail, MARCEAU PAUL EM-MANUEL (1856-1929). A French soldier. Born at Carcassonne, April 6, 1856, he joined the army in 1874, served in Algeria, and became a lieutenant in the foreign legion in 1882.

He was director of infantry under the minister of war in 1907, general commanding the 12th

infantry division, 1911, and successively head of the 8th and 6th army corps. Shortly after the outbreak of the First Great War he was given command of the 3rd army and took part in the first battle of the Marne. In Aug., 1915, he was appointed commander of the French army of the Orient, and next Jan. put at the head of the whole Salonica expedition. Sarrail was high commissioner in Syria from 1923, but in 1925 was recalled after dealing brutally with the revolt of the Jebel Druses. He died March 23, 1929.

Sarre. French name for the river described in this work as Saar. Names of towns in the Saar Basin or Saarland are given the prefix Sarre in French, e.g., Sarrebruck, Sarrelouis, but the German form (e.g. Saarbrücken) is preferred in this work, except for places in Alsace-Lorraine.

Sarreguemines OR **SAAR-GE-MUND.** Town of Lorraine, now in the French dept. of Moselle. It stands at the junction of the Saar and the Blies, 40 m. E. of Metz. It manufactures pottery, velvet, gloves, etc., and is a rly. junction. The town is said to have grown up round an abbey founded by Pepin in the 3rd century. Pop. 13,375.

Sarrusophone. Name of a family of brass wind instruments invented in 1863 by Sarrus, a French army bandmaster. They have a conical bore and are fitted with a double reed, while the mechanism is akin to that of the bassoon. The compass is two octaves and a fourth.

Sarsaparilla (*Spart. zarzaparrilla*, from Basque *zartzia*, bramble). Product of several species of smilax, woody vines, natives of warm parts of America. The roots of the plant are dried, and from them by boiling is prepared the cooling drink, which is bright pink in colour. See Smilax.

Sarsen Stones OR **GREY-WETHERS.** Name given to blocks of hard siliceous sandstone found in Wiltshire and S.E. England. Huge blocks of sarsen stones are scattered in thousands over the Wiltshire downs, the most remarkable being the outer circle of Stonehenge and the stone circle of Avebury. The stone is extremely hard and weather-resisting, and is consequently used in building, especially for stair work, for posts, etc. Windsor Castle is largely constructed of sarsen stones.

Sarsfield, PATRICK (1645-93). Irish soldier. Born near Dublin, of a landowning family, he entered

the English army in 1678 and served in France. He was actively loyal to James II during his short reign, and when the king fled to France Sarsfield was one of his companions. He was in the force that crossed to Ireland to fight for the exiled king. Present

Dublin

at the battle of the Boyne, he won renown by conducting the defence of Limerick, on the surrender of which city in 1691 he returned to France. Serving in the French army, he was mortally wounded at the battle of Neerwinden, July 29, 1693. James II made him earl of Lucan, and his widow married the duke of Berwick. *Consult* Life, J. Todhunter, 1895.

Sarsnet OR **SARACENET.** Soft, fine silk stuff, plain or twilled, in various colours, now used mainly for lining dresses. It is the old "Saracen cloth," originally made by the Saracens. It seems to have been introduced into England in the 13th century, and was popular as a woman's dress material and lining in the 18th century.

Sartain, JOHN (1808-97). Anglo-American engraver. Born in London, Oct. 24, 1808, he studied engraving under J. Swain. Emigrating at 22 to the U.S.A., he introduced mezzotint engraving to that country, and, settling at Philadelphia, rose to eminence in his profession. Sartain was also a portrait and miniature painter. He died Oct. 25, 1897.

Sarthe. River of France. It rises near Moulins-la-Marche, in Orne dept., and flows S.S.W., passing Alençon and Le Mans, to join the Mayenne and form the Maine, which falls into the Loire below Angers. Its length is 175 m.

Sarthe. Dept. of France. Formerly part of the provs. of Maine and Anjou, it lies adjacent to the depts. of Eure-et-Loir, Loir-et-Cher, Indre-et-Loire, Maine-et-Loire, Mayenne, and Orne. Its area is 2,410 sq. m. Mainly hilly, and well wooded, the dept. produces cereals, especially barley; cattle, sheep, horses, and poultry are bred. The forests of Bèrsay, Vibraye, and Perseigne are here, and marble and building stone are quarried. Industries include motor works, bell foundries, metal working, pottery, bricks, tiles, glass, cloth, preserved foodstuffs,

tanning, paper, and printing. The chief rivers are the Sarthe, Loir, Huisne, and Vègre. Le Mans, the capital, is a rly. centre of importance, and other towns include La Flèche, Mamers, St. Calais, Fresnay-sur-Sarthe, Bonnétable, Bouloir, and Pontvallain. Pop. 412,214.

Sartor Resartus (Lat., the tailor re-clothed). Prose work by Thomas Carlyle, which appeared serially in Fraser's Magazine and was published in book form in 1838 with the full title of Sartor Resartus: The Life and Opinions of Herr Teufelsdröckh. Purporting to be largely a translation of and commentary on the philosophy of clothes as set forth by a German author, it presents, in a remarkably stimulating manner, much pregnant thought on things in general. It was the first work in which the author, to suggest its supposed German origin, hit upon that individual, ejaculatory, and sometimes involved style which later came to be known as Carlylese. The book achieved a remarkable and sustained success—80,000 copies of a cheap edition were sold during 1872-91—and stands as the best single representative of Carlyle's literary style and his philosophic thought.
